It is quite clear, however, that a very good opening for original treatment presents itself. Again and again we have been told that we cannot get away from column and entablature because they were a natural development of post and lintel; in ships there comes the opportunity to break away at last. Stringers and iron-frames, garboard strake and web-frame, foremast and wire-stays, iron keels and deck-beams, side-plates and rivets—is there no inspiration in these out of which something new might be born? And the bow? Ruskin tells us that the sum of navigation is in that. "That rude simplicity of bent plank, that can breast its way through the death that is in the deep sea, has in it the soul of shipping. Beyond this, we may have more work, more men, more money; we cannot have more miracle. . . . For there is first an infinite strangeness in the perfection of the thing as work of human hands. I know nothing else that man does which is perfect, but that. . . . The boat's bow is naïvely perfect; complete without an effort. . . . You may magnify it or decorate it as you will; you do not add to the wonder of it. Lengthen it into hatchet-like edge of iron, strengthen it with complex tracery of ribs of oak, carve it and gild it till a column of light moves beneath it on the sea, you have made no more of it than it was at first."

In designing ship interiors the architect might bear in mind the criticism of Sir Westcott Abell, given at a meeting of the R.I.B.A. in the spring of this year. The modern fashion of decorating a ship, he said, does not express the spirit of the ship. The beautiful lines of the ship are not reflected in its interior. All that goes to the making and running of a ship is so essentially efficient and economical; the lines of a ship express that wonderful austerity, that elimination of all that is irrelevant. In the internal decoration of ocean liners one gets all the semblance of bricks and mortar and the weighty and bulky materials of land building. That is in itself inconsistent with the clean efficiency of the ship's structure. Will it not be possible in the course of time to evolve a style of decoration more in keeping with the structure and peculiarities of ships? The answer, we imagine, is in the affirmative. Land architecture is undergoing a slow and painful process of evolution, and it is reasonable to assume a corresponding development in the architecture of the ship. Here, in any case, is a fine field of activity for the architect.

Notes and Comments

Higher Buildings Again

Higher buildings for London are once more "in the air," or, it seems, soon will be, for this time the case is being pressed, not by architects or mountaineers, but by a large combination of business interests. Again and again architects have had before them the evidence for the erection of taller buildings in congested areas, but generally the consensus of opinion has been against any extension of the London Building Act, and the question has dropped. But the planning of garden cities and satellite towns, and the provision of quicker and more comfortable means of transit, can only defer, and never settle, the problem. Clearly it must be faced, and it would have been all the more to the good had it been faced by organized architects in a body rather than by a group of business men. However, so long as there is a proper conformation to good æsthetic standards, and a systematic protection of the lives and health of the people, there seems no reason why the proposals now being put forward by the committee for submission to the London County Council and the insurance companies, should not be actively encouraged by architects and laymen alike.

Too Many Memorials?

When one looks back over the centuries, comparatively few particular figures are discernible—the works and names of the great bulk of mankind are forgotten. And it is wonderful how, faced with this obvious futility, the desire and the attempt to be remembered persists. Memorials for this, memorials for that, are found upon the public buildings and open spaces of every town, while, perhaps, the very act they are there to commemorate is forgotten. Yet when a thing is beautiful and true to its purpose, even when its purpose is only half-remembered, it will be preserved and beheld by generations to come; if it is not beautiful, then it will be doomed. The memorials of the Great War are probably more numerous than those erected for any other purpose since the beginning of Time. Thermopylæ and the burning of Troy themselves have handed down to us only a few broken stones and undecipherable coins. Every village green now has its cenotaph or sculptured group, and where the designing of these has been entrusted to architects—instead of being left in the hands of local stonemasons—they are usually memorials of character and strength.

National Libraries

The annual conference of the Libraries Association is always fruitful in good counsel and common-sense philosophy. Mr. John Ballinger, presiding at this year's conference, which was held at Cardiff, spoke hopefully of the outlook for the library movement. He considers that the time has arrived for the institution of "some kind of national library service as opposed to a number of unconnected individual libraries," and he foretold the appointment of a national committee to go into the whole question. He further suggested the formation of a central library authority to co-ordinate and assist local effort; and the whole of his presidential address supplies yet another clear indication of the modern social trend. "Free institutions," "local self-government," "village autonomy," and similar clichés, are losing the force that seems to have been a heritage from the barbaric days of government by tribes, and the concept of interdependence is everywhere rapidly superseding that of over-independence and comparative isolation. Certainly libraries, of all our "free institutions," should be co-ordinated for mutual help and more efficient national, rather than merely local, service. With a national central library authority we may reasonably expect better collections of books and better buildings in which to house them. There are several respects in which library organization on co-operative lines should be prolific of public benefit. For one thing, the central authority should be empowered to purchase and distribute judiciously approved technical works, thus offering a wider field for the dissemination of useful knowledge and greatly encouraging the most useful kind of authorship. Then, again, scientific and technical periodicals, and the publications of the various learned societies, British and foreign, should be made much more free of access than they are now, and a central organization should put this item in the front rank of the reforms to be introduced without delay.

The R.A. and Decorative Art

It was hoped and expected that, under Sir Aston Webb's presidency, the Royal Academy would show increased energy in developing the applied arts. So far the anticipation has not been disappointed; and the influence of the architect President is surely to be traced in the project for the Decorative Art Exhibition which is to be held at Burlington House in January and February of next year. For the exhibition "is primarily intended to illustrate and promote the application of the arts, in their several forms, to the permanent decoration of buildings." The scheme has breadth. It implies more than the decorative application of paint to wall and ceiling. Sculptor, carver, metalworker, stained glass designer, are invited to exhibit; and the Arts and Crafts Exhibition Society will co-operate. This exhibition will achieve a splendid result if it can demonstrate to a sceptical public that fine art and applied art are not two irreconcilably different things, and that "all art is one" is a true saying. The exhibition should also serve to convince artists as well as the public that the decoration of the home is an object that should stimulate the highest ambition. The R.A. Winter Exhibition should bring about a sorely needed revival of the art traditions of early Georgian days, when no art was considered too good for house decoration.

House-painting for Health!

Looking through a volume of lectures delivered by Sir Thomas Oliver, M.D., before the Royal Institute of Public Health in 1914, we came across the following remarkable statement concerning the antiseptic properties of paints. "Two years ago," says Sir Thomas, "Professor H. J. Hutchens and I carried out a series of experiments with various paints to test their germicidal powers. The micro-organism used was the *bacillus coli*. . . . We found that vapour from drying paint at 37° C. possessed definite bactericidal properties. It retarded and prevented the growth of micro-organisms. Paints which had been dried for forty-eight hours exercised a similar influence, but after five days they no longer possessed such power. Similar results were obtained by H. A. Gardner. Like myself, he attaches considerable importance to the circumstance, for by painting chambers with an oil pigment we have an efficient means of destroying bacteria in rooms which have been occupied by persons who were the subjects of contagious disease." He adds the practical observation that during painting the rooms should be well ventilated, but when finished they should be closed for a day or two, to allow of the vapours exercising their antiseptic influence upon the walls and contents. This is distinctly worth knowing by the general public, who will accept the assurance of the doctor of medicine whereas they might suspect the decorator of self-interest, because the antiseptic property of paint is an additional excellent reason for using it "frequent and free."

The Historical Development of Ship Decoration

By T. W. MacALPINE

THROUGHOUT the ages the ship has called forth wonder and admiration. Man's adventurous spirit, fertility of mind and skill in handicraft, have all contributed to produce her, and he has found pleasure in adorning her with his art.

Nature shows us countless examples of beauty in form, exquisite colour, spectacles of great magnificence and grandeur, and grace in motion. Where man has followed nature, some of these attributes are to be seen in his art, albeit on a lower plane of excellence, and they are also to be found in those other works which owe their existence to his original genius. But perhaps the great sailing ship can alone claim to combine in herself all these attributes, for she alone, of all his works, has grace in motion.

From the earliest times of which records of nautical affairs exist, and right down through the centuries, there is evidence of decoration in ships. In colour, carving, and the devices displayed, the earliest decoration was of a minatory character and, in this respect, followed the practice of savage warfare, where an attempt is made to strike terror into an opponent by means of a menacing spectacle; the war canoe of the savage provides an example of this primitive type.

Sometimes in later, but still ancient, days, ornamentation was intentionally ostentatious, where the owners of the vessels were kings or potentates vying with one another to exhibit their wealth and power. Owing to the fact that she visited many countries, the ship provided an ideal means for this display, and art was pressed into the service of ostentation, more generally with incongruous results. But often the ship has been regarded as an object worthy in herself of the exercise of the artist's talents. The beginnings of this decoration may be traced to two main motives :—

1. All true seamen have an affection for a ship and, in some cases, a belief that she is a living creature on whom they ought to lavish their best gifts.

2. History shows that a ship, owing probably to her warfare with the elements, has always been referred to in terms implying worth and high esteem, and this, again, has caused man to render a grateful return.

But there is yet one more reason : it is a matter of observation that some cannot live without attempting to decorate their environment; and while it appears that the true artist takes more pleasure in the exercise of his powers than in the contemplation of the finished work, the latter is for many others an end in itself. And if such spend the greater part of their lives at sea (and it was usual for mariners to do so from the earliest ages of deep-sea navigation down to the middle of the nineteenth century) we should expect them to direct their efforts to the adorning of the vessel; and, indeed, we know that much of the later development in ship decoration owed its inception to the mariner.

The decoration in ships falls within the category of the domestic; the motive which caused the ancients to lavish their best work on temples to provide worthy dwellings for the gods and to propitiate them, had no influence in the case of the ship, although in mediæval times it was not uncommon to find pictures of saints shown in prominent positions, and sometimes large paintings of sacred subjects were displayed on the sails. The figure-head, too, was often a single figure or a group of sacred imagery; doubtless the supplications of the saints during storm and tempest were desired.

Most of the earliest historical records deal with ships of the Mediterranean Sea and the large rivers and waters adjoining, and we have a fairly connected account of the development of ships from about 1000 B.C., and a disjointed record extending back two thousand years earlier.

In addition there is some rather scanty information on the early Chinese and Arabian vessels. While we are pretty certain that most, if not all, types from the earliest ages are known to us from the records, we could wish that there were more particulars in regard to details. These comprised war galleys and merchant ships carrying grain; and the merchants who were conveying their manufactures and wares to and from the fairs and markets of the countries of the ancient world; and pirate vessels; and wherever illustrated records remain, it is obvious that pleasure was taken in decorating the ship.

Development in type of vessel proceeded infinitely slowly, and some centuries of our era had passed before considerable change appeared. Thus the field for the display of decoration changed but slowly, and this fact—the permanence or transientness of the field—must always have some influence on the development of art.

The sea imposes so severe and searching a test on man's contrivances, and has always been so threatening to his life, that he has always been slow to make experiments in naval architecture; if he has contrived something which serves him fairly well, he has generally shown a tendency to remain content with it. We know that in ancient times, and through a great part of the Dark Ages, the sea and storm and other phenomena, commonly called the forces of nature, were regarded as animate enemies by many races; and experience of the sea makes the naval architect and mariner conservative. This effect may be detected even to-day. It is only the growth of scientific knowledge and the consciousness that, in consequence, he is standing on firmer foundations, that has caused man to be bolder in his experiments in ship construction; for it is almost entirely through science that he has entered into a sympathetic understanding with inanimate nature and has gained thereby the means for more rapid and certain progress.

The main difficulty in tracing the history of decoration in ships is due to the fact that they have always been built of somewhat perishable materials, and most of the ancient and much of the mediæval history of the subject has come down to us in tablets, sculpture, mosaics, documents, frescoes, paintings on vases, reliefs, coins, etc., whereas the archæologist, dealing with architectural remains in stone and brick, often finds the object of his study in a fairly good state of preservation. But in some cases it has been our good fortune to discover remains of very ancient vessels which have been buried in mud and thereby protected, and the structural and other details have been found in good condition.

It is, perhaps, of interest to note that wherever old illustrated records are found showing the decoration on those ancient ships, the character of the decoration generally follows fairly closely the types associated with the country from which the vessel hails.

The maritime traffic in the Mediterranean and adjacent seas and rivers has been extensive throughout all ethnological history, and a glance at the map will show that the sea was the most direct and convenient means of communication between the many nations scattered along the Mediterranean littoral. When we consider that all ancient architecture in Southern Europe, Northern Africa, Asia Minor, and Asia was born and developed within, at most, a few miles of the sea or large navigable rivers, with a few not very important exceptions, it will be seen that the ship must have played a great part in the dissemination of knowledge of art and architectural styles.

These ships frequently carried passengers capable of appreciating the architectural achievements which they saw in the many countries and cities visited, and, doubtless, conveyed much of this information from nation to nation. The shipowner and mariner were thus brought into contact with many different architectural and decorative features; nevertheless, the decoration of the ships still continued to reflect the characteristics of the country from which the vessel hailed.

History of art shows that there has always been taking place, more or less slowly, an interaction of styles resulting in a copying of one from the other, albeit with modification and adaptation in the transit; hence, the fact that the decoration of a ship changed very slowly, notwithstanding the great opportunities presented for the assimilation of other features, would seem to indicate that this apparent inertia was the result of a natural bond of sympathy between a nation and the expression in art which it had developed through long ages. Of course, their art was a language almost as truly national as the articulate speech of daily use. In this connection we may recollect that architecture, building, and the arts were the staple "trades" of ancient and mediæval peoples; and after mankind had emerged from savagery, and on through the long ages down to the end of the eighteenth century, there was a long epoch which might be called the leisured ages of art. The ship came under the influence of art in common with most other things.

All nations are becoming more and more mercantile in their attitude towards life in all its aspects; and it is surely of interest to ask whether art can find sustenance in a commercial age, and command once again the allegiance and appreciation of all peoples. It is hoped that some remarks on the modern steamship appearing later in this article will supply a partial answer to this question.

From the fifth century or, perhaps, rather earlier, down to the twelfth century, there was the great Viking epoch in maritime affairs, and here again, these northern seamen strove to decorate their ships, albeit with somewhat rude effect. These mariners made voyages to the countries of Western Europe and to the Mediterranean and visited many cities famed for their art and architecture.

In view of the fact that the Vikings and other branches of the Scandinavian nations were the forbears of the Normans, and that many Norsemen also settled in this country in post-Roman days, it is interesting to reflect on the probability that knowledge of architectural styles found its way to Northern and Western Europe by these voyagers.

Of course, the origin and development of the architecture of Normandy and England are well known in the main without having recourse to this explanation; nevertheless, the ship in her many voyages to and from the great cities of the ancient world was doubtless a contributory cause. In this connection it is necessary to bear in mind that art and architecture not only received greater appreciation from all classes in those ancient times than is usual to-day, but, on the other hand, there were far fewer counter attractions to divert the attention of the traveller. Circumstances thus commanded the attention of the observer and made him consciously or sub-consciously a channel of communication in a world in which travellers were the main channels of communication.

But it is from A.D. 1300 that nautical history becomes fairly full and connected. In the early years of the Renaissance in Southern Europe the ship came under the influence of the broadening ideas which were finding renewed expression in art and architecture, and from this time all maritime nations expended greater efforts on the decoration of their vessels.

In all ages, but more particularly in the Middle Ages, it was not uncommon for the merchant venturer or explorer to own a single vessel in which he made voyages which

were often, nay generally, long and hazardous; the ship was his home for months together, and in many cases his only home. While his brother on shore was turning attention to the beautifying of his house, the shipowner also did much to adorn his ship, and usually with most pleasing results, as shown by old prints and a few remaining models. But we have rather meagre information on the details of the interior of the living quarters in these mediæval ships, although we can easily imagine that when so much care was lavished on the exterior, the interior was a worthy counterpart, but much simpler.

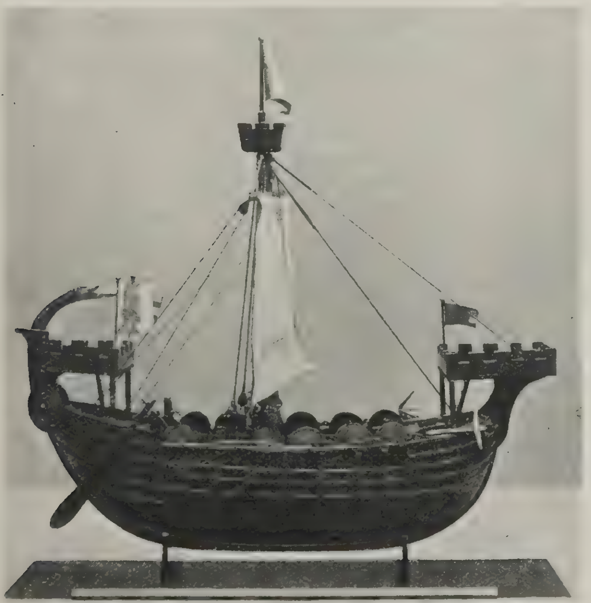
In all ages prior to A.D. 1800, or thereabouts, much more effort was expended in adorning the exterior of a vessel than the interior. From the earliest times, and down to about A.D. 1550, very little interior decoration is to be found in the majority of ships, but commencing about this date, and continuing to about A.D. 1850, hard woods, such as oak, mahogany, and many decorative woods were employed for panellings, mouldings, and wood carvings in the cabins.

The development of the interior planning and decoration from A.D. 1850 to the present day is very extensive, but a separate article would be needed to do justice to it.

The exterior ornamentation reached its highest point during the two hundred years from about A.D. 1575 to A.D. 1775, and, in that epoch, England, France, Holland, and, perhaps, to a lesser extent, Spain and Portugal, built beautiful vessels. Fortunately the Vanderveldes, father and son, were living during a great part of this period, and their drawings and paintings have preserved much of the best of the detail.

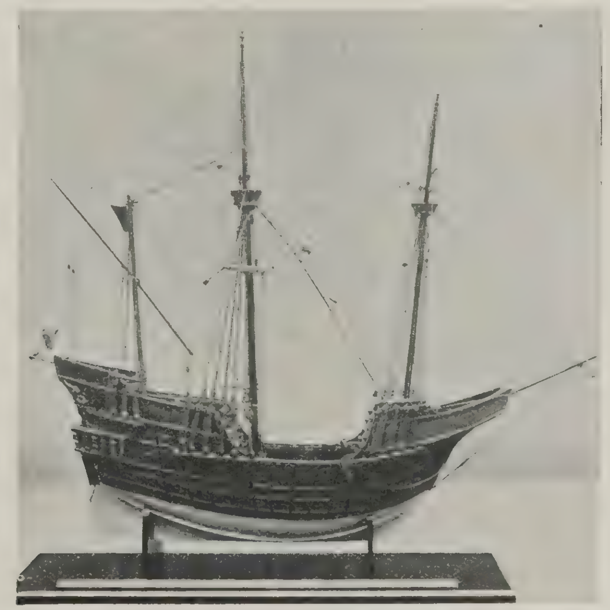
Excluding from our consideration the spars, rigging, and sails which, while adding much to the outward appearance of a ship, are mainly of interest to seamen, it may be remarked, in passing, that the spectacle of a ship was much enhanced in all ages prior to about A.D. 1600 by means of variety in the colour of sails and by exceptionally large and multi-coloured flags and banners.

The two hundred years epoch referred to above saw the finest examples of the grand stern and quarter galleries



KING'S SHIP OF THE NORMAN AND EARLY PLANTAGENET PERIODS (11TH TO 13TH CENTURIES).

The shields and banners of the knights were hung on the castles. The vessels were decorated with heraldic carvings and painted in bright colours, red being a favourite.



From the Science Museum, South Kensington.

TYPE OF SHIP DEVELOPED BY GENOESE, PORTUGUESE, AND SPANISH DURING 14TH AND 15TH CENTURIES.

Columbus and Vasco da Gama made their voyages in vessels of similar type. The overhanging forecastle and the superstructure at the stern were developed from the fighting castles of earlier date.

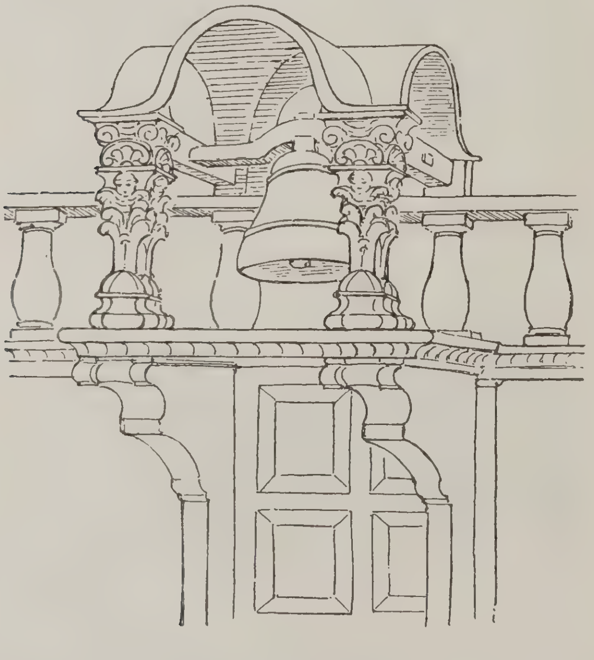
with their carved figures and heraldic devices, and tiers of windows and balconies surmounted by great lanterns. At the bow the figure-head, finely carved—the lineal descendant of the beaks which appeared at the prows of the galleys of Egypt, Greece, and Rome—was painted or gilt. The figure-head surmounted carved and gilt scrolls which were employed essentially as constructive features to strengthen the prow or stem. Along the outside of the bulwarks, figures, festoons, coats of arms, and other heraldic symbols were cut in relief, and gilt or painted, and superposed on a background, often of blue.

Many vessels were entered by a beautiful portal placed about amidships, and along the decks fittings essential to the working of the ship were adorned with fine carvings. The ship's bell was hung in a carved belfry, and the catheads, knightheads, fife-rails, mast-bitts, and cavels were nearly always decorated with carving, while the forecastle and sterncastle—the latter the antecedent of the later poop—were surrounded by gracefully moulded balusters and rails.

Naval architects and seamen pay much attention to the form of a vessel's hull—the lines or model, to give it its technical name. The general efficiency of the ship depends in great measure on this form, but, in addition, graceful lines—and a ship's lines can be very graceful—never fail to command the admiration of naval architects and seamen.

Engineers sometimes use the expression: "If a thing is good, it looks good." Of course, by this they intend to convey that a piece of mechanism, or a structure, well designed or adapted to serve its purpose with efficiency, will have a pleasing and satisfying appearance. To what extent this expression is true need not be inquired here, but it may not be out of place to remark on the coincidence that a very beautiful curve, or family of curves—the parabola—is known from experience to produce a very efficient hull form.

About the beginning of the eighteenth century we find the merchant shipowner becoming possessed of several ships, and with a rapidly increasing commerce. In consequence, he finds it more convenient to live on shore and conduct his business from a home port, the ships and all transactions connected therewith being committed to captains and to agents in foreign ports. To an increasing degree the merchant ceases to be a shipowner, but, on the contrary, hires a vessel or vessels to transport his cargoes; the chartering system so well known to-day was in operation then.



A CARVED BELFRY.

ARRANGEMENT OF SEVENTEENTH-CENTURY POOP LANTERNS.
(*From Leslie's "Old Sea Wings."*)

From that time less effort is expended in decorating the ship, and though the change is hardly appreciable at first, there is, nevertheless, a steadily growing tendency towards commercial utilitarianism—the effect of the mercantile mind is becoming evident. Perhaps, as in other and similar cases, the owner had not the same interest in incurring expenditure on the decoration of a vessel in which he no longer lived.

We know that the merchants of antiquity and of early mediæval times were relatively few in number, and generally occupied a position much inferior to that of the nobles with their large territorial interests and holdings. And it was mainly owing to the growth of towns and the compact commercial communities which sprang up in these centres, that the merchants were able to wrest bit by bit from the kings and nobles the rights and powers which became associated with the guilds, companies, and municipalities of mediæval and subsequent times. The wealth of these towns grew rapidly, as international trade developed, and the ship, of course, played a great part in this trade, so much so, that the majority of the wealthy cities of the ancient and mediæval world were to be found on or near the sea coasts or on navigable rivers—their wealth and power were in great measure due to seaborne commerce.

When this system had reached its highest state of perfection in the mediæval age the merchants were closely connected with the municipality, the citizens were proud of their city and jealous for its welfare, and the community was compact and domestic. For centuries these cities were patrons of the arts, and, within their boundaries, there accumulated, gradually, a vast wealth of art and architecture very much of which remains to the present day in European cities and also in this country. But throughout the greater part of our era it was mainly owing to the ship and the enormous commerce connected with her, that this state of affairs became possible in towns and cities.

Thus far, trade had been carried on in a somewhat domestic manner, but about the middle of the eighteenth century it began to be realized that if groups of workers could be gathered together in factories, workshops, and mines, the owners of these workshops and mines would be able to acquire wealth rapidly. This was the beginning of the period of intensive generation of wealth—the conditions we know to-day in which factories are filled with men and machinery. *Pari passu* with this development in commerce, art and architecture in general declined, because the accumulation of wealth became an end in itself, and, incidentally, much of the physiological architecture of the workers in these factories also declined.

Now, it is perfectly clear that economic conditions of this kind are essential to modern requirements of life, although there may be still ample room for improvement in socia conditions. But we are interested in discovering whether

A SHIP OF THE LATE XVII CENTURY, SHOWING ENGLISH DESIGN AT ITS MOST DECORATIVE PERIOD.

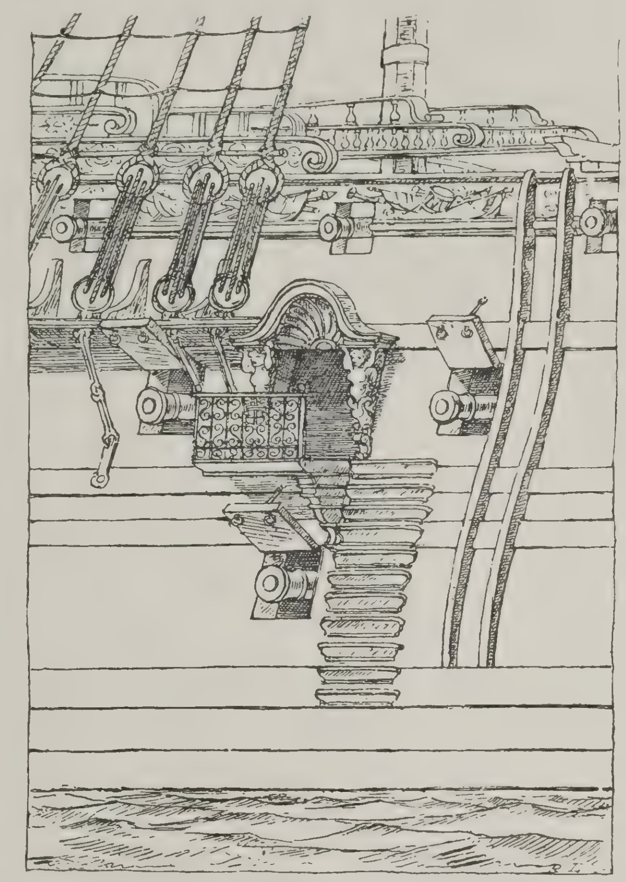
(From a Model in South Kensington Museum.)

the fine arts and architecture can once again regain full vigour in our mercantile age; and the ocean liner, in respect of interior decoration, is going to contribute her share to the solution of this problem. And, strange though it may at first seem, the plutocrat, perhaps unwittingly, and the masses in their revulsion from a life largely devoid of inspiration, are calling the fine arts to their succour.

Prior to A.D. 1575 the chief employment of the ship had been, in war, for fighting and the transport of armies; in commerce, for the conveying of merchandise and merchants to and from the large commercial centres and fairs, and the carrying of the faithful making pilgrimages to distant shrines, and for exploration. But compared with present-day conditions passengers were relatively few, and travelled generally under extreme necessity.

From about A.D. 1600 we find the emigrant in greater and greater numbers leaving the old countries to found settlements in the new lands overseas. But for all overseas travellers before this date and, indeed, for nearly two centuries later, hardship was regarded as a concomitant of the sea voyage, and no very special provision was made to ameliorate the harsh conditions prevailing.

These hardships continued in the sailing ships till about A.D. 1840, and, on the advent of the ocean steamship, we find the latter to be very little different in hull and interior from the sailing ship which she eventually superseded. This is another example of continuity in change, albeit too often associated with the sterile mind unable to perceive that new circumstances admit of new methods of treatment and that precedent no longer determines the course to be followed. This is well exemplified here, for the sailing ship requires a clear and roomy deck so that the crew may work the vessel without being impeded; as a consequence, practically the whole of the passenger accommodation had to be located below this deck, and it was low, dark, and ill-ventilated.



ENTRY PORT OF AN EIGHTEENTH-CENTURY SHIP.
(*From Leslie's "Old Sea Wings."*)

In the steamship clear decks are not a prime necessity, and thus it is possible to arrange a great part of the passenger accommodation in the superstructure: the rooms are relatively lofty, with ample natural light and more easily ventilated. And this form of planning is followed to-day, as far as possible, in all up-to-date steamships; but many years passed before designers availed themselves of the new opportunities provided by the steamer, and there is room still for improvement in planning. In extenuation it must, however, be admitted that some of the early steamships occasionally set canvas, and this would tend to retard the improvement of planning in respect of passenger accommodation.

Before 1850 there were, compared with to-day, very few transoceanic voyagers, and they were obliged to endure considerable hardship at sea; the comparatively poor emigrant who crossed the ocean from an old to a new country rarely made another sea voyage in his life, and he was generally content to endure hardship and discomfort without complaint. But a little later commercial men in ever-increasing numbers are found among the passengers, and they were by no means content to accept without criticism anything that the shipping companies might choose to provide. They began to demand comforts at sea approximating to those found in hotels on land, and, moreover, they were powerful enough to make their voices heard, and also to enlist the support of the Press.

Constant criticism was the main influence which was instrumental in causing the shipping companies to improve the amenities in their vessels by means of better planning and decoration of the passenger accommodation; and the shipowners awoke to the fact that it was to their own interests to meet the demands of the passengers in this respect. These influences have been operating ever since, and the leading shipping companies now study the interests of the passengers with a care unsurpassed in any hotel ashore.

To-day there is a searching after excellence in the planning and decoration of the passenger accommodation on shipboard in all classes, first, second, and third; and if the results are not always satisfactory, it is not because the shipping companies are niggardly in regard to money allotted for this purpose, but rather because those who are responsible for this architectural work have not made full use of their opportunities. While the first class is often ostentatious, restrained and pleasing decoration is to be found in the second and third; fortunately fine architecture and decoration are possible in all classes on shipboard, and all are impressed, consciously or subconsciously, by good art. If all passenger steamship companies could be induced to call in land architects, the planning and decoration of the accommodation would be handled with much more method, variety and originality, and probably at a reduced cost.

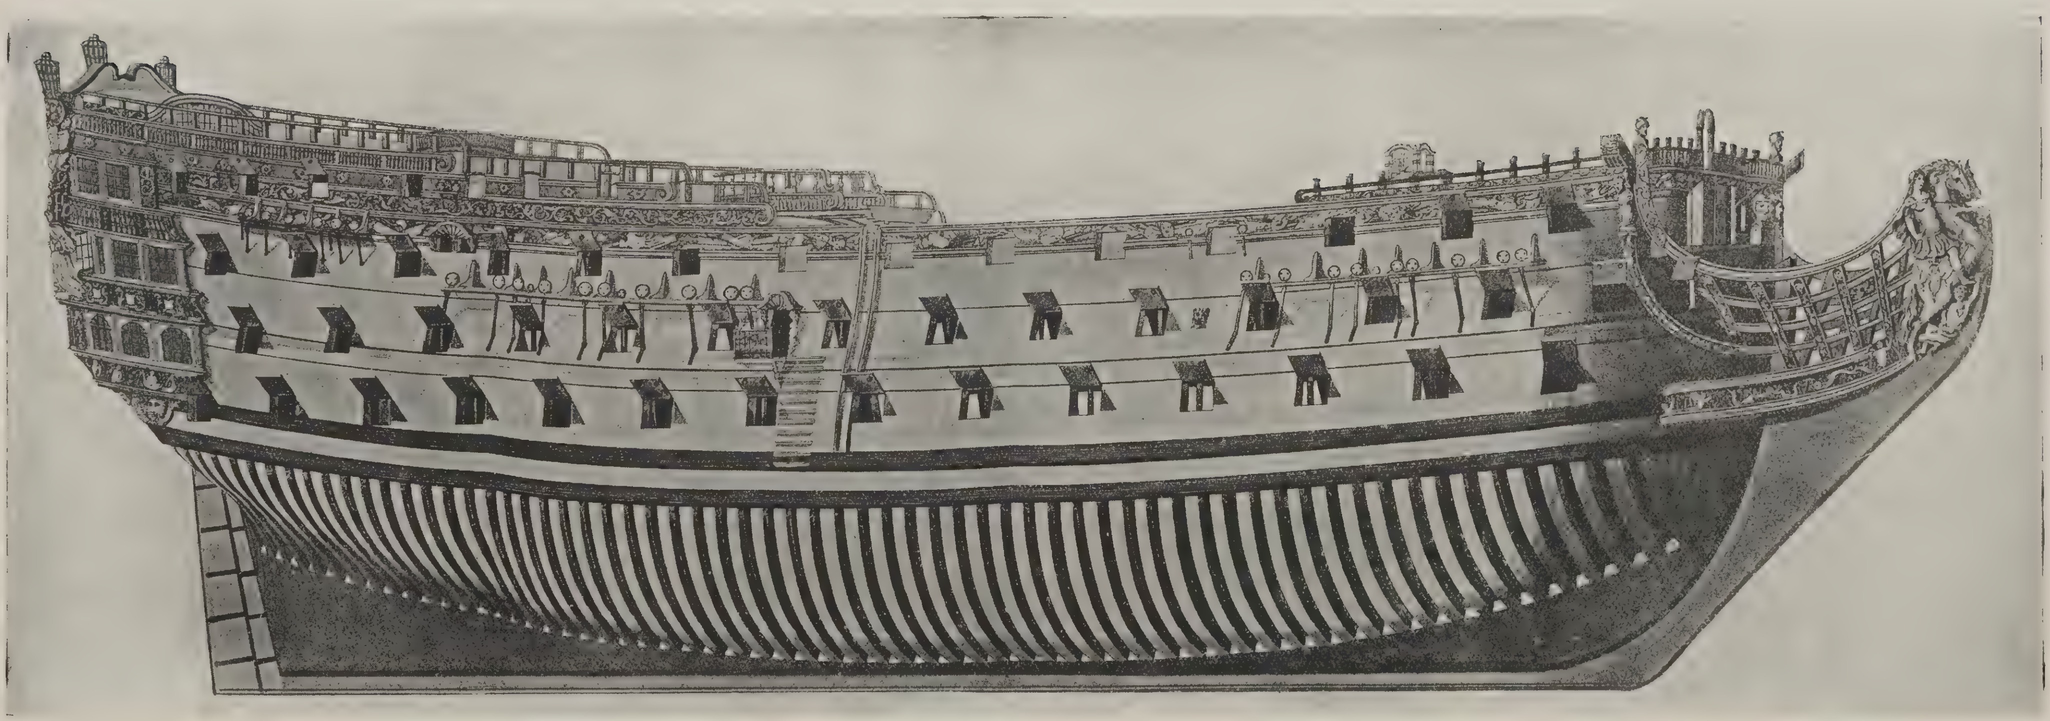
It is fairly obvious that transoceanic travel will increase by leaps and bounds, with the result that the passenger fleets must grow rapidly in the coming years. Hence, it is in the interests of the shipowners to avail themselves of the best architectural advice in the planning and decoration of the space allotted to passengers. It is not unusual for vessels to become unsuitable for the service on which they are engaged, not because they are unseaworthy, but because improvements and developments in marine architecture and engineering, or passenger accommodation, have rendered them obsolete. And a better planning of the accommodation would have tended to increase the length of the ship's useful life.

Those interested in following up this subject will find a mine of authentic information on the decorative features of ships extending back over 300 years or so, at: The Science Museum, South Kensington, London; The Royal United Service Museum, Whitehall, London; The Naval Museum, Greenwich.

A British Man-of-War of the Eighteenth Century

The "Royal George," launched in 1756

(From Charnock's History)



The "Royal George," modelled on the Spanish ship "Princesa" (captured in 1740), was laid down at Woolwich in 1746, launched ten years later, and lost at Spithead in 1782. Reference to the illustration shows that the high poop which formed the chief feature of late seventeenth-century ships has by this time been considerably reduced, while the top sides of the ship tend to horizontality; but the excessive "tumbling home" of the side walls, characteristic of earlier ships, is continued. The prow has been raised in sympathy with the horizontal topsides and the stern. The decorative attributes of the "Royal George" appear to have followed contemporary architectural lines; such features as the door and hood mouldings to the gangway with balcony and wrought-iron railing, the stiff pilasters to the divisions of the stern galleries, and the carved terms finishing the ramps from the beak being of architectural interest.

The Ocean Liner

A New Field for Architects

SINCE the war, many persons, and architects in particular, have been gravely exercised as to whether the architectural education at our principal schools is in the right direction. The question is whether the young architects trained in these schools will ever have the opportunity in after life to carry into practice the lessons they have learned and the teaching they have absorbed.

With, perhaps, one notable exception it may be said that practically all our leading schools follow more or less on the lines of the French Beaux-Arts.

More than anything else the new training differs from the old in the magnitude and compass of the problems set the students.

Can the extended study of these great projects of plan and elevation lead to any definite and valued results? The war has left us, along with the other European countries, depleted in pocket and to a certain extent in energy too. Yet our schools go on as if we were a country of unlimited wealth with great and tremendous building problems in front of us.

And the schools are right. It is a remarkable fact that practically all our post-war efforts in building have been along the lines of what may be described as large scale buildings.

"Crowd Architecture"

Whether it be Government Housing Schemes, with the cottage unit and the resultant village or small town, the modern hotel, the large drapery store and business premises, the extensive factory and great mill, or the enormous modern home for the "movies"—all are problems demanding the greatest exercise of our talents in lay-out and design. Compared with the problems of the old world we have to feed, house, clothe, amuse, and transport great crowds of people, with the result that, as architects, we have to express this modern crowd life in terms of "crowd architecture."

In the middle of nineteenth-century industrialism we erected our "crowd" buildings haphazard and anyhow, but an awakened public sense of orderliness is demanding that the problem of these buildings shall be properly handled, both in conception and execution. The architect of to-day has unrivalled opportunities for the exercise of his talents—opportunities that the past never afforded, and it is up to him to take full advantage of them.

One of the very newest fields for architectural adventure is the great ocean liner—the floating town that connects the life of continents.

In an instructive and stimulating paper recently read before the Royal Institute of British Architects, Mr. Arthur Davis set out the problem for the land architect who is called upon to help in the decoration of the ocean liner.

The writer of this article had the unique opportunity of visiting Southampton recently when four of the largest liners in the world were in dock there. These were the "Majestic," the "Berengaria," the "Mauretania," and the "Olympic," and it was as a result of seeing over these ships in company with a naval expert, who is as enthusiastic for good design (in the ordinary sense as understood by land architects) as he is for good construction (in a ship sense), that the idea occurred that it might be of interest to architects generally if some of the impressions gleaned were set down.

The first thought that occurs to one in going over one of these monsters is that any land architect who may be lucky enough to be called in to design the decorations of the principal rooms (and it is quite possible, as the writer hopes to show, that he might helpfully do far more than this) must know his job thoroughly.

The purely naval part of these ships is so efficient, so thorough, both in design and construction, that it is intolerable that any lower standard should apply to the finish and the decoration.

Unfortunately in the past a very much lower standard has been applied, and it was not until the comparatively recent advent of the land architect into the sphere of ship decoration that anything like an adequate artistic treatment was given to the habitable parts of ships.

A year or so before the war some of the great steamship lines in this country and abroad made the daring innovation of employing a land architect in conjunction with the sea architect (or as Mr. Davis succinctly calls them, "dry" and "wet" architects), and the experiment was more than justified.

The Naval Architect

In his own province the naval architect is superb, unapproachable, is in his own way a great artist as well as a great engineer, and he is amazingly efficient—his is a constant warfare against natural forces, and nature does not condone mistakes, particularly mistakes upon the sea.

His creations are surprisingly beautiful—the least imaginative of us have stood spellbound by the sheer beauty of line and form of these great birds of passage.

The beauty is in a large measure unconscious, is the result of an exact use of material and of a scientific application of ends to means—perhaps, as Professor Beresford Pite would have us believe, the greatest beauty, whether in a ship or in a building, is unconscious; however that may be, there is no question but that along his own lines the naval architect is a great artist.

It is when he leaves his own sphere and descends into the regions of the less happily circumstanced land architect that he is not quite so successful. Or rather when he hands over that portion of his ship to the mere decorator, for it is well-nigh impossible to believe that any man who can lay down the lines of a great ship could condescend to the trivialities and vulgarities that mar the public rooms of so many of our great liners.

One magnificent ship which we visited, considered as a ship was ruined by the low note of its decoration. The dining-room with its carved and twisted mahogany of tortuous shapes, highly polished and inlaid with masses of mother-of-pearl, its windows of the crudest stained glass, suggested nothing so much as a glorified gin palace.

The lounge or drawing-room was not much better; instead of mahogany there was oak carved with nasty little squiggles which vainly imagined themselves to be indicative of Louis XV, and furniture that would have disgraced the worst type of suburban lodging house.

"Aquitania," "Berengaria," "Majestic"

By contrast there are ships such as the "Aquitania," the "Berengaria," and the "Majestic," where the planning and the decoration of the passengers' accommodation reach a very high standard; one need scarcely add that in each case a land architect collaborated with the naval architect to produce this happy result.

In the design of the public rooms of all these ships one may discern the influence of Versailles, and this is, perhaps, inevitable.

Versailles is the historical example of the planning and architectural treatment of great suites of rooms. It impressed itself strongly on the people of the eighteenth century, and, indeed, on all subsequent peoples; and until we have a tradition strong enough to supersede it it may be reasonably assumed that the Versailles models will be followed for similar problems.

How far it is permissible to follow architectural features familiar to land architecture on board ship is a very debatable point.

The Problem of Architectural Form

Mr. Davis, in his paper, pointed out that many passengers wish to escape from all thought of the ship—they want to imagine themselves on terra-firma—and the steamship companies and their architects have to take cognizance of this very human weakness.

It is contended that familiar and traditional forms such as column, architrave, and entablature create a feeling of land security which gives the unwilling seafarer the atmosphere, if not of his home, then of his hotel.

For the comfort of passenger and architect alike, it is probably desirable that the design should follow along traditional lines.

When one is in robust health and full of the joy of life, one may with great enjoyment spend a night in a spare room at a friend's house or an hour or two at the moving-picture house decorated in the latest and most daring jazz manner; but there are very few who would choose to spend a week in such surroundings whilst all the time a prey to violent sea-sickness.

But even accepting the psychological value of traditional forms, it might be contended that a certain amount of mental unrest is caused by unsuitability of treatment.

For instance, a column that is of standard stone or marble proportions might even, if constructed of stucco, have a very unsettling effect when slightly oscillating under the influence of a heavy sea; and a fireplace, the design of which suggested heavy brickwork or masonry might under similar conditions be even more unpleasant.

As a general rule there is not a great deal of movement on these big ships, but there is some, and when all is said and done, a ship is not a building in the land sense of the word.

Without violently departing from tradition, would it not be possible to design the decoration of an ocean liner in a way that would satisfy the sea-sick passenger and critical æsthete alike?

We have had the "gin palace" design and we have had the "period" design; shall we not, by intimate realization of what a ship is, in the future be able to arrive at the "ship" design?

When the Americans adopted the brick and stone "Georgian architecture" of this country for their own colonial use they did not slavishly copy our brick and stone forms. The abundant timber of their own country dictated the terms of their building, and we have the fully-developed American colonial architecture no whit less fine than our own, but a beautiful variant.

Some Suggestions

Now, much in the same way that the timber of America determined the use of the slender wooden columns in "colonial" work, cannot the practical requirements of the ship suggest architectural forms which shall be pleasing and satisfying?

The naval architect's incessant demand is for reduced weight (particularly on the upper decks), and for economy of space, and this in itself would appear to suggest a scheme of architectural treatment widely different from the stone proportions of our land buildings.

If, instead of the column of Classic dimensions, we could give him a column of "colonial" or timber proportions designed so as to give an appearance of being securely held at top and bottom, should we not be in a fair way to treating one feature at least in a shiplike manner?

Another focal point causing much trouble and tribulation to the soul of the architect is the design of the fireplace. It may be said straight away that a fireplace in a modern passenger ship with its centrally-heated rooms is a mere luxury; it serves no practical purpose beyond an attractive centre around which to group armchairs.

When it is a real fireplace with a real fire burning, in it there may be something to be said in its favour even though it be a luxury.

But when, as would more frequently appear to be the case, it is nothing but an electrically contrived sham—which does not even serve as a ventilating shaft, then even the purely psychological value of such a feature is doubtful. As a rule, where there is no fireplace, and the room or apartment is adequately heated, no need is felt for a fireplace—though nothing can be so cheerless as an empty fireplace even in a well-warmed room.

And there are many alternatives to the fireplace when considered simply as a focal point around which to group chairs; there is the well-designed niche, the large scale painting or tapestry, the mirror (though the unconsidered use of mirrors is a grave pitfall for the unwary), even the design and arrangement of the furniture, and many others which will occur to the resourceful architect.

These suggestions are only made tentatively and with a view to giving food for thought and discussion.

No one realizes more than the present writer the magnitude of an architect's task in the decoration of these huge ships. There must be a graduated and carefully considered treatment for the first, second, and third class passenger accommodation. The public rooms of any one class equal in size and complexity of design a large public building!

Many of the private suites of rooms on the larger ships are of the extent of a small house or flat, whilst in addition there are hundreds of cabins forming long streets all demanding consideration and treatment at the hand of the architect. As has already been said, there is an unlimited scope for the land architect in connection with big ships; and when it is remembered that the life of these ships is only some twenty or twenty-five years, so that new ships are constantly being built, the importance of the subject becomes very apparent.

An Opportunity for the Schools

One would like to see the leading architectural schools taking up the problem of ship design and decoration as part of their curriculum—by design here is meant the design of the passenger accommodation only—the design of the ship proper being entirely an affair of the naval architect.

It would be singularly suitable if such a school as, say, the Liverpool School of Architecture, located as it is at one of our most important passenger ports, were to encourage its students in these problems of marine design, possibly with the aid of the great steamship companies who might be induced to help such a departure by the provision of prizes and scholarships. So far it appears to have been the general practice to employ the land architect on the decoration only, though this is sometimes stretched to include the planning of the main entertainment rooms together with the approaches and staircases, etc.

But it is an open question whether the land architect's activities could not extend to the design and treatment of the whole of the passenger accommodation in conjunction and close collaboration with the naval architect.

It is quite obvious after visiting several of our large liners that there is a good deal of variety in the planning and lay-out of the passengers' quarters, and that whilst in some ships these quarters are laid out on good straightforward lines, in others the planning is not so good, and there is ample room for improvement and the infusion of new ideas.

The passenger accommodation on the largest ships might be said to equal that of three large hotels, and the problems to be solved are not dissimilar.

In ship design there are many pitfalls for the unwary land architect, and many difficulties, which will be quite new to him, that he will have to overcome if he is to do his work properly.

The Corridor System

In going round these liners one was struck with the extraordinarily long dull stuffy corridors with internal cabins artificially lighted and ventilated, and one wondered whether after all the corridor system was the only system, or whether something better could be devised.

The passenger accommodation should be planned to permit of easy and quick egress in case of fire, and at the same time direct approach for fighting the fire. It should be so arranged that an outbreak may be restricted as far as possible to a definite section.

Fire at sea is the sailor's nightmare, and should an outbreak occur it is very difficult to keep it localized, and consequently large sections of the ship may be gutted before the fire is brought under control.

Again it is open to question whether long and narrow passages filled with smoke are convenient for the passenger escaping from the fire or for the fireman fighting it.

The need for the employment of fireproof materials as far as possible is so obvious as to require no stressing here.

Another point for the untutored is the question of vibration and the possibility of consequent rattle.

All parts of the structure, fittings, details, etc., in the sleeping cabins, state rooms and public rooms should be so designed and fitted that the vibration of the ship does not cause them to rattle; also it is desirable to avoid using flexible surfaces likely to vibrate and produce a drumming sound. Everything must be well and firmly fixed. All parts of the accommodation should be planned as far as possible to admit of easy ventilation with fresh warm air and without draught.

Ventilation

The system of ventilating trunks should be as simple as possible, and if it can be dispensed with at any part of the ship without detriment to the ventilation so much the better. The temperature in sleeping cabins and state-rooms should be, and usually is, entirely under the control of the occupier, but we often find in a ship with accommodation designed as at present, narrow passages, thin partitions, and indifferent ventilation—so that if the occupier of one cabin has the taste of a salamander, he inflicts considerable discomfort on the passengers in surrounding cabins by reason of the excessive heat which penetrates through on all sides.

Water Supply

Coming to the question of water supply, even on the most modern liners there appears to be a great waste of labour in connection with this. Only the most important suites and cabins have water laid on; in the others small receptacles have to be filled every day.

There does not appear to be any good reason why fresh water should not be laid on to every sleeping cabin and state-room, provided it is borne in mind that fresh water on board ship is somewhat costly, inasmuch as it is produced almost entirely by distillation, and as every sailor knows the conservation of the water supply is of primary importance.

Warm water is also costly, as steam must be expended in heating it—but it might be possible under some carefully contrived system of rationing to lay on both hot and cold water to all cabins and so save an infinite amount of labour. It might be of interest to the uninitiated to know that the fresh water is pumped throughout the ship from the engine-room distillation plant.

Sanitary Arrangements

Another point in connection with passenger accommodation design on which the land architect might bring to bear rather usefully the results of his land experience is the sanitary system. The sanitary system on shipboard is very similar to that of a large hotel with its lavatories, bathrooms, and water supply to some or all of the bedrooms and dressing-rooms. And just as in the case of an hotel the architect has to consider the discharge of the sewage into the drainage system of the town, so, on board ship, the designer of the passenger accommodation is concerned only with the arrangement of the pipe system in such a way that the sewage may be delivered to the sewage pump cesspool.

On some of the large liners there does not appear to have been as much brains expended on the sanitary system as on the other parts of the ship.

In particular, the grouping of the lavatories and w.c.'s would appear to leave room for much improvement. In some ships we find that whilst a certain number of bathrooms, lavatories, and w.c.'s are grouped in sanitary towers, others are dotted about in the most haphazard manner.

Whilst on the best modern liners the pipes, runs, and sanitary fittings are carefully concealed from view, in others they sprawl all over the ship in the most unsightly fashion, whilst the lavatories and bathrooms proper have the appearance of homes for petrified snakes!

Probably in the treatment of the sanitary fittings the American sanitary engineer is in advance of the British and might teach us much in the proper furnishing of our sanitary apartments.

Suitability of Materials

It must be remembered that cleanliness—desirable everywhere—is especially desirable on board ship. It is very difficult to keep a ship absolutely free from vermin such as rats, cockroaches, and other pests; on some routes in certain parts of the world it is absolutely impossible to do so—and the designer of the passenger accommodation should have this constantly in mind. In considering the suitability of materials for decoration and design of the passenger accommodation, it is necessary to remember that a ship in her many journeys over the world may experience all extremes of atmospheric temperature and humidity.

As far as the exterior of the ship goes, the land architect gets very little opportunity. The one last piece of decoration left him is the ornamental work on the counter at the stern—even this is rigorously cut out on some modern ships. It is the last relic of the great and glorious poops of the old sailing ships that is left to us.

Sometimes one must admit that this work had better be omitted, but when it is well-designed, as, for instance, on the "Berengaria," it gives an additional touch of tradition that adds to the interest and beauty of the ship.

Naval architects call this work "gilt ginger-bread."

It is impossible within the limits of this article to deal adequately with all the problems that arise in the design and fitting up of the passenger accommodation on board the passenger-carrying liners, but it is hoped that enough has been said to indicate the field of operation open to the land architect should he ever get the chance to employ his talents in this direction, and to arouse his interest and awaken his ambition. In the decoration of the mighty suites of the public rooms there is enough scope to satisfy the most ambitious-minded, and though for obvious reasons the help of the sculptor is denied the architect in connection with this work, there is ample opportunity for the employment of the painter and the tapestry weaver.

As has been said, the life of these ships is limited to a few brief years; and at the back of his mind any architect who is worth his salt longs to put his work in a permanent setting, in bronze and stone in preference to wood and plaster. But it must be remembered that there is a greater permanence to be achieved than the mere material permanence of enduring materials—the permanence of a great tradition; and it is hoped that the architects of the greatest seafaring nation the world has ever known will gradually but surely build up a great tradition in connection with the passenger accommodation of our ocean liners.

R.N.V.R.

The "Aquitania"

MEWÈS and DAVIS, Architects

THE "Aquitania" has many fine architectural apartments. The decoration of the restaurant is in the Louis XVI style, and the woodwork is in panelled mahogany. The whole is enriched with carved ornament, pilasters and columns. Between the pilasters and on the panels of the vents are hung decorative paintings, representative of the work of masters of the eighteenth century. Two big decorative paintings are hung above two console tables. In the ceiling of the well is a decorative painting representing the Triumph of Flora. The well is surrounded by a rich wrought-iron balustrading, with motifs forming panels representing the monogram of the company and of the ship, with two anchors crossed on a trident, symbolical of Neptune, the God of the Seas.

The general scheme of decoration in the Palladian lounge (first class) is reminiscent of the work of Sir Christopher Wren. The colour scheme is wine-red and grey. The centre of the room, which is 18 ft. in height, is ornamented with a genuine old ceiling painting on canvas, signed by Van Cuygen. Large Georgian windows overlook the garden lounge. The spandrels at the end of the room, on each side of the arches, are copied from old panels representing the Elements—Fire, Earth, Water, Heaven, after Jean Baptiste Van Lee, 1684–1745. A semi-circular stage or platform is planned at one end of the room and is decorated with a coffered vault, under which is a reproduction of the famous Mortlake tapestry representing the Battle of Solebay. The floor is of oak and suitable for dancing.

The Carolean smoking-room (first class) is an adaptation from Greenwich Hospital, the period being late Charles II. It is 76 ft. long and 52 ft. wide, and has a lofty central portion and five spacious rooms adjoining. On all sides are carved trophies and coats-of-arms in the earlier manner of Grinling Gibbons. Much of the carving has been executed out of solid oak. In the centre of the high portion of the room are two large decorative painted panels, in richly carved old gold frames, representing the "Embarkation of St. Ursula" and a "Seaport with Figures." The lower portions of the room have a rich oak-beamed ceiling, and the window treatment suggests the Admiral's Walk on an old battleship. The electric light fittings are copied from an old Dutch ship lantern.

One of the many architectural features comprised in the "Aquitania" is the grill-room. Its decorative treatment, which is early Jacobean, derives certain features from a carved oak-panelled room from the Palace at Bromley-by-Bow, which dates from the beginning of the seventeenth century, and is now at the Victoria and Albert Museum, London. The room is furnished in the same style, the curtains being of an Elizabethan needlework pattern. Blue Delft china ornaments help to complete the scheme.

The Adam drawing-room (first class) is a reproduction from the best period of the brothers Adam, 1780. The principal feature in the ceiling is an oval dome with lunettes. Lead mouldings and ornaments, after the brothers Adam, hold in the glass. The principal features in this room are Cuba mahogany bookcases with a delicately carved and interlacing moulding in the door panels; and also mahogany console tables, with tall gilt three-light frames. The large windows of the period are also noteworthy. The chimneypiece is of carved statuary marble with a figure plaque in the frieze. The doors in the room are made of Cuba mahogany with carved mouldings. The walls are hung with blue tabourette silk, and are adorned with a collection of mezzotints of eighteenth-century beauties.

The panelling of the sitting-room (Gainsborough suite) is in eighteenth-century style, and the furniture is of carved mahogany of the period preceding Chippendale. Two French windows, with finely carved architraves, lead on to the private veranda, which is decorated with trelliswork. The ceiling is adorned with a double loop of fruit and flowers, and a cut-glass electric light dish. At one end of the room is a white marble fireplace. Antique mezzotints of notable pictures by Gainsborough are hung on the walls. Indeed, they form a prominent feature of the decoration of the rooms of this suite.

The period of decoration chosen for the salons is Louis XVI. The camel-covered carpet and the Persian rugs harmonize with the colour scheme of grey and gold and the embroidered silk curtains in purple and old gold. These are draped in manner similar to those in old French châteaux. A large mirror is placed in a recess after the style prevailing at Fontainebleau. Two large painted panels, reproductions of the work of Hubert Robert, add to the charm of these apartments. The furniture is reproduced from famous models of Bergère chairs, settees, occasional chairs and writing tables in mahogany and finely engraved ormolu. The rooms are illuminated by cut-glass dish electric lights.

Another feature of the "Aquitania" is the garden lounge. The endeavour here has been to obtain the effect of an old garden by means of trellis in natural teak on walls treated to represent stone. Glazed windows at the sides and at the after end afford protection, if desired, from the wind. The furniture consists of wicker chairs, settees and tables.

The second-class dining saloon is in the style of Pergolesi. The panels on the walls are decorated with paintings adapted from work by that artist, and are surrounded by enriched mouldings in wood, taken from fine old examples. The ceiling is composed of large panels of plaster with modelled enrichments. It is supported by four Ionic columns copied from an old house in Fitzroy Street, London. The dome over the saloon is surrounded by a plaster frieze, and above this is a wrought-iron balustrade copied from an old Adam balcony still in existence. The staircase leading from this room to the deck above has also been copied from an example by the brothers Adam.

With ordinary windows, similar to a Georgian house on shore, and antique mahogany Heppelwhite furniture, there is little in the appearance of the Adam drawing-room (second class) to suggest a room on a ship. It is decorated in the Adam style, and the wall panelling is relieved with enriched mouldings. The whole of the decoration of this room has been reproduced from existing old examples. Above the beautiful marble chimneypiece is fixed a gilt overmantel. The dome, supported by fluted columns with Ionic capitals, has a fine enriched modelled plaster frieze. The ceiling, also in modelled plaster, has two wrought iron lay-lights.

The Kensington Palace smoking-room (second class) adjoins the Veranda Café, which commands a view over the stern of the vessel. The general decorative idea has been taken from a room in Kensington Palace, and the panelled oak walls, with a beautifully carved fireplace at one end, give it a dignified and restful appearance. Large chairs and spacious settees modelled from old examples add to this effect. The floor is covered with black and grey rubber tiling, and a series of columns and pilasters with carved caps support the ceiling—a fine reproduction of the old Georgian style.

The contractors were as follows: Thornton-Smith, Ltd.; Lenygon and Morant; Paul Turpin; G. Jackson and Sons, Ltd.; Trollope and Colls; Waring and Gillow, Ltd.; Robson and Sons, Newcastle-on-Tyne; P. H. Remon and Sons, Paris; M. Boulanger, Paris; Wylie and Lochhead, Glasgow; R. Crittall & Co.; N. F. Ramsay & Co.; Bagués Frères; Elkington & Co., London and Birmingham; Robert Adams, and Doulton & Co., Ltd.

The "Berengaria"

MEWÈS and BISCHOFF, Architects

THE "Berengaria" has a tonnage of 52,000, and is one of the trio of giant liners which carry out the Cunard Express Service between Southampton, Cherbourg, and New York, the others being the "Aquitania" and the "Mauretania." The saloon accommodation includes an immense domed dining-room, a ladies' room, writing-room, lounge, palm court, smoking-room, swimming bath, state-rooms, numerous *en suite* rooms, and large suites which include bed and dressing-rooms, drawing-room, veranda, and entrance hall.

The "Berengaria" was the first big liner in which glassed-in verandas were successfully introduced. The one illustrated forms part of what was formerly known as the Kaiserzimmer (imperial suite). It has a particularly delightful effect, with its trellised roof and delicately coloured panelling.

The state-room forms part of the Kaiserzimmer, and is decorated in "modernized empire" style. An excellent effect is produced by the light mural decorations in contrast with the dark coloured carpet.

The state-rooms are mostly fitted for one, two, or three passengers, and all are supplied with running water. A very large number have their own private bathrooms adjoining, and practically all are also fitted with beds in the place of berths.

The numerous private suites are furnished throughout in the styles of the great French and English masters. Several of these suites comprise no fewer than ten apartments.

The decoration of the staircases, halls, and corridors of a liner is a most difficult problem. The lack of height necessitates the use of very simple styles and light colours, in order to obtain a good result. This has in this case been successfully accomplished, Louis XVI style being employed. The wrought-iron balustrade of the staircase, executed in black and gold, gives a note of richness to the whole.

Few hotels in the greatest European capitals can boast of a more magnificent dining-room than the "Berengaria." It is a finely proportioned room, and extends across the full width of the ship. Including the cupola, the room rises to the height of three stories. It is decorated in the style of Louis XVI, and the quiet dignity of its grey walls is enlivened by the coloured tapestries with which the chairs are upholstered, and by the ornamental balustrade to the balcony. The cupola ensures unusually good ventilation. In both the upper and lower tiers are numerous small tables, so that friends can enjoy their meals in the comparative privacy of their own particular party.

The extensive range of kitchens which adjoin are fitted with the latest culinary devices in which electricity plays a chief part.

A feature of the lounge apartment is the entire absence of supporting pillars to the roof, so that with the exception of the space occupied by the promenade decks outside, the lounge stretches across the full width of the ship.

The palm court gives a winter garden atmosphere, and the smoking-room, which is in the style of an old English Tudor room, contains some fine carvings and panels.

There is also a spacious ballroom with a dancing floor to accommodate some 250 dancers.

The immense size of the "Berengaria" has facilitated the provision of unusually lengthy and broad promenade decks, both open and covered. The gymnasium is full of all kinds of athletic appliances. The swimming bath is situated next to the electric and sun baths, provision being made for a complete course of physical training.

The "Majestic"

In the "Majestic" (56,000 tons) accommodation is provided for about 4,000 passengers in three classes. This accommodation is arranged upon eight steel decks, four of which are erection decks covering half the entire length of the ship. The first-class passengers are accommodated on seven decks amidships, and the ingenious construction of the boiler casings forms a remarkable architectural feature in this part of the vessel. Instead of being situated centrally, these casings are placed towards the sides of the vessel, and only join above the uppermost deck to form a central superstructure for the funnel. By this means practical use has been made of the great breadth of the vessel in the disposition and size of the state-rooms, and the architect has been enabled to design on the promenade deck a suite of public rooms unhampered by boiler casings. This gives a central perspective from the stage in the lounge at the forward end to the after part of the palm court restaurant, a distance of 250 ft.

The main entrance is situated almost amidships, and is represented by a vestibule of the arresting dimensions common to all the public rooms of the vessel. Here the separation of the two boiler casings (which appear at the sides of the vestibule and are scarcely noticeable) shows one of its characteristic effects, permitting a free view into the dining saloon.

The principal entrance to the dining saloon is situated centrally, and on either side of this electric passenger elevators are arranged. In addition to these, two main staircases, one on each side of the ship, have been erected. The vestibule is repeated throughout five decks, from each of which a wide central corridor leads to the other first-class staircase, which is situated in the forward part of the accommodation. The main staircase ends on the level of the vestibule between the lounge and palm court, 11 ft. above the promenade deck, and giving access to the wireless station and the gymnasium.

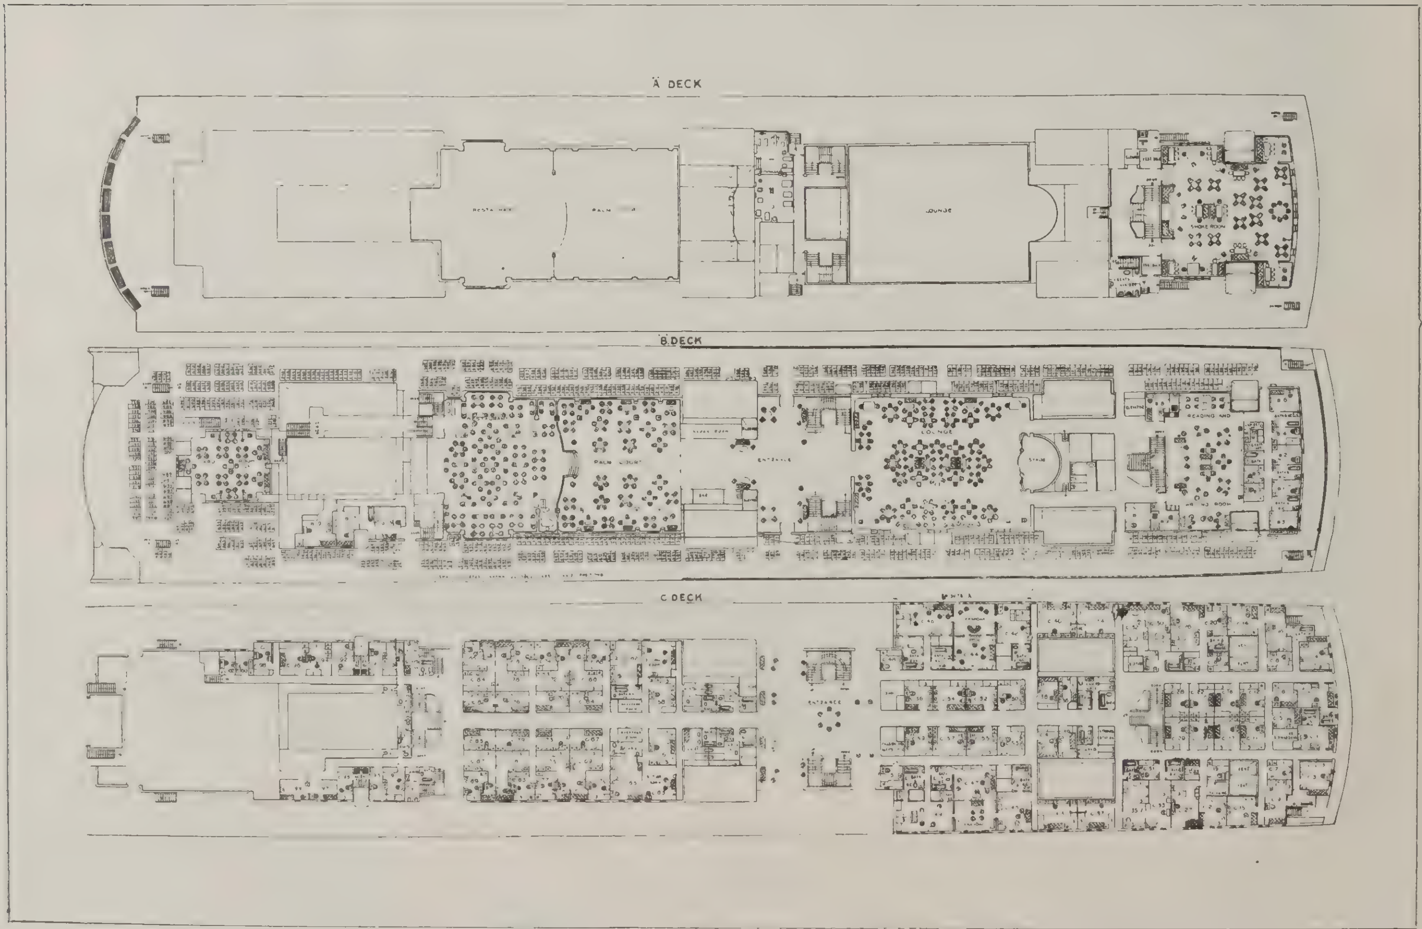
An outstanding feature is the method adopted in the construction of the three public halls on the promenade deck, called "the lounge," "the palm court," and "the restaurant." It is said that never have steel houses of such dimensions—and partly roofed with girders—been constructed on an uppermost deck of a ship with so few internal obstructions.

The lounge, opening aft of the grand vestibule, has an area of 4,000 sq. ft., and a height of 26 ft., while the area of its glass dome is about 3,800 sq. ft. Access from the vestibule to the palm court is gained through a wide portal formed by the two boiler casings and their junction above the boat deck which, at the same time, gives the necessary support to the funnel.

The palm court and restaurant, which form one steel house 23 ft. high, with an area of more than 5,600 sq. ft., have, however, two different floor levels. The restaurant is raised 3 ft., a partial steel deck being arranged at this height, supported by special girderwork below the platform in order to obviate vibration.

In connection with the public rooms, it is claimed that the dining saloon is the loftiest ever built in a ship. The middle part, of 2,300 sq. ft., has a height of 31 ft. between the saloon deck and the steel plating of the covering deck above. This is supported by wide spaced Ionic pillars placed on the sides of the room. The total area of this fine apartment is 11,350 sq. ft.

Forward from the main entrance, in front of the dining



PLANS OF "A," "B," AND "C" DECKS.

A VIEW IN THE PALM COURT.

saloon, is the swimming bath. The basin has an area of 820 sq. ft., and a depth of 9 ft., but is only filled up to 8 ft., and the floor has two levels, one part being of a suitable depth for those who are unable to swim. The bath can be supplied with about 120 tons of warm sea water in about 25 minutes. There are thirty dressing-rooms for the bathers, and, adjoining the main room and the gallery for spectators, there are special steam and electric baths.

Another popular feature of the "Majestic" is the well-stocked and comfortably-furnished library. This apartment is situated near the lounge, and has an area of 1,600 sq. ft. The bookcases with which the room is fitted have a capacity for 4,000 volumes.

Above this is the smoking-room, which is placed at the forward end of the erections on the upper boat deck, and, through great square glass windows, gives a view to the sides of the ship and forward.

Nor should the card-room be forgotten, this being an innovation which proves exceedingly popular among enthusiasts who like a quiet rubber, free from the distractions unavoidable in apartments not solely devoted to the game.

The galleys and pantries for both the first and second classes are abaft the first-class dining saloon, and have an area of 13,500 sq. ft. There are no less than eight galleys in the vessel, separate ones being provided for the Jewish passengers and for the crew.

The second-class dining saloon, situated immediately behind its culinary department, is above the two state-room decks of its class, which accommodate 545 passengers in cabins, with two, three, or four berths. The main staircase and electric elevator for this class are situated in front of the dining saloon; they extend from here two decks down and two decks up, on the promenade deck, in a wide hall, from which there is direct access to the smoking-room and to the gymnasium, while round the deckhouse is a promenade.

850 third-class passengers are accommodated on four decks aft of the second class in two-, three-, or four-berth cabins. They have their smoking and ladies' rooms, as well as extensive promenade space. The third-class dining saloon in this part of the ship is situated on the deck above the uppermost state-rooms, and below the public rooms of this class, and with the easiest access from both. Adjoining are the pantries, and a special galley serves this room. In the forward portion of the "Majestic" 1,542 third-class passengers are accommodated on six decks, two of which are partly promenade spaces, washrooms, and sanitary rooms. Another dining saloon is provided in this section, and is connected with its galley by an electric elevator as well as by staircases. For this accommodation there are special provision storerooms in the lower 'tween decks, on account of the great distance of this part of the ship from the main provision stores aft.

White Star Line.

The "Tuscania"

ADAMS and HOLDEN, FF.R.I.B.A., Architects

IN the decoration of the "Tuscania" the architects have employed a concordant scheme for the various rooms, thus gaining a delightfully harmonious effect.

The first-class smoking-room is panelled in English oak with lime wood carving. A notable feature is the cast-iron firegrate surrounded by Pavonazza marble, and surmounted by a handsome mirror. The cornice is finely plastered.

The first-class lounge is painted in warm grey tones, the ceiling being again ornamented with plaster enrichments. The pillars are of scagliola in pure white with fine black lines. Particularly happy are the proportions of the old marble mantel, taken from a house in Gower Street, which accords delightfully with the scale of the room. The sash windows are framed in teak.

The first-class dining-room is painted in shades of putty and cream, and the colours of the scagliola columns have been arranged to harmonize with the general colour-scheme of the room. Some fine ironwork is noticeable in the balcony of the musicians' gallery and the grille in the dome. In this, as in the other rooms, Ruboleum floors are laid.

The writing-room is panelled in English walnut of fine figure, veneered, the panels being opened and reversed. A green pile carpet introduces a pleasing touch of colour, and the furniture, also of walnut, completes the general scheme.

The following contractors were associated with the work: Messrs. Korkoid and Ruboleum Tile Co.; Plastic and Modellers Association; Kingsmill Art Metal and Electric Co.; A. Broadbent; Yannedis & Co.; McGeoch & Co., Glasgow; Robbins & Co.; Bellman, Ivey and Carter, Ltd. (Scagliola); Birmingham Guild, London and Birmingham; Berry's Electric, Ltd.; Geo. Rome & Co., Glasgow; and E. Levasseur, Ltd.

Messrs. Waring and Gillow, Ltd., carried out the whole of the decorative work in the following first-class apartments: dining saloon, smoke-room, lounge, writing-room, and entrance and vestibules. This firm also constructed and decorated the first-class main staircase which leads from the lounge on the upper promenade deck into the first-class dining saloon.

The "Scythia"

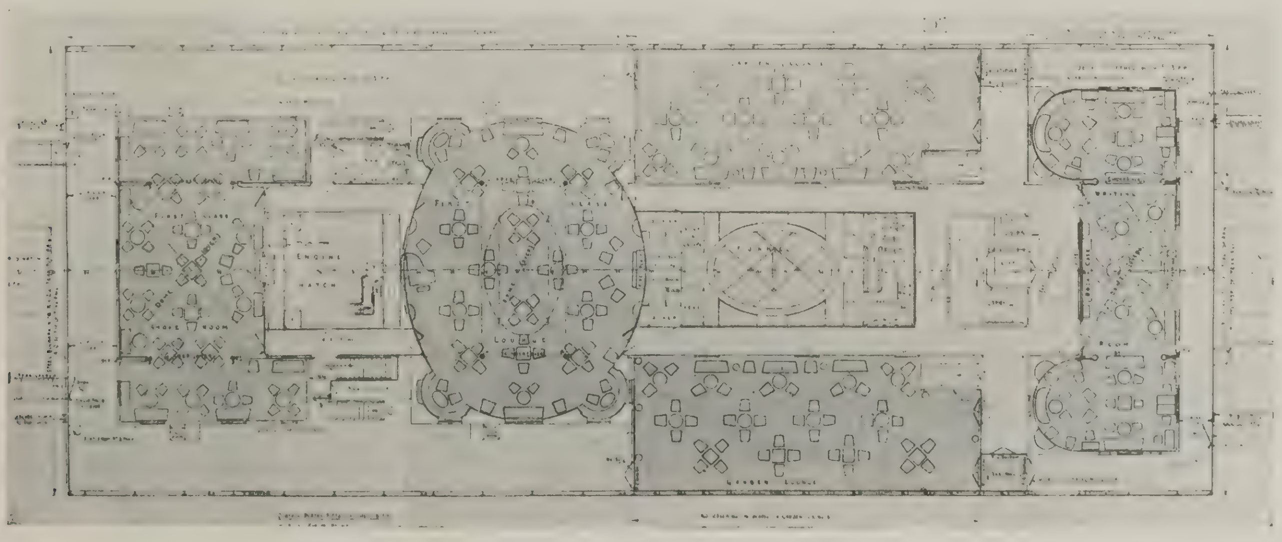
Willink and Dod, F. and A.R.I.B.A., Architects

BUILT at the yard of Messrs. Vickers, Ltd., Barrow, the "Scythia" is the largest passenger vessel afloat designed and built to burn oil fuel. With her 21,000 gross tonnage, 600 ft. length, 73½ ft. beam, and 45 ft. depth, the "Scythia" has space sufficient to provide unusually extensive accommodation for some 2,200 passengers (350 saloon) (350 second class).

In the "Scythia's" saloon passenger accommodation there are two garden lounges, one of them situated on the port and the other on the starboard side of the "A" or upper promenade deck. Here passengers enjoy the sun and the sea-air amidst surroundings typical of an old English garden, fitted with many comfortable rest-inviting wicker chairs. Cold winds and rain do not interfere with the comfort of those who seek the tranquillity of these garden lounges, for they are enclosed on the outside of the vessel with sliding windows. Then there is the veranda café for the sole use of the second-class passengers.

Another feature worthy of note in the "Scythia's" accommodation is the small subsidiary rooms or alcoves which form part of the big public rooms and yet maintain a certain sense of privacy. In addition, the ventilation of the public rooms and state-rooms has been thoroughly studied and the latest improvements introduced.

The main staircase forms itself into an imposing central hall with approaches to the saloon, drawing and writing-room, lounge and smoking-room. This grouping of the public rooms proves of great convenience to passengers. The lounge is particularly attractive. In plan it is oval, with an imposing central dome of white glass. The ornamentation is reminiscent of the Empire period, being delicately moulded in plaster. There are four alcoves, diagonally opposite each other, and these have separate windows. The massive fireplace with its marble mantelpiece is surmounted by a picture in the style of the period. At each side of the fireplace and at the opposite end are carved mahogany console tables. The furniture and appointments of the room present a most effective colour-scheme—black and gold, grey and gold, with here and there touches of vermilion. The rich effect is toned down by a number of pieces of furniture in old mahogany. The coverings are in black and gold, and blue and gold, with charming Chinese designs, whilst grey velvet is also introduced into the scheme. Chinese silk of blue and gold is the



PART PLAN OF "A" DECK.

material used for the curtains, while the reseda green pile carpet completes a successful effort to provide a general representation of the best work produced during the latter end of the eighteenth century.

The drawing- and writing-room is extended at each extremity by an alcove. The main feature of this room is the elliptical dome over the centre portion, finishing with a fan-shaped painted panel on either side. Rising to the full height of the cornice, the fireplace has massive pilasters on either side of its old-fashioned grate. The colour-scheme of the walls and ceiling is white, while the appointments are in the modern style, but showing the influence of the Georgian period. The Adam furniture is of dull old mahogany, and the silk coverings form a colour-scheme of purple and yellow. This, with the purple carpet and the damask curtains, strikes a modern note among the reproductions of Adam models. There is a handsome carved mahogany bookcase, situated on the opposite side to the fireplace.

Panelled throughout in antique oak, the smoking-room is a handsome and cosy apartment, consisting of a centre room with a coach-top roof and two side wings. Its furniture is of the plain Chippendale type with Chinese fretted detail and coverings in early eighteenth century needlework. The large settees and easy chairs are covered in a reproduction of an English eighteenth century version of Chinese tapestry. There is a massive marble fireplace.

The dining saloon for the use of first-class passengers extends the full width of the ship with a length of 64 ft. The walls and ceiling are treated in white decorated plaster, but the level of the ceiling is broken in the centre by a richly decorated pierced dome. Behind this dome is the musicians' gallery. A remarkably effective scheme of lighting has been introduced. The dome hides the strong and brilliant electric lights which shine through the piercings into the room below. The long tables of the past have given place to small tables with portable four-leg chairs, which are now so popular among travellers and at which two, four and six people can sit.

The first-class state-rooms are fitted up in a particularly attractive manner. Those on the promenade deck, for example, have wooden bedsteads for two people with a Pullman berth, which, if necessary, can be made to accommodate a third person. The furniture of these rooms is of carved mahogany. The first-class state-rooms are fitted with all necessary toilet requisites and each has a plentiful supply of hot and cold water.

In that part of the ship devoted to second-class passengers, the comfort of the traveller has received the fullest consideration. Public rooms include a dining saloon, lounge and smoking-room. In the dining saloon small tables for four and six people replace the usual long tables, while the sideboard has given way to a number of small quick-service tables.

Much care has been devoted to the design of the accommodation for third-class passengers. The old-fashioned open berths have been entirely dispensed with, and throughout the ship third-class passengers are berthed in commodious rooms, each accommodating, in general, two to four persons. Spacious alleyways separate the groups of rooms, and any congestion is now completely eliminated. Two large dining saloons, a general room and smoking-rooms, all commodious, well lighted and well ventilated, and ample open and covered promenade space, complete the scheme.

The sub-contractors were as follows: Gillow & Co., Lancaster (woodwork); G. Jackson and Sons (decorative plasterwork and carton pierre work); Bellman, Ivey and Carter (scagliola columns); Kingsmill Art Metal and Electrical Co. (electric light fittings and wrought iron work); J. Stubbs and Sons, Liverpool (marble mantelpieces); E. A. Clark, Ltd., Liverpool (grates); E. Levasseur (carving); James Gibbons (ironmongery).

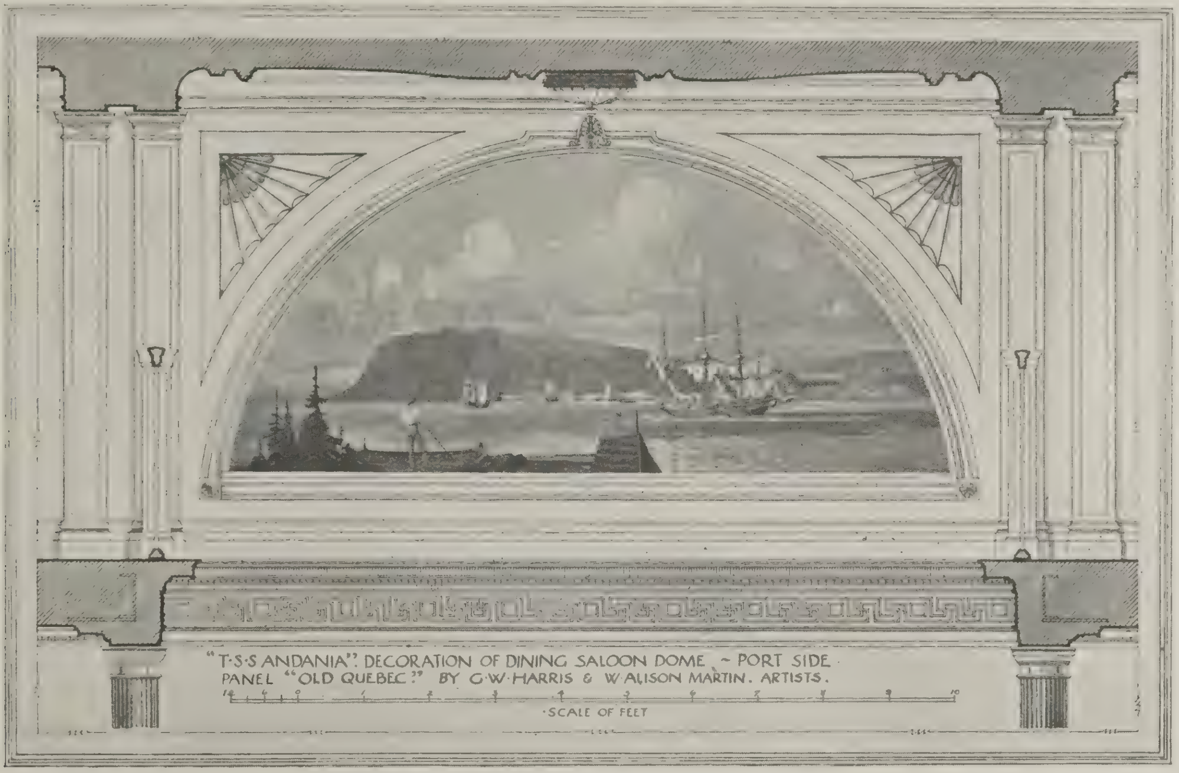
The "Andania"

SHEPHEARD and BOWER, F. and A.R.I.B.A., Architects

SHORTLY after the conclusion of the war the Cunard Line embarked on an extensive shipbuilding programme. The "Andania" is the fifth of the new ships in this programme to be put into commission, and is one of the six ships of its type which will carry only cabin and third-class passengers. The accompanying illustrations show some of the more important accommodation provided for the cabin passengers.

The saloon adjoins the kitchen department, from which it obtains immediate service. It is treated in a Colonial Adam manner. The portholes are arranged in groups of three, and each group is enclosed within one architrave, behind which drawn curtains are hung, thus producing the effect of a series of large windows extending from the floor to the ceiling. The colour-scheme is in shades of ivory white, with rich blue curtains and gold trimmings. The Spanish mahogany furniture is treated in harmony with the decorative scheme. Groups of small tables have been arranged to accommodate two, four, or six persons, and independent chairs are also provided. The centre portion of the saloon is carried up into the deck above, forming a central dome, with a musicians' gallery on one side and the main staircase landing on the other. The other two sides of the dome are enriched with semi-circular shaped fresco paintings in tempera. The architects commissioned Mr. G. W. Harris and Mr. W. Alison Martin, two Liverpool artists, to carry out these paintings.



"T·S·S ANDANIA". DECORATION OF DINING SALOON DOME ~ PORT SIDE ·

BY G. W. HARRIS AND W. ALISON MARTIN.

The main staircase leads from the after-end of the saloon, passes through intermediate decks, which give access to the passengers' state-rooms, etc., and terminates in the writing-room. The staircase rises easily in short flights, and has a wide central and two return flights to each deck. The stairway is of the open type, and has a continuous wreathed handrail supported on elegant wrought-iron balusters. The staircase panelling forms a very handsome feature of the ship.

On the promenade deck is arranged a suite of entertaining rooms, comprising a writing-room, lounge, smoke-room, and a veranda café. These rooms occupy the whole of the available space on this deck. They are all lighted by large sash windows, which are sheltered by the boat deck, and through which the view to sea is gained across the promenade deck. The centre portions of these rooms are carried up several feet above the boat deck, to give an added height and importance to them, and to allow of a pleasing effect of clerestory lighting to be obtained by means of decorative lunettes.

Although the writing-room is designed in a style in keeping with the saloon, its detail is in a rather more delicate manner, as it serves as the drawing-room of the ship. A fireplace is provided at the forward end of the room. The colour-scheme is in shades of French grey, with curtains in old gold and blue trimmings. Groups of small tables are arranged for writing, and occasional tables and settees, harmonizing in colour, and designed to be in keeping with the general treatment of the room, are provided.

The architectural treatment of the lounge shows a French influence both in the detail and enrichment. The colour-scheme is in shades of lavender, and the touch of warmth in the colour of the old rose silk curtains and the upholstery gives the lounge a feeling of comfort. An open fireplace is provided in a comfortable recess in the centre of the room at the forward end.

The smoking-room is carried out in oak, and the walls are panelled in this material; although kept in harmony with the other rooms, more Florentine influence has been introduced into its design. The panelled pilasters, carried up to the ceiling, have dull gilt capitals; the delicate enrichment on the upper part of the panels and the oak ceiling beams gives a sense of dignity and repose to the general scheme of decoration. In the recess forming an ingle, at the forward end of the room, a fireplace has been arranged, furnished with an open electric fire. At the after end a similar recess forms a bay window, which gives a pleasant outlook on to the veranda café. The window hangings are in green and dull gold, and the furniture, consisting of large settees and easy chairs, is upholstered in leather, and harmonizes in colour with the scheme of decoration. The furniture is independent, and the chairs and settees are arranged in groups at separate tables. In this manner all the amenities and comfort of a first-class smoke-room are obtained.

The veranda café is approached direct from the promenade deck and the smoke-room, and it is carried out in a simple treatment of French treillage consisting of panelled walls and pilasters. The fascination of the stern view has not been overlooked, and passengers seated in the café gain full benefit of this through the large central window, the two side windows, and the two large openings looking directly astern. For protection against bad weather the two large openings can be closed by sliding doors. Wicker chairs and tables are arranged in groups round the windows to give passengers the full benefit of the view to sea. The delicate treillage and the cream background give a charming open-air effect, and the sheltered position of the café makes it a favourite resort.

The children's room was designed throughout by the furnishing department of the Cunard Company. It is panelled with sycamore, polished to its natural ivory tint, and the mouldings and enrichments are dyed a bright red. A continuous frieze illustrates the principal incidents from "Alice in Wonderland." Two inglenooks with seats have been built, the frieze on the three sides of which are painted with a large tree, whose branches extend over the cove and entwine on the ceiling. The effect gained is that of a garden arbour where the youngsters can have their "make-believe" alfresco tea. Both the floor and the ceiling have been converted into sources of amusement and interest. The former is provided with an inlaid border of animals, the centre portion being inlaid with the outlines for "Hop Scotch," "Shuffle Board," "Marbles," and other games. The ceiling is painted sky-blue and sprinkled with silver stars, and the lighting is obtained through the conventional cheery-faced sun and the "Man in the Moon." A large slate with a fitment for coloured chalks has been incorporated in the panelling, and a small library of children's favourite books is provided. The miniature furniture is comfortable, and designed with an eye to hygiene —white enamelled, decorated with bright colours, and with all awkward corners eliminated. It delights most children who love to discover articles of their own scale.

The general contractors were Messrs. Gillow & Co. (Waring and Gillow, Ltd.), Lancaster, who were also responsible for the whole of the woodwork in the public rooms. The sub-contractors were as follows: E. A. Clarke, Ltd., Liverpool (firegrates); G. Jackson and Sons (mantels and plasterwork); Thos. Elsley, Ltd. (metal lunettes in public rooms); The Kingsmill Art Metal and Electric Co., London (metal work and wrought-iron balusters); Guiggin Bros., Liverpool (door furniture, locks, etc.); John Stubbs and Sons, Liverpool (marble work in fireplaces); Gent & Co., Leicester (synchronized clocks); Messrs. G. W. Harris and W. Alison Martin, Liverpool (wall paintings); The Cunard Furnishing Department, Liverpool (furnishing). Electric "magicoal" fires, by Messrs. Berry, are fitted throughout.

The "Empress of Canada"

GEORGE A. CRAWLEY and PARTNERS, Architects

THE "Empress of Canada" was completed this year. It has a gross tonnage of about 22,000 tons. The first-class accommodation is arranged on one of the decks in large state-rooms for one, two, and three persons, and on another in rooms for two, three, and four persons. In addition, there are a number of private suites comprising sitting-room, bedroom, and bathroom, and special rooms with bathrooms and rooms with private lavatories. The sitting-rooms are provided with settees (one of a folding-bed pattern), and the suites contain two dressing-tables and wardrobe fittings.

The staterooms are large and airy, with direct light to each room, a great majority of the rooms being of the Bibby type. Each stateroom is fitted up with open porcelain wash-basins supplied with hot and cold running water, and each room is fitted with bedsteads instead of the ordinary ship's berth. A folding Pullman bed, or folding upper bed, is fitted in addition in most of these rooms, and the whole of the accommodation is furnished in the most comfortable style.

The first-class dining saloon is situated amidships, and will accommodate 307 persons at one sitting, the tables being arranged for small parties of six, four, or two people. It is approached from the reception-room, and the general scheme is Georgian in character. The centre portion of the saloon is carried up the height of two decks, the upper part being arcaded in treatment, with a musicians' gallery with a wrought-iron balustrade at the forward end, the whole motif of this portion having been designed to give an appearance of great height. The room is panelled throughout in large painted panels of a light grey tone, with the mouldings picked out in white. At the after end is a fine sideboard in veneered mahogany.

The first-class reception-room is situated forward of the dining saloon. It has been designed to give a large open space suitable for dancing, the floor having an area of over 2,000 superficial feet laid with polished oak parquet. This room has arched recesses at the sides for sitting out and to accommodate the orchestra. A stairway with passenger elevator embodied is arranged at the fore end of this room, with wrought-iron balustrades and elevator enclosure; at the after end there are three large arch-headed mirrors with jardinières for flowers at the foot of the mirrors. The room is treated in large painted panels of light grey tone, with the mouldings picked out in white. Crystal and glass electric fittings are provided.

On one of the decks the main stairway opens into the long gallery, which has been made a feature of the ship, as it gives access to all the principal first-class public rooms. This gallery is about 100 ft. long and 13 ft. wide, and the sides are panelled in polished Honduras mahogany and hung with choice prints. It is amply lighted by large windows on one side. A bookstall has been arranged at the side and about midway of this long gallery.

At the forward end of the long gallery is the first-class lounge, which has been planned to provide a large and lofty central open space about 16 ft. in height, and lit with clerestory windows and a wrought-iron lay light. This room is utilized as a music-room, and also for cinema exhibitions, a cinema operating-room having been arranged for at the forward end. The remainder of the room has been arranged for card parties, and is divided off from the central space by arches supported on columns. The keynote of the design of this room is the wall decoration, which consists of large brocade panels of rich design in walnut frames, and it is also lighted by large windows at the sides with transome lights. The floor of this room will be laid with oak parquet.

At the after end of the long gallery is the first-class smoke-room, which is planned on somewhat similar lines to the lounge, the central portion constituting a large well-lit room 16 ft. high, while the portion towards the sides has been adapted for accommodating card parties. This room is panelled in large oak panels of a Georgian design, subdivided with fine carved Ionic columns, and has large three-light mullioned and transomed windows at the sides. A feature of this smoke-room is the moulded black and gold marble fireplace, with its large canopied pediment surmounting a fine carved coat-of-arms of Canada.

Opening also off the long gallery there are the first-class card-room, panelled in grey sycamore and Queen Anne in character; the first-class drawing-room in mahogany with panels of brightly-coloured "Toile de Louy," and with a painting over the mantelpiece by Mr. Philip Connard; the first-class writing-room, with painted panels in shaded tones of duck egg green, with enriched cornice and panel mouldings, and also the first-class children's room. The card-room has boldly moulded panels and a finely modelled cornice, and the fireplace is fitted with an electric "Magicoal" fire.

Opening out of the first-class smoke-room is the veranda café, which is of oak half-timbered design.

A large swimming bath about 30 ft. long, 18 ft. wide, and with a maximum depth of 8 ft. is provided forward of the reception-room. On one side there are arranged dressing-boxes. The swimming bath space has a marble dado with the tile filling above, subdivided by marble pilasters. A large gymnasium, fitted with the most modern gymnastic appliances, is arranged next to, and communicating with, the swimming bath. Extensive promenade space for the first-class passengers is provided.

The second-class accommodation is arranged in staterooms for two and four persons. These rooms are fitted up in a similar manner to the first-class state-rooms, but have berths instead of bedsteads. The dining saloon for second class accommodates 100 persons, and a large lounge has been provided. Ample promenading space is arranged for.

The third class are accommodated in rooms of two, four, and six. They have a dining saloon accommodating 100 persons. Promenading space for third class is also provided. The vessel is fully equipped with a laundry, operating theatre, dispensary, hospitals, information bureau, barber's shop, etc., and carries a manicurist and stenographer.

The decoration of the first-class public rooms was carried out by the following contractors: Fairfield Shipbuilding and Engineering Co., Govan, Glasgow, the shipbuilders (first-class dining saloon, reception-room, entrances and stairways, swimming bath, veranda café, and gymnasium); Wylie and Lochhead, Glasgow (first-class lounge, card-room, drawing-room, suite rooms); Trollope and Colls, Ltd., Liverpool (first-class smoke-room and writing-room); The Leyland and Birmingham Rubber Co., Glasgow (linotiles); Wylie and Lochhead, Trollope and Colls, B. Cohen and Sons, and Howard and Sons (furniture); J. Reid and Sons, Glasgow (special pieces of furniture and the dining saloon chairs and most of the rugs); General Electric Co. and Messrs. Elkington & Co., Birmingham (electric light fittings); G. and A. Brown, Ltd. (mantelpieces, mirrors, and compo work); Wm. Kemp (grates); Messrs. Berry's Electric, Ltd. (electric fires); Messrs. N. F. Ramsay, Ltd. (door furniture).

The prints were selected from the stocks of Messrs. Basil Dighton, Daniell and Sons, F. Sabin, F. R. Meatyard, and The Medici Society. The clock cases were reproduced from old designs by Messrs. Bolton Smith, and the clocks were by The Magneta Time Co. Most of the public rooms are fitted with electric fires of the "Magicoal" type.

[Some notes on the "Narkunda" and the "Empress of Scotland" appear on page 592.]

THE "EMPRESS OF SCOTLAND."

The "Narkunda"

The accompanying illustrations show the first saloon of the "Narkunda," which has been carried out from the designs of Messrs. Collcutt and Hamp, FF.R.I.B.A., architects. Roof lighting is employed, and at each end of the gallery are ventilating ducts, through which air is drawn off by exhausts into trunks. The mural decorations are by Professor Gerald Moira, who has used light colouring to obtain cool effects suitable for an Eastern service. Above the saloon is an oak-panelled music-room.

The contractors associated with the work were: G. Jackson and Sons; Thomas Elsley, Ltd.; Heaton, Aldam & Co.; and the General Electric Co. Messrs. Nettlefold and Sons, Ltd., supplied the whole of the electric light fittings and the purser's equipment.

The "Empress of Scotland"

The "Empress of Scotland" is an ex-German ship, and was formerly the "Prinz Friedrich Wilhelm." The decoration of the ship was carried out in Germany.

The "Andes"

On the "Andes" there are two suites of cabines de luxe, each consisting of a sitting-room, bedroom and bathroom. The floors are of carpet with linoleum surround, and the upholstery is of brocade.

The state cabins number sixteen on bridge deck, half of which are finished with oak panelling and half in oak dado and white above. All the rooms have oak furniture, and there are plaques and pictures on the walls. Each room is furnished with two cot beds; double and open washstand, wardrobe, etc., a carpet rug on floor. The upholstery is in green velvet. A bathroom is provided to each room.

The first-class state-rooms are arranged on the promenade bridge, and upper decks in one-, two-, and three-berth rooms. Cot beds are fitted in the one- and two-berth rooms, and in the three-berth rooms two cot beds and a folding Pullman upper berth. Each room is fitted with a single or double folding lavatory, wardrobe, etc., while most of the rooms on the lower promenade deck have open wash-basins fitted instead of the lavatory. A large number of the rooms are inter-communicating. On the bridge and upper decks they are arranged on the tandem principle, which gives a natural light and ventilation to all rooms.

Accommodation is provided in the first-class dining saloon for 376 persons, and there is a children's saloon of twenty seats. The dining saloon is panelled in white and gold, and is in the "Adam" style. Oval sliding lights, arranged in pairs, are provided. At the fore end of the saloon there is a large sideboard and eighteen dumb waiters; there is a crescent-shaped buffet at the foot of the stairs, and small round and rectangular tables are laid out in restaurant style. The chairs are of mahogany, the upholstery is in red Morocco leather, and the floor linoleum is of tiles on Veitchi.

The children's saloon, which adjoins the saloon, is

FIRST-CLASS SMOKING-ROOM.

THE "ORDUNA.

decorated in a similar manner. A glass screen with sliding panels separates the two saloons.

Messrs. Harland and Wolff, the shipbuilders, were responsible for all the interior decorations.

The "Orduna"

The first-class smoke-room of the "Orduna" is panelled in slightly fumed oak carved in the Jacobean style. Over the fireplace is a handsome painting of a scene in the town of Orduna. The furniture is of oak and is upholstered in green leather. A raised roof has been constructed over the centre of the room. There is a coal fire, and a bar and lavatory accommodation.

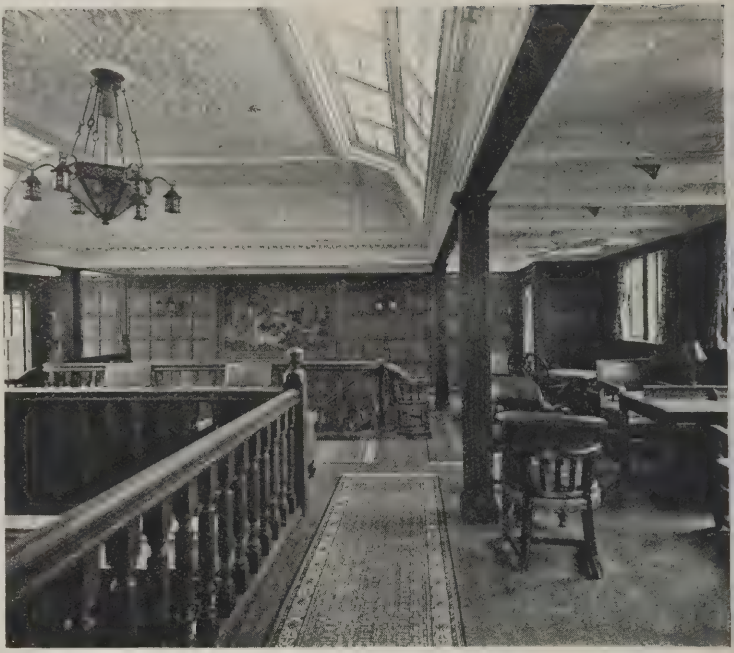
The gymnasium is situated on the promenade deck. The walls are finished in white enamel with an oak dado, and the floor is of linoleum tiles in green and white. The following machines are supplied: hydraulic rowing machine, punch ball, ladies' and gentlemen's riding horse, wrist machine, weighing machine, height recorder, wall bars, foils and helmets, dumb-bells, boxing gloves. In this room is an illuminated map of the world.

On the main deck is the first-class dining saloon which extends the full breadth of the vessel, and is arranged to seat 169 persons. It is treated in the Georgian manner, and is finished in white and gold; at the fore end are paintings. There is a large sideboard forming a cold buffet table and six dumb waiters, and small round and rectangular tables are arranged in restaurant style.

The "Almanzora"

The interior of the "Almanzora" illustrated, is lit from the top and the sides. A special feature of the room is the ceiling which, in the centre, is raised and supported by columns. The ceiling is enriched and panelled with elaborate mouldings, the centre being marked by an electric light pendant. The walls are panelled, and the floors laid with mats.

Messrs. Waring and Gillow were responsible for the dining-saloon, winter garden, smoke-rooms, main stairway, and entrances; Messrs. George Jackson and Sons, Ltd., for the plasterwork; Messrs. Thornton Smith for the first-class social hall; Messrs. Trollope and Colls for the *cabines-de-luxe;* and Messrs. Harland and Wolff for the cabin accommodation and second- and third-class public rooms.

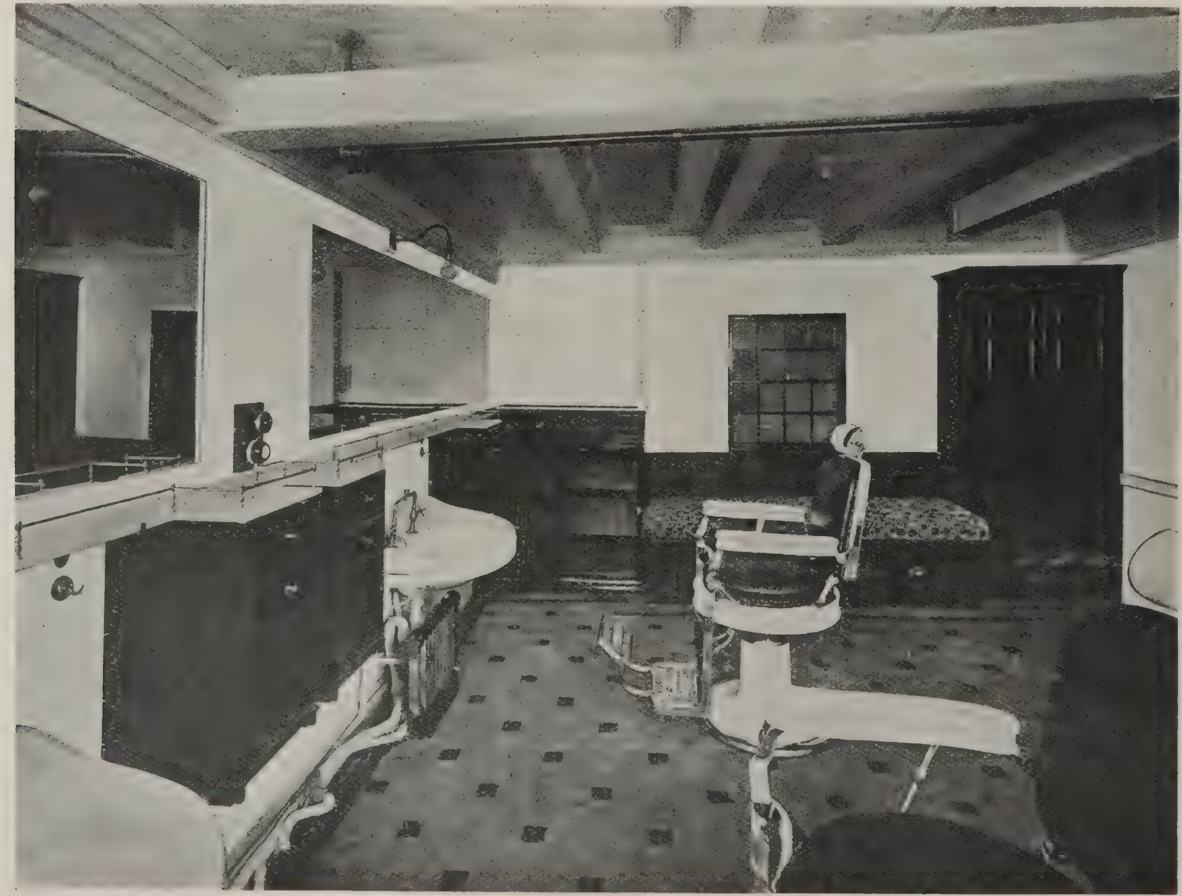


R.M.S.P. Co.

A VIEW IN THE "ALMANZORA."

We learn that Messrs. Doulton & Co., Ltd., supplied sanitary fittings, not only to the "Aquitania," as mentioned on page 552, but also to the "Berengaria," the "Andania," and the "Empress of Canada," among the other ships illustrated in this issue.

Below is a view of a hair-dressing saloon on a Cunard liner, installed by the Vitrolite Construction Co., Ltd.



A HAIRDRESSING SALOON ON A CUNARD LINER.

The Heating & Ventilation of Passenger Ships

By J. L. MUSGRAVE, M.Inst. H. and V.E.

IN the last twenty years or so the large steamship companies have indicated a most progressive spirit in their efforts to improve the amenities of ocean travel; each succeeding ship has shown an advance on the last in the provision of greater comfort and more luxurious decoration. Not only have ships increased in size and speed, but the introduction of improved means of propulsion, such as geared turbines, oil-fired boilers, etc., have permitted the allocation of larger spaces for the accommodation of passengers, and have facilitated the introduction of light and air to various parts of the interior which, a few years ago, would have been considered impracticable.

Many of our first-class ships will compare most favourably as regards interior decoration with the finest buildings, and in fact almost everything that can be done is done to make the passenger forget that he or she is at sea.

It has to be admitted, however, that the methods of heating and ventilation, with few exceptions, have not progressed at the same rate as the other great improvements. At the best, the heating and ventilating arrangements on passenger ships do not compare at all favourably with the average important building which, in these days, is provided with the latest equipment for warming and ventilating; fresh air of requisite humidity is distributed at various temperatures to different parts, according to requirements, and at the same time vitiated air is extracted from all portions of the building. An interchange of from 1,500 to 2,000 cu. ft. of air per person is frequently provided. Devices for cooling the building in hot weather are also fitted on occasions.

Ships are frequently likened to "floating hotels," but a more correct simile, when referring to some of the modern leviathans, would be "floating towns," with a population of 2,000-3,000 or more confined within the limits of each for periods of one week and upwards.

In considering the necessities of air supply to such large numbers of people, the various conditions which may prevail at different times have to be taken into account. Those ships plying across the North Atlantic between Europe and America have to cope with the heat of the American summer and the intense cold of the North Atlantic winter, where zero temperature Fahrenheit is occasionally met with. Frequently during a single voyage considerable variations of temperature take place, the transition from one to the other being extremely rapid.

Passenger ships journeying to South Africa, South America, Australia and New Zealand, etc., present an altogether different problem, however. They have to be prepared to meet the conditions prevailing when approaching or leaving home ports during winter, and, in the case of those visiting South America or New Zealand, in the extreme southerly regions during the cold season there; but the greater part of the voyage takes place in warm or torrid zones. Ventilation, and plenty of it, is the necessity in each case, with adequate means of warming in the cold regions and means of cooling in the hot regions.

It must be confessed that, except in few instances, the problem has not been adequately dealt with, and in spite of the huge sums that are spent in the construction and equipment of the luxurious ocean liners of the present day, the all-important questions of heating and ventilation have not received the consideration and attention they deserve from the owner, designer, or builder.

It is desirable to point out that there is a vast field for investigation and enterprise in this direction, and to those responsible for the design and construction of ships it should be said that the assistance of the heating and ventilating engineer and his scientific application of the art would materially improve the amenities of their ships by increasing the comfort of passengers and crew, and thereby add to the number of the former and the efficiency of the latter; and that any slight additional expenditure that may be entailed would prove a sound commercial investment owing to the introduction of more efficient means of application and more economical methods of working. Admittedly, the difficulties that have to be met are many and intricate, but hearty co-operation between those responsible for the design and construction of the ship, and the heating and ventilating engineer, would speedily overcome these, providing the individuals concerned are brought together in the early stages.

When designing an important building, the architect consults the heating and ventilating engineer at the commencement of the designs, and embodies therein space for the accommodation of the plant and ways for ducts, pipes, etc., as well as the approximate positions of his ventilating inlet and extracts. While these, possibly, have to be modified from time to time as the work proceeds, the general principles having been adopted, the ultimate success of the scheme is assured.

The naval architect is confronted with a similar problem, though probably of a much more complicated nature. The spaces that may be allotted to various services are much more restricted, permissible weight has to be considered, and in addition there are the requirements of the various governments and shipping authorities that have to be met.

One would be led to expect the earliest consideration of the various problems, but in practice, unfortunately, one finds that, beyond certain general outlines of a heating and ventilating scheme, the actual working out of the scheme, more often than not, is left to the shipbuilder to develop, nore or less as the work proceeds. As every inch of the available space is claimed for either the electrician, plumber, automatic door operating gears, fire hydrants, etc., and the numerous other devices which are vitally necessary, the path of least resistance is usually taken, and the ventilating ducts are curtailed. Sometimes this cannot be avoided, but with a live and keen heating and ventilating engineer on the job, determined to provide the guaranteed results for which he had been made responsible, a way round would generally be found. One frequent cause of mediocre results is the divided responsibility. Usually the ship specification includes provisional sums to be expended on the purchase of fans, motors, heaters, etc., the duct work being left to the shipbuilder to include in his general quotation for the hull, no definite scheme being first laid down. The spaces to be ventilated are mentioned, and by "averaging" costs of similar work on previous ships, a price of some sort is included in the tender.

As the work proceeds, fans, motors and heaters are purchased to fulfil certain specified duties, usually all standardized, irrespective of the various functions they have to perform, and in only rare instances has the volume to be dealt with, or the resistance been scientifically calculated. Rarely has the manufacturer of the apparatus any voice in the run, area or arrangement of the trunks in connection with which his apparatus has to operate. For convenience in passing through the restricted spaces, if for no other reason, the duct manufacturer will curtail his work to the least possible area, leading to high-water gauges and high-power expenditure for operating the fans.

Furthermore, the high air speeds usually entail a high speed of emission through the inlet to the cabins or spaces, causing unnecessary draughts which would not be endured in other circumstances, and frequently, to pacify the passengers, the ventilating system to some parts has to be run at reduced speed, therefore the full benefit of the plant, on which so much money has been expended, is not obtained.

Most of the shipping companies and the shipbuilders employ most capable and experienced men on the heating and ventilating systems, but frequently they have not the status to enforce their views in the event of a conflict between claims for space by some other sections.

There is a serious tendency to neglect the provision of adequate means of exhausting vitiated air. Unquestionably this neglect is the principal cause of the oppressive atmosphere which so frequently exists on passenger ships at sea, particularly in bad weather, when portholes and other means of natural ventilation necessarily must be closed.

The large volumes of air introduced by the supply fans must, of course, find an outlet somewhere, but it does not necessarily follow that the fresh incoming air displaces the vitiated atmosphere.

We have many unfortunate and notorious examples of this in public buildings, and it is now the recognized procedure to provide what is practically a balance system of ventilation, in which well-placed extract openings, situated generally near the sources of vitiation and connected to powerful fans, set up a continuous movement of air throughout the spaces being dealt with and prevent the accumulation of air in stagnant pockets.

(The foregoing extracts are from a paper read by Mr. Musgrave before the Institute of Heating and Ventilating Engineers.)

The R.I.B.A. Visit to Westminster Hall

A LARGE and interested company of architects and their friends have paid a visit to Westminster Hall to inspect the famous 14th-century hammer-beam roof. The party, numbering between 100 and 150 persons, was met by Sir Frank Baines, M.V.O., the Director of His Majesty's Works, and taken in the first place to a committee-room, where he gave them a most interesting account of the historical and architectural associations of the great roof and the works recently undertaken for its conservation under his charge. His remarks were illustrated by some beautifully executed drawings, made available for the visitors, and by the use of a wooden model of the roof showing the principle of its construction.

Sir Frank Baines referred to the very interesting find of the original eleventh-century Norman walls and arcading, revealed during the works incidental to the preservation of the roof, and details of which he has had carefully recorded on drawings. The foundations of these walls were, most fortunately, taken down to the old ballast bed of the Thames, so that it was possible, when the great timber roof was undertaken under the charge of Hugh Herland (the King's Carpenter) towards the end of the 14th century, to place it upon what was practically the original walling of the great Hall, though thickened with additional material.

Sir Frank described at considerable length the various features of the old roof, and, like his hearers, was full of admiration for the mechanical knowledge and constructive skill of the craftsman responsible for its design. He pointed out that but for certain failures since Herland's day—for which the Master Carpenter could hardly be held responsible—and the extensive depredations of the Death-watch beetle (*Xestobium tessellatum*), only recently discovered by him, this splendid roof would probably have been in as sound and secure a condition at the present day as at the time of its construction. Instances were given of mistaken methods of dealing with the roof in modern times, some of which had unfortunately had the effect of radically altering its statical condition and of partially, if not wholly, going counter to the original constructive principle. Distortion from various causes was found in most of the old timbers.

The clue to what was the really serious source of peril to the roof was discovered by Sir Frank Baines himself when, as a youth, he climbed with great daring ladders erected by workmen from the floor to the roof timbers, crawled along a beam, and found cavities in the main timbers, from which interior portions of wood, eaten out into channels and holes, could, without difficulty, be detached. The opportunity came to Sir Frank Baines to apply the knowledge he had obtained in this way, when, as Director of Works for His Majesty's Office of Works, he became responsible for the care of the roof, and the carrying out of a thorough examination became possible on the lines of his earlier discovery. He then ascertained that the greatt imbers of the roof were eaten almost completely away in portions by the depredations of the insect, and were in far worse condition than he had imagined to be possible—so much so that a human being might almost conceal himself in the resultant cavities formed in the main timbers. It was, indeed, made clear to him that little short of a miracle had enabled the roof to stand, and that but for the great arched ribs that form so striking a feature of the roof, it must inevitably have long ago collapsed.

In seeking a remedy Sir Frank Baines appears to have proceeded on the basis of preserving all that was possible of the original work, but reinforcing what was left of the old timber with steel, and making good (in new oak from the original Sussex forest) where renewal of the wood was essential. In this way between 300 and 400 tons of steel have been placed in the roof in a manner calculated to give the original work the most effective support, while from the floor of the Hall the new steel members will probably hardly be seen—the aspect of the roof being almost precisely what it originally was.

It is important to note that the old timber is utilized to do whatever effective work is still possible to it, in conjunction with the new steel reinforcement, a condition to which Sir Frank Baines attaches great importance. The timber has been carefully treated with a solution that has not only destroyed the grub, but that may also—it is hoped—prevent the insect ever again finding conditions suitable for its existence in the timbers. The manner in which the old work had been eaten away is almost unbelievable, but fragments of old wood to be seen on the floor of the hall show very vividly how serious and complete were the destructive effects of the insect upon it.

Following Sir Frank Baines's highly interesting lecture, he was good enough to lead the party over the various stages of the roof itself, and to explain every portion of the work in detail upon the spot, encouraging his visitors to ask questions, and so leave, as far as possible, nothing in doubt or unexplained. The facilities so courteously offered for this visit could, indeed, hardly have been bettered. The beauty of the golden-brown colour of the original wood is very obvious on a near view, and there is every indication that it has been sympathetically and carefully conserved to the fullest extent possible.

The floor of the Hall was regained about 5.30 o'clock, when Mr. Francis Hooper, F.R.I.B.A., very happily expressed the thanks of the visitors to Sir Frank Baines for the large amount of trouble he had taken to make the visit instructive and interesting, together with a tribute to the skill and sympathy so obviously shown in all that was done. The motion was, it need hardly be said, carried with enthusiasm.

A very definite impression is undoubtedly left of the advantage to Architecture of having this wonderful 14th-century roof—representing a type of mediæval design and standard of craftsmanship almost without parallel in the world—now left in a condition to make it secure for, one may hope, many centuries to come.

The Manchester Town-Planning Exhibition and Conference

MANCHESTER never does things by halves, and the recent town-planning exhibition and conference organized by the Manchester and District Joint Town-Planning Advisory Committee has been one of the most successful ever held in this country. The Joint Town-Planning Committee consists of representatives from seventy-six local authorities immediately contiguous to the City of Manchester, and the problem of the industrial districts of South Lancashire with regard to town-planning and development is one of the most important anywhere in England. To focus public interest and to vitalize the civic spirit of the whole region nothing could have been better than such an exhibition, showing what is being done in town-planning all over the world.

Town-planning is fast becoming an imperial matter, and the plans exhibited in the Manchester Town Hall illustrated both the art and the science of the subject. There were big schemes from all the industrial towns of the north, and a very representative collection of plans and drawings dealing with towns, ranging from America to India, and in Europe from France and Germany to Scandinavia.

A specially fine set of plans in the large hall illustrated the Manchester district from almost every point of view—its public open spaces, its contours, the traffic densities of its main roads, its railways and canals. One saw at a glance all the salient facts with regard to the region, its drainage areas, its water supply, its gas authorities and electricity undertakings, its rainfall and its sunshine.

The historic growth of the various communities and local government authorities in the area in and around Manchester, and the gradual development of buildings and new streets during the last half century were very clearly shown by diagram after diagram contributed by such authorities as Rochdale, Bolton, Bury, Eccles, Hyde, and Rawtenstall.

In the adjoining rooms were examples of civic survey work carried out in America and Madras, in Sheffield and Leeds, in Birmingham and in the South

Wales region, as well as an example or two of the work carried out by the R.I.B.A. Civic Survey of Greater London. Most of these civic survey exhibits showed in diagrammatic form statistics of railway time zones, tramway time zones, population and traffic densities, position of industries and open spaces. Other diagrams showed insanitary areas and the position of the "back-to-back" houses, which form such a blot on some of our northern towns.

Civic surveys have been carried out in quite a number of towns, and graphic diagrams such as these are probably the readiest means of bringing home to the citizen the weak points of his own city as compared with similar communities elsewhere.

Of town-planning schemes under the Act, the most outstanding examples exhibited were those of Manchester, Bolton, Bradford, Rochdale, Leicester, Birmingham, and Sheffield, together with some of the smaller urban districts adjoining. Of foreign town planning and city development there were many examples from America and Germany, and one or two excellent French examples, showing the reconstruction of such towns as Rheims and Lille, and also illustrations of what is being done in Salonica and in Bombay.

The London Society's map for the development of Greater London and the various regional town-planning schemes at Doncaster and elsewhere formed a large and important section of the exhibition. Noteworthy, too, were the diagrams of zoning as practised in many American towns, and the numerous forms of road sections in use in the arterial roads now in course of construction in various parts of the country.

Garden cities and suburbs and housing schemes were well represented, and open spaces and parks had a special section, showing the laying-out of parks and the linking up of parks and playgrounds by the pathways which are now becoming so general a feature of American cities. The drawings showing the improvement of Dundee deserve special mention, and also the very excellent models exhibited by a firm at Shipley.

An excellent exhibition, indeed, and one of great educational value, as was instanced by the great crowds of visitors and scholars from the secondary schools who flocked through the galleries of the hall.

If a criticism may be permitted, it is not in the subject matter of the exhibition, but in the rather too frequent use of ordnance maps, which are excellent for the expert or the council, but to the general visitor are not apt to convey facts quite so readily as a pictorial diagram giving the same information in a more pleasing form.

There was, indeed, a good deal of truth in the comments of an "impressionist" reporter from one of the local Manchester papers who commented upon the vivid splashes of colour on the maps, and speculated as to the possible hidden meanings of the "futurists" who had been responsible for their perpetration—in other words, there were, perhaps, too many plans and not enough "pictures." The models, although few in number, attracted great interest with the general public. One thing clearly brought out by the exhibition is, that in town-planning matters the expert adviser is beginning to come into his own, and especially, perhaps, in regional planning is it essential to have the guidance of an architect and town-planner of the widest possible breadth of view.

The conferences, which lasted from Monday to Thursday, followed by the meeting of the Town-Planning Institute, were full of interest throughout the week, and seldom has one heard papers and addresses of such a high level.

The conference was splendid; the exhibition stimulating and instructive. From the architectural point of view, it may not, perhaps, have been quite so magnificent as the R.I.B.A. Town-Planning Exhibition at the Royal Academy in 1910, but for examples of actual town-planning work in hand it more than equals the exhibition of twelve years ago.

Considering the long years of war, which terminated barely four years ago, it is indeed a matter for congratulation that Manchester should have been able to exhibit such a wonderful and widespread collection of plans, diagrams, and models from all parts of the world. Manchester has given a most valuable lead to the whole country.

W. R. DAVIDGE, F.R.I.B.A.

The Sociological Aspect of Town Planning

By E. G. Culpin

IN the consideration of any rational system of town planning the first factor to be borne in mind is the sociological one. Other factors demand attention; the highest skill of the technician must be drawn upon throughout the process, but foremost as well as first must be that human aspect which lifts town planning out of the realm merely of art and science and constitutes it a living, palpitating study of the proper mode of life and the fittest manner in which to give expression to the legitimate aspirations of humanity.

It is a truism that one of the most potently determining factors of human existence is the environment in which the human animal passes its time. Slum conditions will make slum dwellers, and criminal associations will create criminals. It is only the exceptions where man is superior to his environment. If this be true, it is easily demonstrable that town planning can have in it the most potent germs for human betterment, and just as the evil, haphazard conditions of past generations have resulted in a terrible legacy of ill health and crime, so the making of sanitary towns, spacious thoroughfares, hygienic homes, beautiful surroundings, and parks and open spaces of real recreative value, shall result in a better standard of inhabitant, and tend, if only gradually, to the ennoblement of the race. The unit of the city is the citizen, and in considering the development of the city, anything which ignores the well-being of the citizen, wonderful and beautiful as it may be, is misplaced energy. Life for its maintenance depends upon sunlight, air, food, clothing, shelter, and all these, with the possible exception of clothing, are influenced by the method in which the town is planned, and the town planning of new areas can vitally affect each one of them.

The great difference between town planning in this country and the town planning that had gone before it, particularly in France and Germany, is this sociological basis. Formerly we have had schemes of magnificent roads, of beautiful public buildings and wonderful vistas, but many of them were brought into being solely for the aggrandisement of the city or an individual, and many schemes were merely military proposals designed to facilitate the easy transport of troops or to secure dominance over the inhabitants. Thus it has always seemed to me that British town-planning proposals started from the other end. It was not with the idea solely of making the city more beautiful or more convenient that town planning was here first preached, but because by properly planning the area, the home of the worker could be secured in the proper surroundings at a reasonable price and accompanied by those amenities of life which would go far towards the building up of a better type of manhood.

In this respect I regret that our Town Planning Institute, when breaking fresh ground and creating a new organization to deal with a new and better condition of things, should not have recognized the sociological side of the movement by admitting sociologists, as such, as members. Town planning should be an expression of the science of civics, and Professor Geddes has defined civics as applied sociology. Since the industrial evolution converted our rural population into an urban one, with the resulting urbanization of the great bulk of the population, it becomes more and more important that the urban well-being of our people should be properly studied.

One great difficulty, indeed, is the definition of what we mean by town planning. It may be so little and it may be so much. The construction of main arterial roads and provision for a town's growth in the main services are thought to be enough in some instances, while others are not satisfied until their scheme covers, as did Mr. Ebenezer Howard's proposals for a garden city, practically every factor of human life, or, in short, opening the way to a newer, cleaner, saner method of life, brought into being without any upheaval of existing systems, but merely by the application of common sense to the affairs of municipal life and government.

And the question of definition is not aided by our present law and practice. At the present time we are only planning town extensions, fixing traffic routes, determining the use of land, regulating growth, and great as is this advance, we have to contemplate something much bigger. In order effectively to house our population and bring some joy of life to the present slum dwellers we must sooner or later contemplate town replanning and be given powers more easily to cut away the festering wens of city life and open up the congested areas. We must be thinking of complete town planning—the building of complete new towns in spots where they ought to be; and we must have country and district planning if our work is to be truly effective. The growing rural areas of to-day are really the places where planning would be really most effective, because it would prevent the indiscriminate urbanization of still unspoiled countryside, and the time is rapidly approaching when natural forces will compel us to a consideration of the query as to whether a limit must not be placed upon the growth of our towns; whether, in fact, after a certain point has been passed, the continued growth of any town is not a menace to its own health and security.

Here again the question of civic importance and justifiable civic pride will largely affect the issue, but at this moment we are considering the needs of society, the well-being of the citizen unit, as being of paramount importance. The cry of "big city" for the sake of "big city," as of "art for art's sake," does not ring true to human experience. Big city must only be allowed when it is demonstrably proved that it is going to secure a happier, healthier existence for its humblest citizens than is possible in smaller city.

I am quite aware of the heresy which, according to many people, I am here expressing. I know the arguments for the big city from many points of view and can appreciate them. But I want to submit also that there is a prior claim to all these, and that even these things could be at least as effectively secured by scientific social planning although a limit were placed upon expansion. To take the latter point first. In a properly preplanned area, belts of park land and cultivated land which separated each unit could be so crossed by proper means of transport that the units would be in close touch with each other and with a common centre—in closer touch, in fact, than some neighbouring districts of our large towns are to-day. But there are other reasons why we should consider whether a limit should not be placed upon the growth of brick and mortar. Is it well that town should be grown into town and absorb town and village with the resulting urbanization which we see to-day in parts of Lancashire? By driving the open country farther from the dwellers in the centre are we not depriving them of something very precious, even if it be not properly appreciated by the victims themselves?

Can you not conceive a model state in which there was a real country and regional planning authority which should look at this suggestion from a bigger viewpoint? This authority would examine the housing needs for the whole area, but with this would also consider the necessities of trade and commerce and agriculture. It would consider the agglomeration of population and also the bare tracts of land suitable for development, and it would decide whether Manchester or Bolton or Rochdale was really the best place to increase, or whether national good would not be better served by grouping together some of the new industries required with some of the new houses required and creating afresh upon virgin soil, with none of the evil heritages of the past, a model community, properly planned and properly equipped for the rearing of a race of virile men and women fitter for the realization of the destinies of the Anglo-Saxon race.

Of course, the *reductio ad absurdum* could be applied to this argument, but I am not contemplating that shipbuilding should be transferred to the West Riding or that regional industries should be dislocated. And also I am not blind to the fact that drastic changes would be necessary and that in all probability vested interests would prevent anything so sensible from ever being carried out. What I want to impress is the power which town and regional planning has within itself for affecting the life and happiness of the citizen, and to ask you whether mere local patriotism has the right further to divorce humanity and nature.

In the consideration of such a conception of town planning we shall look for help to those movements which have so largely directed attention to the study of the city; to such societies as, pioneered by the Beautiful Oldham Society, have not ceased to preach the glorious gospel that beauty and the love of beauty is an asset of incalculable value, whose loss through the sordid period of industrial expansion has more than anything else lowered the moral fibre of our nation; to the civic survey and the regional survey, which have given us knowledge of the complications and implications of civic life; and to the growing consciousness of educated democracy, determined to leave a heritage of goodwill and opportunity.

The sociological aspect of town planning is the citizen's aspect, and the citizen must see that it is made paramount, so that the result of town planning may be not merely grandeur and beauty, but in addition that, just as the child of the wealthy citizen can enjoy the luxuries of the private garden, the private park, the private recreation room, the private museum and library, so through the proper disposition of our municipal resources the child of the humblest citizen shall enjoy these in the public garden, the public park, the public library.

Town Planning Necessary for Industrial Efficiency

By Thomas Adams

If we are to make out a prima facie case for the claim that is implied in the title to this paper, we must first be prepared to recognize town planning as the planning of towns. To plan a town means that we must have regard to its elements and functions as a social organization as well as to the composition and character of its physical or structural growth. A town exists because of some industry or industries, and the well-being of these must be the primary consideration of its citizens. Therefore the first problem that confronts the town planner is how to improve the facilities of the town for carrying on its industries, and what are the social, economic, and physical improvements needed to make these industries more efficient. An economic and industrial survey should be an essential preliminary to the preparation of the plan of a town. The relation between its constituent parts and functions should be studied and the order of their importance ascertained. Hence a town plan should relate to all forms of growth within and surrounding a town, and to the whole of its area whether built upon or not. In that sense we have hardly begun to plan towns in this country.

When we plan a town we must have regard in our studies to conditions, tendencies, relations, and needs in the following order:—

1. *Industrial Development.*—Whether it be manufacturing, distributing, agricultural, governmental, educational, or recreational.
2. *Housing Conditions.*—Including control of the surroundings of dwellings.
3. *Public Services.*—Necessary to provide facilities for successful industry and wholesale living conditions, comprising transportation by rail and water, means of communication by road, water supply, drainage, recreation, education, etc.

When we place any service such as road communication first, we get the wrong perspective, although no part of a plan can be prepared without simultaneous study of all the factors in town development.

One of the first duties in preparing a plan of a town is to make a survey of its industries and economic conditions. In making and advising regarding surveys of this kind on both sides of the Atlantic, I have found it of importance to ascertain the views of manufacturers and business men. It is interesting to note the different attitudes of leaders of industry, especially as between those in America and England. American manufacturers are thoroughly alive to the value of town planning in promoting industrial efficiency. It was the Commercial Club of Chicago that promoted the plan of Chicago at a cost of £100,000 raised by private subscriptions. One of the greatest Chambers of Commerce in the world in the industrial city of Cleveland devotes a large part of its funds and organization to town planning. In three American cities that I was engaged in planning last year the work was begun at the instigation of the Chambers of Commerce, all largely manned by manufacturers. In England the manufacturer up till now has looked with indifference, if not with suspicion, on town planning, whether because of the limited scope of our town-planning operations, or because of his lack of appreciation of its advantages I cannot say. At any rate, I find that manufacturers themselves organize the making of a survey into their industries in the States, and here they are prone to question its value and to look somewhat askance at any questions addressed to them, although when the matter is explained to them they show a willingness to assist.

Some indication of the scope of an investigation may be given by summarizing a few points that influence a manufacturer in selecting a factory site, according to the opinion of manufacturers who have been approached in towns in England, Canada, and the United States. These are :—

1. Comparatively level sites with good access by road where works can be economically built and good facilities for distribution can be obtained.
2. Low priced land, so that sufficient can be acquired at reasonable cost to permit of the best arrangement of buildings and room for future expansion.
3. Access to railways for certain industries with room and gradients suitable for the most efficient and economical arrangement of sidings; or access to good arterial highways for light industries, dependent on motor haulage, for ingoing and outgoing traffic.
4. Availability of tracts of land of varied character to suit different classes of industry.
5. Proximity to gas and electrical works so as to save distribution costs.
6. Facilities to reduce cost of handling and cartage to the utmost extent practicable.
7. Co-operative action by local authorities under expert advice in providing suitable sites and facilities for industries, including the development of modern methods of transportation by water, rail, and road, and the necessary terminal arrangements.
8. Proximity or easy access to dwellings, so as to save waste of time and money in travelling of workers to and from works.
9. Supply of skilled labour.
10. Suitable atmospheric conditions.

In one form or another and in varying degree these matters have a connection with the plan of a town. Our present slapdash methods of urban growth hamper manufacturers in many directions in trying to obtain the facilities needed to carry on industry efficiently. Much of the fault lies in not having our towns planned as great industrial plants, on which full consideration is given to the needs of industrial development outside as well as within the doors of the factory.

The Manchester region is the most extensive manufacturing region in the world. That is a thing to be proud of. Is it also the healthiest and best equipped industrially ? That would be a better thing to say. While it comprises a series of separate towns with Manchester as the centre, it is really one great metropolitan region in which no part or separate corporate area is without relationship to, and dependent on, the others. Each town in the region may be described as a separate unit in one great industrial plant.

It is well that this great centre should recognize its family connections with the group of manufacturing towns that surround it. Speaking of industrial Lancashire, an American has stated that Oldham is the true type, not Manchester. Does this type need a town plan ? A commentator describes Oldham as a place with a modest town hall and a wretched and depressing station. But the people of Oldham, if modest of their public buildings, love beauty and appreciate education. They love flowers—grown in the South of France—and they respect themselves enough to have a vigorous and efficient corporation. But there is ugliness in Oldham that is unnecessary, and enterprise in Oldham that is going to waste because of the need of co-ordinated effort to plan for the future.

My final word is that if any proof is needed of the importance of town planning as an aid to industrial efficiency, it is to be had in this part of the country where a remarkably virile, highly educated and progressive people, entirely dependent for its being and well-being on the successful development of its industries, and the efficiency of its means of distribution, is still drifting along in the grip of avoidable evils of congestion, traffic disorganization, crowded and mean streets, unsightly surroundings to their homes, and the consequent weakening of the whole industrial fabric. There is no place in the world where the combination of science and practice has been so closely knit in developing its industries, and yet where there has been any greater divorce between science and practice in the matter of town development. Individually there is a passion in this part of the country for those forms of beauty that are not divorced from utility; for a high degree of orderliness and tidiness that is instinctive in its womanhood; for corporate dignity, native patriotism, and leadership in industry. If the time arrives when these individual traits can be made a collective passion, then we shall have a new Manchester School—still true to its ideals of personal liberty—but true also to new ideals of public well-being and efficiency in town development, that shall point the way to industrial progress in the future.

Garden Cities and Satellite Towns

Letchworth and Welwyn

By Ebenezer Howard

IN 1898 I published "To-morrow—a Peaceful Path to Real Reform," afterwards republished as "Garden Cities of To-morrow."

The primary object of that book was to show how the twin evils of the overcrowded city and the depopulated countryside—evils long recognized and universally deplored—could be gradually dealt with, and at length entirely removed by a bold, yet extremely simple and practical policy of reconstruction, which could be started upon in the first instance by a small section of the community. The plan suggested was the building of an entirely new and well-planned town—industrial, residential, and agricultural—a town which, as it developed, would combine more and more fully the advantages of town and country life, and would, like a magnet, draw the people towards it. And I suggested that this work should be started upon without waiting for Governmental aid, as one knows how seldom can the State be induced to support any measure, however obviously practical and valuable, until much pioneer work has been successfully accomplished and a demand for national action on a large scale created.

The Garden City Association in 1902, under the chairmanship of the late Mr. Ralph Neville, K.C. (afterwards a judge of the High Court), took steps which resulted in the formation in 1903 of the First Garden City Company, and the acquisition of 3,818 acres of land in Hertfordshire (about twelve miles north-east of Hitchin Junction) on which to build the new town. The total population on that area was then about 250, of whom 75 lived in the decaying village of Letchworth.

The cost of the land (which was in the hands of about fourteen different owners) was £151,000, or about £40 an acre, including timber and buildings.

Great possibilities at once arose from this welding together of fourteen small properties into a single large one, acquired by a company formed to render the community a great public service, and which limited its dividends to 3 per cent. cumulative, all profits beyond those to be expended for the benefit of the town or its inhabitants. For the directors acquired as landowners powers to do many things for the development of the town, some of which even a great city like Manchester does not possess; for while a private landowner can do with his property anything that is not contrary to law or injurious to others, a local authority may only do what it is by Statute expressly empowered to do, and is frequently greatly hampered by the ownership of much of its area being in the hands of private individuals.

Armed, then, with very wide powers, extending over an area of six square miles, and with the great advantage of a practically "clean sheet," the First Garden City Company, without the delay and expense which would be caused by seeking Parliamentary powers, at once proceeded to do some very important and practical things.

First, under the advice of Messrs. Parker and Unwin, a town plan was prepared, a step which the Town Planning Act, passed six years afterwards, expressed by implication its strong approval of, while the appointment of Mr. Raymond Unwin by the Ministry of Health as their chief site-planning architect, shows that the company had been wise in its selection of an expert. I am also proud to recall that Mr. Thomas Adams, the first President of the Town Planning Institute, gained much practical knowledge of land development as manager of the First Garden City.

The new town of Letchworth was to be "planned for industry and healthy living," and therefore the first question to be settled was as to the most suitable site for the erection of factories and workshops.

For this purpose our town-planners

wisely selected an area of about 150 acres, approximately level towards the east of the town, and on the north and south sides of the Great Northern Railway, to which sidings could be readily laid.

And now there have been established, and chiefly on that site, more than fifty factories and workshops, including various large engineering works, steam laundry, motor works, geyser works, printing and binding works, works for the manufacture of scientific instruments, lace and embroidery, bi-focal lenses, corsets, agricultural engineering machines, furniture, silk weaving, etc., etc.

On this factory area there are—with the exception of two or three caretaker's cottages—no dwelling-houses; and the industries are to a surprisingly small extent ever in unpleasant evidence.

Under the company's land-owning powers a drainage system (since taken over by the U.D.C. of Letchworth) has been well carried out, also waterworks, gasworks, electric power works. Indeed, the company is supplying the town of Baldock with pure water in bulk—thus meeting a crying need of a neighbour—and will shortly be supplying it with electricity.

Briefly, then, in the centre of the wilderness of 1903, there has arisen an extremely healthy, airy, clean, well-planned, beautiful, and steadily growing town of 11,000 inhabitants—with varied industries and a large agricultural belt. Thus has been quite literally realized the dream of Ruskin : for "from any part of the city fresh air and sight of far horizon is reachable in a few minutes' walk."

There is no overcrowding of houses upon the land—never more than twelve cottages per acre, thus allowing of good gardens. There are numerous playing fields and open spaces within the town, an open-air swimming-bath, boys', girls', and other clubs, schools, halls, churches, museum, cinema, cottage hospital, etc.

Now, certainly up to the close of the war I had never expected to take any active part in the raising of a second Garden City. However, about three years ago opportunities arose in a very astonishing fashion, which made possible the acquisition of a truly splendid and most suitable site twenty-one miles from London, which I had often to cross by train, and viewed with longing eyes on my way to and from Letchworth.

The Welwyn Garden City Estate embraces an area of 2,378 acres, and is the freehold property of the Welwyn Garden City Company. The property is from 250 ft. to 410 ft. above the sea level. There is an abundance of gravel and sand. Much of the scenery is extremely beautiful. The River Lea is near the southern boundary of the estate, and the River Mimram passes through the northern portion, the Mimram Valley being one of the beauty spots of Hertfordshire. The estate is intersected by the Great Northern Railway main line, and two branch lines (to the west to Luton and Dunstable—to the east to Hertford) have their physical junctions practically in the centre of the estate, near which the Great Northern Railway Company have built a temporary station, and have purchased 73 acres of land for a permanent station, sidings, etc.

It is intended to develop some 120 acres of land which lies to the east of the railway for industrial purposes, and Messrs. Murray, confectioners, of London, have taken a lease of ten acres, Messrs. Pease & Co., engineers, a number of acres, and have commenced operations. A small town of 1,300 has grown up, the population of the estate when purchased being 328. Modern sewage works have been constructed and sewers laid. The town is supplied with the company's water, with gas from the Welwyn and Hatfield Gas Companies, and with electricity from the North Metropolitan Company.

Two hundred and forty-three houses have been erected, and 101 are in course of erection. The County Council of Hertfordshire has purchased 2½ acres for a school, which is being erected. A restaurant near the station, and in very picturesque surroundings, has been opened, as well as a large general store. The New Town Trust Limited, which is working in close co-operation with the company, has been granted a lease of a considerable part of the agricultural belt, and is providing the town with a supply of Grade "A" milk, and with other agricultural products.

The chief difficulty that is experienced is in the provision of suitable cottages for workers. Fifty cottages of this class are now being erected by the Welwyn Rural District Council, and will shortly be completed. One hundred more will be started upon by the R.D.C. when the rate of interest is reduced to 5 per cent. If this difficulty of housing workers under really good conditions can be overcome, then we should quickly attract to the town from London or other overcrowded centres all the industries needed for the harmonious development of our town, and should thus help the nation to work in various ways towards the best solution of the housing problem, as well as many others with which it is closely associated.

The longer the housing problem remains unsolved, the more costly will it be to solve it. Let it not be said that the nation—that is, you and I—cannot afford that the workers should be housed properly. On the contrary, we cannot afford that the workers of this country should be enfeebled and discouraged and demoralized by living under the conditions in which millions of the people of these islands live. I know that there is a ridiculous notion abroad, held by people in authority, that this is not the time for spending, but for saving. On the other hand, I affirm that the truest method of saving is to spend wisely, and this is the more necessary after years of expenditure in that most wasteful of all forms of spending—War.

Progress of Peacehaven

Peacehaven, which was an area of almost waste land but two years ago, and is now on the way to become a garden city by the sea, has celebrated the opening of its first hotel. Situated on the cliffs between Newhaven and Rottingdean, this new town already boasts some 6,000 freehold plot owners, and more than 250 houses of the bungalow type have been actually completed. The Peacehaven Hotel, which is quite near the sea, has been built with a view to comfort, and is surrounded by well laid-out grounds. A large number of visitors went to Peacehaven as the guests of the South Coast Land and Resort Company, Ltd., and were entertained at a luncheon presided over by Lord Teynham, chairman of the hotel directors, who said the place possessed a building company, a water company, and electric light and power company, several shops, and a post office, and there were the beginnings of a church and a Nonconformist chapel.

Mr. C. W. Neville, the founder of Peacehaven, said there were only two buildings on the site a couple of years ago, and today, in addition to nearly 300 houses, they had eleven miles of water main, and a pumping plant to supply a town of 10,000 people was awaiting installation. Before another six months they hoped to have the place lighted throughout with electricity. Plans for a railway line connecting Peacehaven with London would be placed before the Railway Commissioners very soon, and it was hoped that work on the line would be commenced before long.

Coming Events

Thursday, October 26.

Institution of Mechanical Engineers.—"The Importance of Testing Materials for Manufacturing Purposes." By Mr. P. J. Worsley. North-West Branch : Annual Dinner.

Saturday, October 28.

A. and S.A.P.U., Metropolitan Branch. Visit to Royal Naval College and Greenwich Hospital. Mr. T. C. Agutter, F.R.I.B.A., architect to the college, will conduct the party.

Wednesday, November 1.

Glasgow Chapter of the Incorporation of Architects in Scotland.—Smoking Concert.

"The Cathedral of Rheims"

Sir Aston Webb will preside at the lecture to be given at the R.I.B.A. on Thursday, November 16, at 8.30 p.m., by Sir Isambard Owen, on "The Cathedral of Rheims." Sir Isambard made a study of the cathedral during several years before the war, and has a fine set of lantern slides illustrating it. The hall is being lent for the occasion, and a collection will be made on behalf of the British Empire Fund towards the restoration of this, the sister church of our Westminster Abbey, which, but for the sacrifices made on the soil of France by all the allies, might have been to-day in the same sad condition. The Society for the Protection of Ancient Buildings is giving its help in organizing the appeal, as it approves the lines on which the repairs will be carried out by the French Government, which has offered to place a tablet in that portion of the church reconstructed by the offerings of our people as a memorial to our fallen and a tribute of affection for France. The patron of the fund is H.M. Queen Alexandra; the president is the Duke of Portland; the chairman, the Lord Mayor of London; and amongst the vice-presidents are the French Ambassador in London and the British Ambassador in Paris.

Contemporary Art

Paintings and Drawings at the Independent Gallery

TAKING the more charitable view that it was perpetrated under pressure of time, an art critic of a creditable evening paper thought it fit the other day to pour upon this exhibition the kind of low and obvious fun which is pretty sure—wherever the paintings submitted nonplus or make no easy appeal—to draw the laugh of the overwhelming multitude.

Now, that man was unfortunate, because his criticism, or, rather, his partiality to the "safe" and fashionable painting, as compared with the painting of sincere artists (the sort of painting necessarily modern then), betrayed his bewildered senses and also a judgment incapable of formulating without the help of some outside and more authoritative mind. And so he poured fun, dull and mirthless, on a good and upstanding lot of oils and water-colours.

It may not have all been grand and reproachless. Some may have been garish, and, perhaps, a little gaunt and self-conscious. Too much puritanism may have been indulged in by some of the more wayward artists, but taking it as a whole this exhibition at the Independent Gallery, in Grafton Street, is a brave and sincere show, and it is doing a disservice to the cause of art to scoff and question and gurgle. Far better live an æsthetic sensation.

So much for a digression rendered necessary by this increasing tendency in certain quarters to prejudge and misguide and misnome "bolshie" and "futurist" anything beyond Sir William Orpen or A. J. Munnings.

As a matter of fact, it is probably true that many exhibits shown at the Independent Gallery are not very pleasant. An unwonted asperity of presentation is here and there discernible: many artists seem to concentrate so much upon the particular emotions under which they labour at the time, that a kind of unseemly and visible effort to be barely articulate creeps in their work, which is to that extent marred. But, of course, one does not, one cannot, know for certain at first, and many a picture heartily disliked has, on successive occasions, caused one's judgment to veer round to a truer and pleasanter appreciation. This applies to some oil paintings by Duncan Grant, especially the one depicting the "Open Window," and by that excellent and sturdy artist, F. J. Porter. Mr. F. J. Porter, let it be known, is at his best in these typical East Anglian landscapes, which he now tackles with such relish. And the same feeling is again experienced when confronting the fearless "Nude" of Vanessa Bell. It shows a heavily-framed female figure. The naked lady is seated, and rests her right arm across her thighs. The left arm is drawn back over the chair, with the deftly-painted fingers almost touching her large and round breasts, one of which, by being planted somewhat higher than the other, gives even more rhythm to an already well-balanced piece of drawing. The head is happily poised, and the whole vigorously painted. There is no denying here a sane and clear vision, nor its transcription in robust terms. Many will consider it better than Mr. Roger Fry's "Nude" (28), although that, too, is a finished and honest piece of painting.

The drawings are very interesting. Most of them are, no doubt, studies for larger things to come, but they do afford illuminating glimpses into the methods of our younger painters, and are a key to some of their intriguing secrets.

"London and Elsewhere." Water-colours by Barry Pittar, at the Fine Art Society, New Bond Street

Whatever his shortcomings, no one can charge Mr. Pittar with a lack of enthusiasm for vast and ever-changing London. Mr. Pittar wields the water-colour brush with easy grace and alacrity. Like most sustained series of paintings, his have their ups and downs. A good many ups, a few downs. The larger water-colours are downs, as a whole; it is so difficult to keep the interest going smoothly in a large water-colour; the sense of unity is soon lost unless one is a Cotman, a Turner, or a Donnington. If one isn't, incidentals allow themselves to obtrude and be singled out, and then off goes that sense of unity and its concomitant sense of lyricism or tragedy. Here "St. Martin-in-the-Fields" (15), "St. Mary-le-Strand" (3), "The Law Courts" (22) especially bear witness to this truism. In all of them Mr. Pittar fairly slaps on his washes: biff . . . and here goes a column; biff . . . and here again goes a cab, or some figurant. "St. Clement Danes" (26) is the more glaring instance of this insistent and hardy method. That the more polished manner suits him very well is evidenced by those two charming little creations: "Charing Cross by Night" (17), and "Piccadilly by Night" (21). These, as a fact, are pastels heightened with touches of water-colours to give them more vim. Another kind, light and airy, is that exemplified in "Barges, Chelsea" (5), where river and sky are washed on very lightly. A departure into more creative regions is brought to a fairly successful issue in "The Shower Bath" (13), where we espy with a certain amount of surprise various fair and naked ladies disporting themselves in the shallow and playful waters of Trafalgar Square fountains, those very fountains made the venue for countless generations of children when summer comes. But Mr. Pittar, in spite of all the water and all the artificial light which he showers upon the back of those daring ladies, does not bring off his refreshing surprise with the "aplomb," or spontaneous geniality, which Sims brings off in his. But it is, nevertheless, jolly and laudable. . . .

At the same gallery, scattered in two or three rooms, is an "Autumn" exhibition of paintings and drawings by leading artists. It could equally be called "Sale of Remnants by Old-established Favourites." They are all excellent in their own way. Tom Mostyn, W. G. Robb, Archibald Barnes, Lamorna Birch, Brangwyn, Walcot, Arnesby Brown . . . Frank Brangwyn's "Albi" and William Walcot's "Palace Pandolfini, Florence," are certainly rather superb. They are in those artists' characteristic and dashing manner. Mr. Russell Flint is also on view, at his surest and in his most aggravating mood. But over and above all these reigns the fatal spell of Anecdotes . . . told for their own sake, or for the sake of achieving an apparently difficult technical triumph.

G. HOLT.

List of Competitions Open

Date of Delivery.	Competition.
Oct. 31	Essay Competition. "The True Function of the Technical Assistant in the Building Industry." Prize £5 5 0. Essays to the Secretary, Architects' & Surveyors' Assistants. Professional Union, 36 Victoria St., S.W. 1.
Nov. 1	Labour-saving Bungalows. Prizes of £300, £125, and £75 are offered by "The Daily Mail." Apply to "Ideal Bungalow," "Daily Mail," 130 Fleet Street, London, E.C. 4, by above date.
Nov. 1	New Building for the "Chicago Tribune." Prizes total 100,000 dollars. Applications had to be sent to "Chicago Tribune," 5 Rue Lamartine, Paris, by Aug. 1.
Dec. 1	Pavilion to be erected in the Eastern Esplanade Gardens, Ryde, for the Town Council. Cost to be from £8,000 to £10,000. Premiums £50 to the successful competitor if the scheme is not carried out, otherwise he will be appointed at an inclusive sum of £300 to carry out the work; and £30 and £20 to competitors placed second and third respectively. Apply for site plans, together with conditions and instructions to Mr. B. F. Holness, M.Inst.M.&Cy.E., Borough Surveyor, Ryde.
Jan. 15	Hospital for a typical small community in America. Competition open to all Architects. Premiums $500, $300, and $200. Apply The Modern Hospital Publishing Company, Inc., 22 E. Ontario Street, Chicago, Ill. Closing date for applications, November 15.
March 31	War Memorial for Port Said, Egypt, to the memory of the soldiers of the Australian and New Zealand Forces who fell in Egypt, Palestine, and Syria during 1916, 1917, and 1918. Premiums: 250 guineas, 100 guineas, and 50 guineas. Apply High Commissioner for Australia, Australia House, Strand, W.C.
No Date	Designs and Estimates for a Public Hall and Baths, etc., to be erected at Lytham. Premiums of 100, 50, and 25 guineas will be awarded under the advice of Mr. A. W. S. Cross, M.A., Vice-President of the R.I.B.A., as professional Assessor. Apply Mr. Chas. A. Myers, Clerk to the Council, Council Offices, Lytham. Deposit £1 1s.
No Date	Bournemouth. Plans for a pavilion to cost £100,000 at Pier Approach. Premiums £300, £200, and £100. Apply Municipal Offices, Bournemouth.
No Date	War Memorial at Birkenhead. Cost not to exceed £4,000. Premium 75 guineas. Assessor Major Gilbert Fraser, M.C., F.R.I.B.A. Apply Town Clerk, Birkenhead. The competition is open to all architects and sculptors of Birkenhead, Liverpool, and Chester only.

Birmingham University War Memorial

A mural memorial has been placed in the Birmingham University vestibule at Edgbaston to commemorate the 170 former members of the staff and students who fell in the war. The memorial is from the designs of Sir Aston Webb, P.R.A., the architect of the new University buildings, and has been executed by Messrs. Farmer and Brindley, of London, and Mr. T. Rowbotham, of Birmingham. It has been executed in light yellow marble, and takes the form of three large panels. The centre one, surmounted by the arms of the University, in true heraldic colours, bears the following dedicatory inscription in black letters: "In grateful memory and to the inspiring example of her sons who gave their lives in the Great War, 1914–1918." Then follow, in red lettering on the three panels, the names in alphabetical order of the men who fell in the war.

The Week's News

Housing at Grimsby.

New houses for the Grimsby Corporation have been tendered for at £344 each.

Super Cinema for Hull.

Work has begun on the super cinema, to be built at the corner of Morrill Street, Hull.

New Works for Hull.

Works are to be erected on the Saltend Estate, Hull, for the manufacture on a large scale of alcohol for power and industrial purposes.

Proposed Pavilion for Eastbourne.

The Eastbourne Pier Company propose to erect a large pavilion at the shore end of the pier. The scheme will involve many thousands of pounds.

Birtley War Memorial.

At Birtley, near Newcastle-upon-Tyne, a cenotaph is to be erected from the designs of Messrs. Davidson and Sons, of Gosforth, architects.

Birmingham Canal Widening.

It is proposed to widen and deepen the Birmingham-Worcester Canal and to reconstruct and enlarge many of the locks at an estimated cost of £1,500,000.

Proposed War Memorial for Manchester.

The Lord Mayor of Manchester is inviting subscriptions towards the cost of erecting a war memorial. The cost is estimated at £10,000.

Rebuilding Lambeth Bridge.

It was stated at the last meeting of the London County Council that financial and other considerations had prevented action in connection with the rebuilding of Lambeth Bridge.

R.I.B.A. Exhibition of Architecture.

It has been found necessary to postpone until further notice the Exhibition of British Architecture which was to have been opened on November 1 in the Galleries of the R.I.B.A.

Organ for Eton School.

An appeal is being made for £1,000 to erect in the Memorial Hall at Eton School the Rotterdam organ presented to the school in 1914 by Mr. H. E. Luxmoore.

New Cafe for Newcastle.

Messrs. Dixon and Bell, of Newcastle-on-Tyne, are the architects for a new café and billiard saloon in that city. The new premises are to be built above the Northumberland Street branch of the National Provincial Bank of England.

New Houses for Doncaster.

The National Housing and Town Planning Trust have begun the erection of 183 workmen's houses near Bullcroft Pit, Doncaster, A similar number are to be commenced at Highfields by the same company.

Masonic Temple for Birmingham.

An appeal is being made to the masonic lodges of Warwickshire for £150,000 to erect a masonic temple in Birmingham. A site has been secured in Broad Street. The temple will form the memorial to the Freemasons of Warwickshire who fell in the war.

New Theatre for London.

A new theatre is to be built shortly in Drury Lane. We understand that the site adjoins "Old Drury," and that plans are in process of preparation for an early start of building operations.

More Houses for Birmingham.

At Birmingham it is proposed to form a company of public men to build 600 houses. Mr. L. H. Collier, of Collier and Keyte, architects, is negotiating with the Corporation for the purchase of a large tract of land at Billesley Common.

Students' Exhibition at Leicester.

Successful designs in connection with the R.I.B.A. special war examinations are included in an exhibition of drawings by students of the Leicester School of Arts and Crafts, which has been opened to the public.

Sir Thomas Brock's Estate.

Sir Thomas Brock, R.A., the sculptor, whose death was recorded in our issue for August 30, left £83,555. He was responsible for the Queen Victoria Memorial facing Buckingham Palace, the All-India memorial to King Edward at Delhi, and for a large number of other public monuments.

New Dock for Southampton.

A new floating dock, to accommodate the largest vessels in the world, and having a lifting capacity of 60,000 tons, is to be built at Southampton for the London and South Western Railway. The contract, which involves about £1,000,000, has been placed with Sir W. G. Armstrong, Whitworth & Co., of Newcastle.

Regent Street Theatre.

A new theatre is to be built in Regent Street at the corner of Regent Street and Jermyn Street. A Crown lease of this site has been acquired by a syndicate headed by Mr. Benjamin Hicks, of Apollo Films, Ltd., and Mr. Wychkoff, an American with large theatrical interests in the United States.

Restoration of St. Paul's.

Sir William Treloar is raising a "Ludgate Fund" towards the cost of restoring St. Paul's Cathedral, and has forwarded to Canon Alexander a cheque for £2,245 12s. Messrs. Nelson, of Stockton, near Rugby, have offered a gift of thirty tons of best Portland cement, which has been accepted by the Cathedral authorities.

Architects' Bursaries and Scholarships.

Out of the money bequeathed by the late Sir R. Rowand Anderson, the Council of the Incorporation of Architects in Scotland have decided to set aside £5,000 for education purposes. The Council have also decided to open a subscription list for the structural repairs fund in connection with St. Paul's Cathedral.

New Bank Premises for Doncaster.

Work is in progress on the demolition of existing buildings on a site at the junction of High Street and Priory Place, Doncaster, on which it is proposed to erect new premises for the National Provincial and Union Bank of England, Ltd. The bank has been designed by Mr. F. R. C. Palmer, F.R.I.B.A. The general contractors are Messrs. H. Arnold and Son, of Doncaster.

The Condition of a Westminster Church.

An appeal is being made for £1,500 towards the restoration of Christ Church, Westminster. Grants have been made of £300 and £200 by the Bishop of London and the Ecclesiastical Commissioners respectively towards the cost of the work. Contributions should be sent to Mr. G. A. Hall, at 1 Victoria Street, Westminster, or to the vicar, the Rev. P. T. R. Kirk, at the vicarage.

North-Eastern Railway War Memorial.

The erection of the North-Eastern Company's War Memorial at York is to be proceeded with. The original design for the memorial involved some interference with the mound of the city walls. Sir Edwin Lutyens has produced a modified plan for the memorial on the same site adjoining the old passenger station, which will avoid any encroachment upon the mound. The approval of H.M. Office of Works and the York Corporation has been obtained, and it is hoped that the memorial will be completed by June 1923.

Painters' Exhibition at Harrogate.

At the opening of the Painters' and Decorators' Exhibition at Harrogate Mr. J. E. Butterworth was presented with a writing-desk and Mrs. Butterworth with a silver tea service. The amount required was over-subscribed, and the balance is to be devoted to an annual gift known as the Butterworth Prize, awarded for papers on the business side of the craft. Mr. Butterworth was the chief technical adviser on behalf of the painting trade to the British employers' delegate appointed by the Government to enquire into the use of white lead in paint.

York Minster Windows.

Good progress is being made with the work of restoring the stained glass of York Minster. The east window is said to be the largest area of stained glass in the country, being the size of a tennis court, and it does not contain a section of glass as large as the top of a tumbler, and most of them are the size of a five-shilling piece.

An Exhibition of Furniture.

Mr. Maurier S. R. Adams has opened a reception studio at 67a Baker Street, W., for the exhibition of some of the furniture executed from his designs on traditional lines. The selection on view includes some plain pieces suitable for a cottage style of house, old or new, and some are elaborated with very choice veneers and inlay work. The premises till lately were used for St. Dunstan's Gift Exhibitions, now located in Regent Street. The entrance to 67a Baker Street is the first door in Dorset Street. The gallery is not far from Messrs. Selfridge's new building in Baker Street.

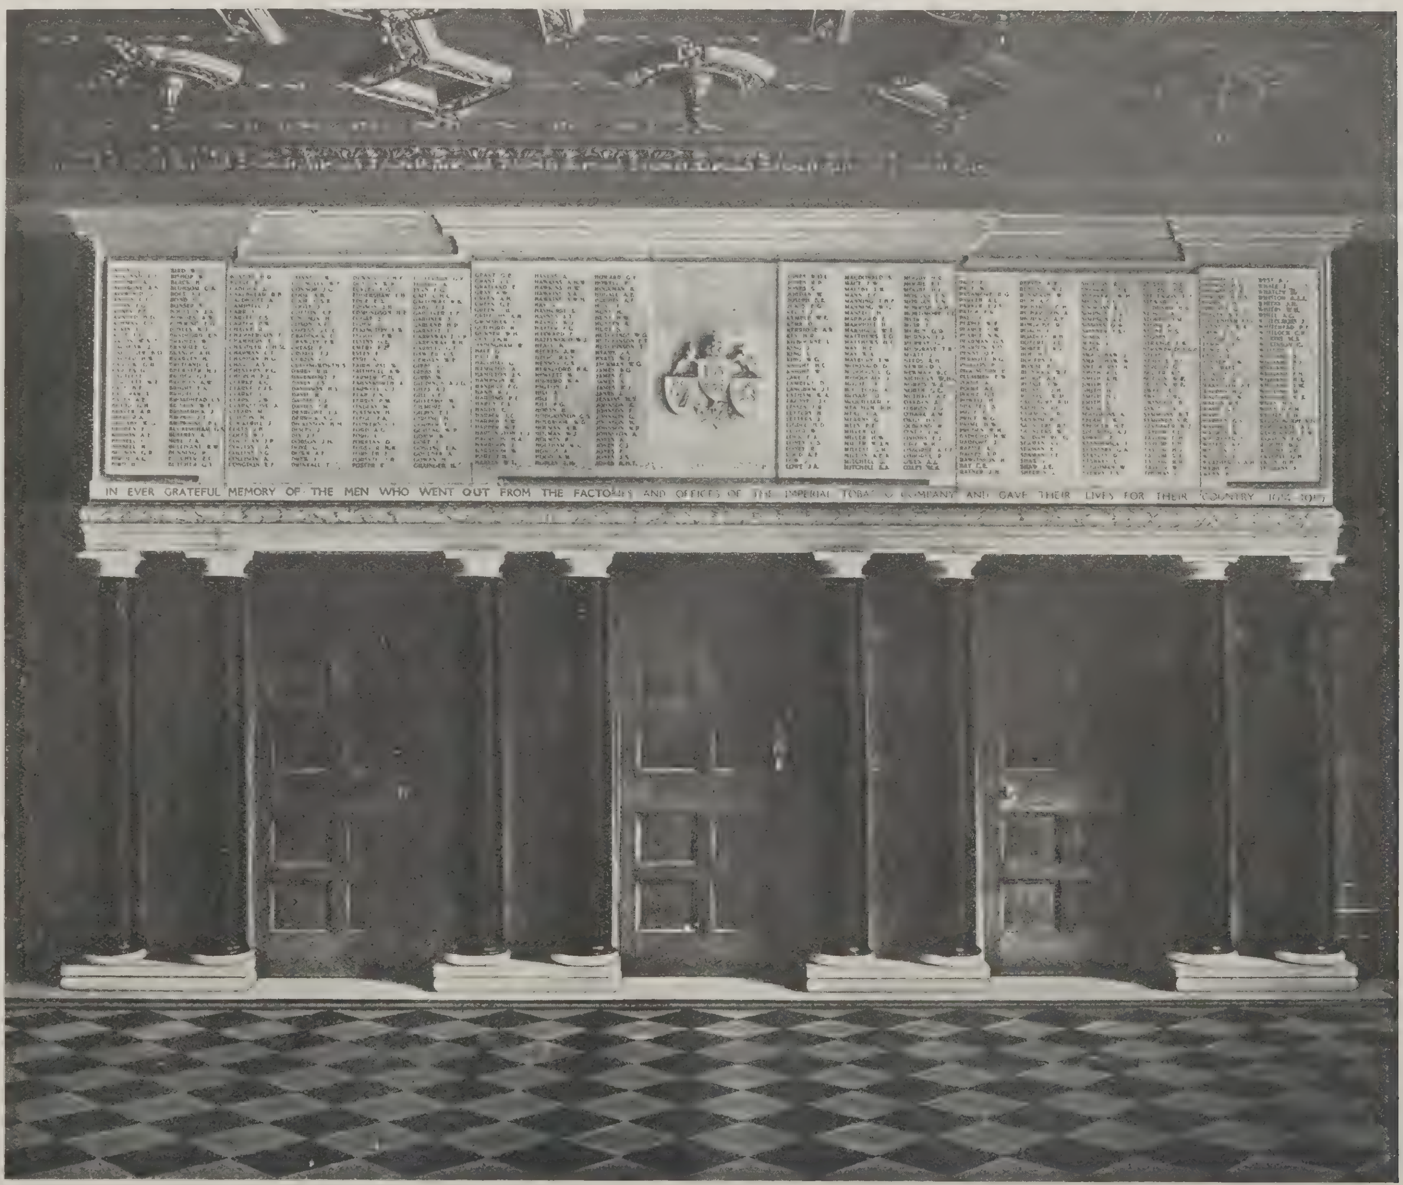
War Memorials. 30.—Screen in the Offices of the Imperial Tobacco Company, Bristol

Sir Edwin L. Lutyens, R.A., F.R.I.B.A., Architect



IN EVER GRATEFUL MEMORY OF THE MEN WHO WENT OUT FROM THE FACTORIES AND OFFICES OF THE IMPERIAL TOBACCO COMPANY AND GAVE THEIR LIVES FOR THEIR COUNTRY

This Memorial has been erected to the memory of the men of the factories and the offices of the Imperial Tobacco Company who gave their lives in the war. Sir Edwin Lutyens was responsible for the design of the screen and the columns, the panelling in between the latter already being in existence. Statuary marble has been used for the screen and black marble for the columns.

THE

ARCHITECTS' JOURNAL

27-29 Tothill Street, Westminster, S.W.1.

Wednesday, November 1, 1922 **Volume LVI. No. 1452**

Sir Edwin Lutyens and the London University

THE controversy over a site for the London University has recently been given a certain picturesque turn by an article that appeared in the "English Review" from the pen of no less an interesting personality than Sir Edwin Lutyens, supporting a proposal for a site at Millbank.

It may be assumed that every architect will respect and have due regard for the opinion of so eminent an artist as Sir Edwin, but it is conceivable that as "an amateur," if not "a child in finance," and as one who has apparently given little thought to the growth of University Departments, his purely architectural predilections may have led him to be carried away by influences superficially dramatic and not very real.

His contribution to the question is valuable, however, as emphasizing the importance of considering the purely spectacular value of a site.

On the other hand, we have the two lectures of the Provost of University College, Sir Gregory Foster, whose arguments in favour of the Bloomsbury site on the grounds of efficiency and convenience are absolutely convincing.

Sir Gregory points out, what Sir Edwin Lutyens and, indeed, most of the general public, appear to be quite ignorant of, that a London University is not a corporate body that can be enclosed in a single carcase. It is a great community spread over the whole area of Greater London, and consists of some thirty-six colleges, already covering some 212 acres, and teaching no less than 21,000 students. Moreover, there are, in addition, halls of residence and playing fields, together covering a grand total of 434½ acres.

The Bloomsbury site of 11½ acres was offered by the Government and accepted by the Senate for further developments, the immediate intention being, as funds permitted, to erect there accommodation for the Senate House, now temporarily located at the Imperial Institute. It may be assumed that many more acres would be available for future development at Bloomsbury when required.

Could the Senate House at Cambridge be described as the University of Cambridge? As well might a Senate House and dependent buildings erected on the Embankment truly represent the London University.

The Universities in our provincial towns, and, indeed, in many American and German towns, are collections of buildings more or less grouped, and as groups have a dramatic appeal. If all the colleges that make up the London University could be scrapped and re-erected on a single central site along the river front covering some 400 acres, they would certainly make an astonishing panorama. But they are where they are, and this cannot be. The best we can do is to concentrate attention on enlarging and developing the nucleus, University College, situated at one end of an available site, which is terminated at the other end by that centre of learning, that world-famed library and greatest of archæological collections—the British Museum.

It is obvious to those who, like Sir Gregory Foster, are intimately acquainted with the ramification and the destiny of the London University that it cannot be adequately represented by any single building. At best it can only appear to the general public as a group of some of the more important buildings. The real question to be decided therefore is as to whether a site for a Senate House, Offices, and perhaps a few ancillary buildings, should be chosen in an eminently picturesque, though unquestionably inconvenient, and perhaps experimental, position; instead of a site which by tradition and actual usage has already become to the general public a great centre of learning, a "Latin quarter," and a "Sorbonne." Admittedly, it is not alone on the grounds of convenience that the decision should be made. The purely dramatic appeal might well lay claim to be a deciding factor in a final choice. It is really a question of the depth and reality of the dramatic appeal.

Needless to say, it is only in the deep-rooted foundations, upon which rest tradition and usage, that a great artistic pile of intrinsic worth, as opposed to an artistic fantasy, can be reared. Moreover, any huge building or architectured façade would "look well" on the Embankment. Although the right place for a County Hall, it is no place for the heart of the University of London, severed as it would be from its body.

The County Hall, like many other great buildings that future generations may erect on the river front, has no past, no tradition, and no ancestral domain; and though a University group of buildings at Bloomsbury cannot be reflected in a river, they can, if designed with understanding and imagination, form a more real architectural achievement, because on this site they would be expressive of a great sociological fact. Moreover, adjoining the British Museum they will, let us say, not be hidden, but enhanced by a building of so great renown.

But, let there be no misunderstanding, whether the buildings be erected at Millbank or Bloomsbury, they will be a hopeless confusion unless as an organic growth they are made to develop in accordance with the dictates of a well-considered plan.

Notes and Comments

The Opening Meeting of the R.I.B.A.

NEXT Monday will bring the inaugural meeting of the R.I.B.A., when the President will deliver the customary *ex cathedra* address. Any mere adventures in electioneering should not deprive a single member of the pleasure of listening to what, if it is up to the President's usual standard, is sure to be a model of polished eloquence. Thoughtless critics have often remarked that halting deliverances of members who take part in the R.I.B.A. debates or other functions compare very unfavourably with the accomplished speaking of American and other visitors. It must be admitted that the contrast is rather marked, but the reason for this is absurdly simple. It is certainly not that the Americans have a greater native gift for public speaking, but because they put in more practice at it. The pains that our American cousins take in preparing their speeches would astonish the average Briton, who in this matter is wont to rely on nature rather than on art, with the inevitable result that he cuts a rather feeble figure in debate, and is lucky to avert catastrophe. On the other hand, the unprepared speaker is, as a rule, glad "to get it over," whereas the practised speaker is sometimes tempted to air his accomplishment, and to acquire the sorry reputation of a "wind-bag." When that title has been fairly earned, his influence is at an end. A meeting will good-naturedly tolerate an indifferent performer, but will not abide a bore. This fact should encourage the diffident member who has something to say but no skill in saying it, and repress the loquacious person who has nothing to say and says it at enormous length under the mistaken impression that his auditors are as fond of hearing his voice as he is himself. From instances of the latter sort the R.I.B.A. has always been remarkably free; and as far back as one can remember its presidents have all been free from the vice of loquaciousness. As for the present President, his speeches are always excellent models of clearness and conciseness.

The Founder of Bournville

Mr. George Cadbury, who died last week, had very considerable claims to immortality as a philanthropic housing pioneer. In support of this assertion, it is sufficient to remember that he founded and planned the garden village at Bournville, near Birmingham. For the building of this model village he advanced the money at the nominal interest of 2½ per cent., afterwards handing over the property to the Bournville Village Trust. Ultimately—in 1891—the whole property was made over to a trust under the Charity Commissioners, this trust being charged with the duty of devoting the whole of the income to the settlement of other villages on similar lines. Mr. Cadbury took but little part in public affairs, refusing invitations to stand for Parliament, and declining the honours offered him. He was, however, indirectly the originator of the Trade Boards Act, his sometime property, "The Daily News," having organized a sweating exhibition which led to the passing of the Trade Boards Act. But, as we have already intimated, his noblest monument is Bournville garden village, the parent of many.

Road Reform

This year no less a sum than seven millions sterling is being spent on road improvements. In this large sum the chief item is the three million pounds which, it is estimated, the Manchester-Liverpool concrete road will cost; and Lancashire has in hand other extensive schemes of road-making. Plymouth, Portsmouth, Birmingham, and Swansea have also extensive undertakings in hand, or in contemplation; but the most interesting of all the schemes for road improvement is the widening of the existing road between Penzance and Land's End, which will be widened to make it a main road. Holiday-makers will greatly appreciate this improvement, for the present road is much used by charabancs, which at certain points could not possibly pass each other when travelling in opposite directions. A still more interesting point refers to the extreme antiquity of the road, which may have been originally an ancient British trackway of prehistoric origin. It runs past many a group of dolmens or cromlechs, and it may be reasonably conjectured that the excavations for the widening will yield many interesting remains of the ancient Britons.

Holborn and its Fusiliers' Memorial

The memorial to the twenty-two thousand Royal Fusiliers who died in the Great War is to be unveiled next Saturday by the Lord Mayor. At Holborn Bars, one of the City boundaries, Mr. Albert Toft's bronze statue of a Royal Fusilier in full fighting kit is very appropriately placed, for there, obviously, he will speak with the enemy in the gate. Yet there are those who complain that the monument is situated obstructively. It is but mildly obstructive, however, compared with the extreme case of Middle Row, which was a row of small houses blocking the street at the south end of Gray's Inn Lane. Even in 1657 the nuisance was inveterate, Howell noting Middle Row as "a mighty hindrance to Holborn." Architects visiting the new memorial will find it worth while to stroll round in search of other objects of architectural interest—Staple Inn, for example, of which, however, a fair sight cannot for the moment be had, its quaint front being now obscured by scaffolding and screens. Of another interesting building not far from the spot, Sir Walter Besant reminds us, pleasantly, if somewhat promiscuously, that "Hardwick, one of the last of the school which might be connected with Chambers, the Adams, Payne, and other architects of the English Renaissance, was employed to complete Stone Buildings, begun by Sir Robert Taylor before the end of the eighteenth century. Hardwick was at work in 1843, and his initials and a date, 'P.H., 1843,' are on the South gable of the hall." A not unnoteworthy instance of a "signed" building. A record of similar instances would be very welcome.

Honesty and Simplicity

In the course of the election campaign, one great politician has just said of another that "he is honest to the verge of simplicity." This hard saying, we may suppose, was not intended as a compliment, but the distinguished rival against whom it was alleged was sufficiently adroit to accept it at that valuation. To be "honest to the verge of simplicity" is a stingless taunt, unless simplicity is understood as a euphemism for mental feebleness: the historical case in point being that of "Simple Simon." With the moral and political issues involved in this quaint charge we are not at all concerned, but the gibe is not wholly destitute of architectural interest. Now, in building, howsoever it may be in politics, honesty and simplicity are in close partnership. A few politicians may find it convenient to set a limit to honesty by keeping it well away from "the verge of simplicity." Not so the architect. An article of whose creed it is to believe steadfastly in "the frank expression of purpose"—in his building designs at any rate—a thing that the average politician regards with horror and contempt as an indiscretion, if not a downright political crime. Wherefore it is clear that politics and art together can never go. The best that can be done for the present is for the architect to endeavour, by the beauty and truth of his buildings—in which the politician must live—to teach him plainer and straighter ways!

The Architecture of Robert and James Adam

THERE never has been a British architect more successful than Robert Adam. For over thirty years he was continuously occupied with the design and supervision of important works of building and of decoration, applauded by all save his rivals and a few eccentrics like Dr. Johnson and Horace Walpole. An artist of strong and uncommon personality he planned a revolution in the architectural art of his country, and brought that revolution to pass. He persuaded the patrons of architecture that they did not want what they were getting from other men, and that they did want what they were going to get from him.

Inigo Jones started a similar revolution, but did not live to see its effects. Pugin, another revolutionary, was saved by an early death from seeing effects which he would have deplored. Norman Shaw, if a revolutionary, was merely the elected leader of a party. Each of these was a man whose moment found him ready, but to Robert Adam there came no opportunity save that of his own making. He inoculated with discontent a generation contented with the architecture which it possessed, and compelled it into a new adventure.

Independence of mind is a rare quality even among artists, and perhaps it is because it is a necessary quality in a great artist that great artists are few. It is not shown in the breaking of rules, for that may be mere childish defiance, but in the sweeping away of the small rules which limit most men's perceptions, to make room for larger rules which most men have not perceived. This sweeping away will be opposed vehemently by those who dread to expose their minds in the rough weather of big problems, and Robert Adam made more enemies than friends in his profession when he proclaimed himself evangelist of a gospel greater and truer than the established Palladianism of mid-eighteenth century England.

The first half of the eighteenth century was an unhappy time for English architecture. Wren's force was spent; that great man had been ousted from his post by one of the creatures of the Dutch Prince who sat upon the throne. A Dutch architect of genius, Sir John Vanbrugh, had brought all architectural magnificence into popular disrepute by the extravagance of his conceptions. Nicolas Hawksmoor, a native genius, second to none whom England has produced, was led by his association with Vanbrugh into the practice of a style unsympathetic to the mass of his countrymen. The mass of his countrymen, therefore, finding the two great architects of the age determined upon a manner of building which was generally disliked, left them to what employment the Court would give them, and turned to lesser men for the supply of their wants.

These lesser men did the best that was in them, but that best was not very good. National pride may lead us to discriminate nicely between the work of Flitcroft and of Ripley, of James and of Gibbs, finding particular beauties in each, but it were idle to expect concern with such architecture in anybody but a fellow-countryman of its authors. It was an architecture of fear, fear of taboo, based upon the mysterious revelations of that remote deity, Vitruvius, and of his equally mysterious prophet, Palladio. It was a Puritan architecture, of which the highest aim was, not to acquire merit, but to avoid sin.

Robert Adam's disgust with this slave attitude towards an art which to him was a vehicle for free self-expression, was strong and undisguised. In the famous preface to the published collection of his designs, beside claiming, with truth if not with modesty, to have delivered his countrymen from false notions concerning internal decoration, he makes some sensible remarks about freedom in the use of the orders, which must have galled his pedantic contemporaries past bearing. Europe, he said, had been "servilely groaning for these three centuries past" under the load of "mistakes of the first modern Italian artists"—presumably of Alberti and Bramante, the forerunners of Vignola and Palladio. The Renaissance had attempted to catch the spirit of antiquity and had got it wrong. Robert Adam was prepared to get it right.

A return to the antique, at first hand, for inspiration was a common movement among artists of the time. Already

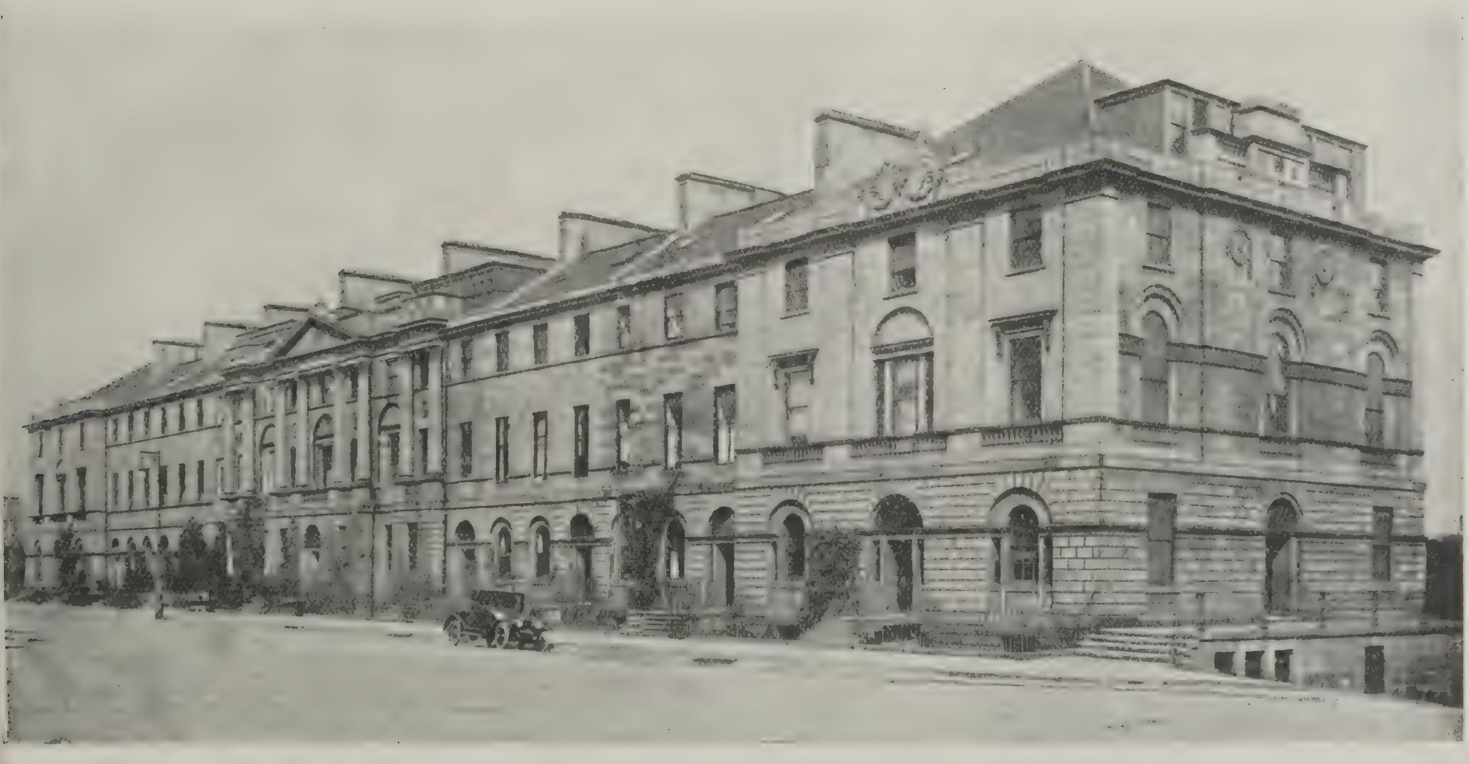
The Architecture of Robert and James Adam. By Arthur J. Bolton, F.S.A., F.R.I.B.A. Two vols. £8 8 o. Country Life.



THE NORTH SIDE OF CHARLOTTE SQUARE, EDINBURGH.

(From "The Architecture of Robert and James Adam.")

Gabriel, Adam's senior by eighteen years, and Soufflot, his senior by fifteen, had shown, by the simplicity and purity of their designs, that the classic spirit was again awake in France. The fine volume of Le Roy, which first revealed to the French the beauties of Grecian architecture, was published in the year of Robert Adam's arrival in England after his studies in Italy. If a return to the style of antiquity had been all that Adam wished for, he would have had little difficulty in bringing it about; the Society of Dilettanti were already working for it, and the public mood invited it.

What Adam wished for, however, and had need to wish for, was the return of English designers, not to the style of antiquity only, but to the fine art of architecture itself. Architecture, as understood by Gibbs or by Flitcroft, was hardly more of a fine art than cookery, in which certain quantities of certain ingredients are combined by rule so as to produce certain desired results. Large conceptions, such as Webb's design for Whitehall, or Wren's proposal for rebuilding the City of London, were as far out of the reach of the early Georgian architects as the fantastic combinations of Vanbrugh were beyond their understanding. Adam, on the other hand, was never at a greater advantage than he was when exercising his powers of pure design upon some grandiose and elaborate plan.

A student's exercise made by him at Rome, though faulty in many small particulars, is a strong witness to the early maturity of his imagination. In the designs of his later life this imagination never fails, and there is a degree of art in the disposition of his plans to which no other British architect has attained.

The architectural details of Adam's work have been much admired and much found fault with. Although taken separately, they could mostly be matched in late Roman work or in French work of the Louis Seize period; taken altogether they make up a very personal "style." The north side of Charlotte Square, Edinburgh, and the south front of Stowe, are characteristic, the first of his everyday manner, the second of his magnificence. As a designer of interiors he can be seen at his best in the round hall at Kedleston, or the ante-room at Syon. His furniture and minor decoration are too well known to need any particular illustration here.

Furniture and minor decoration, however, formed a part of Robert Adam's achievement which is of great significance, since the design of such things is not within the scope of most architects. William Kent, it is true, was a designer of furniture, but of furniture which affords the beholder less pleasure than anxiety, seeing that it is not provided with the concrete foundations which it obviously needs. What Flitcroft's or Gibbs' furniture would have been like we are happily spared from knowing. In their day the design of furniture was left, in the main, to its manufacturer, with surprisingly successful results. These results, however, were not of the same order as those of eighteenth-century France, where artists of real distinction designed for manufacturers who were scarcely less artists themselves. If it cannot be said that Adam raised the quality of English furniture to that of the French cabinet-makers, it can at any rate be said that he taught his patrons that no domestic object was too small or too mean to be capable of beauty. He was, in fact, the first conscious British propagandist of what a later generation chose somewhat ludicrously to call "Art in the Home."

"Art in the Home" has had no recent propagandist more powerful than "Country Life," a journal to which every British architect owes much. The occasion of this article, and the source of its illustrations, is a publication from the "Country Life" offices entitled "The Architecture of Robert and James Adam," consisting of two volumes of brilliant reproductions of photographs and drawings, with text by Mr. Arthur Bolton. Mr. Bolton's curatorship of the Soane Museum, where the great Adam collection is preserved, has enabled him to make an interesting choice of drawings for reproduction, and he has been at the pains of visiting many of the actual buildings illustrated, and causing certain plans to be re-drawn for this publication.

It is probably in the nature of such a compilation that there should be a great deal both in text and illustrations which has nothing whatever to do with Adam. It is also probable that method in the arrangement of such heterogeneous material is difficult to practise. A projecting medallion upon the cover of each volume seems to indicate that the book is intended for the table rather than for the bookcase; and in a table-book the mass of irrelevant chat about Adam's employers to which Mr. Bolton treats us may not be found amiss. The degree of completeness of his account of Adam's work seems to be conditioned by the degree of completeness of the collection of drawings in Mr. Bolton's care—thus Gosford, St. Paul's Walden, and the important decorative works at Inveraray are not described.

Mr. Bolton has made some interesting identifications of work hitherto not known as Adam's, for which every student will be grateful. He has made one attribution, that of the design of the original house at Hatchlands to Thomas Ripley, for which there is no authority beyond a rather remote degree of inherent probability. In causing to be printed the late Mr. Walter Spier's *catalogue raisonée* of the Adam drawings, and in providing it with convenient cross indices, he had done to all lovers of Adam's work a real service. If this list could be made to give some indication as to whether each design described in it was executed or not, and whether or not it has been subsequently destroyed, it would be of greater value still.

Rebuilding Soviet Russia

By HUNTLY CARTER

7. Civic Art since 1917

BEFORE the war I was greatly interested in the civic renaissance, which was taking place in Europe and America. During my visits to foreign cities I usually made a note of what was being said and done in the matter of civic art, city development and embellishment, the beautifying of civic centres, the adornment of public buildings, the brightening of boulevards and bridges, and the general work of making modern cities fit for angels to live in. I found that a great deal of interesting work was being carried on in the cities of Europe. It was, however, limited by the original plans, or want of them. The cities had not been planned to admit of modern improvements, and for this reason the proposals to beautify squalid and congested areas often appeared unrealizable.

Such, it seemed to me, was the position of the civic movement in Russia. Extensive schemes of city improvement, including comprehensive systems of lighting, sewerage, transportation, water supply, etc., were numerous enough, but it was never quite clear how they were to be carried out in old or badly planned modern cities, some of which appeared to have been built on the higgledy-piggledy principle of dropping the houses from heaven and allowing them to sort themselves out.

When I re-entered Russia after the war I was filled with the reconstruction ideas which I had been fostering during my four years on the Western Front, and subsequently in Germany. I had heard that the Communists had gigantic schemes involving the reconstruction of the whole of Russia —think of it, a sixth of the world's earth-mass !—and I expected to find cities like Moscow and Petrograd levelled, and being rebuilt according to new communistic town and ground plans. Nothing else, it seemed to me, could be done in order to make them cities beautiful, or electric cities, as the Communists prefer to call the objects of their dreams.

NEVSKI PROSPECT, PETROGRAD.

But I reckoned without the revolution and the counter-revolutionary war, and all the odds and ends of conflict set up by the two. Though these events were quite capable of levelling the cities and towns of Russia, as, indeed, they almost have done, they were hardly fitted to become city builders or city beautifiers, except in a very indirect way. By stirring up the insurgent and resurgent forces, and liberating certain sections of the community to an unaccustomed use of their own initiative, it was quite possible for them to open a path to civic resurrection. This, in fact, did happen. Workers and the intelligentsia were thrown together in such a way that the latter were forced to come out of their hot-houses and participate in the aims of the former. Art became life-centred, and art workers were drawn into a life-centred current of civic renewal, which swept over the depopulated and devastated cities of Russia leaving much that was instructive, but nothing likely to be permanent.

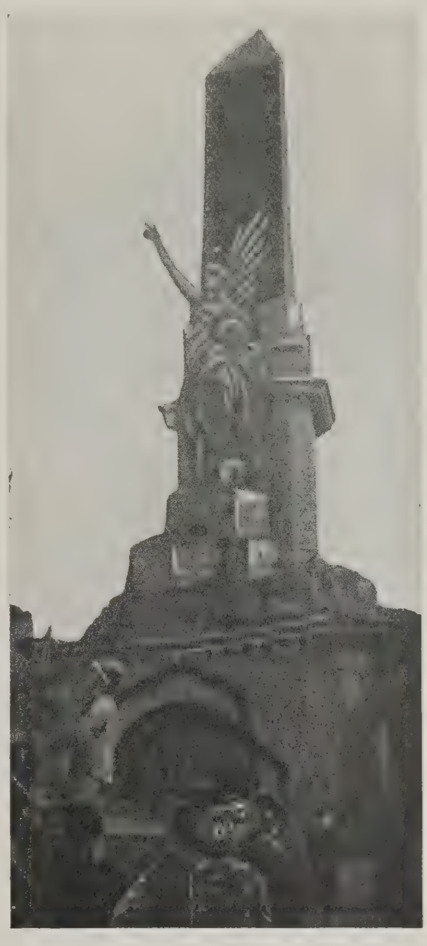
I have shown how the Communist call stirred the hearts of such men as Maiakovsky and Kamensky, who composed odes to the union of art and life, and urged their fellows – poets, painters, decorators, and the rest—to "come on into the streets" . . . "to take all vacant fences, roofs, façades, sidewalks," and to "decorate them to the Glory of Freedom" (whatever this may mean).

For a time the appeal worked. Artists crowded into the streets, mixed with the crowds, tore down some of the old bourgeois civic art forms, and put up others. Their efforts were particularly noticeable in the statuary. Figures and groups of the Imperialists who had moulded the life of Russia and of the big cities were quickly replaced by those of Communists who were remoulding them. And, generally speaking, a large number of monuments that related to the history of Russia, or to the cities in which they were located, were removed and destroyed to make

ANOTHER VIEW OF NEVSKI PROSPECT, PETROGRAD.

THE MODERN ZARSKY-SELO STATION, PETROGRAD room for others that had no history or interest to speak of beyond a strictly contemporary one. Of course, from the point of view of civic art one statue doubtless is as good as another, so long as it harmonizes with, and increases, the beauty of its surroundings. And as harmony is a fundamental law and principle of art it may be questioned whether the figures of Communists can be used to decorate a mediæval city like Moscow with as much appropriateness as, say, the figures of rulers like Ivan the Terrible, terrible though they be—as rulers.

However, the newly-fledged communistic art-craftsmen were not deterred by considerations such as these from letting themselves go civically. Very soon heads, busts, profiles, and three-quarter and full-length figures of the entire range of Communists from Karl Marx to Lenin began to appear in all directions. Thus in Petrograd and Moscow the comparatively short history, theory, and doctrines of communism were commemorated, but not its growth and development, for there has been none. Communism as applied by the Russian Bolsheviks is simply communism as conceived and formulated by Karl Marx. It entirely leaves out of account the advances made in socialistic theory and action during the past century. And by all accounts it no longer exists in Russia.



THE OCTOBER REVOLUTION MEMORIAL IN SOVIET PLACE, MOSCOW.

In turning out this statuary the artists seemed to have found ample opportunity for the exercise of their undoubted ability. At the same time, with one or two exceptions, they kept their expression well within the life-centred limit. They stuck to representational forms mainly because the working-class population would tolerate little else. Among the exceptions was Boris Korolchov, who tried to preserve the absolute essence of an idea in his Michael Bakunin monument, completed in 1919, and erected in the Mchasnichky Market, Moscow. The effect is of something emerging from chaos. It bears the cloudy inscription, "The spirit of destruction is the creative spirit." Something nearer the working-class idea was achieved by another sculptor, S. Konchenkov, leader of the primitives, and the Russian Rodin, as he is called. His most important post-revolutionary work was the wooden group of the Atman, Stenka Rasin, and his comrades, which was erected in the Red Place, Moscow. Stenka has revolutionary propensities which the Communists like. But for the most part the new statues do not differ from traditional forms of art. It is from such traditional heights that the effigies of Marx, Engels, Lassalle, Lenin, Trotsky, and the rest look down. It is mainly as rather handsome, but uninspired, pieces of civic furniture that the newcomers, theorists, doctrinairio, practitioners, and prophets turn their faces towards the rising sun (or should it be the setting one, since it is reported that communism in Russia is dead?). In this respect they match the sprinkling of pre-revolution survivors who are considered to belong to the communistic forerunners. These include popular painters, poets, sculptors, orators, politicians, and scientists. For instance, a very good statue of Pushkin is still standing in one of the Moscow boulevards.

Newcomers include Bakunin, Dostoyevsky, Rasin, Nikitin, Heine, Danton, Robespierre, popular and celebrated poets, painters, and composers, and other outstanding individuals already mentioned. The intelligentsia have been chosen for their revolutionary tendencies. Thus among them one notices the statues of Cézanne, Skriabin, and Rimski-Korsakov—an international choice pointing to a liberality of taste on the part of the Bolsheviks. Several very important historical monuments have been destroyed, including the magnificent bronze statue of Alexander II that stood just outside the Kremlin, Moscow, overlooking the river. On the other hand, some have escaped destruction, for instance, Peter the Great and Catherine at Petrograd.

Besides expending a great deal of energy on statuary, the new civic enthusiasts did their best to plaster the walls of Russia with an amazing display of propaganda and educational posters, as described in a previous article.

A third considerable expenditure took place in connection with pageants, as the outdoor mass performances of political mysteries and revolutionary satires may be called. Special decorations were required calling for originality and ingenuity on the part of the decorators. A number of well-known artists, whose names include those of Dobuschinsky, Professors Mischeyev, Annenkov, Brodsky, Asov, A. R. Kugel, Lopuchin, Temkin, Urvanzov, and Schtschoko, were drawn together in this work. The performances took place in front of public buildings (for instance, the former Bourse), at street-crossings, anywhere that a suitable space offered.

With these three activities the scope of the civic artists may be said to end. Even if the latter had the intention, they were prevented from attempting to alter or embellish buildings, boulevards, and open spaces by lack of materials, and progressive and unpreventable decay, also by the new economic policy of the Government, which by re-establishing free trade threw open the eighteen town squares to petty traders and embellished them with human scenery, so to speak. In 1921 eighteen squares contained nearly 7,000 stands from which the Government drew a rental of 2,555,465,000 roubles. Where the artists ended, the Government began. On the whole the Government contrived to get in a good deal of eccentric work. In one town they put up a statue to Judas Iscariot — the great Poletar - Prometheus and Red forerunner of the world revolution, as the sponsors of the effigy were pleased to re-interpret Judas. Then they planted dead revolutionaries beneath the wall of the Kremlin facing the Red Place and adorned the graves with rude monuments, such as, for instance, the inscribed monolith which serves to perpetuate the memory of John Reed, the American agitator.

Beyond this they have done a good deal, assisted by dirt and dilapidation, to spoil the colour-schemes in the cities and towns.

One of the pre-war features of Russian cities and towns was the predominance of coloured architecture. The extensive use of plaster on the exterior of buildings made it possible and easy to introduce colour. Much of this colour was very bright, interesting, and even refreshing after the monotonous greys and other neutral tones of Western cities. Moreover, it was always fresh, owing to the fact that the plaster did not last and had to be continually renewed. But it must be said that harmony was not always sought, and the mixtures of browns and yellows, and greens and reds, and black and white, were sometimes far from pleasing. The Kremlin, for instance, had very nice bits of colour thrown on in patches without reference to intervening spaces. Some of the effects, though isolated, were striking. A very interesting bit of Oriental colour occurs in that portion of the main Kremlin building which is now occupied by the Ministry of Education. This portion has the unusual appearance of having been inserted without reference to the architectural requirements of the rest. Moscow used to be a magnificent example of a colour city, especially when viewed from the Kremlin. Distance seemed to lend enchantment to the colours—the toned-down buildings, with their masses of dull red roofs, the green settings afforded by the trees in innumerable parks and gardens, and the brilliant golds and blues of the church domes and spires.

In those days the Russian hated whitewash. To-day, the Communists love it—it may be for more reasons than one. At any rate, they have put a great deal on the walls of Moscow and Petrograd, and not a little on themselves. They have tried to warm it up here and there by introducing patches of blood-red. The latter seems to be the hallmark of Government buildings. You know the Kremlin by its dull red dome. All other domes are glittering gold or turquoise blue. Likewise you know Soviet Place by the great building facing it which is smothered from roof to cellar with the gory tone. And so on elsewhere. Nowadays visitors to Moscow find their way about by the all-red route.

AN EQUESTRIAN MONUMENT TO PETER THE GREAT IN PETROGRAD.

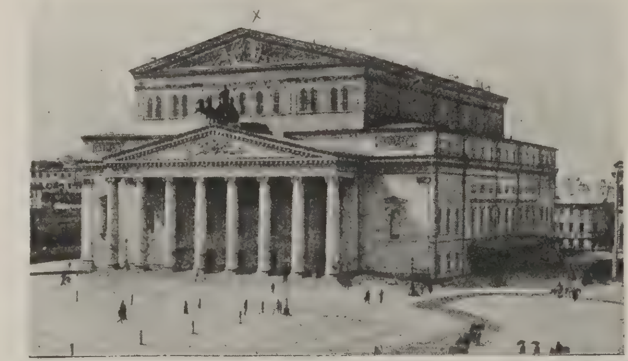
The Government, too, has been very busy re-naming streets, boulevards, academies, and other public buildings, vessels, etc., all of which are now dedicated to Labour and its stalwart champions. In this way they have laid a sort of labour-veneer over Soviet Russia. Thus one finds squares rechristened, Soviet Place, Revolution Place, Red Place, etc.; public institutions, House of Art, House of Science, Palace of Labour, Museum of Revolution, etc.; theatres, in Moscow, the State Opera House becomes the Bolshy or Big Theatre; in Petrograd, the Marinsky becomes the Theatre of Opera and Ballet, the Alexandrinsky, the Dramatic Theatre, etc.

There has been a feeble attempt at restoration. The Moscow Kremlin is in scaffolding, but the work is greatly hindered by the difficulty of getting materials. There has been also an attempt at preservation. The National Educational Committee, feeling that their duty lay in the preservation and systematic care of monuments and highly-developed works of art of the past, endeavoured to safeguard established museums, and enriched their collections with property taken from private collections and churches. Beyond this, they increased the number of public museums. But for all their care they have not prevented the wholesale destruction of precious monuments, the looting of big private invaluable collections, and the destruction and decay of public buildings, many of which are now in a ruinous condition.

For the rest, from a civic art point of view both Petrograd and Moscow remain as they were, with the exception that they are both worn-out beyond repair. In Petrograd there are the very wide streets and generous expanse of open space and avenues branching from a common centre much as they do in Paris. Its boulevards are embellished with many statues, monuments, and fountains. Its colour has gone, except in the gardens and parks where the trees and shrubs manage to keep alive. Its numerous large open bare spaces, which at one time enabled one to see the surrounding buildings in perspective, are now mostly littered with booths. Moscow also retains many of its pre-war civic attractions; the great open cobbled spaces like the Red Place, the ring boulevards, the great number of little parks and gardens, which, viewed from the Kremlin, give the city such a charming rural aspect, the decorative churches and chapels, and old buildings (crumbling to ruin, it is true), the statuary and fountains—all these offer an attractiveness which not even the great pseudo-European hotels and stores which surround the Theatre Place, or the dirt, destitution, and disease—the aftermath of revolution—can conceal. But when all is said for both cities, the fact remains that they want pulling down and rebuilding according to a modern inspired town-plan.

THE RED GATE, MOSCOW.

The foreground is a typical cobbled open space.



THE IMPERIAL THEATRE, MOSCOW; NOW THE BOLSHY THEATRE.

The Imperial Arms (marked x) have been removed.

Staple Inn Hall:

The Condition of the Roof Timbers

THE history of Staple Inn is a long one, and, as its name implies, it dates back to the Ordinance of the Wool Staple. In 1353 the Ordinance of the Staple was embodied in the Statutes of the Realm, and from that time formed one of the chief taxes and one of the most lucrative sources of the Royal income for the next century and a half. Staple Inn, however, had always had a leaning to the law, and by 1463 it had yielded up all connection with wool, and had become one of the regular Inns of Chancery.

The Hall itself is not very large, but it is well proportioned. Its chief glory is the roof, which is dated with a panel bearing the date 1581, with the initials R.C. entwined in a cord device. The initials are those of Richard Champion, Principal of the Inn, and the panel is curious, because the date and other incised carving were filled with coloured wax. A few years ago this wax was gilded, as it was becoming obliterated by dirt, and it was thought to be the best method of preserving it.

In 1887 a certain amount of work was done by the late Alfred Waterhouse, R.A., to strengthen the roof, and this principally consisted of strengthening the oak timbers with tie rods. In those days the presence of the "worm" was noted, but its work was confined to small areas; and as, unfortunately, science had not by then realized the fatal power of the pest or discovered its remedy, little was done to check the ravages beyond putting a coating of preservative on the outside of the timber.

The failure of a lintel over one of the windows a few months ago drew attention to the fact that *Xestobium tessellatum*, the Death Watch Beetle, was at work here as in the famous Westminster Hall roof. It was discovered, on opening up the base of the roof, that the beetle, or more properly speaking, the grub, had entirely devoured all except a small part of the built-in woodwork, and that, as this supply was being exhausted, he was turning his attention to the feet of the principals and hammer-beams. There was an exceptional amount of built-in wood, as the common rafters and principals each rested on separate plates, and the spaces between these plates and the wooden lintels were filled in with wood packing-beams.

The Prudential Assurance Co., the owners of the building, gladly assented to Mr. Waterhouse's proposal to call in Professor Lefroy, the entomologist, who has done such valuable work in this direction, and he gave advice as to the best way of destroying the pest and preventing a further visitation.

This work is now in progress, and the most decayed portions of the wood are being cut out. Steel plates and lintels are being inserted, and the feet of the principals and hammer-beams are having new oak scarfed into them where necessary. In order that the roof may continue to stand in its present form, it has been arranged to take the entire weight on steel principals, which are being inserted above the old plasterwork so as to be entirely concealed. It has also been contrived that the purlins, hammer-beams and braces shall be independent of the steel, so that in the event of further failure from any cause there shall be no fear of collapse.

The work has had the advantage of the care and interest of the district surveyor, Mr. Perkins, and is in the hands of Messrs. Holland and Hannen, who have shown constant vigilance over this difficult piece of restoration. The various tenants of the Inn have shown great forbearance in tolerating the general discomforts attending the work, and this is particularly the case with the Institute of Architects who are accustomed to hold their meetings in the Hall itself.

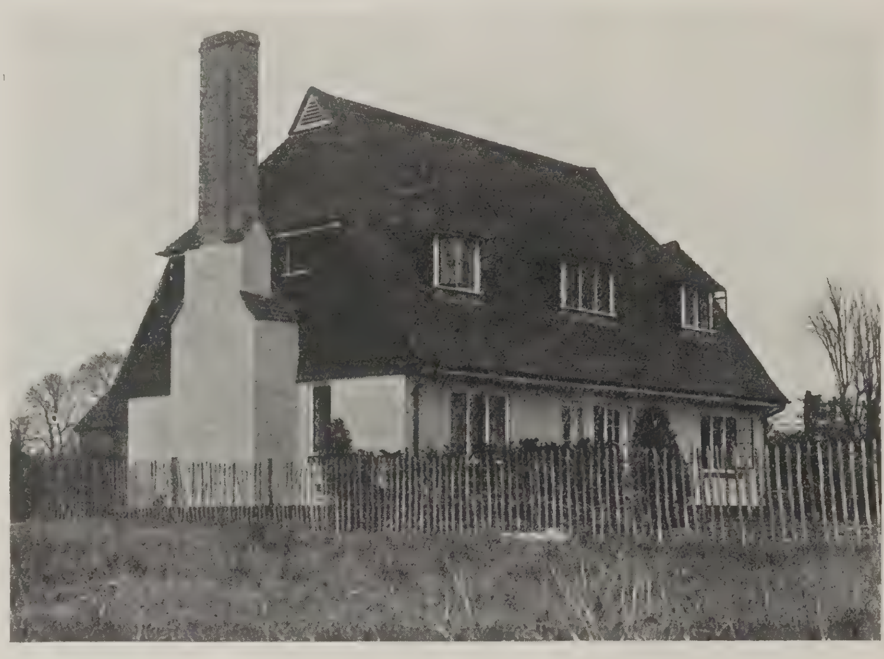
THE ROOF TRUSS IN STAPLE INN HALL.

Showing the ravages of the Death Watch Beetle. It will be noticed that the end of the Hammer-Beam has been eaten away, and the unsupported Principal Rafter must have soon collapsed. The roof is now being repaired, a solution of naphtha and barium soap being used to treat the affected timbers.

"Dormers," Thames Ditton

G. ALAN FORTESCUE, A.R.I.B.A., Architect

THIS house has been erected from the designs of Mr. G. Alan Fortescue, A.R.I.B.A., architect. The entrance front is laid out as a forecourt, in front of which is a low brick wall, this treatment being thoroughly in keeping with the composition of the house. There are two steps up from the pavement to the forecourt. Externally the 9 in. brick walls are covered with Portland cement, the last coat being applied with a "wood float" to obtain the necessary texture. In order to bring out the colours of the front door the walls have been twice distempered with Duresco white, and the tubs containing pyramid box trees at each side of the front door painted blue. The tiles are a rich dark brown turning to grey, and the elm boarding is stained black with two coats of Solignum to match the 11 in. concrete plinth which is twice tarred.



A VIEW FROM THE SOUTH-WEST.

Hand-made sand-faced tiles from Sussex, of dark brown colour on $\frac{3}{4}$ in. boarding, have been used for the roof. The valleys of the dormers are "swept" in the old manner, and "Bonnet" hip tiles have been used; 2 in. silver-grey bricks with rough joints have been used for the chimney stacks, and the external cills, thresholds, and blocks for box-tree tubs are in blue Stafford bricks. The standard steel light windows, in wood frames, have been fitted, the T iron bars of which have been taken out and fitted with $\frac{3}{4}$ in. lead cames.

The dining-room has been planned to be used solely as a feeding room, and is not intended as a room for general use. There is a service hatch from the kitchen to the dining-room. On the kitchen side the top part of the hatch forms a receptacle, with a glazed door, in which china may be stored. Beneath the

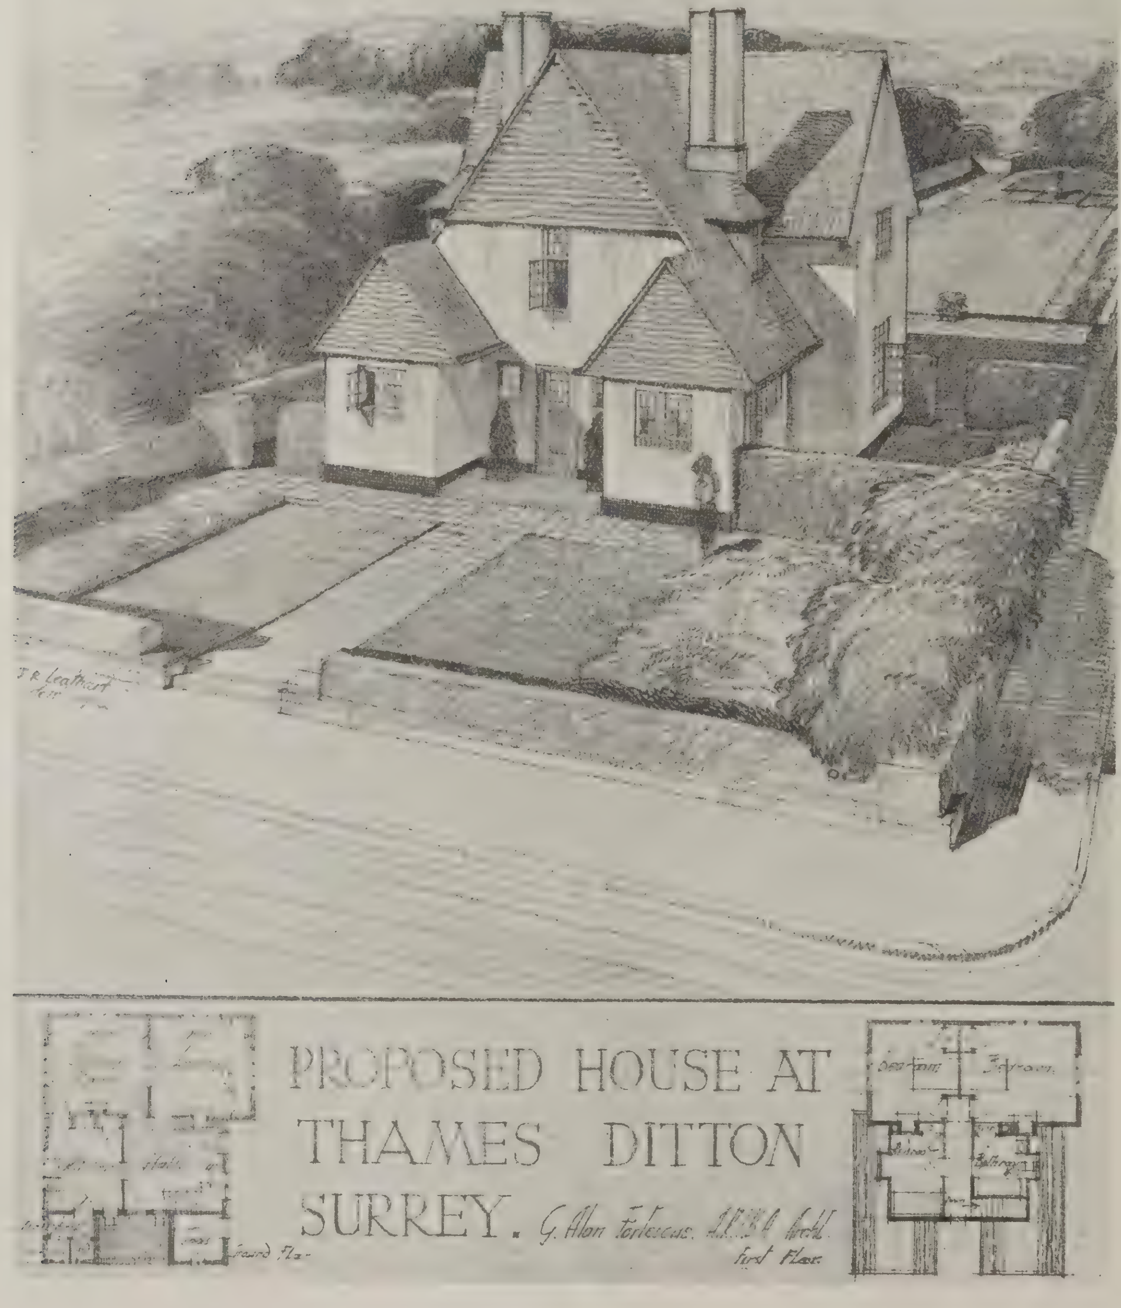
serving portion are drawers to pull in and out either side for knives, and underneath these and above the skirting a cupboard for glasses and decanters, etc. In the kitchen there are cupboards for dry store and for brooms built in each side of the serving hatch, forming one long fitting.

All heating is by built-in gas stoves except to the lounge and to No. 1 bedroom, which have coal fires. The gas stoves have concrete vents built into the brickwork instead of projecting chimney breasts, and these are taken above the ceiling into the loft-space. For the ventilation of the loft-space louvres have been formed in the gables. These also give a free circulation of air to the roof timbers. The surrounds to the gas stoves are of red briquette, 6 in. by 3 in. by 2 in., with $\frac{1}{4}$ in. raked-out joint, and the tile hearths and mantelshelf are of 6 in. by 6 in. red quarries twice beeswaxed. The lounge fireplace is constructed of brick up to ceiling level, with a 9 in. by 6 in. beam over, and the hearth is of herring-bone brick raised 2 in. above the floor.

The floors of the hall and the kitchen are of 9 in. by 9 in. red quarries, and the internal cills of 6 in. by 6 in. red quarries twice beeswaxed; the doors are of two panel, square both sides, the panels filled in with five-ply Venesta (birch), and the whole twice stained with Solignum; the skirting is 6 in. by 1 in. square; and the built-in cupboards to the bedrooms are taken to ceiling level and fitted inside with rods upon which to hang clothes.

All the ironmongery, electric light pendants, brackets, switch plates are in black ebony. The cooking is done, and the hot water for the bath is obtained by a Stimex gas stove.

The tiling was laid by Messrs. Hall & Co., of Croydon. The builders were Messrs. S. Macey and Sons (for "Dormers") and Messrs. Wheatley and Sons (for house at Thames Ditton).



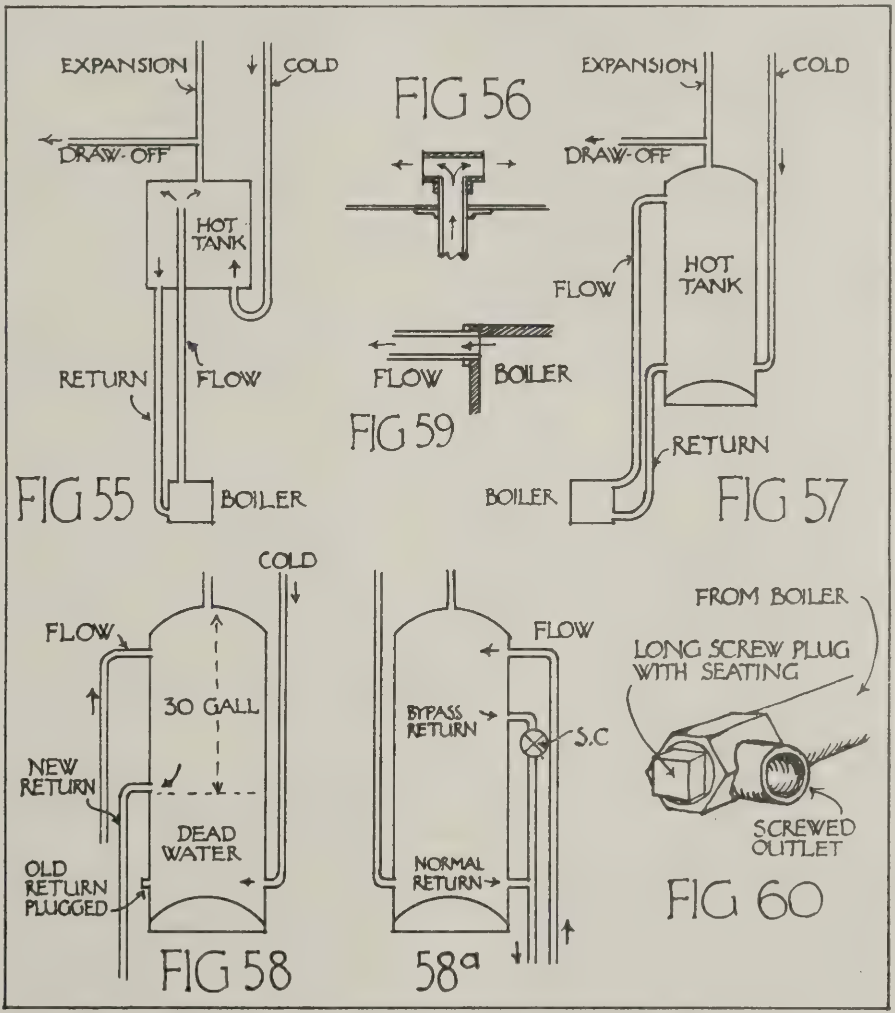
PROPOSED HOUSE AT THAMES DITTON SURREY. G. Alan Fortescue. A.R.I.B.A. Archt.

Little Things that Matter. XVII—Hot-Water Troubles

By EDWIN GUNN, A.R.I.B.A.

HOW often is an otherwise satisfactory house marred by the complaint that really hot water is not readily obtainable? The trouble is often due to quite minor faults, which, though they may be easily avoided, are commonly committed.

The diagram, Fig. 55, shows a type of hot-water system frequently installed. Both the flow and the return pipes enter the bottom of the tank or cylinder, the latter being prolonged inside to deliver its water into the upper part of the storage space. This does not look like a serious fault, but it is, nevertheless, prejudicial. The hot water is cooled in passing through 1 ft. of cold water in the cylinder as much as it would be in passing 50 ft. of air. Although in effect this heat is not lost, since it is given up to the water in storage, the water arrives cooler at the point from which supplies are drawn than need be the case. The cold supply in the same diagram is introduced through the bottom of the cylinder.



Remembering that the pressure of the cold supply is the motive power of the low-pressure system, it is evident that each time hot water is drawn it will be because it is impelled by the cold water entering to replace it. When this upward direction is given to the cold supply its tendency is to rise in a stream—"shooting up" and mixing with the hottest water, which it cools down. If the cold supply must necessarily enter beneath, a tee should be fitted on the connection inside the tank as shown in Fig. 56, to divert and spread its flow.

A better arrangement is shown in Fig. 57, in which the flow pipe enters at the side near the top, the return being taken off on the same side at the bottom, and the cold supply brought in opposite. Even where connections are correctly made the provision of a tank or cylinder out of proportion to the boiler may result in dissatisfaction. About twelve to sixteen gallons per sq. ft. of boiler heating surface is considered good practice. Where existing apparatus, which is not in that proportion, has proved unsatisfactory, a simple remedy may often be arrived at merely by raising the return connection higher and so reducing the bulk of water circulating. This increases the heat attained—see Fig. 58, where the effective capacity of the cylinder is reduced from 50 to 30 gallons, since the dead water in the lower part will not circulate.

Akin to this expedient is the contrivance of a by-pass return pipe, as Fig. 58a, which may be brought into action by opening a fullway stop valve at X. This is very useful where alternative gas-heating is in use on the ordinary circuit, as the capacity of the tank may be reduced at will when this is in action, which is particularly advantageous where the gas circulator is controlled by a thermostat—bringing it into use much more rapidly and checking gas consumption.

Further points in connection with hot-water supply, which are worth attention, are as follows:—

(1) In case the flow pipe tapping of a range boiler is made otherwise than on top be very careful to see that it is as high up as possible—in line with the top inside; otherwise the packing of the boiler manhole will soon be burnt owing to the cushion of air trapped in the boiler (Fig. 59). If it is on top the same bad effect will follow should the pipe drop below the upper surface of the boiler.

(2) The drain cock from a domestic boiler should be used periodically to flush off dirt and deposit, as done in larger installations. For this purpose a full-way stop-cock or plug valve is best, and as running off is a messy business, it is convenient and can usually be arranged to extend from the cock to a position over an external gulley or channel. Failing this, a screwed nipple adapter for a hose pipe should be fitted (Fig. 60).

(3) Where pipes pass through brickwork (as at the back or side of an independent boiler), it is best not to build them in in such a way as to leave no latitude for slight movement.

STUDENTS' SECTION

The Orders and their Application by the Italian Masters

By CHARLES GOURLAY, B.Sc., F.S.A. (Scot.), Professor of Architecture and Building, The Royal Technical College, Glasgow

(*Continued from October* 11, *page* 494)

THE Old Library, Venice, is a very dignified building by Sansovino, 1536, which sets rules at defiance. The lower arcade is Doric and has an entablature one-third, instead of one-fourth, of the height of the column. The upper arcade is Ionic, and its entablature is, in height, equal to one-half of the column which supports it. The adjoining building to the west is the Zecca or Venetian Mint, also built by Sansovino in 1536. The heavy cornice at top of its second story cuts off the topmost story, giving it the appearance of being a later addition. Except for this defect this design is well worthy of study because of its suitability for present-day practice, in which the varied treatment of its three stories and the regularity of its composition are applicable.

The garden front of the Villa Medici, on the Pincian Hill, Rome, by Annabale Lippi, 1540, is a very beautiful and indeed playful composition in the Orders, which is most appropriate to a loggia on a garden front. The archivolt of the central opening springs from the top of the entablature, the columns are coupled, and there is a column adjoining a pilaster at each end of the loggia.

The Loggetta at Venice, by Sansovino, dating from 1536–40, is a triple composition in which three wide archways of slightly low proportion are divided by two Corinthian columns having niches between them. The wider spaces are twice the width of the narrower ones, measuring from centre to centre of column in each case. Above is a high attic with sculptured panels, while the design is terminated by a balustrade of double-bellied balusters, and the pedestals divide the balusters into groups of four.

St. Peter's, Rome, the greatest building of the Renaissance period, is by Michelangelo, and dates from 1546–64. The application of the Corinthian Order internally as pilasters on a very large scale is probably due to Bramante. The arches between the piers are richly coffered, but the imposts supporting them project too much, for they extend beyond the face of the pilasters. The barrel-vault is coffered and the semi-dome of the apse is ribbed. The baldachino over the high altar has bronze wreathed columns, and was erected by Bernini in 1629–67. The scale is very large for it has a total height of 100 ft.

The three-storied façade of the Grimani Palace on the Grand Canal, Venice, by San Michele, date 1549, is a remarkable instance of the use of two similarly designed stories one above the other, a treatment not to be recommended, although it is quite successful in this instance. Closer inspection shows, however, that the similarity is more apparent than real, for the entablature of the upper story is proportioned to govern the height of the whole façade and not to the Order of the top story only, also the second story has pedestals, while the top story has none.

The interior of the circular Capella Pellegrini, attached to the church of San Bernardino, Verona, dating from 1557, is said to be San Michele's most famous work. An attached Corinthian Order is here spaced so as to give four wide and four narrow intercolumniations, the wider spaces being recessed and the narrower containing niches. The jambs have pilasters and the imposts are returned on the face of the jamb, forming entablatures above the pilasters.

The façade of the Uguccioni Palace, Florence, stated to be by Mariotto Folfi, dated 1521–1600, is a stately elevation of two stories of coupled columns resting on a rusticated basement containing an arcade. The great projecting eaves, casting a deep shadow, are a valuable feature of the design.

erected in 1571, by Palladio, tall attached columns of the Composite Order rest on high block plinths, and carry the full entablature of the Order, which is broken round them. The lower story is a loggia, and the windows above break through the architrave of the entablature at top and have balconies at their sills, which spring from brackets in the spandrils of the arches below.

In the façade of the church of Il Redentore, Venice, by Palladio, dating from 1576–92, the largest Orders are Composite, and they rise from the same base as the Corinthian Orders of the doorway. The Corinthian Order is also used to decorate the niches. The pediment over the doorway could be omitted with advantage to the whole design, because it competes with the main pediment above it.

The interior of this church shows the use of attached Corinthian columns with adjoining pilasters, which are diminished and have entasis to the same extent as the columns, which is not good practice. The Corinthian Order is also used as pilasters to enrich the piers from which the arches spring, thus using the same Order on two scales and rising from the same base line.

The Liverpool University School of Architecture

The Policy of the School and the Work of the Students

THE reassembling of the School of Architecture of the University of Liverpool after the long vacation brings many new students with the obvious gap left by the departed fifth year men. There has been a deal of travelling by students in France, Italy and notably in America.

Messrs. Knight, Vallis and Fry spent six months of the summer—their summer term and long vacation—working in New York offices: Mr. Knight with Amer Embury, whose colonial domestic work is well known on both sides of the Atlantic; Mr. Vallis with Helme and Corbett, the architects of the Bush Terminal Buildings in America and London; and Mr. Fry with Carrère and Hastings, on whom has descended the highest honours of the R.I.B.A.

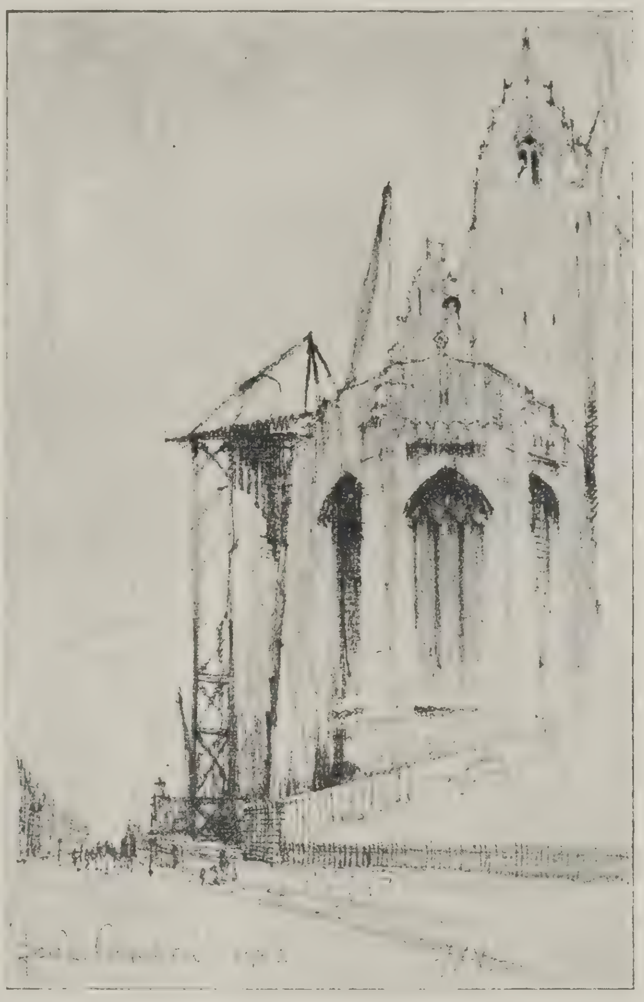
They regard their trip as successful, both for the experience gained in their work there, and for the widening influence that travel and a closer acquaintance with the robust school of American Architecture has brought them. They were able, besides thoroughly exploring the possibilities of New York, to visit Boston, and, memorably, Washington.

Their office experience has been of the most varied character, from great Masonic Memorials to Spanish Mission domestic work and cheap New York apartments.

The annual exhibition of students sketches made during long vacation has resulted in a very cheerful show in colour, pencil and pen. Mr. Velarde took the first prize, and other awards went to Messrs. Bridgwater and Fry. Some examples of the work of these students are illustrated in this issue.

MR. P. B. HASWELL, B.ARCH.
THE WINNER OF THE R.I.B.A. MEDAL FOR DESIGNS.
(*See also page* 625.)

One of the students, Mr. P. B. Haswell, B.Arch., has just been awarded by the Council of the R.I.B.A. their new medal for the best set of four designs—one carried to the working drawing stage—by any student of a recognised school who has obtained his A.R.I.B.A. by taking a five years' course.



LIVERPOOL CATHEDRAL. FROM A SKETCH BY F. A. VELARDE, LIVERPOOL UNIVERSITY SCHOOL OF ARCHITECTURE.

The courses of study arranged by the school are as follows :—

(1) FOR CERTIFICATE AND DEGREE OF B.ARCH.

Ordinance.

1. The degree of Bachelor of Architecture shall be conferred either as an Ordinary Degree or as a Degree with Honours in Architectural Design or with Honours in Architectural Construction.

2. All candidates for the degree of Bachelor of Architecture shall be required to have passed the Matriculation Examination, and, thereafter, to have attended approved courses of study. The entire course of study shall extend over not less than five academic years, except as provided in Clause 4.

3. There shall be five examinations and reviews of work for the degree of Bachelor of Architecture :—

The First Examination.
The Second Examination.
The Third Examination.
The Fourth Examination.
The Final Examination.

The First and Second Examinations may not be taken before the end of the First and Second Years of University study respectively, except as provided in Clause 4: the Third, Fourth and Final Examinations may not be taken before the end of the Third, Fourth and Fifth Years of University study respectively.

4. Graduates of approved Universities and other matriculated candidates, who in the opinion of the Faculty are qualified by previous work and training, may be excused the first and second years' study and examinations, but shall be required to take, together with the Third Examination, one or more papers of the First and Second Examinations as the Faculty shall in each case determine.

5. The Degree of Bachelor of Archi-

tecture may be given with (*a*) Honours in Architectural Design, (*b*) Honours in Architectural Construction, on the result of the Fourth and Final Examinations considered together.

6. Candidates during their Fourth and Fifth Years shall be required to spend the third term and summer vacation of each session in practical work under approved conditions, except in such special cases as Faculty shall determine.

Regulations.

1. The subjects of the First Year's course of study and of the First Examination, with the following relative values attached, shall be :—

- (*a*) Studio Work in—
  - (i) Elements of Architectural Construction 5
  - (ii) Elements of Architectural Form 5
- (*b*) Elements of Architectural Construction 3
- (*c*) History of Architecture .. 3
- (*d*) Physics and Mechanics .. 1
- (*e*) Geology 1
- (*f*) Descriptive Geometry and Sciagraphy 1
- (*g*) Presentative Technique and Rendering 1
- (*h*) Elements of Architectural Form 1

2. The subjects of the Second Year's course of study and of the Second Examination, with the following relative values attached, shall be :—

- (*a*) Studio Work in—
  - (i) Elementary Architectural Design 5
  - (ii) Architectural Construction 5
- (*b*) Architectural Construction .. 3
- (*c*) History of Architecture .. 3
- (*d*) Symbolism in Classic Architecture 1
- (*e*) Theory of Architectural Planning 1
- (*f*) Perspective 1
- (*g*) (Optional subject) Drawing or Modelling 1

3. The subjects of the Third Year's course of study and of the Third Examination, with the following relative values attached, shall be :—

- (*a*) Studio Work—
  - (i) Architectural Design .. 5
  - (ii) Architectural Construction 5
- (*b*) Mechanics of Architectural Construction 2
- (*c*) Sanitation and Hygiene .. 1
- (*d*) Laboratory Demonstrations in Strength of Materials .. 1
- (*e*) Theory of Architectural Design 1
- (*f*) Surveying 1
- (*g*) A set of measured drawings and surveys of a building approved for measurement by the Faculty 2
- (*h*) (Optional subject) Drawing from Life or Modelling .. 1

In the First, Second, Third, and Fourth Examinations for the Degree and Diploma in Architecture, students failing in any subject or subjects to which the value of 1 or 2 is attached, shall be permitted to proceed to the next year's course of study and the next examination, but shall be required—in addition to the subjects prescribed for that examination—to repeat the courses and pass the examinations in the subject or subjects in which they have failed in the preceding examination. But in no case shall students failing a second time in such subject or subjects be permitted to proceed to the next year's course of study until they shall have satisfied the Examiners in the subject or subjects in which they have failed on two occasions.

4. The subjects of the Fourth Year's course of study and of the Fourth Examination, with the following relative values attached, shall be :—

(i) *For those taking the Ordinary Degree :*

- (*a*) Studio Work in :
  - (i) Advanced Architectural Design 5
  - (ii) Preparation of Working Drawings 5
- (*b*) Advanced Architectural Construction 2
- (*c*) Decoration 2
- (*d*) Furniture 1

(ii) *For those taking the Degree with Honours in Architectural Design :*

- (*a*) Studio Work in :
  - (i) Advanced Architectural Design 10
  - (ii) Preparation of Working Drawings 5
- (*b*) Advanced Architectural Construction 2
- (*c*) Decoration 2
- (*d*) Furniture 1
- (*e*) Advanced Architectural Programmes 2

(iii) *For those taking the Degree with Honours in Architectural Construction :*

- (*a*) Studio Work in :
  - (i) Advanced Architectural Design 5
  - (ii) Preparation of Working Drawings 10
- (*b*) Advanced Architectural Construction 3
- (*c*) Decoration 2
- (*d*) Furniture 1
- (*e*) Architectural Construction in Reinforced Concrete .. 2

Candidates desiring to take the Degree with Honours in Architectural Construction must, before entering upon their Fourth Year of study, satisfy the Board of Studies in Architecture and Civic Design as to their competence in Mathematics.

5. The subjects of the Fifth Year's course of study and of the Final Examination, with the following relative values attached, shall be :—

(i) *For those taking the Ordinary Degree :*

- (*a*) Studio Work in :
  - (i) Advanced Architectural Design 5
  - (ii) Advanced Architectural Construction 5
- (*b*) Specifications, Estimates and Contracts 1
- (*c*) Professional Practice .. 1
- (*d*) Thesis, showing advanced and individual work in *one* of the following subjects :
  - (i) Historical Architecture : the work to be based on the study of actual buildings 5
  - (ii) Theory of Architectural Design 5
  - (iii) Science as applied to Architectural Construction : a special study of an application of Science to definite problems of Architectural Construction 5
  - (iv) Architectural Design, including Decoration : a study in civic, monumental, decorative or other branch of Architectural Design 5

The subject proposed by the candidate for his thesis must be submitted for the approval of the Board of Studies in Architecture and Civic Design not later than the first day of February, and the thesis presented not later then the first day of June preceding the examination. All theses offered in subjects (iii) and (iv) must be accompanied by a set of drawings.

(ii) *For those taking the Degree with Honours in Architectural Design :*

- (*a*) Studio Work in :
  - (i) Advanced Architectural Design 10
  - (ii) Advanced Architectural Construction 5
- (*b*) Specifications, Estimates and Contracts 1
- (*c*) Professional Practice .. 1
- (*d*) Civic Architecture and Landscape Design 3
- (*e*) Thesis, as specified under Regulation 5 (i) (*d*) (ii) or 5 (i) (*d*) (iv) and subject to the same conditions .. 10

(iii) *For those taking the Degree with Honours in Architectural Construction :*

- (*a*) Studio Work in :
  - (i) Advanced Architectural Design 5
  - (ii) Advanced Architectural Construction 10
- (*b*) Specifications, Estimates and Contracts 2
- (*c*) Professional Practice .. 1
- (*d*) Quantity Surveying .. 2
- (*e*) Thesis, as specified under Regulation 5 (i) (*d*) (iii) and subject to the same conditions 10

6. The minimum attendance required of candidates in each Term shall be twenty-five hours a week.

7. Students in the School of Architecture shall not be permitted to take the Certificate or Diploma Courses in the Department of Civic Design, until they have passed the Third Examination in Architecture.

8. The fees for the First, Second and Third Years' courses of study shall be £35 in each case, and for the Fourth and Fifth years' courses of study, £22 10s. in each case. The fee for the Examinations shall be £5 payable in one sum.

(2) FOR CERTIFICATE AND DIPLOMA

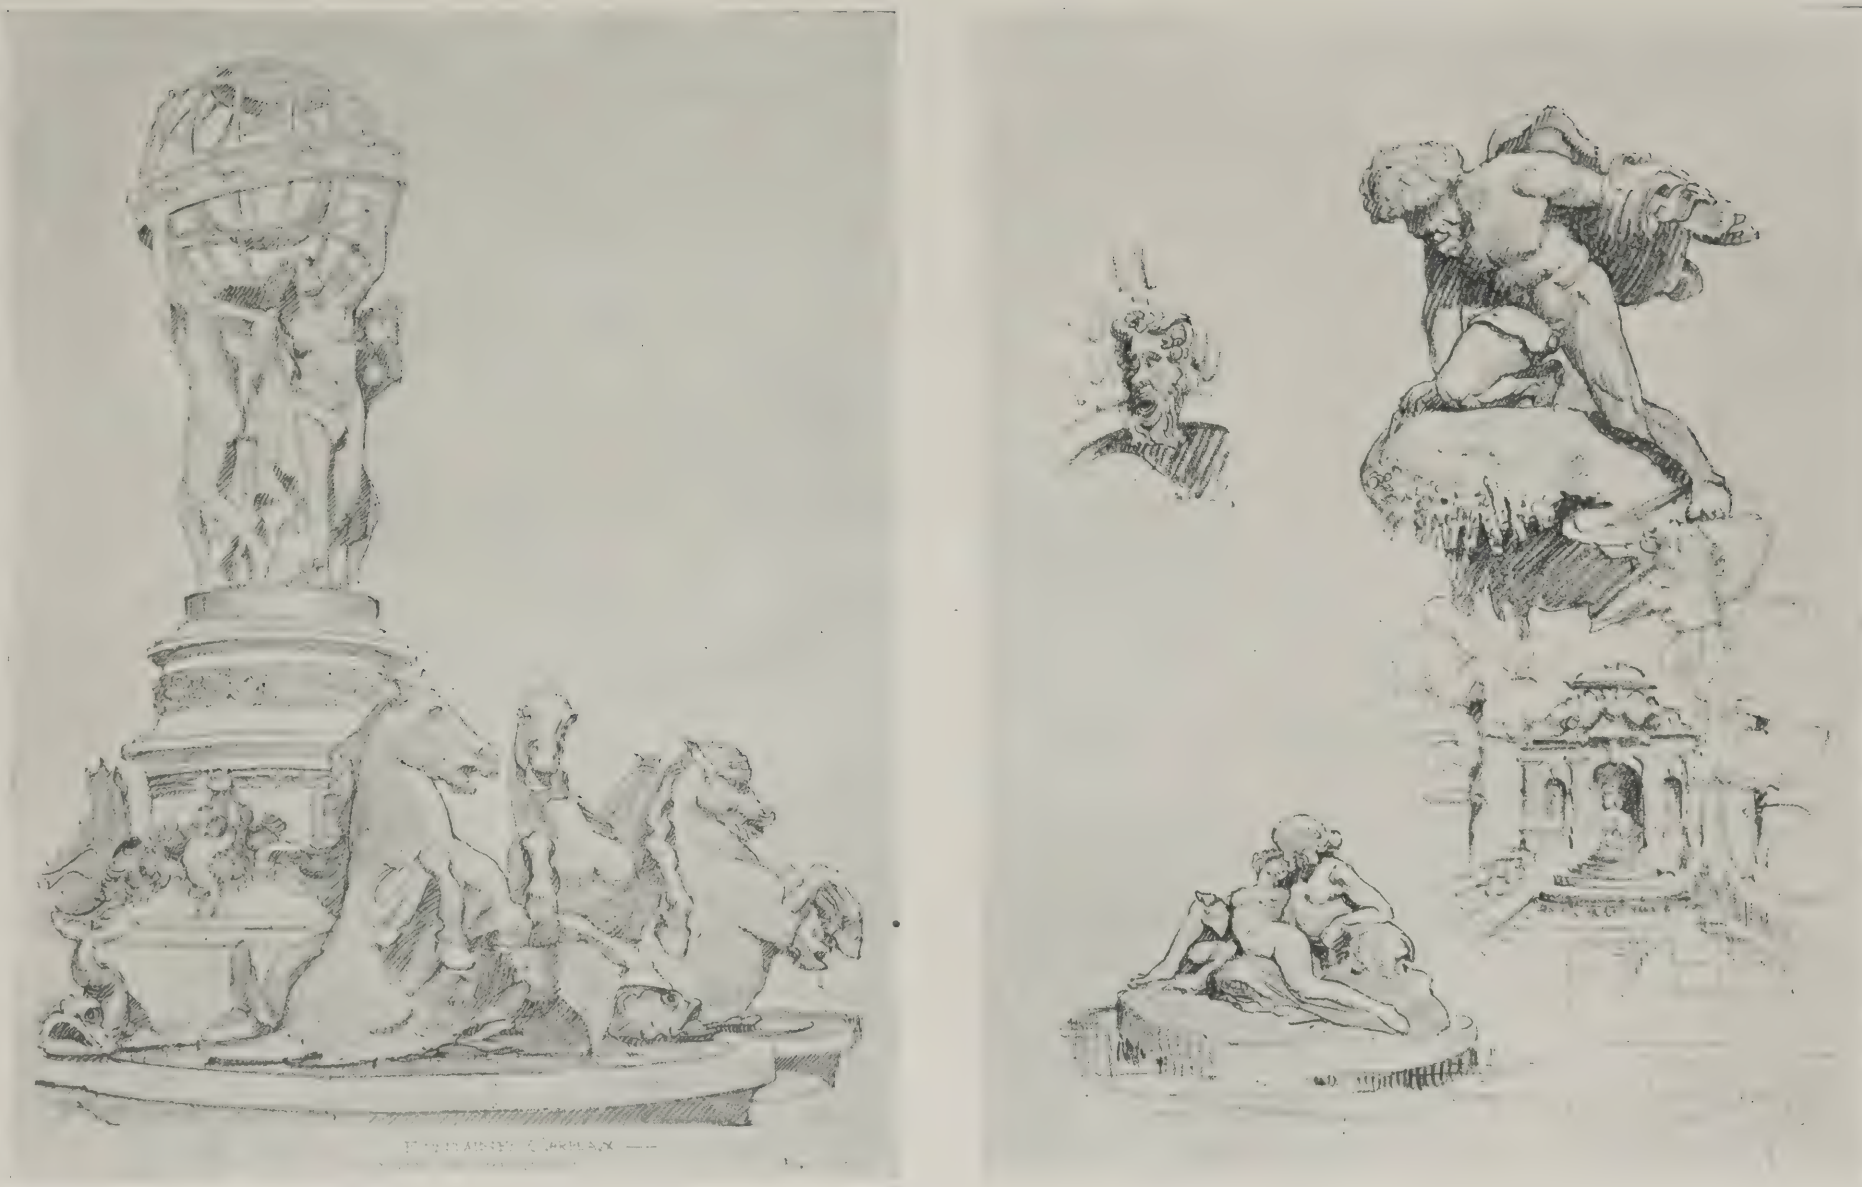
Ordinance

1. The University shall award a Diploma in Architecture to candidates who take the Degree Course and pass the five examinations of that course, but who have not passed the Matriculation examination.

2. Candidates who, in the opinion of the Faculty, are qualified by previous work and training, may be excused the First and Second Years' study and Examinations, but shall be required to take, together with the Third Examination, one or more papers of the First and Second Examinations as the Faculty shall in each case determine.

3. The Regulations governing the five years' courses of study for the degree of B.Arch. shall apply to and govern the courses for the Diploma in Architecture.

4. The Diploma in Architecture may be given with (*a*) Distinction in Architec-



THE FONTAINE CARPEAUX AND THE FONTAINE DE MÉDICI, PARIS.
FROM SKETCHES BY D. L. BRIDGWATER, LIVERPOOL UNIVERSITY SCHOOL OF ARCHITECTURE.

tural Design, (*b*) Distinction in Architectural Construction, on the results of the Fourth and Final Examinations of the Degree in Honours considered together.

5. The University shall award a Certificate in Architecture to Candidates for the Degree or Diploma in Architecture who take the first three years of the Degree Course, and who pass the First, Second and Third Examinations.

6. The exceptions specified under Clause 2 of this Ordinance shall apply also to the Certificate.

7. Candidates for the Diploma during their fourth and fifth years shall be required to spend the Third Term and Summer Vacation of each session in practical work under approved conditions, except in such special cases as the Faculty shall determine.

8. The Regulations governing the first three years of the course for the Degree of B.Arch. shall apply to and govern the course for the Certificate in Architecture.

(3) CERTIFICATE IN ARCHITECTURAL DESIGN

This Certificate is designed to meet the case of students who wish to come to the School of Architecture for its special teaching in Architectural Design.

CERTIFICATE IN CIVIC DESIGN

Students may take Civic Design as an additional optional subject in the Fourth and Fifth years of the Degree or Diploma Course in Architecture, and may thereby qualify for the Certificate in Civic Design.

The staff is as follows: School of Architecture: C. H. Reilly, O.B.E., M.A., Cantab., F.R.I.B.A., Professor (Roscoe Professor of Architecture in charge of School); L. B. Budden, M.A., A.R.I.B.A. (Senior Independent Lecturer and Studio Instructor); E. R. F. Cole, M.C., B.Arch., A.R.I.B.A. (Lecturer in Rendering, Perspective and Sciagraphy, and Studio Instructor in Design); J. E. Marshall, B.Arch., M.S.A. (Lecturer and Studio Instructor in Construction); B. A. Miller, A.R.I.B.A. (Junior Lecturer and Studio Instructor in Design); J. W. Williams (Junior Lecturer and Studio Instructor in Construction); G. Gilbert Scott, R.A., F.R.I.B.A. (Reader in Ecclesiastical Architecture); C. J. Allen (Recognised Teacher of Modelling, City School of Art); W. C. Penn, M.C., R.O.I. (Recognised Instructor in Drawing from Life, City School of Art); J. P. Droop, M.A., Professor (Special Lecturer in Classical Archæology); P. G. H. Boswell, O.B.E., D.Sc., M.Inst.M.E., F.G.S., Professor (Special Lecturer in Geology); W. Mason, D.Sc., Assoc.M.Inst.C.E., A.M.I.Mech.E., Professor (Special Lecturer in Strength of Materials); L. R. Wilberforce, M.A., Professor (Special Lecturer in Physics); Miss A. E. Edwards, M.B.E. (Secretary and Librarian).

Department of Civic Design: L. P. Abercrombie, M.A., A.R.I.B.A., Professor (Lever Professor of Civic Design); T. H. Mawson (Special Lecturer in Landscape Design); J. A. Brodie, M.Eng., Past Pres. Inst.C.E., M.I.Mech.E., Associate Professor (Special Lecturer in Civic Engineering); S. A. Kelly, F.S.I. (Special Lecturer in Civic Engineering); H. B. Ward, M.Eng., Assoc.M.Inst.C.E., F.S.I. (Special Lecturer in Civic Engineering); E. W. Hope, O.B.E., M.D., D.Sc., Professor (Special Lecturer in Civic Hygiene); J. J. Clarke, M.A. (Special Lecturer in the Law of Housing and Town Planning); A. C. Holliday, B.Arch., A.R.I.B.A. (Research Student in Civic Design); Miss S. Townshend (Secretary).

R.I.B.A.

The War Memorial.

The Rt. Hon. the Earl of Crawford and Balcarres has consented to unveil a war memorial tablet in the Galleries of the Royal Institute on Monday, November 20, at 3 p.m.

Council Meeting.

At the last meeting of the Council it was decided to take immediate steps to lodge the requisite Parliamentary notice in November next of the intention of the R.I.B.A. to bring forward an Architects' Registration Bill. It was further decided to convene a general meeting of the Royal Institute at an early date to obtain the approval of the general body to the draft Registration Bill prepared by the Registration Committee. The Code of Professional Conduct and Practice adopted in 1920 and published in the Calendar was rescinded and ordered to be deleted from the Calendar. The Ashpitel Prize for 1922 and the Mark of Distinction for Thesis in connection with the Final and Special Examinations were awarded to Mr. A. S. Reid.

Magazines of the Month*

A Literary and Pictorial Digest

MODERNE BAUFORMEN illustrates, as usual, a good deal of modern German housing-scheme work, and also publishes illustrations of buildings and interiors designed by Mr. Derry Roth, the Berlin architect. Some fine specimens of furniture designed by him are included.

L'EMULATION, the organ of the Société Centrale d'Architecture in Belgium, has some fine plate illustrations of the Place Royale in Brussels, described as one of the city's most precious possessions. In spite of the strictures of the Emperor Joseph II, who condemned it as "stupid and tasteless," the Place Royale has remained an object of universal admiration, and certain portions, notably the Borgendael of Embrace, may justly claim to be considered models of their kind.

The chief feature of the October issue of THE ARCHITECTURAL REVIEW is an article on Sir Philip Sassoon's house at Lympne, illustrated by delightful photographs by Mr. F. R. Yerbury. A coloured reproduction of Conrade's painting of the interior of Les Invalides is also given, and Mr. Chalton Bradshaw contributes an article on Two Tombs on the Via Latina, accompanied by finely photographed details.

DOORWAY OF A GOVERNMENT OFFICE IN BERLIN. WERRY ROTH, ARCHITECT.
(From "Moderne Bauformen")

THE ARCHITECTURAL FORUM illustrates a Chinese Temple in Formosa. A Buddhist temple of the type usually found on unrestricted sites, it is beautifully situated on the side of a little hill, facing south-west.

The well-known conservatism of the "heathen Chinee" is nowhere better demonstrated than in the art of building. In other countries to see a building is to be able to date it fairly accurately, but in China the same rules have been adhered to for so long that the appearance of a temple such as that described gives no sort of clue as to whether it has stood for 30 years or a thousand. Obviously, however, a type of architecture which could endure for so long must have its good points.

The house built for himself by Mr. F. L. S. Mayers, of Mr. Bertram Goodhue's office, is the subject of an illustrated article. The colour-scheme of the exterior, a combination of stone and stucco, is thoroughly harmonious.

THE AMERICAN ARCHITECT, of September 13, treats of colour in architecture, illustrating various examples of its successful use. In the Fulton Theatre, New York, the material used was terra-cotta throughout, except the painted panel under the cornice, which is in coloured cement, and the reveals of arched doorways in highly coloured glass mosaic. Diaper pattern of walls is developed in deep amber yellow and ivory, with blue spots at the intersection of lattice, this blue being repeated in the brackets, soffit, and fret ornament of the cornice. Mr. Cameron continues his article on the Relation of Pipe Organs to Architecture, and the prize-winning designs in the Beaux Arts competition are also reproduced.

(*From "The American Architect.*")

The issue of September 27 illustrates the new Standard Oil Building in New York and the Henry Ford Hospital, Detroit. It is believed that the former building is the first in New York in which extensive foundations have been installed by the compressed-air method before the removal of existing buildings on the site. The advantage of this procedure is, of course, that the old building need not be vacated until the foundation work is practically complete, and that as soon as the old building is wrecked the foundations of the new building are ready for steel.

GARDEN CITIES AND TOWN PLANNING illustrates the much-discussed £300 house, and the practical cost method is fully discussed in an interesting article by Ernest B. Belham.

HOUSE AND GARDEN for October gives some very charming illustrations of a terraced garden in Tuscany, and the confessions of a post-war house-builder embody a great deal of information calculated to assist the layman. The possibilities of pergolas are discussed in another delightfully illustrated article.

GOOD FURNITURE for October illustrates some fine examples of present-day American craftsmanship, decorative fabrics playing a very prominent part.

L'ARCHITECTURE of September 10 reproduces the winning designs in the Concours du Grand Prix d'Architecture. The subject set was an Ideal Military School, including accommodation for elementary, advanced, and special courses of military training, administrative buildings, and a sports arena. The successful competitor was M. Girond, pupil of MM. Laloux and Lemaresquier Duquesné and Recoura, whose design embodies a great central court, open in front, and surrounded by the main buildings.

Le Château de Fontaine Henry is also dealt with in an illustrated article. The issue of September 5 has an interesting article on the Ruins of Djemila in Algeria. The Curcal of ancient times, it was probably founded by Trajan, and excavations

still in progress have revealed extensive ruins. These include a basilica, fort, theatre, tombs, houses, market place, forum, temples, etc., and much more remains to be discovered.

Professor Leonard Hill at the R.I.B.A.

A Chadwick lecture on "Ventilation and Atmosphere in Factories and Workshops" was given by Prof. Leonard Hill, M.D., F.R.S., at the R.I.B.A. last Thursday. Sir William J. Collins, K.C.V.O., who was in the chair, introduced the lecturer, who demonstrated the Kata-Thermometer, a large-bulbed spirit thermometer, by means of which the cooling power of an atmosphere as due to evaporation, radiation, and convection, may be determined. By keeping the cooling power in proper relation to the work done and the heat output of the worker, the latter can be kept from sweating, and, working with comfort and ease, naturally stimulated to greater production.

Among instances of the good results attending careful regard for ventilation and atmosphere in factories and other enclosed places of labour given by Dr. Leonard Hill, was a large English steel tube-drawing-shop where clusters of large air ducts have been installed over the heads and to the side of the workers in front of the furnaces. The men are warmed by the radiant energy and cooled by the wind alternately, as they draw the tubes from the furnace and pause. The output here is stated by the firm to be greater than any other factory of the kind, and industrial unrest is unknown.

The ventilation of furnace-rooms, engine-rooms, etc., by fans placed at the bottom of wide trunks down which the cool air naturally sinks, the fan breaking up the air into fine streams, was advocated by the lecturer. Such fans, he said, are called "Joy Wheels" in the turbine-rooms of Cunard liners.

Radiant heat from gas or coke fires, or warmth from heating coils, should warm the floors and walls; and open windows, or a system of fans to impel cool, fresh air through gratings about 8 ft. from the ground and extract it through the ceiling, according to the size of the room or hall, were the best methods of heating and ventilating.

Expensive Plenum systems are not wanted. There must, however, be proper control by a skilled attendant of heating coils, open windows and extract fans in offices, shops, and workrooms of all classes.

The Builders' Benevolent Institution

The seventy-fifth annual report (with rules and regulations) of the Builders' Benevolent Institution has just been issued. There are now 22 men and 29 women receiving the benefits of this Institution, as against 16 and 30 respectively last year. The Committee express their sincere thanks to the members of the family of the late Mr. Joseph Hill, who have transferred to the Trustees of this Institution certain investments, the income from which is sufficient to endow a pensioner. The only conditions attached to this gift are that it shall be known as the "Joseph Hill Memorial Fund," and that one pensioner shall be identified therewith. The Committee were again able to grant a Christmas Gift of £5 to each pensioner. The Institution, which is supported by voluntary contributions, was established in June, 1847:—"For granting temporary relief and pensions to necessitous masters who have been engaged in the building trade and its branches, and their widows." The offices of the Institution are 48 Bedford Square, W.C.1.

TRIUMPHAL ARCH OF CARACALLA AND TEMPLE OF THE SEVENTH RACE, DJEMILA. (*From "L'Architecture."*)

Correspondence

Acoustical Research

To the Editors of THE ARCHITECTS' JOURNAL.

SIRS,—I have been extremely interested to read in your columns a suggestion to the effect that further work is required on the subject of acoustical research. As you are no doubt aware, I have been conducting experiments on this subject and urging its further investigation for the past twelve years. During the war I constructed a number of machines for research in connection with the testing of gun silencers, and I have also experimented at length upon the reverberation effects of motor traffic, horse traffic, and the London Underground Railways.

The fact that sound means the wasting of energy, which requires actual effort to resist from the human body, seems to have escaped attention. Not only do the irregular waves of noise and the low frequency regular oscillation of sound have a very trying effect upon the nerves, but they are responsible for actual mechanical wear and tear. In many cases the human ear is the only means we possess of judging as to the efficiency of noise production or the reproduction of speech. Just as when inspecting a troublesome sound from a piano, it is usual to test roughly the frequency of the note of noise in part, and to vary this frequency or increase its speed to such a pitch that no effect will be audible to the human ear and no beat or reverberation can take place, so by mechanical means it is possible to investigate the wave shape of various sounds and noises. By this means it is so often the simplest alteration that will effect a cure with a consequent saving. It is little use relying upon the human ear for this work which can only be employed by methods of slow elimination.

There was a time when the rattling of a coach over the cobble stones of an hotel, or the cry of a street seller were regarded as an asset. Progress has brought us to rubber roads and "Organs and street cries are prohibited." It is the effects of noise with which we should concern ourselves from the mechanical standpoint. Nearly every mechanism is without power of recuperation. It is therefore the machine, not necessarily the human frame, that we must pity.

A. M. LOW,
A.C.G.I., D.Sc., etc.

Whitgift Hospital

To the Editors of THE ARCHITECTS' JOURNAL.

SIRS,—I have been much interested in the plan which you have reproduced, having as its object the preservation of the Whitgift Hospital. The plan has on previous occasions been before my committee, but, in spite of its many advantages, it is not practicable owing to the expense involved. Locally, we have to look for a practicable scheme, and your correspondent can scarcely have adequately considered the values attaching to properties in Central Croydon. It may, I think, be taken as quite settled that Croydon ratepayers will never consent to such a scheme. I am afraid its promulgation is calculated to do harm to our cause in Croydon.

EDWARD A. MARTIN,
Joint Hon. Sec. Whitgift Hospital
Preservation Committee.

[The plan referred to appeared in our issue of October 11, and was put forward some years ago by Mr. Harold Williams.]

The Institution of Structural Engineers

THE new Institution of Structural Engineers is now an established fact. As mentioned in a previous issue, at a meeting of the Concrete Institute, held on September 28th last, resolutions were passed changing the name of the Institute to that of The Institution of Structural Engineers. On that occasion there was some opposition to the change from a minority of the members, but at a meeting of the Institute, held on October 19th, for the purpose of confirming the resolutions, this minority abstained from voting, and they were confirmed without opposition.

Mr. Wentworth Sheilds, who proposed "That this meeting confirms the resolution passed at the last Extraordinary General Meeting, held on 28th September, 1922—'That the name of the Company be changed to The Institution of Structural Engineers,'" said they were very nearly all agreed that the change of name which was proposed was the natural outcome of the work which the Institute had been doing in the past, and was due to a desire to express the work they had been doing, and would continue to do, in a more logical manner than they had hitherto done. In discussing the matter at the previous meeting, some of what he would call the "diehards" had suggested that they were trying to form a sort of addition to some of the small engineering societies existing, to range over the subject of engineering generally. That was far from being the case. He pointed out that the civil engineering profession is a very many-sided one. The Institution of Civil Engineers included within its ranks men who had specialized in different branches of civil engineering, because it was impossible for an engineer to make himself acquainted with the details of all those different classes of work, and for that reason, since the Charter of the Institution of Civil Engineers was granted, many societies had been formed to deal specially with various branches of the profession. Until 1908 there was no special branch dealing with structural engineering, but at that time the Concrete Institute was formed, and took up structural work broadly; it had more than justified its existence. At first it dealt particularly with concrete and reinforced concrete, but very soon it enlarged its borders, and admitted those interested in allied branches of structural engineering. There was no doubt that that broadening of its interests had been of immense advantage to the Institute and to the profession at large. Therefore, it was considered sensible and right that they should adopt a title which would convey their sphere of usefulness.

Professor Henry Adams, who seconded, reminded his hearers that at the previous meeting the resolution was carried by an overwhelming majority. The meeting that evening was merely a formal one to confirm the resolution, and he suggested that it would be a graceful act on the part of those who had opposed before if they would abstain from voting against it, so that it would be carried *nem. con.*

Mr. Yeatman, who opposed on the previous occasion, said he had hoped that the Concrete Institute, with its aggregate of designers in concrete, the sand of the metallurgists and chemists, and the reinforcement of structural engineers, kept in shape by the forms provided by the architects, and bound together by the cement of the organizing genius of the President, might have remained a durable structure under its old and most appropriate name. The majority at the last meeting had seemed to think differently, and he did not see a sufficiently large number present that evening to make it any use opposing. There were, of course, many fine structures in iron and steel, in which concrete took no part, but those structures needed constant care and frequent painting to preserve them from corrosion. With that word of warning, he wished all success to the Institution of Structural Engineers.

There was no amendment, and the resolution was carried *nem. con.* Two further confirmatory resolutions, dealing with the necessary alterations to the Articles of Association, were also carried *nem. con.*

The point raised by Mr. Yeatman with regard to iron and steel structures was taken up by Mr. Spencer, of Manchester, who, as a steel-work designer, reminded Mr. Yeatman that there were some reinforced concrete designers who were not quite certain what was the basis of the theory of the design of reinforced concrete, and that some reinforced concrete designers had a bigger problem than the steel-work designers. Further, as a steel-work designer, he pointed to the admirable work done by the Concrete Institute. There were, however, too few structural engineers of eminence in the membership, and he felt certain that by broadening the basis of the Institute they would get an increased membership of structural engineers. In connection with an attempt to form a branch of the new Institution in Lancashire and Cheshire, he had made enquiries to find out what increase of membership they might expect thereby, and had found that in the drawing office of his firm 14 members of the staff were willing to join. If they could get 14 new members from one firm, it was proof that they would be able to bring a big increase of membership from the Lancashire and Cheshire area.

It was mentioned by the President (Mr. E. F. Etchells) that preliminary enquiries are being conducted with a view to forming a branch in the west country, by Mr. Gomer Pimm, of Bath, whilst the formation of a Yorkshire branch, in Leeds, and of a Midland branch, probably in Birmingham, is also being considered.

At the conclusion of the proceedings a very hearty vote of thanks was accorded the members of the Council of the Institute for the work they had done in connection with the change of title. The President, who said he would have great pleasure in conveying the vote of thanks to the members of the Council, expressed his gratitude for the manner in which they had advised and helped him. He also pointed out how grieved he was that he had not been able to meet the views of the whole of the members of the Institute, but no man had ever tried harder than he had done to accomplish this.

Votes of thanks were also accorded the President, the Secretary and staff, and the solicitor.

Trade and Craft

The New Samson Clark Building.

On November 6 the new Samson Clark building, in London, will be formally opened by Lord Leverhulme. The occasion will be made a great festival to celebrate the completion of what is claimed to be the largest building devoted solely to advertising service and requirements in Great Britain. The equipment will range from printing presses in the basement to photographic rooms and studios on the roof. The new building is close to Oxford Circus.

Simplex Triple-Purpose Signs.

Messrs. Simplex Conduits, Ltd., of Garrison Lane, Birmingham, have sent us copies of their signs folder No. 957, together with a supplementary list issued some time ago. A glance at the illustrations of the Simplex triple-purpose electric signs at once reveals the possibilities of this form of advertising, especially when it is realized that a sign will not only light the window well, but will, with the same light, draw attention to the name or virtues of the wares displayed. Provided that electric current is available, there is no shop so small nor corporation so vast for whom a publicity scheme could not be devised by the installation of an electric sign. The illustrations shown represent only a selection of the signs, and by no means exhaust the resources of the extensive department set aside exclusively for their manufacture. A large number of signs have been made for leading manufacturers of every description for distribution amongst their agents.

"Alredma" Protective Paint.

The Redaluma Paint Co., Ltd., of 1 Lloyd's Avenue, London, E.C.3, are placing their specially prepared "Alredma" protective paint on the market for the first time. Composed in greater part of alumina, 60 to 72½ per cent. which is mixed with a substance to give it the necessary adherence, it is an entirely neutral product and offers a minimum of corrosion resulting from the special preparation. It is thus claimed to resist indefinitely the action of exterior agents. Moreover, the basis of "Alredma" is chemically a neutral oxide, which in determined conditions can, it is said, act either as an acid or as a base. There are several salts of oxide of alumina (sulphate, acetate, etc.), and also aluminates (of soda, lime, zinc, etc.), but these salts are not formed under ordinary conditions nor at ordinary temperatures. The moisture of the air also, it is claimed, has no action on this product, as carbonic acid will not combine with the base of "Alredma." As a result of these several protective properties it is claimed to be "as capable as red lead of resisting all changes of temperature, dampness, heat, or cold. It shows neither cracks nor scales, even after long exposure to the sun, and can withstand great variations of temperature." The paint is suitable for all kinds and descriptions of ironwork, brickwork, concrete, cement, and plaster surfaces, and woodwork. When thoroughly dry "Alredma" will take paper, distempers, varnish, or other paints or enamels without striking, or it may be used as a finishing coat of itself. It is very suitable for use also in lavatories, bath rooms, sculleries, hospital wards, laboratories, schools, offices, garages, and engine rooms.

The "Relay" Automatic Telephone System.

The "Relay" Automatic Telephone Co., Ltd., of Marconi House, Strand, W.C.2, have issued a brochure giving an interesting illustrated description of their automatic telephone system. The advantages claimed for the "Relay" automatic telephone system are considerable and manifold; not the least important being immediate connections, clear and secret transmission of speech, the elimination of human operators, prevention of wrong numbers, instant disconnection from any one number, and immediate reconnection to any other that may be required.

Directors, chiefs of departments, etc., can have priority of service when this is necessary. Conferences may be held between chiefs of departments whilst remaining at their desks, and when required, principals can have all telephone calls to their numbers filtered through their secretaries to avoid the distraction of attending to telephone calls which could be dealt with by subordinates. With the "Relay" system connections are established in four seconds. The British Post Office has recognized the value of, and the growing demand for the system, and is prepared to replace existing private branch exchanges with a "Relay" private automatic exchange, by means of which a combined public exchange and automatic interdepartmental service is provided on a rental basis.

The Admiralty have the system in use at various centres, likewise the India Office, and many of the leading banks, insurance companies, shipbuilders, merchants, and manufacturers throughout England.

Switchboards from ten line upwards can be supplied and consist of an iron frame into which the "Relay" groups are fitted. The switchboard can be increased as required, from time to time, by the addition of groups for extra subscribers' lines, without putting the service out of action.

The "Relay" takes the place of the human operator, and by a series of electrical circuits actuated through the dial on the telephone instrument, the caller can automatically get into touch with any connection required within four seconds.

The "Relay" switchboard is claimed to embody the following important advantages :—

(*a*) No electro-mechanical switches or other mechanical devices are used, therefore the system does not require any attention in connection with adjustments, oiling, or cleaning.

(*b*) The system is not liable to be affected by varying climatic conditions, whether the result of dust, heat, or damp, etc., etc.

(*c*) The switchboard has no parts that can wear out or require skilled attention.

(*d*) The whole of the operations in the switchboard are entirely controlled and actuated electrically.

(*e*) The only moving parts in the switchboard are small armatures which have a movement of one thirty-second of an inch.

All the operations of number selecting, connecting, and disconnecting are performed by telephone relays, and it is the latter feature which constitutes the keystone of this invention, and allows the business man to get in touch with any of his departments without the intervention of human operators.

The absence of moving parts, as generally understood, reduces the liability for apparatus to get out of order through wear and tear to a minimum. Each piece of apparatus is wired up in unit form in the factory, that is to say, the individual relays, with their associated wiring, are enclosed in a sheet-iron case, and the requisite number of these cases are then mounted up on H iron uprights to form the complete installation. This method of assembly enables the complete switchboard to be tested out in the factory, and, consequently, reduces the work to be executed on the site in connection with the erection and testing of the switchboard.

The Week's News

New Sea Wall for Scarborough.

A new sea wall to cost £50,000 is proposed for Scarborough.

New Art Gallery for Kirkcaldy.

A new art gallery is to be erected at Kirkcaldy, Fife.

The Brighton Aquarium.

The Brighton Corporation have abandoned the scheme to lease the aquarium for conversion into a motor garage.

Housing at Camberwell.

Camberwell has erected 448 dwellings under its housing scheme, which is now practically completed.

School Building.

Building schemes, estimated to cost £237,832, are being considered by the Board of Education.

The Rebuilding of Kinnaird Castle.

Kinnaird Castle, north of the Forth, is in the hands of the builders. It was destroyed by fire, but is being rebuilt in French Chateau style.

Housing at Weetslade.

At Weetslade, near Dudley, the Burradon and Coxlodge Coal Company propose to build from 100 to 200 workmen's houses.

Proposed Baths for Newcastle.

The Newcastle Corporation are considering the erection of swimming baths, Turkish and slipper baths, and a concert hall. The cost is estimated at £200,000.

Leadenhall Street Widening Scheme.

If the London County Council will pay half the cost, the Corporation will widen Leadenhall Street in front of East India House by 50 ft.

£70,000 Hospital Memorial.

A hospital is to be erected at Roseneath, Wrexham, at a cost of £70,000, as a war memorial for Wrexham and East Denbighshire.

New Library for Broughty Ferry.

Mr. James Thomson, city architect, Dundee, has been instructed to prepare sketch plans and costs for a new branch library for Broughty Ferry. The site has been selected.

New Stained Window for Birkenhead Priory.

On November 7 a new five-light stained glass window is to be unveiled in the restored Church House of Birkenhead Priory to the memory of Dr. R. Sydney Marsden.

More Houses for Grays.

The Ministry of Health have sanctioned the erection of twenty-six more houses by the Council, and also the borrowing of £11,123 for that purpose.

Proposed Washhouses for Manchester.

The Manchester City Council are considering the erection of public washhouses at Hulme, Ardwick, Mayfield, and New Islington at an estimated cost of £46,250, and the building of ninety-four houses on the Gorton Mount Estate.

New London Baths.

The London County Council proposes to construct open-air swimming baths in Southwark Park, Highbury Fields, and Peckham Rye, and a south-western storm relief sewer, costing £315,000.

Scottish Building Proposals.

It is proposed to erect a new infirmary at Falkirk, and additions are to be made to the Robertson-Stewart Hospital at Rothesay. At Aberdeen the University will erect a building in the Botanic Gardens at an outlay of £4,000.

Housing at Eastbourne.

It is proposed to erect a commodious concert pavilion, near the shore end of the pier. A scheme has been approved by the Town Council for the building of 100 houses on the Victoria Drive estate, the cost to be borne entirely by the town.

Institution of Civil Engineers.

The roll of honour which has been erected in the Institution of Civil Engineers to the memory of the members and students of the Institution who fell in the war will be unveiled by the Duke of Connaught on October 27.

The New County Hall.

It is proposed to allow visits of inspection to the principal floor of the new County Hall by organized parties of visitors on Saturday afternoons and by parties not exceeding six persons, and accompanied by a member of the Council, at any time while the County Hall is open.

Housing at Glasgow.

The Glasgow Town Council have had a report put before them that 13,000 houses will be required to replace those declared to be not reasonably fit for human habitation. The city housing director has been instructed to submit plans for houses, one room and kitchen with bath, and two rooms and kitchen with bath. There is a great demand in Glasgow for the two-roomed house.

The Lady Margaret Hall Chapel.

The Bishop of Winchester dedicated the temporary chapel of Lady Margaret Hall at Oxford. The ex-army hut is decorated with some stained-glass windows and will shortly be provided with an old Italian painting and an altar, designed by Sir Reginald Blomfield—both of which will be notable features in the permanent chapel that is one day to be.

£30,000 Beach Scheme at South Shields.

An important scheme has been prepared by the South Shields Council for the improvement of the beach. Following upon the acquisition from the Admiralty of the seaplane station, a very large erection, it is proposed to erect an open-air sea-water swimming bath, 176 ft. long and 50 ft. wide, together with shelters, tennis courts, and a children's playground. It is also proposed to extend the concrete platform at the seaplane station, so as to form a promenade to the South Pier. In connection with the swimming bath, it is proposed to provide seating accommodation for 2,000 spectators, and additional standing room for 2,000 people. The whole scheme is estimated to cost £30,000, and is to be undertaken in connection with efforts to provide work for the unemployed during the coming winter.

Nottingham Home for Paralysed Soldiers.

The new wing of Ellerslie House, the Nottingham home for paralysed sailors and soldiers, has been formally opened. The wing, which comprises a large recreation room for the patients on the ground floor, and an extra bedroom for members of the nursing staff on the first floor, together with a large covered veranda, has been built at a cost of approximately £1,200. Three hundred pounds remains to be raised. The extension has made Ellerslie House one of the largest and best-equipped institutions of its kind in the country.

List of Competitions Open

Date of Delivery.	COMPETITION.
Oct. 31	Essay Competition. "The True Function of the Technical Assistant in the Building Industry." Prize £5 5 0. Essays to the Secretary, Architects' & Surveyors' Assistants. Professional Union, 36 Victoria St., S.W. 1.
Nov. 1	Labour saving Bungalows. Prizes of £300, £125, and £75 are offered by "The Daily Mail." Apply to "Ideal Bungalow," "Daily Mail," 130 Fleet Street, London, E.C. 4, by above date.
Nov. 1	New Building for the "Chicago Tribune." Prizes total 100,000 dollars. Applications had to be sent to "Chicago Tribune," 5 Rue Lamartine, Paris, by Aug. 1.
Dec. 1	Pavilion to be erected in the Eastern Esplanade Gardens, Ryde, for the Town Council. Cost to be from £8,000 to £10,000. Premiums £50 to the successful competitor if the scheme is not carried out, otherwise he will be appointed at an inclusive sum of £300 to carry out the work; and £30 and £20 to competitors placed second and third respectively. Apply for site plans, together with conditions and instructions to Mr. B. F. Holness, M.Inst.M.&Cy.E., Borough Surveyor, Ryde.
Jan. 15	Hospital for a typical small community in America. Competition open to all Architects. Premiums $500, $300, and $200. Apply The Modern Hospital Publishing Company, Inc., 22 E. Ontario Street, Chicago, Ill. Closing date for applications, November 15.
March 31	War Memorial for Port Said, Egypt, to the memory of the soldiers of the Australian and New Zealand Forces who fell in Egypt, Palestine, and Syria during 1916, 1917, and 1918. Premiums: 250 guineas, 100 guineas, and 50 guineas. Apply High Commissioner for Australia, Australia House, Strand, W.C.

Competition News

Spofforth Memorial Hall.

In a limited competition amongst local architects for a memorial hall at Spofforth, near Harrogate, in memory of the late Mr. J. Godfrey Long, the designs of Messrs. Gibson and Hill, architects, of Harrogate and Knaresborough, have been placed first. The adjudicator was Mr. Sidney Kitson, F.R.I.B.A., of Leeds.

Ryde (I.O.W.) Pavilion Competition.

The R.I.B.A. Competitions Committee have issued a notice to call the attention of members and licentiates to the fact that the conditions of the above Ryde (Isle of Wight) Pavilion Competition are unsatisfactory. The Committee are negotiating with the promoters in the hope of securing an amendment. In the meantime members and licentiates are advised to take no part in the competition.

Rates of Wages in the Building Trades*

The following table, which is published in the first issue of THE JOURNAL for each month, shows the rates of wages of craftsmen (bricklayers, masons, carpenters and joiners, woodcutting machinists, slaters, plumbers,* plasterers, painters †) and labourers in the building industry. The labour rates for London are given in the Table of Current Prices on pages xix, xx.

District.	Grade A.		Grade B.		Grade C.		Grade D.

* In the case of towns printed in *italic type* below, the rates shown in the Table for craftsmen do not apply to plumbers.
† Except in Scotland, where painters are not included within the scope of the area grading scheme.
‡ Excluding Liverpool and Birkenhead, where the rates are 1s. 11d. for plumbers, 1s. 10d. for other craftsmen, and 1s. 5d. for labourers.
§ Excluding Aberdeen, where the rates remain unaltered at 1s. 7½d. for masons, joiners, and plasterers, 1s. 8d. for slaters, and 1s. 9d. for plumbers.
‖ It is reported that the Plasterers' Union in Scotland has not accepted the national reduction in June.
¶ In Scotland, labourers are not included in the general grading scheme.

Grading of Towns.

The localities in which the above rates have been reported to be in operation are as follows. In the case of localities printed in *italic type*, the rates shown in the above Table for craftsmen do not apply to plumbers.

NORTH EAST COAST :—

Annfield Plain, *Birtley*, Bishop Auckland, *Blackhill*, *Blyth*, *Chester-le-Street*, *Consett*, *Darlington*, *Durham*, *Ebchester*, *Gateshead*, *Hartlepools*, *Hebburn*, *Hexham*, *Jarrow*, *Lanchester*, *Leadgate*, Medomsley, *Middlesbrough*, *Morpeth*, *Newcastle*, *North and South Shields*, *Seaham Harbour*, *Stanley*, *Stockton*, *Sunderland*, *Thornaby*, *Tynemouth*, *Wallsend*, *Whitburn*, and *Whitley Bay*.

YORKSHIRE :—

Grade A.—*Altofts*, *Barnsley*, *Batley*, *Bingley*, *Birstall*, *Bradford*, *Brighouse*, Calder Valley, Castleford, *Cleckheaton*, *Colne Valley*, *Crosshills*, *Dewsbury*, *Doncaster*, *Gomersal*, Grimsby, *Guiseley*, *Halifax*, *Harrogate*, *Hebden Bridge*, *Heckmondwike*, Holmfirth, *Horbury*, *Hoyland*, Huddersfield, Hull, *Ilkley*, Immingham, *Keighley*, *Knottingley*, *Leeds*, *Liversedge*, *Mexborough*, *Mirfield*, *Morley*, *Normanton*, *Ossett*, *Penistone*, Pontefract, Pudsey, *Rawdon*, *Rotherham*, Scunthorpe, *Selby*, *Sheffield*, *Shipley*, *Sowerby Bridge*, *Stocksbridge*, *Wakefield*, *Wombwell*, *and Yeadon*.

Grade B.—Barnoldswick, Beverley, Bridlington, Goole, Hornsea, Scarborough, Skipton, *Whitby* (plumbers 1s. 7d.) and York.

Grade C.—Driffield, Kirby Moorside, Malton, Norton, Pickering, and Wetherby.

NORTH WESTERN COUNTIES :—

Grade A.—*Accrington*, Adlington, *Alderley Edge*, *Altrincham*, *Ashton-under-Lyne*, *Atherton*, *Bacup*, Barrow, Birkdale, Bispham, *Blackburn*, Blackpool, Blackrod, *Bolton*, Broughton (Flints), *Burnley*, *Bury*, Carlisle, Chester, Chorley, *Church*, Cleveleys, *Clitheroe*, *Colne*, Connahs Quay, Dalton-in-Furness, *Darwen*, *Denton*, *Droylesden*, *Eccles*, *Farnworth*, Fleetwood, Frodsham, *Glossop*, *Great Harwood*, *Haslingden*, Hawarden, Helsby, *Heywood*, Higher Kinnerton, *Horwich*, *Hyde*, Lancaster, *Leigh*, Leyland, *Littleborough*, Longridge, Lymm, Lytham, *Manchester*, *Middleton*, Morecambe, *Mossley*, *Nelson*, *Ormskirk*, *Oswaldtwistle*, *Oldham*, *Padiham*, *Pendlebury*, Poulton, *Preston*, *Prestwich*, Queensferry, *Radcliffe*, *Ramsbottom*, *Rawtenstall*, *Rishton*, *Rochdale*, Runcorn, St. Anne's-on-the-Sea, St. Helens, *Saddleworth*, *Sale*, *Salford*, *Shaw*, Shotton, Southport, *Stalybridge*, *Stockport*, *Swinton*, Thornton, *Todmorden*, *Tyldesley*, *Walkden*, *Warrington*, Westhoughton, *Whalley*, *Whitefield*, Widnes, Wigan, and *Wilmslow*.

Grade B.—Askam, Broughton, Buxton, Cleator Moor, Congleton, Coniston, Crewe, Distington, Egremont, Grange-over-Sands, Harrington, Knutsford, *Macclesfield*, Maryport, Market Drayton, Middlewich, Millom, Mold, Nantwich, *New Mills*, Northwich, Sandbach, Tarporley, Ulverston, Winsford and Over, Whitehaven, Workington, and Wrexham.

Grade C.—Ambleside, Bala, Bangor, Bowness-on-Windermere, Carnarvon, Colwyn Bay, Conway, Grasmere, Holyhead, Holywell, Kendal, Langdale, Llandudno, Llandudno Junction, Mostyn, Penrith, Prestatyn, Rhos, Rhyl, and Windermere.

MIDLAND COUNTIES :—

Grade A.—Alfreton, *Belper*, Bilston, *Birmingham*, *Blackheath*, *Burslem*, *Cheadle*, *Chesterfield*, Coalville, Coventry, *Derby*, *Hanley*, Heanor, Hinckley, *Ilkeston*, Kenilworth, *Leicester*, Lincoln, *Long Eaton*, *Loughborough*, *Mansfield*, Newcastle-under-Lyme, *Nottingham*, *Nuneaton*, Oldbury, Ripley, Stoke-on-Trent, *Sutton Coldfield*, *Sutton-in-Ashfield*, West Bromwich, Willenhall, and Wolverhampton. (Plumbers employed by the Birmingham Master Plumbers' Association within 8 miles of Birmingham, 1s. 9d.)

Grade B.—Atherstone, Bewdley, Boston, Brierley Hill, Bromsgrove, Burton-on-Trent, Cannock, Coseley, *Darlaston* (plumbers 1s. 7½d.), Dudley, Gainsborough, Gornal, Grantham, Halesowen, Hednesford, Kidderminster, Knowle, Leamington, *Leek*, Lichfield, Louth, Malvern, Market Harborough, *Matlock*, Melton Mowbray, *Newark*, Northampton, Oakengates, Old Hill, Peterborough, Redditch, Retford, Rugby, *Rugeley* (plumbers 1s. 7½d.), Sedgley, Shifnal, Shrewsbury, Skegness, Sleaford, Solihull, Southwell, *Stafford*, Stamford, Stourbridge, Stourport, Stratford-on-Avon, Swadlincote, Swanwick, Tamworth, *Walsall* (plumbers 1s. 7½d.), Warwick, Wednesbury, Wellington, Worcester, and Worksop.

Grade C.—Ashbourne, Bridgnorth, Church Stretton, *Horncastle*, Kettering, Ludlow, Newport, Oakham, Oundle, Raunds, Rushden, Spalding, Thrapston, Uttoxeter, Wellingborough, and Wirksworth.

Grade D.—Buckden, Eaton Socon, Huntingdon, St. Ives, and St. Neots.

EASTERN COUNTIES :—

Grade A.—Baldock, Bedford, Berkhamsted, Biggleswade, Braintree, Brentwood, Chelmsford, Cambridge, Colchester, Halstead, Hatfield, Harpenden, Hemel Hempstead, Henlow, Hertford, Hitchin, Hoddesdon, Ingatestone, Ipswich, Letchworth, Luton, Norwich, Ongar, St. Albans, Sandy, Sawbridgeworth, Stevenage, Stotfold, Ware, Welwyn, and Witham.

Grade B.—Aldeburgh, Ampthill, Attleborough, Aylsham, Braughing, Chatteris, Cromer, Dovercourt, Dunstable, Ely, Fakenham, Felixstowe, Frinton, Gorleston, Halesworth, Harwich, King's Lynn, Leighton Buzzard, Leiston, Lowestoft, March, Much Hadham, Newmarket, North Walsham, Puckeridge, Renthem, Saxmundham, Southwold, Standon, Stowmarket, Walton-on-the-Naze, Wickham Market, Wisbech, Woodbridge, Wymondham, and Yarmouth.

Grade C.—Bungay, Coltishall, East Dereham, Royston, Saffron Walden, and Tring.

[N.B.—Bury St. Edmunds :—bricklayers, masons, carpenters and joiners, slaters, plumbers and plasterers, 1s. 4½d.; painters, 1s. 2d.; labourers, 11d.]

SOUTHERN COUNTIES :—

Grade A.—Abingdon, Addlestone, Amersham, Ascot, Ashford (Middlesex), Banbury, Beaconsfield, Bournemouth, Bracknell, Brighton, Byfleet, Chalfont, Chesham, Christchurch, Cremborne, Eastbourne, Eastleigh, Egham, Eton, Gerrard's Cross, Goring, Gosport, Gravesend, Guildford, Henley, Hove, Laleham, Maidenhead, Marlow, Northfleet, Oxford, Poole, Portsmouth, Reading, Southampton, Staines, Stanwell, Sunningdale, Sunninghill, Tilehurst, Tonbridge, Tunbridge Wells, Wallingford, Windsor, Winkfield, Woking, Wokingham, and Wycombe.

Grade B.—Arundel, Ashford (Kent), Aylesbury, Bagshot, Basingstoke, Bexhill, Bicester, Bletchley, Bognor, Bosham, Broadstairs, Brockenhurst, Buckingham, Burgess Hill, Camberley, Canterbury, Chatham, Chichester, Chipping Norton, Cranleigh, Deal, Dorking (plumbers 1s. 5d.), Dover, Fareham, Faringdon, Faversham, Fenny Stratford, Folkestone, Gillingham, Godalming, Hailsham, Haslemere, Hastings, Havant, Herne Bay, Horsham, Hythe, Lambourn, Liphook, Littlehampton, Lymington, Maidstone, Margate, Midhurst, Milford, Milton Regis, Newbury, New Milton, Newport Pagnell, Oxted, Pangbourne, Petworth, Ramsgate, Redhill, Reigate, Rochester, Sandgate, St. Leonards, Sevenoaks, Sittingbourne, Strood, Stony Stratford, Stow-on-the-Wold, Thame, Walmer, Wantage, Wendover, Westerham, Westgate, Whitstable, Winchester, Winslow, Witney, Wolverton, Woodstock, and Worthing.

Grade C.—Andover, Ardingley, Farnham, Godstone, Hawkhurst, Hartley Wintney,* Haywards Heath, Horley, Isle of Wight, Liss, Petersfield, Rye, Smallfield, Staplehurst, Steep, Turners Hill, and Uckfield.

[N.B.—Leatherhead :—painters, 1s. 5½d.; plumbers, 1s. 6½d.; other tradesmen, 1s. 6d.; labourers, 1s. 1½d.]

SOUTH WESTERN COUNTIES :—

Grade I.—Bristol.

Grade II.—Plymouth * and Devonport.*

Grade III.—Dartmouth,* Exeter,* Kingswear,* Newton Abbot, Paignton, Portishead, Stroud,† Taunton, and Torquay.

Grade IV.—Barnstaple, Beaminster, Povey Tracey, Bradford-on-Avon,* Bridgwater, Bridport,* Brixham, Bruton, Burnham-on-Sea, Calne,* Castle Cary, Cheddar,* Cirencester,* Clevedon, Coleford,* Corsham,* Crewkerne,* Dawlish, Dorchester,* Exmouth, Fairford,* Frome,* Glastonbury, Lydney,* Melksham,* Midsomer Norton, Minehead,* Radstock, Shepton Mallet, Street, Swanage,* Teignmouth,* Tetbury,* Thornbury,* Totnes,† Trowbridge,* Wells, Westbury,* Weston-super-Mare, Weymouth,* and Yeovil.*

[N.B.—Bath, Cheltenham, Gloucester* (except painters), Hereford,* and Swindon* :—tradesmen, 1s. 5d.; labourers, 1s. 0¾d.]

SOUTH WALES AND MONMOUTHSHIRE :—

Grade A.—Aberavon, Aberdare, Abergavenny, Ammanford, Barry, Bridgend, Briton Ferry, Brynmawr, Cardiff (plumbers, 1s. 8½d.), Chepstow, Duffryn Valley, Ebbw Vale, East Glamorganshire and Monmouthshire Valleys, Garw Valley, Gorseinon, Llanelly, Maesteg, Merthyr, Mountain Ash, Neath, Newport, Ogmore Vale, Pontardulais, Pontypool, Pontypridd, Porthcawl, Port Talbot, Rhondda and Rhymney Valleys, Sirhowy Valley, Swansea, and Tredegar.

Grade B.—Haverfordwest, Pembroke and Pembroke Dock.

[N.B.—Brecon and Carmarthen :—tradesmen, 1s. 6d.; labourers, 1s. 1½d. Llandrindod Wells :—tradesmen, 1s. 5d.; labourers, 1s. 0¾d.]

SCOTLAND :—

Grade A.—Airdrie, Alloa, Alva, Armadale, Ayr, Bathgate, Bellshill, Bridge of Weir, Buckhaven, Burntisland, Clydebank, Coatbridge, Dumbarton, *Dundee*, Dunfermline, Edinburgh, Falkirk, Glasgow, *Gourock*, Grangemouth, *Greenock*, Haddington, Hamilton, Harthill, Irvine, Kennoway, Kilmarnock, Kirkcaldy, Larbert, Largs, Leith, Leslie, Leven, Markinch, Methil, Motherwell, Neilston, Newmains, Paisley, Pencaitland, Perth, *Port Glasgow*, Renfrew, Stenhousemuir, Stirling, Uddingston, Uphall, Wemyss, Whitburn, Windygates, and Wishaw.

Grade B.—Arbroath, Montrose, and Peebles.

Grade C.—*Dumfries*, Galashiels, Hawick, and *Maxwelltown*. (Plumbers at Dumfries and Galloway, 1s. 6d.; and at Inverness, 1s. 7d.)

[Douglas and District (Isle of Man :—Bricklayers, masons, carpenters and joiners, plumbers, plasterers, and painters, 1s. 4½d.; labourers, 1s. 0½d.]

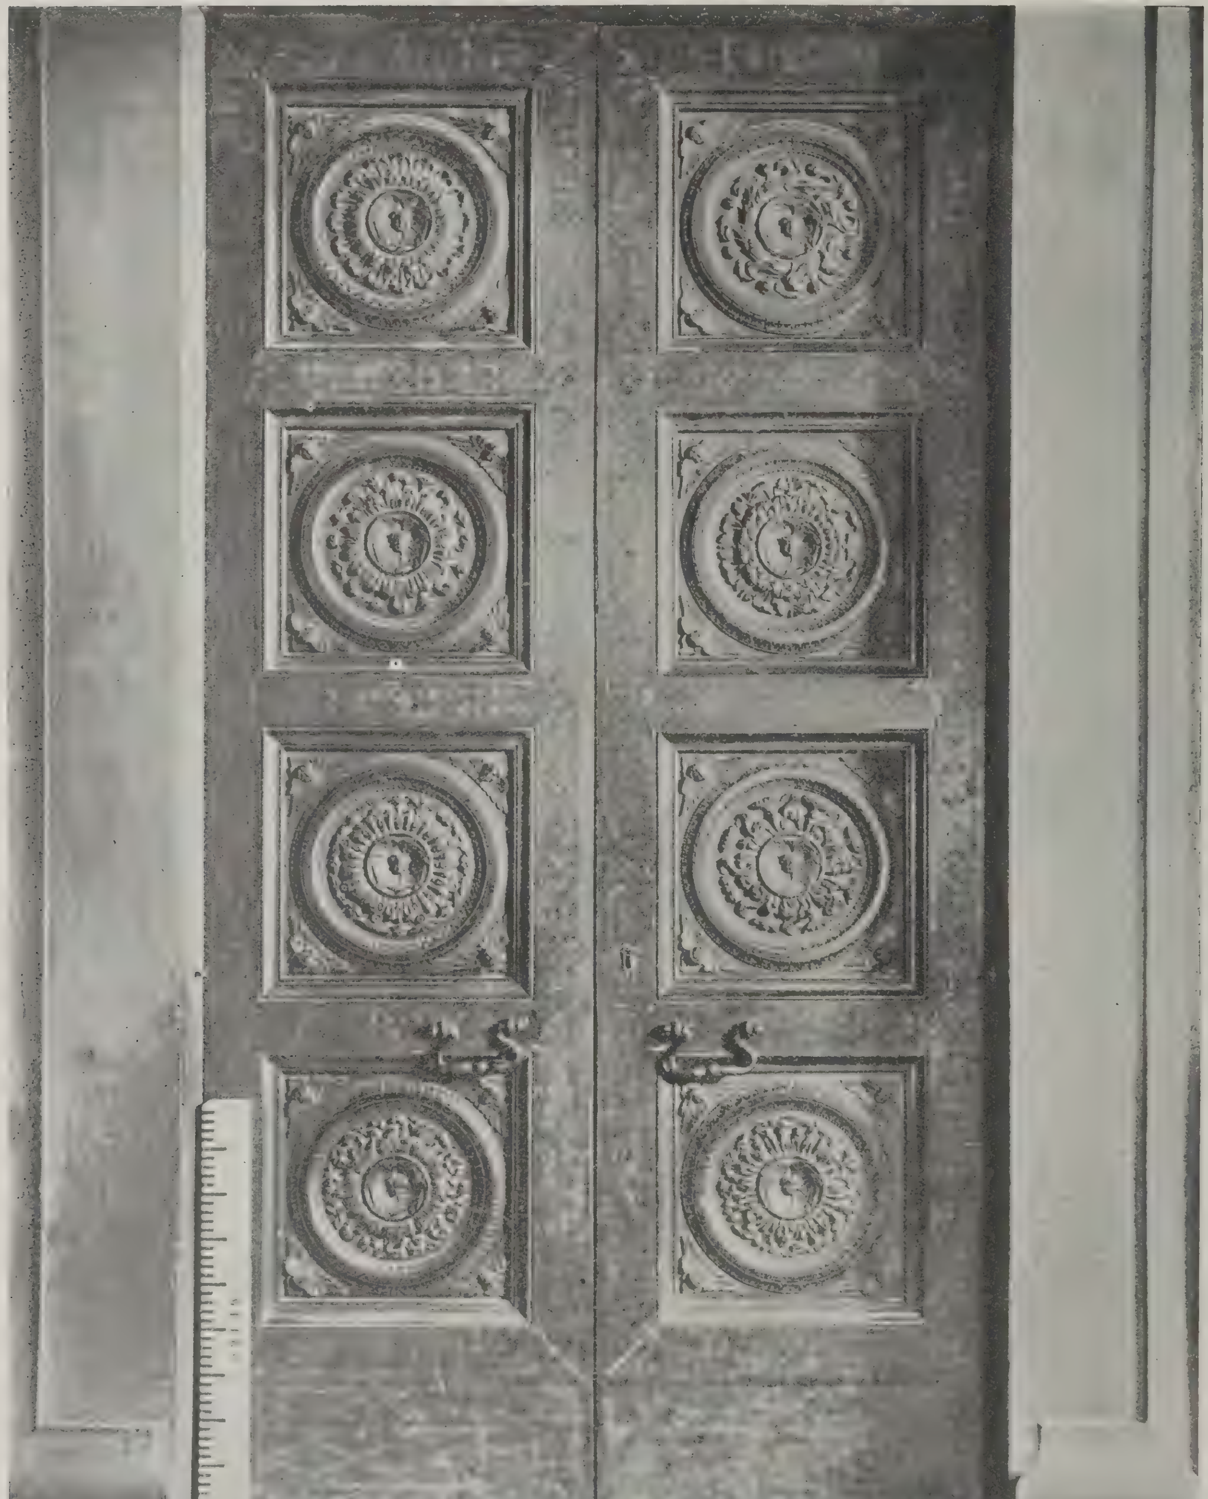
THE ARCHITECTS' JOURNAL & Architectural Engineer

With which is incorporated "The Builders' Journal."

A FOUNTAIN IN THE BOBOLI GARDENS. FROM A DRAWING BY GILBERT LEDWARD.

27-29 Tothill Street, Westminster, S.W.1.

Architectural Details. 36.—Door in the Church of Santa Croce, Florence



This magnificent door is notable for its dignity of design and richness of detail. It is of good proportion, and the carved wood panels and the surrounding mouldings are in perfect harmony, though perhaps the two wrought handles are not happily placed.

The Common Apathy towards Art: A Remedy

SEVERAL architects, including Sir Ernest George, R.A., have taken part in the continuous correspondence (in "The Times") on the newspaper practice of systematically suppressing the names of the authors of war memorials and other monuments.

It is natural enough that architects should join in this protest, because in reality they suffer from this injustice more generally than sculptors, buildings being so much more numerous than examples of statuary, while attracting much less public attention, complimentary or derogatory.

The correspondence was started by the Duchess of Rutland, whose powerful plea for a more just and more generous recognition of the artist we print on a later page. It will be seen that the Duchess's protest was directed against the common and disreputably mean practice of suppressing the names of the designers of war memorials, but it has, of course, a much wider range, and Sir Ernest George was entirely in order in putting in a word for the architect, and was only too entirely right in the reminder that "architects as well as sculptors suffer for the want of general interest in the creative part of their work." The indifference of the public is reflected not only in the lay press, but in the work of the artist, whose super-sensitive soul is always strongly affected by praise, blame, or indifference; and the better sort of architect is most distinctly of this susceptible type. Appreciation encourages him to high endeavours, but dispraise or indifference is apt to damp his ardour and dull his genius.

Sir Ernest George's letter is followed by a useful expression of opinion by Mr. Fredk. R. Hiorns, who, needless to say, is in full sympathy with Sir Ernest's point of view, and with "all who desire proper recognition of the work of artists and the association of their names with their works." As an architect speaking up valiantly, but temperately, for his own order, Mr. Hiorns makes the poignant but true remark concerning the appalling general apathy towards our important and often very fine modern buildings, that "not one in a thousand of our citizens knows the authors of even the more recent of them, or, what is worse, is interested enough to enquire." The sting of the accusation is that last painful clause. The public do not care! Why? Mr. Hiorns thinks that "the reason is perhaps not far to seek; only a very small section of our nation has what may be called an intelligent appreciation of æsthetics or any real sense of its value."

That again is only too true. But while the case is certainly grave, it is by no means hopeless. Mr. Hiorns is rightly optimistic about it. He believes—and most architects have the same robust faith—that our country would be quite responsive to the right sort of instruction, and that it is for the exponents and professors of the arts to see that they get it.

Nothing of all this will be seriously disputed. The sole outstanding question relates to ways and means; for it is above all things necessary to convince those who pull the purse-strings that there is value in art—that to educate the public in æsthetics is not only possible, but, all things considered (especially ultimate issues), would be well worth while—would, in fact, be economy at long range.

There is no need to remind us that the largest section of the British public, in their hectic craze for violent and percussive pleasures, have coarsened their tastes well-nigh irremediably. Among the thirty-five thousand to fifty thousand opportunists roaring themselves hoarse at an inconsequent football match, it cannot be confidently supposed that even one enthusiast of a moment has ever been inside Burlington House, or is capable of taking reposeful pleasure there—except perhaps some plumber who may have gone there to inspect, not the pictures, but the pipes. All the pictures he wants to see are living pictures.

Not that his preference for athletics over æsthetics should bring scorn upon him. Rather should his hard and artless case evoke sincere commiseration; he is sacrificing to percussive violence he knows not what of refined pleasure; and Mr. Hiorns is no doubt correct in his conjecture that many of our people are "quite responsive to the right sort of instruction." If they do not get it, the fault lies at other doors than theirs. It is not sufficient to open wide the doors of museum and picture gallery. The people who so persistently remain outside must be advised and persuaded that inside there is something well worth seeing. That is but another way of recognizing that the capacity of the public for the appreciation of æsthetics is not dead, but only dormant.

Yet at the adult age the faculty of æsthetic appreciation is likely to have become atrophied for want of exercise. The "human boy"—or, for the matter of that, the human girl—must be captured for art when young and tender; but the mischief is that not one school in a thousand spreads the like lure. Children are drilled in drawing, painting, modelling, carving, and other "Mechanick Exercises," as old Moxon called them, but the principles underlying them are not efficiently instilled. The pupil's capacity for admiration is not developed in the process. He is but seldom taught how to recognize good design from bad, or what are the elements of amenity in a town or in a street. He is not brought to a true understanding of shape, proportion, colour.

He should be so educated as to be able to discern for himself, by his own sharpened faculties, wherein beauty consists, and to tell whether or why a building, picture, statue, vase is beautiful or not. It is with a wry and wistful smile that one here recalls the hackneyed aphorism, "We needs must love the highest when we see it," so strong is the virtue of "when." Therein is the gist of the matter. Our faculties should have been trained to see it, and not only to see it, but to feel it, and to become obsessed with a more or less urgent desire to emulate it.

In the schoolroom there should be none but seemly objects in orderly array—flowers if you will, but certainly good pictures, including very specially views of important buildings, old and new. Beautiful and dignified objects should surround the child, moulding his mind and shaping his thoughts "in a concatenation accordingly"—creating for him an atmosphere favourable to the steady growth of a love of the beautiful and noble.

That this favourable atmosphere is almost entirely absent from our elementary and secondary schools is the gravest defect in our system of education, and the nation is suffering from it no less cruelly than the architect and the other creative artists. Hence the value of the fine protests made in "The Times" by the Duchess of Rutland, Sir Ernest George, Mr. Hiorns, and others, who have done the country an excellent service in reminding our would-be legislators, who are mainly appealing to the electors on issues that are really much less important, of a subject that has suffered from cruel neglect. We refer, of course, not to the mere omission of an artist's name from newspaper accounts of examples of his work, but to the deeper significance that this comparatively trivial fact always discloses—that it is symptomatic of the public apathy to art, which must be by all means overcome, lest the people be left without vision to perish. The remedy is to import into education the vitalizing element of Art.

The A.A. Presidential Address

Mr. Stanley Hamp's inaugural address as president of the Architectural Association was of a different complexion from the addresses of most of his precursors in office. Mr. Hamp seemed more concerned with practicality than with polish, with substance than with style. To be equally rich in both respects is to achieve a rare distinction. He did well to direct thought to a consideration of what is the architect's niche, for that is a subject on which there is much confusion in the public mind, if not among architects themselves; and Mr. Hamp's declaration of what an architect should not be expected to do—that he should not be expected to supersede any sort of specialist, still less to take upon himself the functions of all kinds of specialists, that, in effect, the public must be disabused of the idea that an architect is a Jack-of-all-Trades—is a reminder that needs frequent reiteration, lest we (or they) forget. Mr. Hamp did well, also, to uphold the dignity, not only of his own calling, but also that of the builder who is proud of his work and jealous of his reputation.

Housing Reform

The recent concerted housing appeal from the pupils of all London should spiritualize the movement. Hitherto that form of inspiration had been sadly lacking to it, and was long overdue. Until now it has been insufficiently realized that the housing of the people is something more than a purely secular matter, or a merely economic problem. Its moral aspects seemed to have been somewhat neglected by the churches, which, however, have evidently not overlooked the problem, but would appear to have been brooding over it in the hope of discovering a solution. They have not yet produced one; but the committee of the Religion and Housing Campaign have expressed a "pious hope" that, "in the midst of party strife, men and women will be able to sink their differences and unite in trying to secure the reform, which is overwhelming in its difficulty; but which can be rendered practicable by those who believe in the power of the spirit in everyday life." It is not necessary either to urge or to contest this as a point of dogmatic theology or other species of pious polity. Quite evidently the housing question has been made the football of political partisans and greedy profiteers, and it is time that these sinister housing experts should make way for humanitarians whose concern is not to get out of it all they can, but to put all they can into it. In other words, to spiritualize the movement. Hitherto, housing has been completely dominated by an extraordinarily high (but low would be the more appropriate word) degree of selfishness all round, not less observable in the persons for whom houses have been, or were to be, provided, than in those who sought to turn the opportunity to pecuniary advantage. It is to the churches that the community is entitled to look for guidance in matters of the heart and conscience, and the housing movement is one in which a change of heart is a crying need. With respect to the workers, their wholesale defeat in the municipal elections should be for their chastening, showing plainly enough that the electors will not tolerate a policy of greed and confiscation. Getting away from politics and polemics, it must be admitted that, on the whole, housing has been a horribly soulless business, always excepting the efforts of Mr. Aldridge's fine society, with certain other philanthropic endeavours of like sincerity, and the intervention of the churches was, as we have said, rather overdue. For a more purely secular view of the situation commend us to the letter of Mr. Ernest A. Fuller, of Repton, who suggests that "in order to cope with unemployment, the income from every house built during 1923 be tax-free for five years," as "this would be sufficient, probably, to induce investors to build in all directions, thus relieving unemployment amongst builders and allied trades, as well as going far to solve the housing problem. At the end of the five years there would be a much larger taxable income from house property than if nothing is done towards encouraging private enterprise in building." But then nothing ever is done; or, alternatively, as surely as a Mond succeeds to an Addison, is promptly undone almost as soon as initiated. As soon as fruition was imminent the Geddes axe was laid to the root of the tree.

Anonymous Architecture and Other Art

In "The Times" of November 1, the Rev. Waldegrave Bainbridge-Bell, of the Vicarage, Epsom, advocates the signing of architecture and other works of art. He does so feelingly, having a direct personal interest in the matter. "When seeking for the right architect," he says, "to prepare plans for the rebuilding of our church, I naturally took steps to visit recent examples of modern architecture. Often I had considerable difficulty in discovering the name of the chief craftsman. Surely there ought to be some method of recording, as in pictures, his signature." He adds that "the same necessity applies to screens, stained windows, church plate, and other important details of ecclesiastical and civic furniture." We do not follow him all the way. He is fully entitled to look for "the right architect," but there is something repugnant in the idea of stamping or engraving the church plate with the name of the artificer. With respect to the name of the architect, churches and chapels are less reticent than secular buildings. Very often the foundation stone bears the names of architect and builder, as well as of witnesses to the deed of laying it; and one has noticed, in the instance of a certain church in Edinburgh, the name of the architect, Playfair, placed in a prominent position at the entrance.

The Municipal Elections

It is with rather mixed feelings that one notes the overwhelming success of the "Economical" candidates in the municipal elections. There is such a thing as being too successful; and economy is so little understood that there is no small danger of the newly elect acting on the decidedly perilous assumption that they have been given a mandate of meanness—a rooted policy that was certainly in no need of emphasis. That our country is greatly in need of true economy is perfectly obvious, but their conception of economy is often as wasteful as that of the miser who starved to death the animal that bore the burden. To save the oats and lose the horse is the asinine conception of many a newly elected borough councillor, and our particular interest in the fact is the apprehension that a policy of muddle-headed meanness that mistakes miserliness for economy (whose name it is persistently taking in vain), will result in bad building, and little of it. We trust that this fear may prove to be groundless, but it is dictated by bitter past experience. It seems necessary to repeat once again that unwise saving is not economy, but the worst form of waste.

The Architect's Niche

Mr. Stanley Hamp's Presidential Address to the A.A.

At a well-attended meeting of the Architectural Association last week Mr. Stanley Hamp delivered his inaugural address. The gathering included Messrs. Arthur Keen, Maurice Webb, Ralph Knott, Austen Hall, Manning Robertson, H. M. Fletcher, Roland B. Chessum, and Professor Gerald Moira.

Mr. Stanley Hamp, in the course of his address, said: My predecessor in this chair gave you some very sound advice as to how to be a student. I am going, perhaps you will say, to sermonize on "The Architect and his Duties." That sounds a formidable subject, but it is not so bad as it sounds.

In meeting the Dutch architects it was forcibly impressed upon me that we architects in England were very far behind in the appreciation by the general public of our work; in fact, the more I talked with them about it the more I realized that here the architect was not really understood or appreciated as he should be. Now, why is this?

I think the present-day architect's training gives that appreciation for form and colour which no other does—and if this were more realized (and it is the architects themselves who are responsible that it is not) then this training would be more highly thought of and sought after.

The more architectural your training is, the more you will realize the truth of what I am saying, and it is the A.A. School, the Liverpool School, the London University, and others like these, that will in time make this felt. The results of the training have not yet had time to do so, but it is already interesting to see signs of what I am foreshadowing.

One of the masters here, I am told, took in hand the designing of the body of the motor car, and produced in a short time one of the best to be obtained—and what is more important, made the manufacturer realize that the designing of the body of a car was an architect's job.

Do we explore the commercial world for every new material with a view to its artistic use?

How are we to do this? Being the creative artist, which is our calling, we should at least be held partly responsible for all new departures in design made necessary by new materials and new inventions, in fact, we must follow in close touch with all these new developments.

Take, for instance, the advent of electric heating and lighting. What did architects do at its first introduction, and what might they have done? Surely it opened up a large field for design.

Until the public say at every new invention affecting the artistic appearance of their buildings or any object they live with, "What do our architects say?" we shall not occupy in their minds the place we should, in fact, we shall not occupy our proper niche.

I do not think it is our job to experiment and find out the strength of materials, such as stone, wood, metal; neither is it our job to discover the reason and remedy for dry rot—all such work should be undertaken by the builders. It is much more their duty as responsible builders to see that all this research work is done—we should only use the knowledge they would obtain. They would do this readily enough and much better than we could, if we as architects asked it of them, instead of trying to do it ourselves.

We too often look upon the builder as one who is trying to make profit at the expense of his work, but my experience is that responsible builders in this country are as anxious as we are to do really good work for the high reputation which many of them possess. They should be more encouraged to do research work upon all materials usable in buildings. They have the opportunity, and what is more, volumes of experience behind them.

In the same way, we are not steelwork engineers, neither are we experts in electric lighting and hot-water engineering, nor sanitary engineers. The sooner we leave these matters to the expert, and let the public, our clients, realize the fact, the better.

Our course surely is to collaborate with the expert. It would be a fine thing if there were a group of these various experts whom we could consult, whose knowledge and experience is so necessary to all architects nowadays.

If such a group of men started, they would, I am sure, soon get a large connection with all practising Architects, and save much waste of time and energy which now prevails. Such a body of men, if they confined their energies to this work, could do most valuable research work in the interest of the building public. It only needs a few men to start the idea and architects would soon take advantage of it.

These men must not in any sense represent any particular system but must be open to all, to advise in the particular way best suited to the particular problem. They would be men who would study every new development on its merits, and in that way be not only of great value to the architectural profession, but of service to the public.

We should say quite frankly to our clients that we are not engineers, but architects, and that for all such special work which we control we employ experts in each particular branch. If we did this, there would be fewer failures, and clients would be better served.

I think, for instance, it is a bad practice for the architect to leave to the steelwork contractor the designing and detailing of his steelwork construction in competition. It is quite impossible under such conditions to get fair competitive estimates, with the result that the firm who unwisely cuts down the weight of steel in the work will be the lowest in price.

The one difficulty which has always stood in the way of this being done by architects is on account of the additional fees payable by the client to these experts.

The architect has a duty to humanity to deal with all new requirements in the spirit of the new inventions. It is no good repeating traditional motives in our designs where, obviously, they are unsuited to present-day requirements.

With the introduction of electric heat, gas and steam heat, take, as a simple illustration, the open fire. Do we realize that in many rooms now that this is not required the chimney as a feature in our designs may disappear.

You may be interested to know that in such a building as the Savoy Hotel, and others like it, nearly all the fireplaces in the bedrooms have been filled in, and electric fires and central heating relied upon; that means that the chimney-stack for this purpose is no longer required, and with the open fire this decorative feature in our rooms will probably disappear. Are we thinking out a new treatment for when this happens? Do we lead in these things, or are we going to leave it to the trade?

To give but one more instance. Take such a residential neighbourhood as Kensington. What is to happen to the large derelict houses which, on account of changed conditions, are no longer desired? Is there no solution of this problem which can bring into use for modern requirements these buildings which are constructionally sound. Someone must solve this problem in the near future in this and other neighbourhoods.

Take again whole streets of houses in a district like Clapham. Are we as architects making any suggestion for their use. We are the people to do it in a really comprehensive way. We should think this out and guide the public to the solution.

Why not start a Designing Guild, the object of which would be to assist all those who are really anxious to improve their goods, and who at present do not consult the practising architect? Let the speculative builder come and have his houses designed. Let the factory builder, who would not employ the architect, come for advice; in fact, encourage the whole commercial world to realize that they can get sound artistic advice upon any matters and materials to do with our buildings, at a fee which would not deter them as at present; for there is no doubt that but for this the architect would be more often consulted, and the result would be to raise the general standard in design in matters which now receive no artistic consideration. It would also be a means of getting quickly in touch with practical design.

If we are creative artists, as we should be, we should demand to be consulted upon all branches of industry where artistic advice is needed, and if you think for a moment you will realize the thousand-and-one things that would be the better for such consideration; but at present it is left to the good taste of the layman, often the business man. The architect is not in his niche.

Take, for instance, materials, such as bricks, tiles, figured woods. All firms providing these materials should be encouraged to seek the advice of the architect; at present they are almost afraid to do so, although some realize that we do possess the knowledge they need.

What a field of work lies here for architects if we occupied our place in these matters. There would be no talk of us encouraging too many to enter the ranks of the profession. We should never have too many in our schools, for the outlet of their energies would be so much increased—in time, the whole world of commerce would be influenced by the training we give.

Then take all fittings, such as grates, door-furniture, and electric fittings, &c. Why is so little progress made in these things in this country? Are architects consulted by the firms who make them—and if not, why? Is it because they do not realize it is our work, or is it that they think we are above these things, or is it that they think we know nothing about them, or that if they ask our advice they will be incurring an unknown expense?

I was told by a firm of brickmakers the other day that they badly needed the architect's advice upon the right kind of brick to manufacture, but did not know how to approach anyone. They said quite frankly, "We are not designers, and therefore cannot be expected to know what various shapes and colours would be the most useful." They would willingly make and experiment if they had someone to advise them.

We have a duty to another section of the community, which, I fear, we as the controlling force in building work generally do not fully recognize. I mean the professional craftsman, such as the young decorative painter, the sculptor, the wood carver and the metal worker.

We have a number of gifted men working individually in this country who should be able to rely upon the architect for their chances. What do we do? In a large number of cases we are inclined to place such work in the hands of contracting firms. It is our duty to see that these artists are fully employed by us. Our buildings should express their time by employing these men.

I should like to see the time arrive when the architect will consider no building, however small, complete without there being in it the personal work of other artists.

For instance, instead of having in our rooms a richly moulded plaster cornice, reduce the size of the cornice and have a little plaster or coloured decorative panel executed by an artist; instead of having yards and yards of moulded enrichments in stone façades, let us have less, and, instead, have a beautiful carved panel by an artist.

We are all anxious that architects should be better appreciated in this country. We all do our work, such as we can get, and charge for it; but do we ever consider that there is much practical work we could do if we would accept for our remuneration our countrymen's approval and gratitude?

Take the Housing Problem. Have we, as architects, done all that we might have done? Why do we let Government Departments prepare for the building-public books of designs which can be bought for a few pence? I think such information is valuable, but we, as practising architects, should have produced such a book. Are we afraid of giving something away for nothing? We can hardly be so short-sighted. Then why is it?

Are there not many things that architects as a profession could do without the usual fee? Yes, there are, and I shall presently try to tell you a few of them.

There are plenty of subjects waiting to be so dealt with, as, for instance, the lay-out in front of Victoria Station. Are there not in all our cities many such problems that we, as architects, should turn our hand to? They may not be carried out, but every effort in this way is good for the profession, and in time will bring its own reward.

Take the scheme that was produced and published with regard to the Charing Cross Bridge first suggested by Mr. Collcutt, Sir Aston Webb, and Sir Reginald Blomfield. They may or may not entirely approve the scheme, but the public is interested and they are made to realize that in any case it is an architect's conception. The more work that is done in that way the more will the public realize what architects are for. At present when they consult us they often think it is an expensive luxury.

If we look back into the ages and see the big men in architecture, we shall surely see them in their proper "niche"—their reputation lies in their art, not in their qualities as engineers, or even men of literature. These things some of them did, but their energies were not hampered by all the scientific matters as ours must be if we do not ask the assistance of the men experienced in these modern scientific matters.

If we occupy the "niche" we should in the eyes of the general public, and if we do our *duty* to humanity, there is little doubt in my mind that these towns and villages of ours would be better places in which to live than they are to-day.

DISCUSSION.

Mr. Maurice Webb said that Mr. Hamp had talked a great deal about the creative artist, but there was no creation without knowledge, and he rather doubted whether architects were qualified to design the body of a motor car properly. He himself was the owner of a small car, and he thanked God every time he got into it that he had not designed the body.

He agreed that the architect ought to lead the public, and he could do it in some things, such as town planning, public health, but not in motor cars and illuminated signs.

With regard to housing, America had given us a lead, the architect's fees working out at sixteen dollars a house compared with about £30 a house in England. Housing could not stand this, and the Americans had realized it. If architects in this country were to follow, they would do more to identify themselves with housing than by any other means.

Mr. Austen Hall said that he entirely agreed with what Mr. Hamp had said. It was very natural that Mr. Webb should have referred to the way these things were done in America. It was almost impossible to keep America out of these discussions on architecture. In America they were so much more proud of their cities, and he told an anecdote of how, even at a funeral, when the followers were asked if anyone would like to say a few words, there arose one who said he would like to say a few words about Los Angeles!

Mr. Benslyn said that Mr. Hamp's remarks naturally fell into three heads: the relation of the architect to his fellow men; the relation of the architect to the experts assisting him; the relation of the architect to his client.

With regard to the employment by the architect of experts, he thought that it was largely a question of liaison.

Mr. Arthur Keen humorously remarked that had it been a stranger and not a friend who had read that paper amongst them they would have arisen in their wrath and destroyed him. Had Mr. Hamp forgotten that it was an architect who designed the hansom cab?

Mr. Roland B. Chessum spoke on behalf of the master builders, and expressed the pride a good builder always took in a completed job. Quite as much as an architect was a builder proud to walk in a great city and see the buildings he had helped to create.

Professor Moira, the painter, said that in his opinion architects were too much in a niche, and he thought it was about time they came out of it and gave other people a chance to come in.

In his reply to the vote of thanks and expression of goodwill for Mr. Hamp's term of office as President of the Architectural Association for the coming year, Mr. Hamp said that though everybody except Mr. Austen Hall had appeared to disagree with him, he found that all his critics had passed opinions which were really what he himself had already voiced. He was quite sure that he and they were all of the same mind.

Rebuilding Soviet Russia

By HUNTLY CARTER

8. The Future of Russia: A Forecast

(*Concluding Article*)

THE game of prophesying the future of Russia has occupied the attention of a good many outstanding writers since 1918. It has been, and still is, one of the most prominent features of Press articles and books on the Russian situation. "Economic Russia does not exist"; "The World needs Economic Russia"; "Russia is a Potential Klondyke"; "Russia is the Modern Aladdin's Cave"—are some of the headlines adopted to express the anxious interest in a veritable Tom-Tiddler's Ground. Statesmen, politicians, financiers, tradesmen, art and craftsmen of all countries are glancing eagerly towards a country full of mystery and uncertainty. They are told that it is being ruined beyond recovery by its present occupiers. They refuse to believe this, and even the strongest opponents of the Soviet régime are unable to compel persons possessed of common sense to accept the statement that Russia is ruined beyond recovery, or that it will become a totally wrecked country separated from civilized countries if it remains under the present Government. This does not mean that the present Government are absolutely necessary to its recovery.

Perhaps Russia's strongest hope of recovery lies in the fact that the Western World, at least, needs it economically and otherwise. It is, in a familiar trade term, a world supplier. There's no doubt about that. It can supply the world with wheat, with timber, with oil, with minerals, and with many other essentials, as an examination of pre-war exports certainly proves. Take away everything except the oil, and Russia will still remain a great commercial and economic necessity.

The world needs Russia. It is equally true that Russia needs the world. This is the age of co-ordination, not of isolation. Let Russia be modelled after a new pattern, called proletarian, communistic, or what you like; let its old bourgeois population be replaced by horny-handed sons of toil, thick-set men and massive women, naturally equipped for the wear-and-tear sort of life that a modern industrialized country is bound to provide, it is perfectly unreasonable to believe that the new type of country and its population can exist separated from the rest of the world.

It is not unreasonable to believe that the oil behind Russia is sufficient to guarantee its recovery, and, perhaps,

a rapid one. In my experience there are several more significant factors to guarantee recovery. I shall doubtless be told that I am too optimistic for my facts. I shall be accused of taking back much that I have implied in my previous articles. But I must say that I had no intention of implying that I am at all pessimistic about Russia's splendid future. If I appear to have done so I can only say that I have expressed myself badly. My articles were written for the purpose of showing that externally Russia is in a terrible condition. It is a condition that justifies the opinion that Russia ought to be rebuilt from end to end. In my view there is no reason why the truth of this condition should not be made widely known, so that foreign technicians and others may watch for favourable opportunities to participate in what is likely to be a memorable piece of nation building.

The pictures I have sketched of Russia, then, are real. They linger vividly in my mind. But behind them is a great and wonderful country—one that in olden times might easily have figured in Arabian Nights' stories of fabulous wealth hidden from the eyes of all but beings with eyesight capable of penetrating the steel walls of a Dreadnought. It has never been developed. The sight of the undeveloped agricultural areas alone is sufficient to break an agriculturist's heart. I have sat in a train and throughout a long journey noted acres upon acres of rich, fertile black earth—earth in which anything could be grown—lying idle, absolutely untilled virgin soil.

This great and wonderful country is not one to be destroyed. The Communists know it. It is a country to be built up and developed on the broadest basis. That is the only reasonable thing anyone can expect who is acquainted with Russia to-day. Some believe that the Communists will make good, and will work out their schemes. Others believe that they will be replaced by organizers and administrators of a different type, or, at any rate, that the Communists will work out the salvation of Russia, not as Communists. Personally I do not think it matters much what we call the men who do start building the new Russia. The thing that matters is that Lenin and his immediate followers have conceived vast plans—really magnificent plans—for the reconstruction of Russia, and that these plans are informed with ideals and ideas drawn from advanced, scientific, industrial, social and economic thought and action prevalent in the most modern centres of the world.

Such ideas have carried them, in spite of themselves, far beyond the Marxian standpoint. They have made them neo-Marxians — ultra-materialist philosophers, neo-proletarian economists—anything but the undiluted Marxians which they claim to be. All this is perfectly clear in their proposal to apply ideas with which Marx could not possibly have had acquaintance. Take the idea of the application of knowledge to industry, not for the sake of acquisitive gain, but for the sake of communal wealth—that is post-Marxian. The idea of the humanization of industry is Marxian, indeed, pre-Marxian, for Marx derived it from Robert Owen. But the idea that the higher education of the worker must include a human kind of industrial teaching not to be found in science alone goes beyond Marx. Such ideas, and many others as valuable, have been introduced to Russia. They will live, whatever happens to the men who introduced them, and exercise a powerful influence not only on the Russian workers and peasants, but on peoples outside Russia.

In a way we may regard the Russian Communists as planners and architects. They have outlined a new Russia, and they have cleared the ground for the preliminary work of building. But in doing so they have locked up their building resources, and they need a magician's key to unlock them. They have made many errors of judgment and have acknowledged them, and beyond this have tried to profit by the lessons therefrom. Still, after four years of destruction, they have got no further than the threshold of construction.

I think the general plan for rebuilding Russia is pretty well known. Perhaps its details are not known mainly because the plan itself has not come within practical politics as yet. The conversion of Russia into a great power country was, I believe, the original plan at the back, or front, of Lenin's mind. By power country I mean one in which the industrial and scientific sources of power are fully developed and adjusted to national and international requirements. Thus all the potential and industrial scientific resources of the country in labour productivity, in hydro-electric power, oil, turf, minerals, and so on, were to be fully considered, developed, and utilized. Scientific industry and agriculture were to be fully promoted, and humanized, and adapted to education as a means for expanding native aptitude to its full economic stature.

It is almost beyond doubt that this magnificent plan will survive the vicissitudes of changing Russia. In any case, electrification is still one of the predominating questions in Soviet Russia. To this has been added concessions. Both questions are of equal importance to the economic recovery of Russia, but that of concessions now comes first. It is, in fact, the practical one, whereas electrification is still in the theoretical stage, and theoretically faced by many real difficulties. I referred in my first article to the proposal to electrify the whole of Russia. By this means Lenin and his Government see, as they believe, an effective means of regenerating Russia both politically and economically.

Electrification is to serve as a means of proletarianizing the great mass of the population, workers and peasants alike, of realizing Russia's vast material resources, and of adding a spur to productivity and fertility. Not very long ago Lenin, when addressing the Third All-Russia Congress of the Russian Communist League of Youth, said, "Before us stands the task of the economic renewal of the whole country, the reorganization, the restoration of agriculture and industry on modern methods. You fully understand that electrification is not a matter for the uneducated, and that rudimentary education therein is not sufficient. It is not enough to know what electricity is; one must understand how to apply electrical technique to industry and agriculture, and their different branches. One must know this intimately, and the whole rising generation can learn it." Elsewhere he remarks that "it is necessary that the mass of youth from twelve years up should be educated as disciplined and conscious scientific workers." Only in this way can we hope that the great task of the electrification of Russia will be carried out in ten years. This task is no less than that of co-ordinating all parts of Russia and its life—even the life of village communities buried in dense forests or isolated in immense plains with the life of the great cities—by linking them together in a network of electric communication. So old electricity supply undertakings must be overhauled and new ones, including large, central power stations, established. And along with it must go the linking of an entire population of 130,000,000 to the task of modernizing Russia by scientific education.

The task, vast as it appears, has its practical side, and will, I believe, be attempted sooner or later. But before a start can be made there are many difficulties, besides the scientific education of an illiterate population, to be considered. After discussing the question of electrification with experts in Russia and different parts of Europe, I have come to the conclusion that the difficulties are enormous. I will not stop to consider them in detail, but will only say that, electrically considered, Russia is not by any means a privileged country. Its size, primitive conditions, orographical structure, climate, the difficulties of realizing its power resources of coal, peat, wood, and water; its present limited financial and technical resources, are all obstacles of the first magnitude. To take one concrete instance of a difficulty to be overcome in the matter of the development of hydro-electric power. There are many immensely long rivers in Russia, but they are vastly inferior as regards the volume of water they discharge to the rivers of western Europe. They describe immense curves on their way to the sea, flow with gentle gradients, and are so shallow that they dry up in summer and freeze in winter; their chief practical value is for communication between towns thousands of miles apart.

Another present overwhelming difficulty is finance. This has led Lenin to remark that Russia will have to pay the capitalists hundreds of millions of kilograms of oil for help to electrify Russia. A further difficulty worth noting arises from the fact that the plan for electrification is inseparably connected with a consistent scheme of political economy necessitating the study of many complex technical and economic questions before it can be realized in the most rational manner. Still, I need not stress these difficulties overmuch, for in spite of them all Russia presents to many prominent technical experts a wonderful field for electrical and other development. Moreover, the mind of man is ingenious enough to overcome and profit by the vastest obstacles. Look, for instance, how Germany is overcoming the difficulty presented by one of the clauses of the Peace Treaty. It may not develop its aeroplanes in one way, so it is doing it in another cheaper and far finer way. Hence the international competition in gliders.

As I have said, concessions form the immediate practical question. Concessions to the peasants and others is the first practical step towards the renewal of capitalism. But the Soviet Government is pleased to call it a new form of capitalism, to wit, State Capitalism. It looks like juggling with words. Anyhow, capitalism is now accepted as a ground of economic recovery and industrial re-establishment. The Soviet Government are aware of the great possibilities of realizing raw material in Siberia and elsewhere, and they have for some time been inviting foreign exploitation of wide areas, such as those of the timber, mine, and agricultural concessions in the north of Russia and Siberia indicated in the accompanying map (page 645). Only the approximate extent of concession areas is shown. It would occupy far too much space to describe the nature and extent of the forest, mining, and agricultural concessions. With regard to actuality, it may be said that the offer of concessions to foreign capitalists has not attracted many concessionaires. Perhaps the Urquhart bid is the largest the Government has had as yet. It is one of the attempts to obtain from the Soviet Government concessions for old property. It has been rejected on political grounds. Concession is really a method of pawning Russia to get money for rebuilding the large scale industry and carrying out the electrification plan. The reason it hangs fire is that there is a want of confidence in the Soviet Government and a refusal to accede to the peculiar terms of concession, which, for one thing, are bound to bring into conflict imported labour and native labour engaged for capitalistic enterprises.

The logical deduction from the foregoing is this. The Soviet Government are compelled by sheer necessity, political and economic, to make certain concessions, both internal and external. Externally, to obtain necessary outside co-operation to realize the vast resources of Russia and to place them on the world markets, and beyond this to reconstruct the country according to the plan already adopted. Soviet Russia, on the admission of its own Government, cannot do without co-operation, and close co-operation, with foreign peoples. How are these closer relations to be established? That is the main question. Something has already been done by: (1) recognition, as in the case of Germany; (2) exchange of trade delegations, as in the case of England; (3) proposed *rapprochement* through trade pacts, as in the case of France. Doubtless the attempt to establish co-operation will continue, but its success will depend mainly on one thing, the development or disappearance of Bolshevik communism. If Russian communism remains in the hands of extremists clearly the struggle with other nations will continue. Recovery under Bolshevik communism can only come, if at all, through a long destructive process, that is, a bitter struggle against Western forces, not only military ones, but the great world-wide anti-revolutionary body of capitalistic organizations. If, on the other hand, there is a growth of the present moderate policy, the representatives of commerce and industry and private traders of all countries will proceed to negotiate at their own risk with the Soviet Government without waiting for political agreements between their own countries and Russia. For the moment revolutionary ardour has died down all over Europe and strong moderation has ousted excess. Whether moderate politics will have the effect of changing or displacing the Soviet Government is hard to say. It is easier to prophesy that when the great rush to the new commercial Klondyke takes place, and men from all parts of the world have entered Russia to stake out claims, a political miracle will happen. Miracles do happen even in the twentieth century.

The map of concessions is a composite one made from three maps which I brought from Russia. It is produced here by courtesy of the editor of "The Beama."

Peeblesshire County and Town War Memorial

ORPHOOT and WHITING, Architects

THE town of Peebles stands romantically at the junction of the Eddleston Water, with the Tweed surrounded by rolling hills, some well wooded, others heathery moorland. The low hills near the town and the banks of the Tweed offered many fine sites for a memorial, and a number of these were considered. The memorial is placed on the east side of the courtyard of the Chambers Institution. It consists of an arcaded canopy or shrine, hexagonal on plan, sheltering the memorial proper, which takes the form of a cross. The shrine is half recessed into the new eastern boundary wall of the courtyard. The situation was not suitable for symbolic sculptured groups, and it was felt that a cross was most appropriate. The grey old courtyard seemed to call for some colour to relieve its rather sombre character, and it was decided to apply this to the cross itself which was to be the dominating motif. To get this colour and richness various materials were considered. Billiemi stone, inlaid with vitreous mosaic, was finally selected. This is a beautiful Sicilian stone little known in this country. Both these materials will retain their brilliance and withstand smoke and dirt better than those with less highly polished surfaces.

The cross, like the shrine, is six sided, and is a Renaissance version of the celtic form. It is about 13 ft. high, and stands on a low base attached to the back walls of the shrine, and is of the same stone. The shaft is tapered. The head and arms, also six sided, terminate in moulded finials, and are connected to the shaft by a detached ring surrounding the central disc at the crossing. The six faces of the shaft, arms, and head, the disc and the ring, are all inlaid with mosaics of varying patterns, based on the twelfth-century Norman Arabic mosaics of Monreale. The execution of the cross and mosaic was entrusted to a native Sicilian craftsman, Professor Matranga, whose life has been spent in restoring these world-famous mosaics. He has well justified the confidence reposed in him.

The hexagonal shrine sheltering this cross is about 13 ft. in diameter. It is treated with a simple Doric order, and surmounted by a copper cupola or ogee dome and lantern. The three sides facing the courtyard consist of open arches to enable the cross to be seen. The three sides behind the line of the eastern wall are filled in with masonry, and form a setting for panels with the names of the 541 men of the county who gave their lives. These panels are in bronze, quite plain, with bold and clearly readable Roman lettering, and are surrounded by 6 in. bands of mosaic, on the lines of those on the cross, but rather simpler and broader in character.

The underside of the roof has a groined oak ceiling divided into panels by moulded oak ribs. The ceiling is gilded to reflect some warm light on the cross. The king post of the roof projects below the ceiling as a moulded pendant.

The whole of the masonry is of Auchenheath stone. A low flight of steps leads up to the three arches of the shrine. Part of the concrete of the courtyard has been removed to make way for green turf to form a foreground for the memorial.

The general contractors were Messrs. J. Millar and Sons, Edinburgh. The sub-contractors were: Mr. T. Murray; Messrs. William Fairbairn and Sons; Mr. L. Grandison; Mr. C. Runciman; Messrs. J. G. Lindsay and Son; and Mr. A. Smythe, all of Peebles; Mr. Thomas Beattie, Edinburgh; Professor G. Matranga, Monreale, Palermo; and The Bromsgrove Guild, Bromsgrove. The Clerk of Works was Mr. William Scott, of Edinburgh.

The Restoration of Westminster Hall Roof

SIR FRANK BAINES, C.B.E., M.V.O., Principal Architect to the Office of Works

AT the Institute of Mechanical Engineers on Friday evening last Sir Frank Baines lectured on the repairs recently carried out on the roof of Westminster Hall. He began by saying that the roof had justly been described as the most wonderful example of mediæval carpentry and of a timber-frame roof that the world had ever seen. The roof was begun on January 21, 1394, and the last accounts for expenditure were 1402. It without doubt took the place of an earlier roof, namely, the original William Rufus roof. The entry in the "Saxon Chronicle" recorded the commencement of the William Rufus roof in 1097, and it was completed in 1099. The walls were still the same as those of the time of William Rufus. The William Rufus roof had evidently fallen into decay, for Richard II had given a definite order to repair the hall and re-roof it. John Godmeston, who was given the order, had power to commandeer labour and materials for the purpose, which he seemed to have done.

But the person who was really responsible for executing this great roof was Hugh Herland, the master carpenter who designed the structure. Evidently he was a fairly old man at the time, for it is found in 1366 that he was in receipt of an allowance of 10 mks. per year for his long and arduous services to the Crown. They would ask themselves on what historical basis he proceeded to work. There was, however, nothing extant that would be in the nature of a guide to give him a lead or confidence to undertake the tremendous responsibility of the design of this great roof. There were no records of a hammer-beam roof embodying in general principles those included in this design. The roof at Westminster Hall was really a true hammer-beam roof. There were many other roofs generally claimed to be hammer-beam roofs, but they were not of the true type. It was also interesting to note that in roofs of the hammer-beam type constructed since the Westminster Hall example there had been a gradual falling away in design.

The Office of Works was now dealing with the hammer-beam roof at Hampton Court Palace, but there the problem was not the same—the span was but 40 ft., whereas that in Westminster was 69 ft. Hugh Herland's problem was to re-roof the hall in one great span and to find timbers suited to the work. He adopted the principle of the hammer-beam truss with a timber arch, which acted as a brace, extending from the wall corbel to the collar beam. The design had been referred to as incomparable—the construction was also incomparable. The enormous great brace had been the means of actually holding the roof, when the destruction of the joints caused the roof to fall in. The main brace included three members, two members continuous, and the middle one discontinuous.

The original roof of Hugh Herland contained no iron in any shape, oak pins were used throughout for fastenings.

The problem of the Office of Works was to preserve the roof and not to reconstruct it. They would have loved to have had the privilege of reconstructing this mediæval roof, but what would have been the good? They could only have provided something which was a copy of the real thing. Therefore, they desired to keep as far as possible, for the benefit of our own time and for posterity, as much of the original roof in its original form as was possible. The decay was not a new thing; it had been taking place at least for the past three or four hundred years. Even a comparatively few years after the original building we hear that repairs had to be made.

The cause of all the trouble was not dry rot, but a grub called the *Xestobium tessellatum*. But for the action of this insect it might have been expected that the roof would have been as perfect to-day as when originally constructed. This led one to conclude that pedunculate oak was probably one of, if not the most permanent of constructive materials that were known. It was difficult to imagine that steel or masonry would have been so perfect after so long a period. One might say that English pedunculate boring oak was one of the finest building materials in the world.

The attack of the beetle had occurred at all junctions. There were huge cavities in the principals; in the main collar there was actually a cavity of almost 22 in. *In the past some wise person had filled one of these large cavities with concrete;* this had been taken out. Had they dealt with the matter as a timber reconstruction work they would have had to take out most of the roof. This would have been sacrilegious. On each end of the hammer-beam, for instance, there was a remarkably fine carving of an angel issuing from a cloud and holding a shield with the Royal Arms. This was priceless mediæval work. Had they had to renew all these principals and to do some new carving the whole would have been without any interest at all.

The beetle had attacked along the whole length of the hammer-beam and all the principals; that the rafters themselves had largely escaped the reason was obvious: the rafters were steeply pitched, and the female beetle would not lay her eggs on them for they would roll off. The main beam, however, was horizontal, and a good egg-laying ground. Had reconstruction then been resorted to, it would have been a case of "what was left" of the original roof.

With the present-day knowledge of construction he must admit, with entire humbleness, that they could find very little fault with the timber construction of this roof, and could hardly improve it. The upper purlins were, however, a failure. In every case they had failed; in many cases they had cracked right across. Another failure was interesting, and would not immediately strike one. The purlins were carried across the top of the hammer-post, their upper surfaces being in contact with the underside of the collar-beam. One small portion of the hammer-post, a projecting nib, was also carried up to the underside of the collar-beam.

Hugh Herland did not realize that the shrinkage in the purlin would be more serious than in the hammer-post, consequently when the shrinkage occurred the total weight from the upper collar came on to the projecting nib, and caused it to shear from the larger portion of the hammer-post to which it was attached.

It must seem that there would be weakness in the fact that the two principal members of the great curved brace were apparently housed weakly at the apex. This was not so, however, for they were housed on a projecting portion of the face of the great collar. The oak, of which this roof was constructed, was grown in Sussex, where there was still growing pedunculate oak of the boring structure. Of this oak they had used much in the restoration work.

There had apparently been no seasoning of the original oak whatever; it was practically impossible that it could be seasoned as the oak was cut between the years 1393 and 1396. Certainly, therefore, the oak was used green. A sample had been taken of some of the timbers. They were put in a humid atmosphere for a time and they *warped;* though it had been cut in the thirteenth century. Oak could only be seasoned satisfactorily in the ultimate form

in which it was to be put up. Therefore they had taken their courage in their hand and used the oak green, it not having been possible to cut it as desired before erection.

It is difficult to look at the works of repair which previously have been carried out without feeling that the architects and engineers responsible for them had not fully grasped the principles on which the roof was constructed. Even as late as 1850 Sir Charles Barry, a great engineer, had introduced some tie-bolts extending from the end of the hammer-beam to the crown-post above the collar, which, if tightened up excessively, would have caused the end of the hammer-beam to be raised from the wall-head and thus accentuate a defect which had appeared during the progress of decay, viz., the tilting downwards of free ends of the hammer-beams. The correct position of the wall end of the hammer-beam was to rest on the top of the wall and to be held in position by the downward thrust from the principal rafter.

Without doubt the great decorative feature of the roof, the mighty curved brace, had really saved the roof from destruction by supporting it. As to the repair of the roof, it could stand no more of the previous patching up, and it was necessary to design something which would take the weight, merely using the timber as a bracing. He would admit that the whole of the steelwork was carried out in a manner which might not appeal to engineers; it was very uneconomical and expensive in parts, but the necessity of the case demanded unorthodox treatment. Thus the steelwork was very heavy; it had to be to take the great pressure. Then, owing to inequalities in beams and so forth, separate templets had to be made for each joint and plate.

The *Xestobium tessellatum*, or wood-boring beetle, of which samples would be shown, lived three years in the timber. It did not want for food or water; these it got from the timber, which passed through its body, and emerged in the form of

the well-known dust. The eggs were laid by the female on the timber, and the grub hatched out by natural temperature. It immediately started boring. When about to take chrysalis form it bored laterally to the nearest timber surface. On emerging from the chrysalis, it broke the timber skin and flew away. The tapping known as the death watch was the beetles' sex call. Sir Frank Baines said he had a live specimen in his office in Westminster Hall. With the beetle twelve feet away he had imitated this tapping. At first the beetle took no notice, but when, with a little practice, he got the perfect rhythm of the call, it instantly answered.

An insecticide had been evolved, consisting of a mixture of ortho-paradichlor-benzine and cedar-wood oil, and with this it was hoped to prevent or delay the action of this grub for at least one year, which would result in freeing the wood for a very long time. To prevent the action completely would necessitate a scientific method of spraying, which would probably be too expensive for the Office of Works.

H. M. Office of Works
King Charles St. Whitehall S.W.

The lecturer then showed, by lantern slides, what was the nature of the destruction which had been found, and of the steel construction work which had been carried out. He mentioned how the plan had been to lift the principals, this being effected by the erection of a complicated steel staging. A steel bracing was carried up by a lattice at the back of the great arch, and continued by steel plates to the apex of the roof. A heavy girder collar supports the queen posts on which in turn rests the upper collar. The steel work follows exactly the tracery of the original mediæval timber, though it is so carried out as to be absolutely concealed when viewed from the floor.

One feature of the work was the fact that it was necessary to make compensation for the thrusts on the walls. The displacement diagrams were prepared, and it was calculated that the truss would open horizontally $1\frac{3}{4}$ in. under dead load with freely supported ends. It was necessary to reduce this outward thrust in order that the walls should have maximum stability.

This was done by lifting the truss with hydraulic rams, and permitting it to spread, the horizontal movements being recorded in units of 1/64 in. When this lifting takes place the roof, of course, is not covered with the loads from the purlins, roof boarding, slates, etc., and the spread of a truss under the final load has to be calculated. The figure obtained by calculation is compensated for temperature, and finally the feet of the truss are forced out horizontally by means of hydraulic rams, and then secured and bolted down into their correct positions.

In reply to the chairman (Dr. H. S. Hele-Shaw), Sir Frank said they hoped to get away the scaffolding next March or early in April, and he felt sure the Government would then allow inspection of the roof by the public.

An Exhibition of Holiday Sketches at the A.A.

THE exhibition of holiday sketches opened last week at the Architectural Association shows that architects have as nice a sense of colour as they have of form and composition. Many, it would seem, might have won as much distinction on canvas as they have in brick and stone.

Mr. Curtis Green, Mr. Austin Blomfield, and Mr. Knapp-Fisher, all indicate a delicacy and taste in the handling of landscape and architectural subjects which would sell their pictures at least as readily as many by painters of the various present-day groups.

The exhibition is perhaps limited, and does not sustain the interest as do some of the other shows by their breadth and originality; nor have the architect-artists roamed far in imagination to look for a subject, but if those chosen are somewhat hackneyed, at least they are usually well and conscientiously done.

Mr. L. H. Bucknell exhibits one or two landscapes, warm and homely, and suffused with sunset. Mr. Knapp-Fisher gives, besides others, Brookland Church, Romney Marsh, with its picturesque, misplaced steeple. Professor H. M. Berrington has some charming views of Southern

France, and Mr. Maurice Chesterton brightens the room with the poetical colouring of his "Michaelmas Daisies at Kew."

Mr. Winton Newman's Cornish and Dorset cliff-scenes are well painted, though a trifle heavy and overworked at; the pictures by Mr. Stanley Hamp and Mr. Curtis-Green show careful composition, and the latter's "Southwold Harbour" shows an eye for delicate colouring. Mr. Austin Blomfield's distant "Santa Maria de la Salute, Venice," is to be preferred to the close-up of the same subject by Mr. J. E. Lutyens, which is rather topsy-turvey and does not hold together. The former's "St. George's, Hanover Square," is also praiseworthy.

Mr. J. E. Shephard shows some Italian water-colours, and Mr. Cyril Farey contributes two architectural subjects in his well-known style.

Of particular interest is the sepia pen-and-ink work of Mr. Keith Murray. This has in it a fineness of line and handling of architectural form which amount to positive distinction. H. JOHNSON.

Contemporary Art Exhibitions

The London Group.

SELDOM have the deep-seated urges and convictions of artists been so crisply brought home to the general public as in the short foreword which Mr. John Middleton Murray contributes to the catalogue of the autumn exhibition of the London Group, where, again and again, as one goes from picture to picture, his words yield up their full significance.

The artist is the man who, amid this riot of unmeaning events, strives to pause and possess himself, and by so doing to give us the chance of possessing ourselves also. When you stand before a picture in this exhibition and ask yourself: *Is that now any good?* you are at least half-way towards a condition of mind which nowadays has to be snatched from the very teeth of angers and distractions and despairs. If you can say with deep assurance: *Yes, that is good*, you have reached it wholly.

That moment of recognition, that consciousness of revelation, is the evidence that still there is a way by which the spirit of man can conquer the world of appearance, even though at other moments the signs are legion that the world of appearance has won a final victory over the spirit of man. The artist, whose aim is to awaken this half-forgotten faith, deserves his reward. For remember that the rareness of your moments of belief is a true measure of his difficulty in grasping his. The popular professional artist, the one securely fixed in his niche, as the cliché now goes, seldom meets such difficulties, for he seldom has the capacity to create them. But here, with many of these young and keen artists, they do exist, and it is pleasant and rather thrilling to observe them.

Mr. Edward Wolfe, a South African artist of great promise, had his meed of difficulties in "Diana del la Torre" (3), which he has surmounted exceedingly well. Also Mr. Adrian Allinson, whose very lively still-life "Sunflowers" (25) is lovable for its graceful and peccant deportment. A grand and sensuous nude is Mr. Gertler's "Queen of Sheba." Miss Savo Popovitch, brings, beside her usual skill, a lot of slav cunning in the arrangement of her "Unemployed" (49). Mr. Walter Sickert, that undisputed leader of the "atmospheric school," has a large and Flaubert-like canvas called "The Bachelor Hotel" (60), an intimist scene in the French manner. Somewhat unfinished, it nevertheless possesses all the qualifications of success. The modest price quoted, £300, did not deter it from being sold. Are American agents so very cute and active? Perhaps one of the most charming oils shown is Therese Lessore's "Kensington Gardens," where discreet and alluring play is made upon effects of chiaroscuro, a painting also notable for the wide gamut of its greens. The drawings and water-colours are up to the usual standard, "In the Morning" (114), by Lydia Pearson, being especially good.

The Leicester Galleries.

Here three artists stand up for friendly trials. There is Mr. Walter Tittle, whose dry-points of "Eminent Statesmen who attended the Washington Conference," make one wonder why he so signally failed to reach the excellent standard shown in his drawings of "Authors." Was it perchance nervousness in face of so many gorgeous uniforms, and so many awe-inspiring countenances? However, we all know the delightful story of Jumbo and little Lawson . . . Of far greater interest and intrinsic values are the landscapes of Lucien Pissaro. Son of Camille Pissaro, the famous French impressionist, he struck out on his own early in life, and soon evolved that most taking way of painting, which is his and his only. No one mirrors so beautifully the sunlit aspects of our English countryside. The son works in a somewhat higher pitch of colour, but though potent, it never seems aggressive. Charm and skill epitomize his appeal and achievement.

The paintings of Simon Bussy in the third room are essentially decorative. Mr. Bussy believes in the motif. Have a motif, and play simple colours and shapes about it. So each one of his 26 oils, pivots on the decorative treatment of animals, chiefly birds. A gorgeous amount of colour is flung out; but it is done so well that at first one hardly notices how deep and insistent is the colour scheme. Light blue and dark blue are allied together on a background of cool grey, or flaming yellows stand up bravely enough against the heavy appeal of Venetian reds: it is all a trifle thin and bizarre, but as simple, bold, decorative panels these oils are an undoubted success.

G. HOLT.

List of Competitions Open

Date of Delivery.	COMPETITION.
Dec. 1	Pavilion to be erected in the Eastern Esplanade Gardens, Ryde, for the Town Council. Cost to be from £8,000 to £10,000. Premiums £50 to the successful competitor if the scheme is not carried out, otherwise he will be appointed at an inclusive sum of £300 to carry out the work; and £30 and £20 to competitors placed second and third respectively. Apply for site plans, together with conditions and instructions to Mr. B. F. Holness, M.Inst.M.&Cy.E., Borough Surveyor, Ryde.
Jan. 15	Hospital for a typical small community in America. Competition open to all Architects. Premiums $500, $300, and $200. Apply The Modern Hospital Publishing Company, Inc., 22 E. Ontario Street, Chicago, Ill. Closing date for applications, November 15.
March 31	War Memorial for Port Said, Egypt, to the memory of the soldiers of the Australian and New Zealand Forces who fell in Egypt, Palestine, and Syria during 1916, 1917, and 1918. Premiums: 250 guineas, 100 guineas, and 50 guineas. Apply High Commissioner for Australia, Australia House, Strand, W.C.

Competition News

Ryde Pavilion Competition.

The Society of Architects have issued a notice requesting their members not to take part in the Ryde (Isle of Wight) Pavilion Competition without first ascertaining that the conditions have been approved by the Council.

New Building Contract for South Africa

An approved form of agreement and schedule of conditions for building contracts has been approved by the following South African Associations:—Association of Transvaal Architects, Natal Institute of Architects, Cape Institute of Architects, Transvaal Institute of Architects, Society of Architects (London) South African Branch, Port Elizabeth Society of Architects, Orange Free State Institute of Architects, South African Institute of Quantity Surveyors, and The National Federation of Building Trade Employers in South Africa. This form of agreement is the outcome of very careful consultation between the said associations. Copies may be obtained on application to the Registrar of the Association of Transvaal Architects, P.O. Box 2266, Exploration Buildings, Johannesburg, at 6d. per copy. A copy is in the possession of the Department of Overseas Trade, and may be seen on application to Room 42, 35, Old Queen Street, London, S.W.1. (Reference 9692/ED/MP.)

Mr. Somerville a Parliamentary Candidate

Mr. D. G. Somerville, managing director of D. G. Somerville & Co., Ltd., the Somerville-Barnard Construction Company and the Entreprises Somerville, Paris, has been adopted as Conservative Candidate for Barrow-in-Furness. It was only some fourteen years ago when he started business as an engineering contractor in one small room in Victoria Street. By sheer hard work and concentration he now controls one of the largest engineering, contracting, and building businesses in this country, has his own constructional steelworks, and in France is carrying out, through his French company, huge reconstruction contracts for the French Government in the devastated regions, in addition to constructing the whole of the British Military Cemeteries in France for the Imperial War Graves Commission.

Correspondence

Counteracting the Weaknesses of Collar Roofs

To the Editors of THE ARCHITECTS' JOURNAL.

SIRS,—I appreciate very much Mr. Gunn's admirable notes on "Little Things that Matter." Evidently he is a craftsman of great enthusiasm. It is a delight to read what he says, and to realize with how great an affection he regards the materials and methods whereby we carry out our work.

I should like to comment upon, and, I hope, add to the usefulness of his notes with regard to the weakness of collar roofs at the point where the collar meets the rafter.

My suggestion is that the really sound way of building these roofs is to insert a purlin or beam under the collar at that point (see Fig. 1). This method has a number of advantages. It removes the tendency of the rafter to bend at that point and it gives a very necessary help in the way of a return plate, possibly a dragon tie, to the roof when it is hipped from the collar level upwards, as is often done in Kent and Surrey. Another (see Fig. 2) advantage is that the end of such a purlin or beam projecting over the gable wall serves as a good stout support for the upper end of any verge rafter of the part of roof below the purlin. This method also provides good supports at that point on both sides of the roof, and the appearance if good from the inside.

Another "dodge" which may be useful to those who may happen not to have evolved it for themselves, or seen it, is shown in Figs. 1 and 3. It is useful where it is necessary in a collar roof to support directly upon the wall a crossbeam which has to support in its centre an over-long purlin. One does not want to truss such a purlin, and there is a limit to the length of an untrussed one, hence the necessity of one or more intermediate supports. How, then, is it possible to get the best result where the top of side wall is, say, 2 ft. or 3 ft. below the purlin level? I wanted to avoid an expensive truss, a thrust on the outer wall, and a tie at the wall-plate level, which would have spoilt the bedroom.

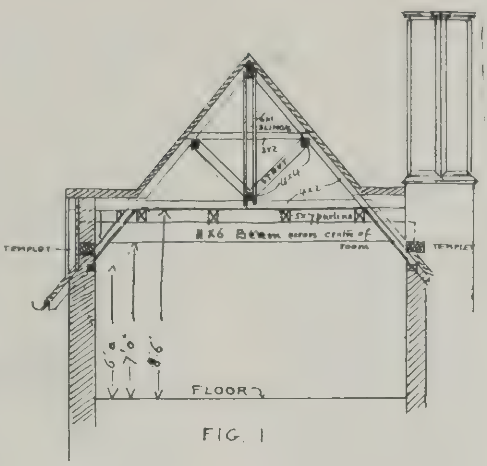

FIG. 1

TO MAKE A COLLAR ROOF STRONG

My solution was to run the crossbeam through the roof till it reached a point over the side wall, and there support it on a gablet built up for the purpose.

The great charm of many of our old farmhouses and cottages lies in their low roof-plates and their collar-roofs. By means of these roofs the greatest economy of habitable space may be secured with the minimum of waste roof space. It is therefore very useful to be able to construct these roofs in the soundest possible manner.

W. B. HOPKINS,
A.R.I.B.A.

Sanitary Engineering on Liners

To the Editors of THE ARCHITECTS' JOURNAL.

SIRS,—I have read with interest the notes on sanitary arrangements on page 551 of your Special Ship Number. While in general agreement with these remarks, may I add that the drainage system of the boat appears to be generally left in the hands of the foreman plumber attached to whichever shipbuilding yard the vessel is being erected in? The specialist sanitary engineers have frequently no voice in the arrangement of sanitary pipes on the vessel. One would certainly not expect a superior workman of the class named above to be in charge of the installation of the whole of the plumbing, etc., of a large hotel on land, and there appears to be very definite scope for trained supervision in the installation of the sanitary schemes for large liners.

The above explains the penultimate paragraph of your notes on sanitary arrangements, that "in some boats the pipes are very carefully concealed, whilst in others the pipes sprawl all over the place." This certainly is the case.

With regard to the last paragraph, I would certainly say that the English is in advance of the American sanitary engineer when it is a question of things that matter. In other words, whilst the American bathroom and its fittings may superficially appear a better one than that designed by the English craftsman, yet in the actual design of the fittings themselves there is no doubt whatever that the Englishman is very much in advance of the American. May the improved appearance of the bathroom not be due to the fact that the American employs his architect to arrange and plan the rooms?

That the English fittings are superior to the American appears to be proved by the fact that shipping companies trading with America, and having to equip ships which are mainly concerned with the transport of American citizens, almost invariably have their ships fitted in England, and with English fittings.

One would like to take the opportunity of saying that sanitary engineers rarely appear to have a voice in the selection of fittings for a boat. The matter is placed out to tender in general terms, and in exceptional cases patterns may be seen by the owners, but generally the matter is decided upon prices, and the detail arrangement of bathroom and lavatories is then in the hands of the shipbuilder.

There would appear to be no doubt that a very large field is open to architects if their services would be utilized by ship-builders in the selection of appropriate fittings and the proper arrangement of bathrooms and lavatories on liners.

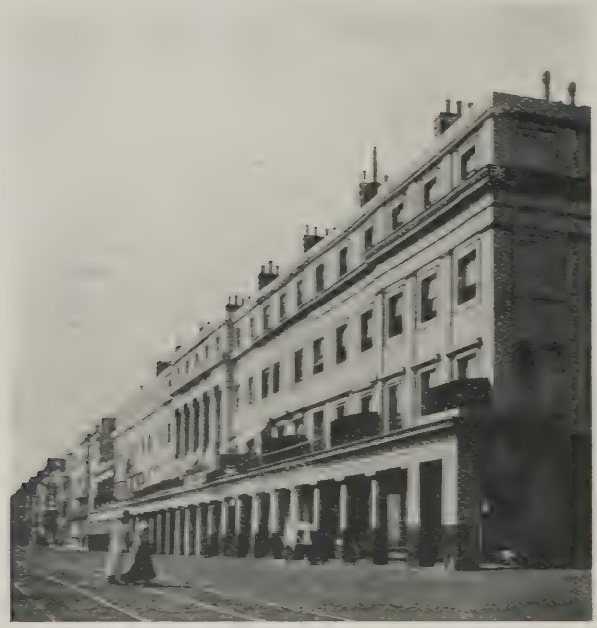
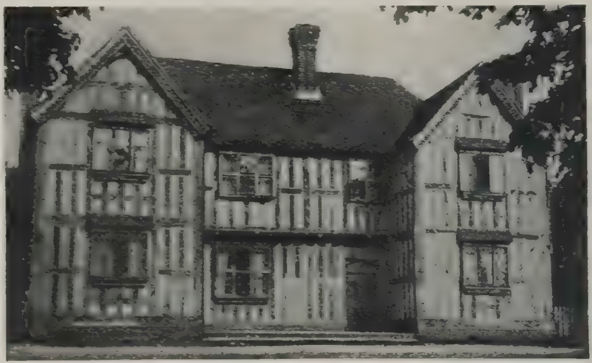
A Pictorial Review

Illustrations of Topical, Practical, or Curious Interest

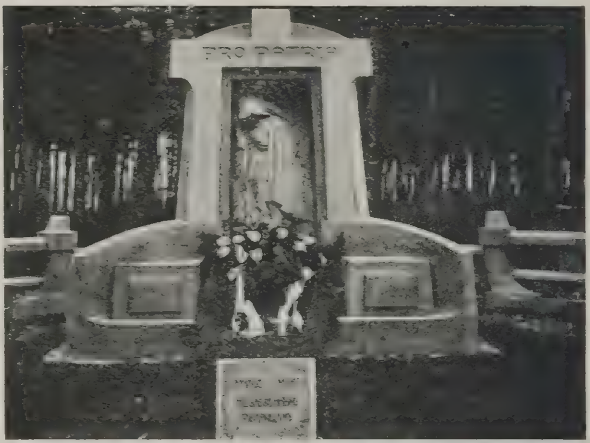
Readers are invited to send in sketches and photographs for publication in these pages. A fee of 2s. 6d. will be paid for each illustration accepted. Contributions should be accompanied by short explanatory notes.



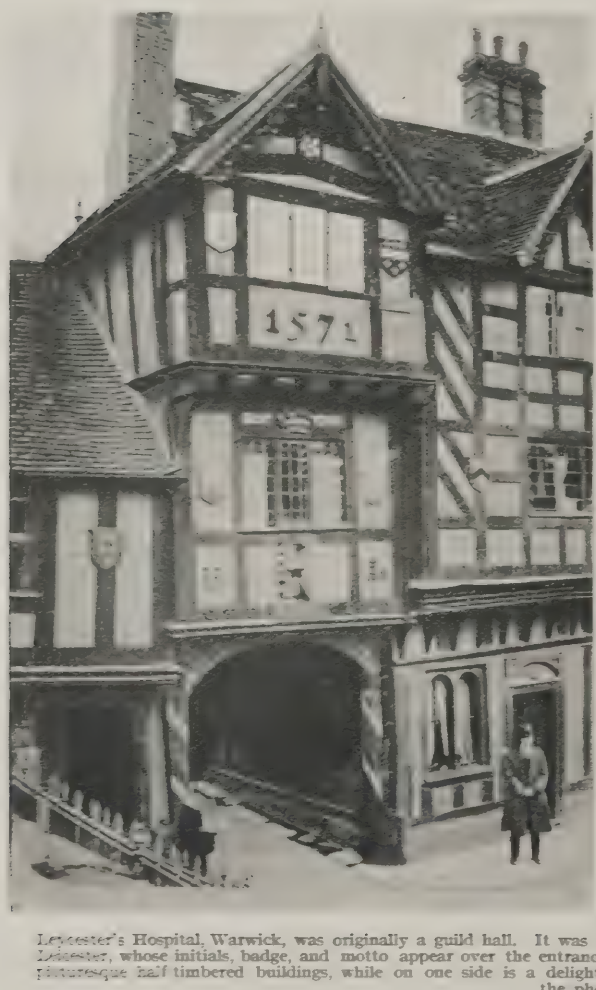
Decimus Burton made St. Leonards, and in converting waste lands into a more or less decorous seaside town he naturally resorted to the somewhat heavy classicism which in his day was so much admired in his London work. His two rows of colonnaded shops, of which one row is shown in the photograph, give a very distinctive character to the sea front at St. Leonards.—J. F.

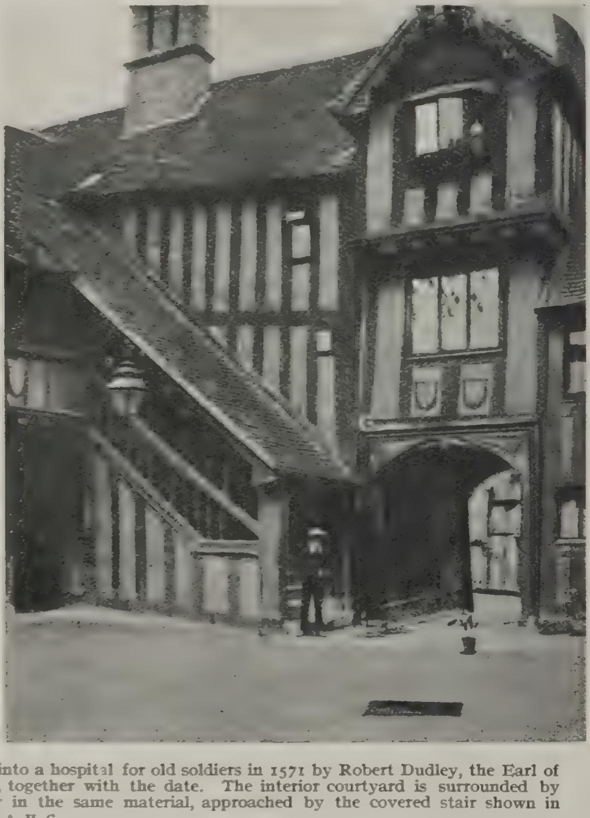


The old manor house at Bramley in north Hampshire, near Silchester. Although now divided into tenements it is in an excellent state of preservation—J. B. T.

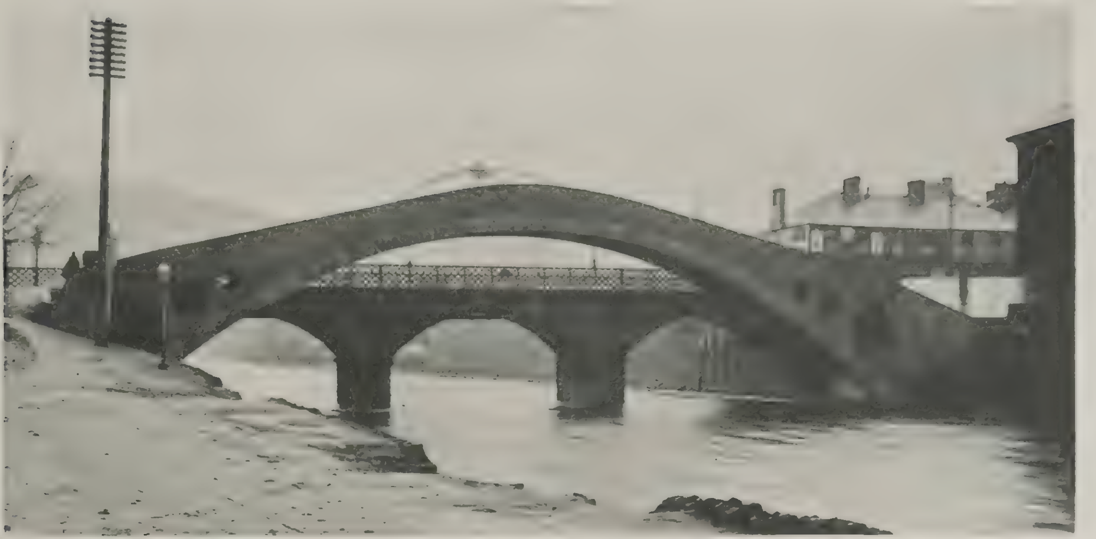


This memorial was erected by subscription in memory of British French, and Russians who died in captivity at Müncheberg Camp, Germany, during the years 1914-1918. It was executed by Monsieur Auxenfans.—S. C. C.

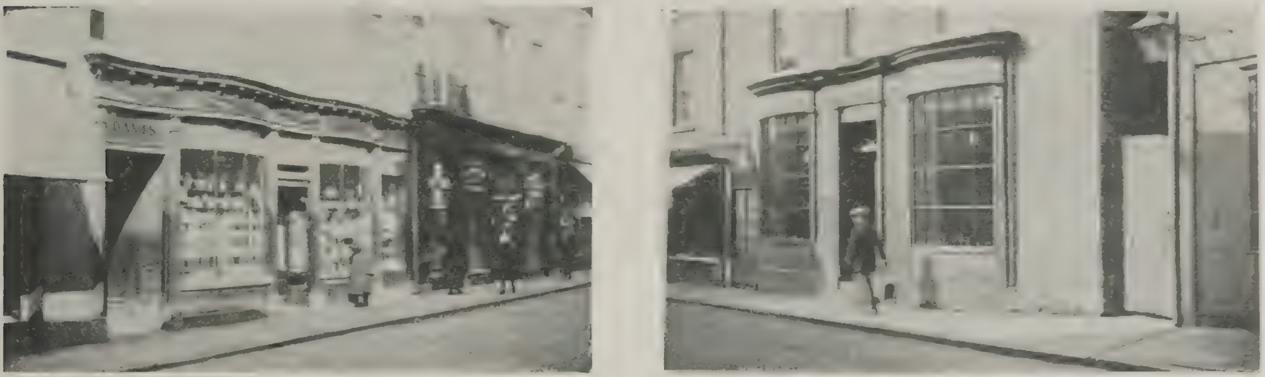




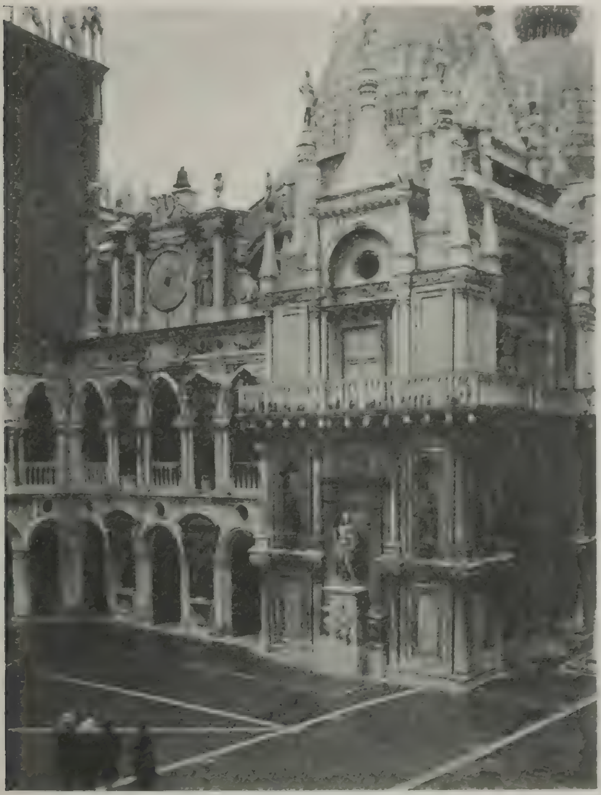
Leycester's Hospital, Warwick, was originally a guild hall. It was converted into a hospital for old soldiers in 1571 by Robert Dudley, the Earl of Leicester, whose initials, badge, and motto appear over the entrance gateway, together with the date. The interior courtyard is surrounded by picturesque half timbered buildings, while on one side is a delightful gallery in the same material, approached by the covered stair shown in the photograph.—A. H. G.



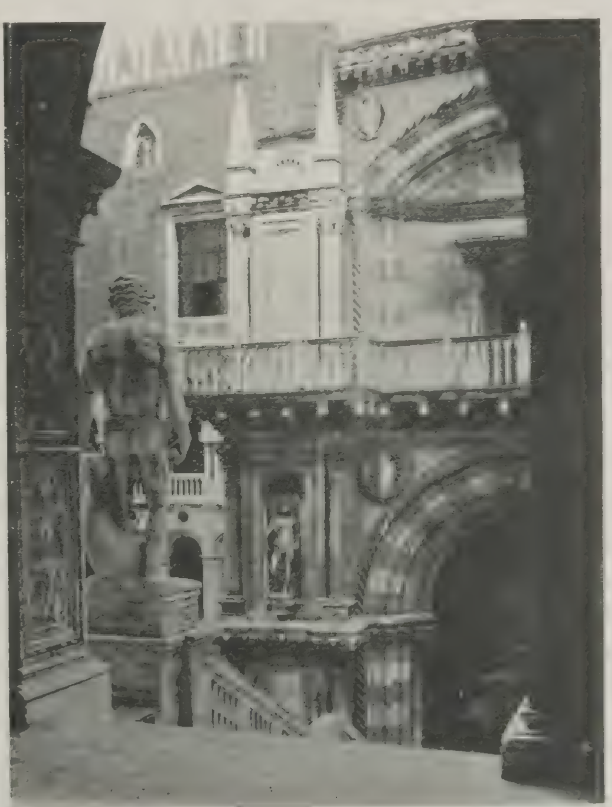
The Rainbow Bridge, built at Pontypridd in 1750 by William Edwards, a working mason, was the first bridge in Great Britain t be erected with so wide a span as 140 ft. Edwards made two unsuccessful attempts before he could secure a firm crown and eventually he adopted the three circular openings in each of the abutments. This device reduced the weight and prevented the springing of the crown.—J. B. T.



These two shop-fronts at Stamford were evidently constructed by the same hand as those at Falmouth illustrated in your issue for October 4. The concave curve over the entrances is very successful, and seems to add to their grace. The smaller front is the better design, for there seems no reason why the larger one should not curve in and out for ever, and it has been spoiled by the insertion of plate glass.—[illegible]. N.



A corner of the Cortile of the Doges' Palace, Venice. The domes in the background are those of St. Mark's Cathedral, and in front is the dell' Orologio façade, which is mainly seventeenth-century work. On the right is the Arco Foscari leading to the Giants' Staircase.—J. V. D.



A view from the top of the Giants' Staircase in the courtyard of the Doges' Palace, looking towards the Arco Foscari and the Porta della Carta. The statue on the left, representing Neptune, is the work of Sansovino, and is one of the two colossal figures from which the staircase derives its name.—J. V. D.

The South Canterbury Hospital, Timaru, New Zealand

HERBERT HALL, Architect

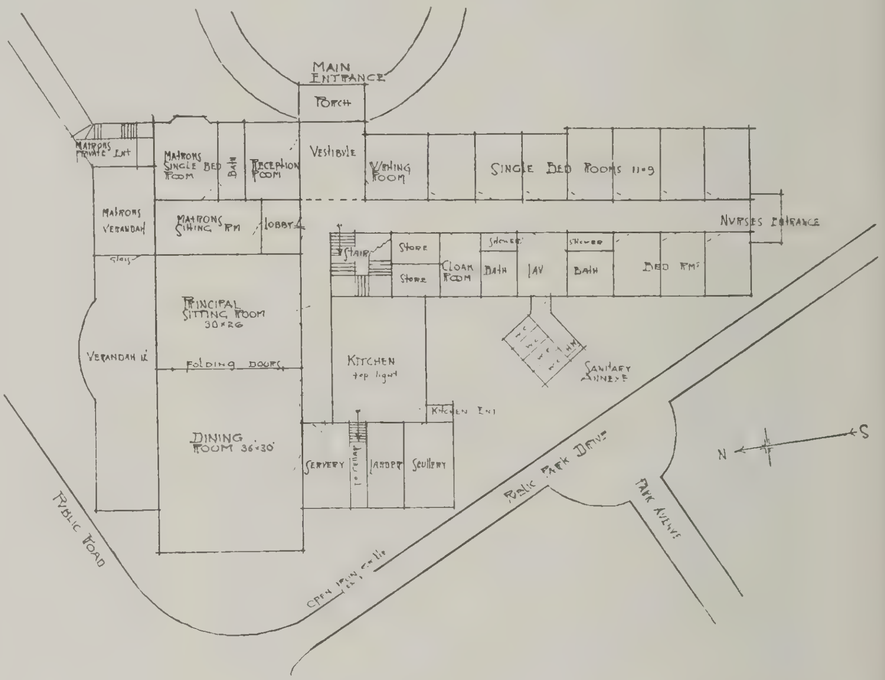
FOR the general guidance of hospital boards the State Health Department of New Zealand lay down rules for standard requirements with regard to the lay-out of the buildings and the principles of design. To adapt these set rules to the climatic conditions of different districts and the peculiarities of each site is the business of the hospital architect. In the case of accommodation for the nursing staff, the stipulations are that each member of the staff must be provided with a separate bedroom with at least 100 ft. of floor area; also that these quarters must constitute an independent building, as isolated as circumstances permit from the main hospital buildings.

The nurses' hostel at the South Canterbury Hospital provides accommodation for forty sisters and nurses, with special rooms for the matron or sister-in-charge of the hostel, while provision for building additional floors on top has been made.

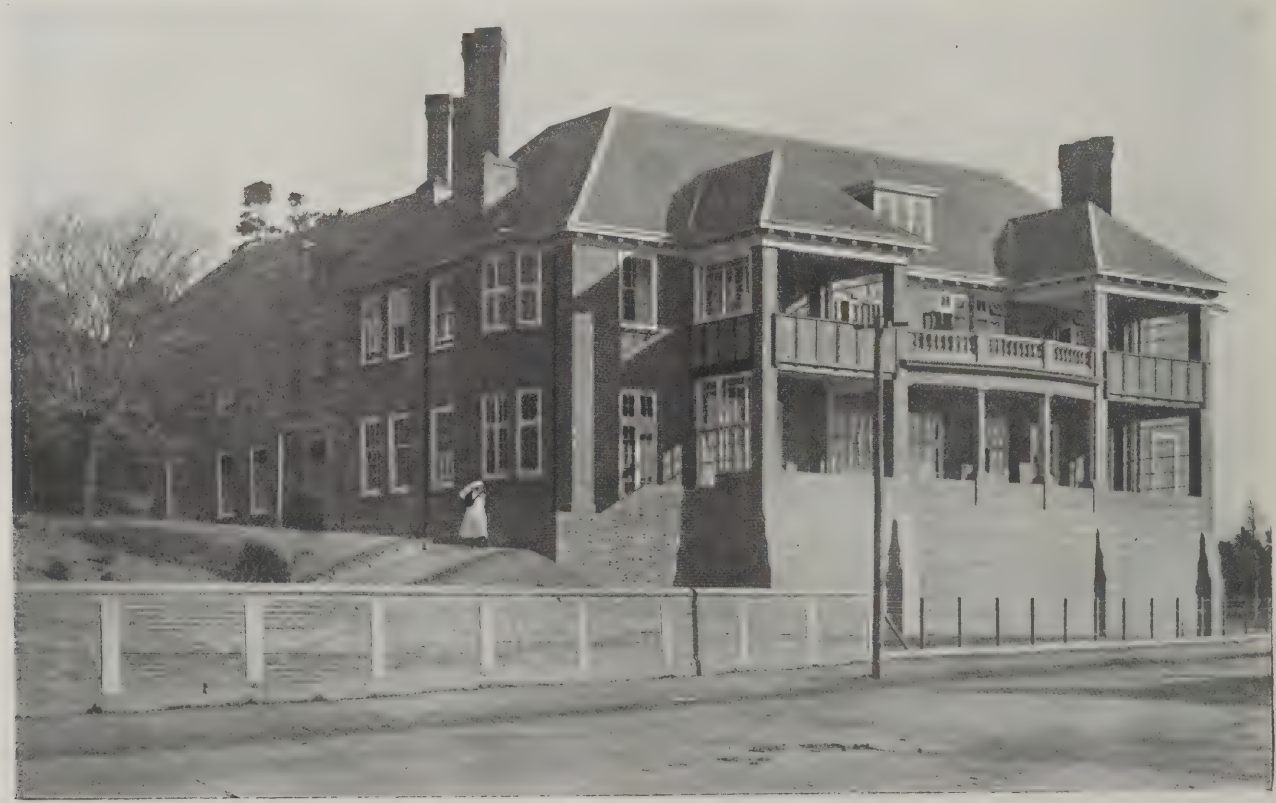
On the ground floor are placed the reception and writing-rooms, matron's quarters with bed and sitting-rooms, vestibule, bathroom, and private veranda with garden entrance. The principal common sitting-room and dining-room occupy the sunny aspect facing north. These rooms are divided by folding doors of full width, to combine them when required for dancing and entertainment. To the rear of the dining-room is the kitchen, kitchenette, servery, and other offices, only one story in height with a flat roof.

Most of the bedrooms are on the first floor, arranged regularly on either side of a main arterial corridor, and also four smaller sitting-rooms.

All the sanitary fixings are situated in a special annexe, with the bathrooms adjacent, opening off a lavatory vestibule



PLAN.



A GENERAL VIEW.

THE NURSES' HOSTEL.

containing a series of wash-basins, showers, etc. As an important public-park avenue approached the building on this side, the annexe was designed as a tower and placed opposite the end of this avenue.

Reinforced concrete construction has been used for the walls and structural members, but the building has an external lining of brickwork to provide cavity walls. For internal finish the principal rooms and vestibules are panelled with Australian bean-wood, while the trimmings are of New Zealand rimu, selected for grain and colour.

The case-isolation and infectious diseases building was erected to provide accommodation for the strict isolation of certain cases and for special classes of infection which are capable of suitable treatment in a general hospital. To get the maximum amount of open-air bed-space the verandas and balconies were arranged with a westerly aspect overlooking the public park; they were designed of sufficient size to allow all patients to be in the open air at one time.

Both floors are identical in arrangement; the external stairs are not used as communications between the two floors, but for separate access to the upper floor. They are two separate units operated independently of each other. Patients are received at the main entrance of these buildings and, after being under observation in the single-bed wards, are placed in the "acute" division and finally discharged from the "convalescent" end. Two sanitary annexes were required to give complete isolation during the progressive stages of the cases.

Each of the single-bed wards has a private veranda with glass partitions, and the wards are opened to the air by full width folding doors. The larger wards have similar isolated verandas and wide doors opening on to them between each of the beds. Every bed has a call bell and a separate movable electric light fitting.

To give the greatest open-air effect, and for thoroughness of supervision, the partitions are made of clear plate glass.

Keene's cement was used for the wall surfaces and "Fama" composition for the floors. The ventilation is entirely natural, being provided by large windows and doors, while the building is heated by hot-water radiators on the overhead system, all piping being exposed.

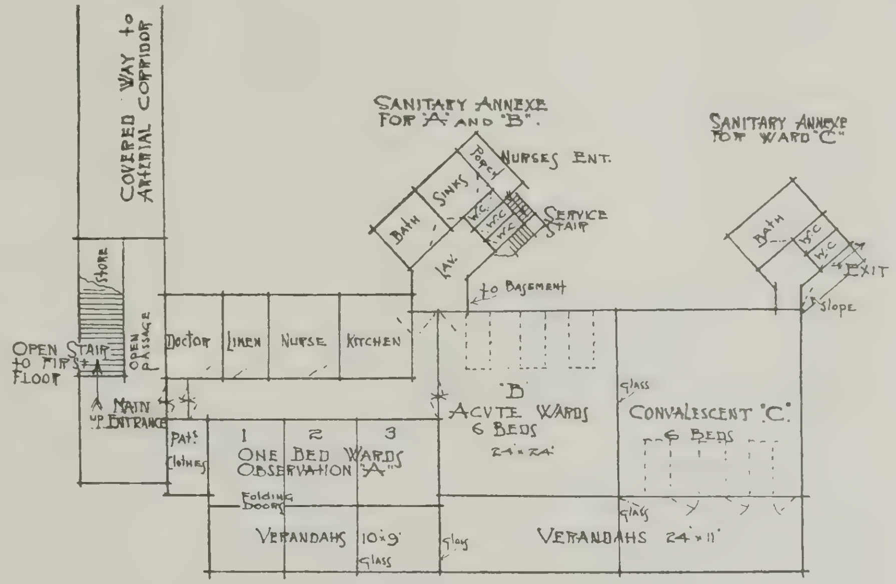
Ferro-concrete was adopted for the construction of floor members and walls, while to provide an external cavity for temperature purposes the walls were lined with a shell of brickwork.

Both the buildings above described were built by contract by John T. Hunt, of South Canterbury.

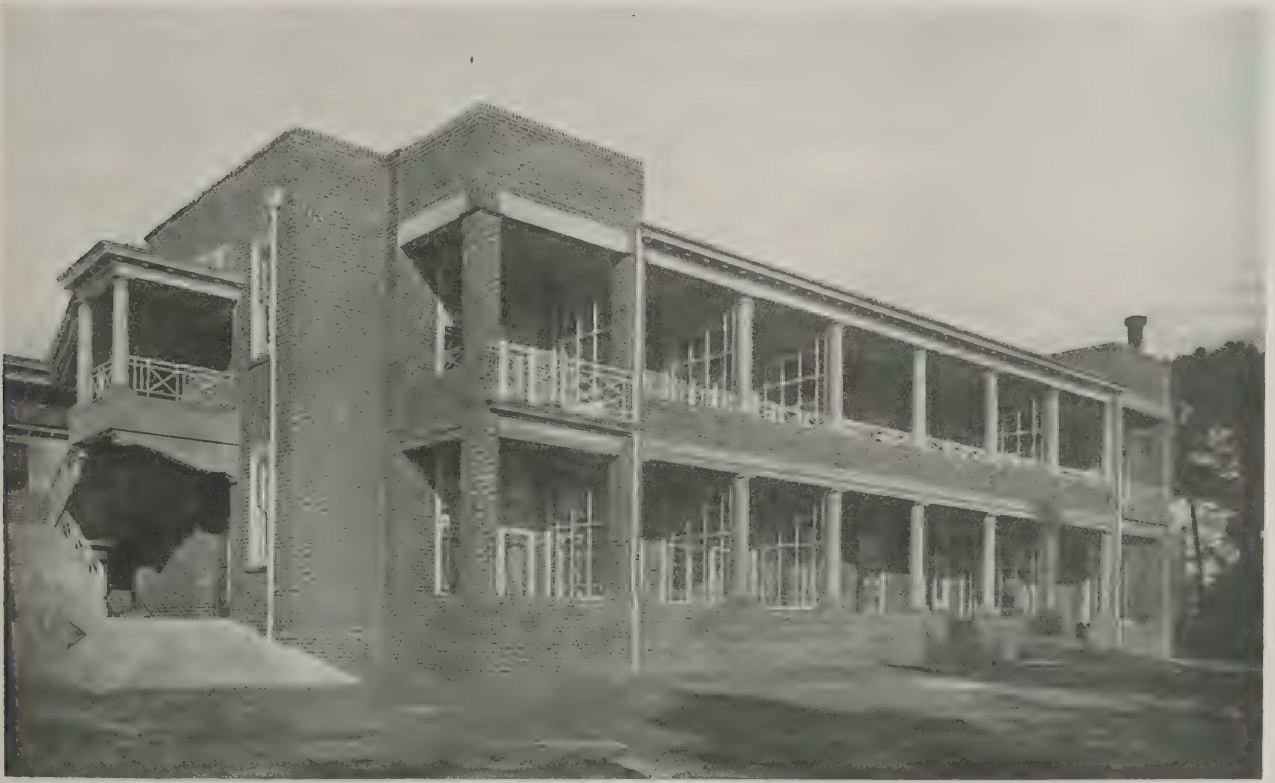
The Wannati Hospital is a smaller institution under the control of the same hospital board, and it forms part of the South Canterbury public health system. As the site is an extensive one, the buildings were designed for one story only.

For case-isolation purposes a small building capable of extension, with four single-bed wards, has been erected; 100 sq. ft. of floor space is provided in each of these wards, and a private veranda 10 ft. by 7 ft. connected to the ward by folding doors of full width. From actual experience it has been found that these doors are seldom closed, the patient preferring to be on the veranda or in the ward with the whole end open.

The patients are received at the respective veranda gates, but the nursing staff only enter and leave the pavilion through



GROUND AND FIRST-FLOOR PLANS.



MAIN ELEVATION.

THE SOUTH CANTERBURY HOSPITAL, TIMARU, NEW ZEALAND: THE CASE-ISOLATION AND INFECTIOUS DISEASES PAVILION. HERBERT HALL, ARCHITECT the special disinfecting porch at the back. Here provision is made for changing uniforms, bathing, and disinfecting before they mix with the ordinary patients or staff. To allow the freest movement of cross air-currents in the wards they were designed 2 ft. 6 in. higher than the verandas in front and sanitary annexe and passage at the back. This does not place the patient in a draught.

Glass partitions allow the nurse on duty to supervise all the wards and verandas from the duty-room, and communication by telephone to the main hospital is provided. The walls are finished with washable white Keene's cement, and the floors are of polished hardwood. Messrs. Shillito Bros., of Timaru, were the builders.

Mr. Haywood on Town Planning

Mr. William Haywood, F.R.I.B.A., has delivered the second of the series of lectures which he is giving at the Birmingham University on civic design and town planning. The course of lectures has been arranged at the instance of the Bournville Village Trust.

Mr. Haywood said the first evidences of town planning in Italy were to be found in certain lake settlements of the Bronze Age, known as Terramara, of which about one hundred existed in the north between Piacenza and Bologna, and dated from 1400–800 B.C. They next had some slight knowledge of Etruscan cities, and then the beginnings of Pompeii in the sixth century. Roman colonial town planning was first apparent in the period of the late republic, approximately 200 B.C., at which time compact bodies of emigrants were established in colonies favourably situated for the spread of Roman dominion.

The Roman policy differed from the Greek, in that their cities remained integral factors of the commonwealth, and were subject to the central power, whereas Greek settlements became politically independent. Roman colonies were arranged after the pattern of the Roman military camp. A typical example was Timgad, Algeria, founded by Trajan A.D. 100, for time-expired soldiers of the Third Legion.

Timgad proper was a very complete city, although built upon the small area of 30 acres. Its main street was colonnaded for protection from the weather. The streets were paved with stone slabs. The drainage was excellent, and public lavatories were provided on a scale to which we moderns had only attained in recent years.

The Roman settlement of Silchester in England differed from the normal. Its irregularities were probably due to its existence as a tribal centre before the Roman era. The plan was neither compact nor typical. Many houses were detached, and gardens appeared to have been common. It seemed, indeed, that even so early as A.D. 70–85 the people of these islands showed that love for gardens and individuality in housing which was characteristic of our nation.

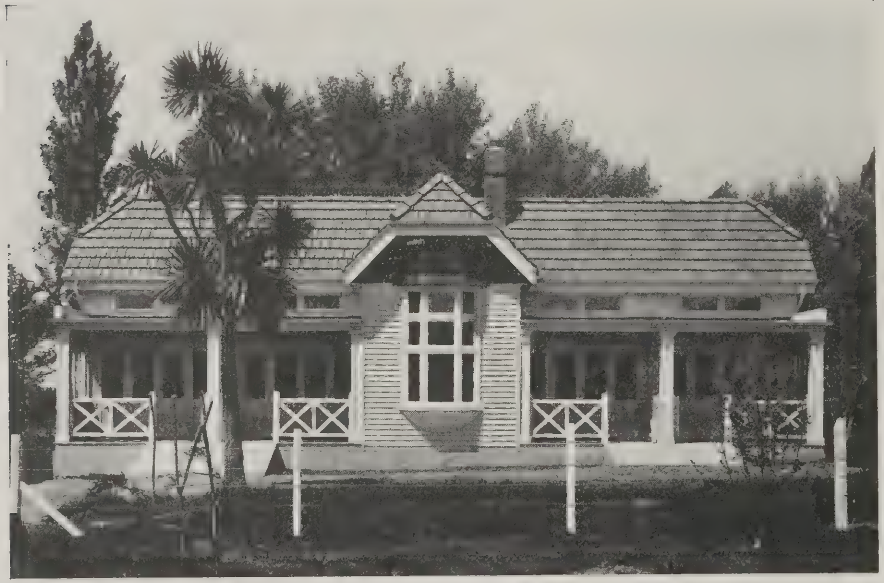
In another lecture of the series Mr. William Haywood said : No definite town forms were produced between A.D. 500 and 1000. In the eleventh century, however, strong rulers began to re-establish here and there conditions favourable to a collective form of life, and the fortress towns of the Teutonic conquests in Poland and Prussia, with those of England after the Norman Conquest, are the first indications of a new progress which culminated in the thirteenth century—the golden age of mediæval town planning.

From A.D. 1209 onwards the Papal crusade against the Albigensians led to the founding of many towns in the south of France. These towns, or bastides, were built by the invaders, not only for military security, but also as economic rivals to the older and still wealthy cities of the heretics, and settlers were attracted to them by liberal concessions of land, with the object of diverting vitality and commerce from a still hostile people.

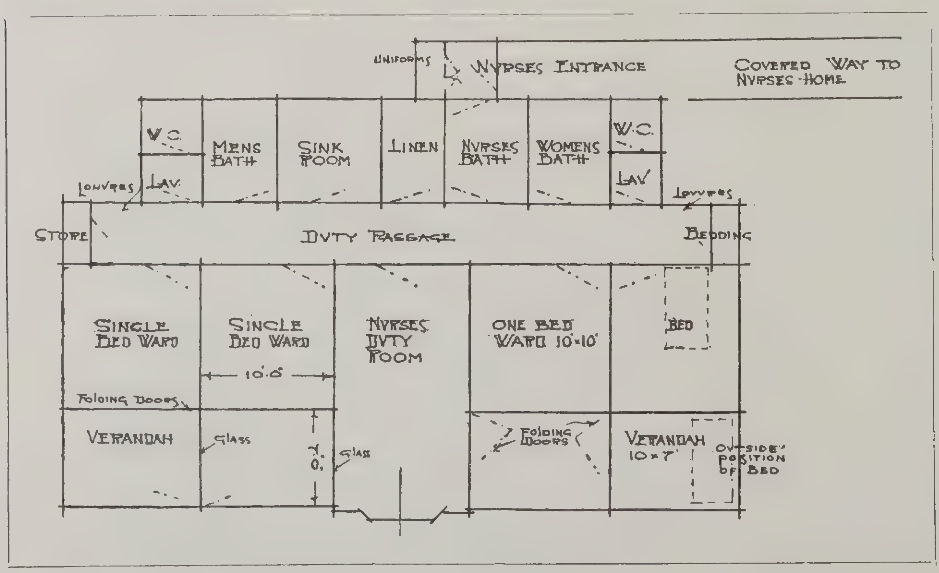
As the political situation changed many of these cities disappeared, but some still remain, usually where natural advantages in situation have satisfied more permanent needs. Thus Libourne, founded by Edward I at the confluence of two navigable rivers, is now a *chef lieu d'arrondissement* with 10,000 inhabitants, and Aigues Mortes, designed by Louis IX to become a great Mediterranean port, remains a walled city of 4,000 people.

In England Liverpool and Hull were founded by Edward I on sites so well chosen that both cities have become great. Conway, Carnarvon, and Flint, bastide in origin, have been kept alive because their situation favoured peaceful pursuits when their political function lapsed.

The chief and constant factor in the arrangement of towns founded for political purposes by military powers, whether in the Macedonian and Roman colonies, or after the conquests of the eleventh and twelfth centuries in Europe, is the chessboard type of street plan. This arrangement is evidently the first to present itself to an orderly mind when about to plan a town *ab initio*, but it is important to remember that planning of this type, while in some respects an improvement on natural evolution, is merely the readiest way of solving an immediate problem, whereas the mediæval town of natural growth, to the arrangement of which less thought may appear to have been given, was often adapted to local topographical conditions and to certain essentials of comfort and amenity which experience had shown to be desirable.



EXTERIOR VIEW OF CASE ISOLATION WARDS.



PLAN.

THE SOUTH CANTERBURY HOSPITAL, TIMARU, NEW ZEALAND: THE CASE-ISOLATION PAVILION. HERBERT HALL, ARCHITECT.

The Week's News

New Town Hall for Walthamstow.

Walthamstow Council are considering the erection of a new Town Hall.

Ramsgate Pier.

Ramsgate promenade pier, practically destroyed by fire during the war, is to be lengthened and widened.

Croydon "New Building"!

An opening in a party wall has been approved by Croydon Council as a "new building."

New Council School for Hayes.

A new County Council School is to be erected on the Hayes Urban Council housing site.

St. Paul's Bridge.

It was stated at a meeting of the L.C.C. that there was no likelihood of St. Paul's Bridge being constructed for many years.

Swimming Bath for Harrow.

Approval has been given by the Ministry of Health to a loan of £9,500 for an open-air swimming bath at Harrow.

New Science Building for Wales.

With reference to the proposed science department of the University College of North Wales, it is reported that the new buildings would cost £65,000. Building will begin next spring.

City Quantity Surveyor for Dublin.

Dublin Corporation have approved of the temporary appointment of a Quantity Surveyor on the staff of the City Architect's department at a salary of £500 a year.

House Prices Halved in Two Years.

The latest tenders of private builders for the erection of Corporation houses at West Hartlepool are within the range of £400 each. Two years ago the builders wanted £800 each for a similar class of house.

Newcastle Town Planning.

Newcastle City Council have decided to prepare a town planning scheme for the North-Eastern area of the city, and a map showing the exact area included in the scheme has been deposited for inspection at the Town Clerk's office.

New Café for Letchworth.

Plans have been approved by the Letchworth Welfare Committee for a new café and social centre. The option of a plot of land at the junction of Leys Avenue and Norton Way has been secured by the committee.

Historic Hall Destroyed.

Yaxley Hall, near Eye, Suffolk, has been burnt out. The hall, a Tudor mansion, contained some famous heraldic stained-glass windows and other historic fixtures, all of which were destroyed. A quantity of valuable furniture, however, was saved.

Aldwych Island Site.

It is reported by the Improvements Committee of the London County Council that the Bush Company (Limited) has undertaken to commence building on one wing of the island site in the Strand within a year, and on the other within two years.

Stained Glass Window in Auckland Castle.

It has been decided to complete the unfinished stained glass window in Auckland Castle as a memorial to the late Bishop Moule, of Durham, and to erect a brass tablet commemorating his life and work, the balance of the memorial fund going to St. Monica's Home, which was founded by Bishop and Mrs. Moule.

New Pavilion for Deal.

Deal Town Council have decided to erect a pavilion subject to a suitable scheme being approved. The alternate sites proposed are at the shore end of the pier, at the top of King Street, and opposite the present bandstand. Another scheme is for the construction of glass shelters round the present bandstand.

Halifax Building Society's New Leeds Premises.

The Halifax Equitable Building Society have purchased a block of buildings in Albion Street, Leeds, and early in the new year the Society's directors are hoping to reconstruct the premises and make them the branch offices of the Society. Hitherto the Halifax Equitable Society have not attempted business on an extensive scale in Leeds.

New Concert Hall for Broadstairs.

Broadstairs is to have a new and up-to-date Pavilion, Concert Hall, and Winter Palais de Danse. It is to be erected on the sea front, where, in pre-war days, the old Grand Pavilion used to stand. The plans have been prepared by Mr. Geo. Graham Tucker, and the buildings will accommodate over 1,200 people. It is anticipated that the new buildings will be ready for business next June.

An Architect Drowned.

The body of Mr. Percy Walker, 42 years of age, architect, has been recovered from the canal, Droylsden. Mr. Walker, who resided at Fairfield, was subject to epileptic fits for many years. The coroner, Mr. Bennett, at the inquiry gave a verdict of accidental death, due to drowning from falling into the canal whilst subject to a fit. Mr. Walker was the architect of St. Andrew's Church, Droylsden.

Cottages £310 Each.

Tenders for the building of twenty-six semi-detached cottages, containing parlour, living-room, scullery, three bedrooms, bath-room, etc., at the cost of £310 each, have been accepted, states the Ministry of Health, by the Bentley-with-Arksey (West Riding of Yorkshire) local authority. The cottages will be of brick with tiled roof, and the price covers the provision of drains, paths, fences, and the installation of electric light.

Deceased Architect's Will.

Mr. Arthur Harrison, F.R.I.B.A., of The Croft, Yardley Wood Road, Moseley, Birmingham, a member of Messrs. Harrison and Cox, Colmore Row, Birmingham, architects, and a former president of the Birmingham Architectural Association, who died on August 22, has left £31,441, with net personalty £17,818. He gives any one of his drawings or paintings by J. W. Wainwright to the Birmingham Corporation for the Art Gallery.

Leeds School of Art.

The following awards have been made in connection with the Architectural Section of the Leeds School of Art Sketching Exhibition :—

Architectural Design : G. W. Alderson, for drawings of an Italian villa.

Measured Drawings : F. Chippendale, for drawings of Bolton Abbey and Adel Church, Yorkshire.

An exhibition of R.I.B.A. Prize Drawings, for 1922, and specimen Testimonies of Study have also been held in the City Art Gallery.

Exemption from R.I.B.A. Final Examination.

The following candidates, who have taken approved courses at their respective schools of architecture, have satisfied the vice-presidents of the Royal Institute in the examination in professional practice : E. R. Arthur, School of Architecture, University of Liverpool; W. A. Devereux, School of Architecture, The Architectural Association; P. B. Haswell, School of Architecture, University of Liverpool; I. A. Moodie, School of Architecture, Robert Gordon's Technical College, Aberdeen; G. B. Scotland, The Glasgow School of Architecture.

R.I.B.A. Special War Examination.

The R.I.B.A. special war examination will be held from December 11 to 14 inclusive. Candidates may sit in London, Liverpool, or Leeds. The method of conducting the examination has been revised. There will be *no* oral examination on the day following that on which the work on the design subject is completed. At the close of the examination on December 14 the designs of all the candidates will be forwarded to London for consideration by a special jury of the Board of Architectural Education. The jury will have discretionary power to call any particular candidates to an oral examination which will be held in London *only* at a later date. These candidates will be required to bring their approved testimonies with them to the oral examination.

The New County Hall.

At the last meeting of the London County Council, Mr. J. D. Gilbert asked the chairman of the Establishment Committee whether the committee had come to any decision as regards the completion of the new County Hall by erecting Block D, and whether any report had been presented to the committee by the architect urging that the final block should be erected forthwith. Mr. Greenwood said the committee had not come to any decision. The architects had reported on certain factors requiring consideration in view of the present foundations of the building being incomplete. This aspect of the position, as well as the question of Section D generally, was being carefully examined by the committee, and a report would be submitted, he hoped, this side of Christmas.

Two Grates in One

A valuable contribution to the solution of present-day difficulties has been made by Mr. Allan Ure, the inventor of the dual grate illustrated on this page. We recently had the pleasure of examining the Back-to-back Living-room Grate and Scullery Cooker, which may be seen in action in one of the L.C.C. Housing Schemes near London, where it has been installed, and were greatly impressed by the domestic advantages of the invention. By the use of this grate, which is built into the wall between living-room and scullery, an open fire in the one room and a cooking range in the other are obtained with a single fire, and where a high-pressure boiler is installed an abundant supply of hot water is available soon after the fire is lit.

The accompanying illustrations show the construction of the grate, built into an 18 in. wall. On the living-room side nothing is to be seen but an inviting-looking open fire with two swinging side trivets, one of which can be taken off and used over the centre of the fire. By the use of these, and of the extra boiling ring at the bottom of the oven, ample space is available for saucepans, while baking can be done in the oven itself, in which an excellent heat is maintained with an extraordinarily small consumption of coal. A hot bath can be enjoyed in one and a half hours (and a kettle can be boiled in fifteen minutes) after lighting the stove. After the stove is heated water can be boiled in half that time. The oven heat is regulated by a damper, and it should be noted that there are no flues to build at the sides or back, the thickness of one brick forming the bottom of a 3 in. flue under the oven. Glasgow, Manchester, and other public bodies have already shown their appreciation of the Back-to-back Grate by installing it in their various schemes, and its obvious economy and undoubted efficiency should recommend it to promoters of house building all over the country.

Coming Events

Wednesday, November 8

Chadwick Public Lecture.—"Ventilation in Mills and Factories." By Professor Leonard Hill, M.D., F.R.S. Textile Institute, Manchester. 4 p.m.

Thursday, November 9.

Society of Architects.—Presidential Address. By Mr. E. J. Partridge, F.S.Arc., F.S.I. 8 p.m.

Sheffield, South Yorkshire, and District Society of Architects and Surveyors.—"The Architecture of Two London Streets." By Professor C. H. Reilly.

Birmingham University, Edmund Street.—"Mediæval Town Plans." By Mr. Wm. Haywood, F.R.I.B.A. 5.30 p.m.

Friday, November 10.

Town Planning Institute.—Presidential Address. By Mr. H. V. Lanchester, F.R.I.B.A. 6 p.m.

Institution of Heating and Ventilating Engineers.—"Instruments for Heating and Ventilating Engineers." By Mr. M. Kinoshita, M.Sc. 7 p.m.

Saturday, November 11.

Building Surveyors' and Inspectors' Association.—"Triangulation in Roof Construction." By Mr. Walter Percival, Grissell Prizeman, Liverpool Technical School. 3 p.m.

Metal Industry Research Work

A new pamphlet, "Research Work in Progress," has just been issued by the British Non-Ferrous Metals Research Association, of 71 Temple Row, Birmingham. The investigations in hand cover many important problems of the copper, brass, aluminium, nickel, and lead industries, as well as subjects of importance to all users of such metals. The support given to this association by the leading firms seems to be most encouraging, but the field covered is very wide, and many of these researches, such as those on the improvement of brass, on metal polishing, and on soldering, should attract the attention and support of many other sections of industry. The user is apt at first sight to overlook the fact that he is even more interested in the improvement of quality of his raw material than the manufacturer of the metal. In the case of failure, however, it is the user who always bears the greater loss, since he sacrifices all the time and workmanship which has been expended on the article being manufactured.

The Bureau of Information of the Association also seems to be doing excellent service in distributing to members reports of the results of the experimental researches and acting as a live intelligence service collecting and distributing information likely to be of service.

Finally, some indication is given of the further work which the council hope to take up when additional financial support is forthcoming, which includes problems of importance to the electrical industries, to die casters, and to the tin-plate trade.

The Elections and the Housing Movement

TO-DAY no one doubts the presence of a strong tincture of political virus in the State housing movement. In plain words, the movement was engineered, the needs of the people were exploited, for party purposes, and those who engineered it are being called to account at election meetings. Its Nemesis will haunt them, and occasionally secure their defeat.

It is not to be lightly assumed, however, that all their accusers are *ipso facto* angels of light. Many a perfervid denouncer of "the housing muddle," or "betrayal," or "fiasco," or whatever other fancy description may be applied to it, by impassioned orators with their tongues in their cheeks while waiting for the applause to subside, has no real interest in the matter beyond that of vote-catching with an effective bait.

Some few earnest souls there are, no doubt, whose denunciation is perfectly genuine and from the heart. In their case it is prompted by a sincere desire for the physical and moral welfare of the people, and by consequent indignation that State interference in such a vital matter has proved to be injurious rather than beneficial, because that interference was to so great an extent merely political.

Equally in earnest, no doubt, are some few members of the Labour Party who so vigorously denounce the housing muddle of the late Government; but the bulk of the railing accusers, no matter to what party they belong, are simply exploiting the subject with political intent. 'Twas ever thus, and it would be futile to deplore or deprecate so inveterate, so deep-seated a habit.

Nor is the housing propagandist entirely exempt from suspicion of placing self-interest before the interests of the commonweal. In most instances, housing reformers are unquestionably altruistic—self-sacrifice rather than self-interest is the badge of all their guileless tribe. Some other types of propagandists have only too evidently some sort of axe to grind, and they are not always at pains to conceal the fact, feeling well aware that their axe-grinding is of a perfectly legitimate kind; for though the whetstone is manifestly self-interest, nevertheless the grinding process s of some benefit to the community at large. At all events, the operator always likes to think so, whether or not the assumption is quite firmly based on the facts.

We are not at all sure whether "philanthropy and five per cent." (or whatever the current rate may happen to be) s not a fairly sound policy after all. To build on a basis of doles and subsidies is to build on a rotten foundation, and he system has wrought untold havoc all round, the very people (but not the profiteers) whom it was ostensibly ntended to benefit being almost the worst sufferers from t. At all events, it is they who are sending up the most xceeding bitter cry, and who, indeed, have the most subtantial reasons for feeling acute disappointment and istress. They are direct sufferers from the State interference from which no single member of the community always excepting the profiteer) can have escaped absolutely cathless. Of course, the true remedy is to make reasonbly sure that this State interference with housing, or with ny other legitimate phase of building or other kind of usiness activity, shall not happen again.

It is to make reasonably sure on this head that the National Federation of House Builders are endeavouring to influence votes in the General Election. The first item in the programme they have put forward is that all restrictive legislation with respect to housing should be withdrawn. Electors who question their candidates on this point must be prepared to counter an obvious retort. Of course, to withdraw all legislative restrictions on housing, or to encourage local authorities to laxity in the administration of their by-laws, would be unsafe in the extreme. Unhygienic hovels would spring up like poisonous fungi after a shower if there were weak by-laws, but clearly the Federation are not advocating anything that would lead to so barbarously unwholesome an effect. What they mean is that there should be no State interference with economic conditions; yet it would seem that if such a question were clumsily put to an alert candidate, especially if he were an "old Parliamentary hand," an evasive reply might result. Some candidates are evasive on principle, for the sake of discouraging the gentle art of heckling, or of scoring a smart point at his expense.

Another point in the programme of the Federation seems rather to play into the hands of the wily question-dodger. The programme suggests that local authorities should be compelled to charge economic rents. This would rather seem to provoke the retort that the Federation has here gone back on its deprecation of the principle of restrictive State interference, repudiating it when it is against them, but advocating it when it tells in their favour. This is exactly the sort of quibble in which the astute election agent would coach his candidate with the object of gaining a paltry triumph at a meeting. Open to a similar cross-counter is the advice that if there is to be any State assistance at all, it should be equally distributed to all agencies. If the principle of State assistance is vicious, the incidence of its distribution does not render it entirely immune from that reproach.

The Federation is on safe ground, however, in its pious opinion that the people should be encouraged to invest their savings in house property. Two rather awkward questions arise here. In these hard times, have the people any savings to invest; and, having the savings, would they care to purchase house property at the present inflated prices? An inducement to build and to buy house property is proposed by the propagandists, who suggest the exemption of new properties from local rates for a more or less extended period. It might be a good plan for the encouragement of building; but it is not free from the taint of preferential treatment.

Nor do we at all like the proposal that local authorities should be empowered to lend money on mortgage. Are there no building societies? Thus to encroach on their domain is an insidious form of municipal trading or quasi-State monopoly; and a local authority engaging in such business would soon incur considerable public odium through getting itself mixed up in money-lending transactions of dubious legitimacy.

More practical is the suggestion that the local authorities should revise their by-laws with the object of cheapening building and road-making. In the by-laws of most local authorities there are no doubt requirements that are not only costly but superfluous. They were, in many instances, formulated under conditions that have long been obsolete, and were often founded less upon local requirements than upon general principles that were coloured and distorted by the outburst of an almost passionate and fanatic zeal for admittedly much-needed hygienic, sanitary, engineering, and structural reforms; the disciples of such red-hot gospellers of hygiene as Simon, Playfair, and Benjamin Ward Richardson, exaggerating, as usual, and showing a disposition to go far beyond the reasonable precepts of their masters.

Whether the extreme relaxation of these antiquated by-laws would not swing the pendulum too far in the opposite direction, reviving through unhygienic building the dreadful epidemics which were the real *causa causans* to such drastic regulations, is a grave question that certainly ought not to be regarded as subsidiary to merely economical considerations; more especially since the small dwellings for which the by-laws were more expressly devised are only in comparatively rare instances built under architectural supervision.

That is a state of things that ought not to occur or to be tolerated in a civilized country; nor should the conditions that foster and promote a small-pox epidemic, such as that with which we are now threatened, be at all possible. Bad housing is at the bottom of most ill-health, bad morals, and the bad temper that, cumulatively and in bulk, leads to disastrous strikes and the frequent threat of revolution.

It is well that Parliamentary candidates should be heckled about housing; but the heckling should be done judiciously, and be free from all suspicion of self-interest. We regret exceedingly to be unable to accord that high praise to the programme of the National Federation of House Builders.

The President's Speech and Some Press Comments

Comparisons are not always odious. As a case in point, Mr. Paul Waterhouse, in comparing Paris with London, in the course of his presidential address, pleased the one without offending the other. Londoners, in fact, are as likely to be as pleased as Parisians by the casual but astute saying that "Paris is a large, a very large, country town, while London, however much its size were reduced, could never be a country town." It is a truth that could hardly have been expressed with more crisp felicity. Mr. Waterhouse would have been very much amused, by the way, by the cognate expression used in a recent advertisement of a residence for sale. The auctioneer described it as "a country house in town," and somehow it is easy to realize at once, in both instances, what is intended to be conveyed. In France, town and country merge without a perceptible break in character. In England, they are so sharply divided that the "town house" and the "country house" are as different in species as were, presumably, the town mouse and country mouse immortalized by the poet. But the great virtue of Mr. Waterhouse's comparison—an even greater merit than its aptness—is that it mightily took the attention of the lay Press. Some of the great London daily newspapers wrote leaders on that and on cognate themes, and very many newspapers in London and in the country thought it worth while to quote copiously from the president's speech; which, indeed, was as admirable in theme as in treatment. The leader in "The Daily Telegraph" took up, with approval, the president's parable concerning the hideousness of the suburbs of London, and more particularly the approaches to it. "And," our contemporary observes, "it is much the same with most of our big cities. One draws into them through approaches ragged and untidy at the best, and at the worst sordid and squalid." "The Morning Post" does not greatly encourage the idea of a grander London. "We are delighted," it says, "that o architects are so zealous in the great cause of maki London a comely city, and at the attention their words a receiving from our municipal governors and the great fir who have building ambitions. But how can archite construct if economists are out for destruction?" "T Morning Post" has for many years helped on the moveme for the popularization of architecture and town-plannin and richly deserves the same tribute which it now accor to Sir Aston Webb, Sir Reginald Blomfield, and Mr. Pa Waterhouse—that "they are undoubtedly compelling t citizens of London to interest themselves in the beautifyi of their city." May they all—newspapers included—s the fruits of their travail and be satisfied!

Planning "Licensed Premises"

The enquiry by the Ministry of Health into the Bourn mouth pavilion scheme has disclosed a point of which arc tects will duly take note. When, some years ago, t Bournemouth Corporation sought sanction for a loan £60,000 for the erection of a pier pavilion, the since defun Local Government Board imposed the condition that p sons should not be able to get intoxicants at the pavili bar without first paying an admission fee, and there see to be a disposition to revive this modified form of prohi tion. In the course of the present enquiry, the town cle suggested that the Ministry of Health need not deal wi this licensing question, but should leave it at the discreti of those familiar with local conditions, while the May thought that the building should be arranged simila to the London "corner public-houses," by which his worsh meant, presumably, to recommend the provision of separa entrances to be used respectively by those who go in simp for drink, and *ces autres* who enter with other objects view. Architects accustomed to plan "licensed premise need not be reminded that the designs must be in str accordance with the special requirements of the licensi justices, as well as of the local authorities; but "gene practitioners" having little or no experience of such wo as, say, the youthful winner of a competition for some s of refreshment pavilion, may not take it amiss to be advis of the desirability of taking counsel with all the authorit as to possible pitfalls and complications besetting t adventure. That otherwise he might have to alter his wo when he had thought it finished is rather less serious th the postponement of the date of opening, which would costly and vexatious to all concerned.

Society of Architects' New President

This may be said to be the season for presiden and this week we have to offer our best wishes a congratulations to the gentleman who has taken office at the head of the Society of Architects. T new president, Mr. E. J. Partridge, comes from Devonshire family, and served his pupilage in Mr. Merv E. MacCartney's office. Then for twelve months was busy acquiring a practical insight into building the office of a building firm, and after ten years as gene assistant took up practice on his own account. He pass the examinations of the Surveyors' Institute, and w admitted as an Associate of the R.I.B.A. in 1889. In 18 he became a Fellow of the same Institute. He won t Driver Prize, Crawter Prize, and Penfold Gold Med For fourteen years he was on the Council of the Soci of Architects, serving in all the honorary offices, and practice he occupied the position of architect and survey to the Richmond Board of Guardians, and a similar po tion to the Ham Estate of Lord Dysart. Among the wo designed and carried out by him are the Richmond Un Infirmary, dining hall, laundry, and stores, new board-ro offices, several branch banks, private residences, busin premises, shops, village halls, printing works, etc. He a undertook the survey of Morden Cemetery for the Batter authorities and the Chalkwell Hall Estate, Westcliff-on-S

Architects and Housing

By MAURICE E. WEBB, F.R.I.B.A.

“ As a profession we have missed a great opportunity and allowed the State Official to interfere in a matter which should ave been settled by the Architect and Builder. There is time yet to do something, but it is late in the day.”

Mr. Stanley Hamp.

THIS sentence occurred in Mr. Hamp's recent address at the A.A., during which he emphasized the need of recognition of architects by the public, and the necessity for architects to show some more practical way their interest in the needs of e community at large, before such recognition will be ly granted.

I ventured afterwards to mention the great effort which nerican architects have made in the matter of housing ce the war, by the formation of the Architects' Small use Service Bureau—an effort which has passed almost noticed in England. The editor of THE JOURNAL has asked to give further particulars, which I do, knowing full ll that there are many difficulties, and also that the nerican scheme may not be, and almost certainly is not, table without modification over here.

But the need, and this is Mr. Hamp's point, is so great, d the failure of the Government's scheme so complete, t it behoves architects to see whether they can now step and take a part in some constructive scheme for building re and better houses, and also by a co-operative effort enable the services of the architect to be secured by ry one who is building, even the smallest house.

As far as I can see this American scheme does two things. associates architects directly in the public mind with lding, and teaches them in a practical way the value of architect's knowledge to every one engaged in building, hout, in the case of the really small home or cottage, ping so deeply into their pockets for fees as to make the hitects' services for these a luxury instead of a necessity.

The result in America of the Architects' Service Bureau l, it is hoped, prove in the future to lead to an extension the architects' useful service to the community.

f a similar result could be achieved in England, archi- ts would benefit ultimately no less than the public, and builders would no doubt be prepared to co-operate, they have done in America for the same reasons. As a eral rule they wish to build well, and to build to good igns and well-thought-out plans, but for economy these st to some extent be standardized. They always have n in the days of the speculative builder, and in more ent times by the Ministry of Health. They always will Therefore America says, Let them be standardized by hitects, and let the public have every benefit of the t of our concerted knowledge and skill by the provision complete plans, specifications, quantities and details, ked out by us in co-operation and supplied at reason- e prices to those who cannot afford to employ us ividually for the cottage in the usual way. The doctors rate at the hospitals for nominal remuneration, and ain their livings by private practice outside amongst ir more fortunate patients.

The American architects' housing scheme seems to be ed on this underlying idea, and is at least worthy of ly over here, if not of exact imitation, with a view to sting the vitally pressing problem of adequate housing ur great cities.

t is impossible to explain the details of the American rt in a short article, but full particulars are given in the ceedings of the Fifty-fourth Convention of the American titute of Architects in the R.I.B.A. library, published in 1921. Very briefly they have mapped America out into thirteen divisions. Groups of architects in these divisions design various types of small houses, complete to the last detail, and sufficient to obtain tenders from. These groups are called Bureaux working under a central Bureau, which, in its turn, works under the auspices of the American Institute.

The Bureau has a small capital divided into $10 shares upon which 8 per cent. interest, and no more, may be paid to the members of the Bureau who are the shareholders. A book has been published containing 100 complete designs, with quantities, specifications, etc., for cottages, each design being sold separately for from $17 to $32. The names of the members of the Bureau are published as joint authors of the designs, but there is no individual advertising of any sort or description in the book other than the fact that it has been published for the Architects' Small House Service Bureau by the Southern Pine Association. The latter company have agreed to pay the cost of publication, to advertise it, and to put it into the hands of their seven or eight thousand dealers throughout the United States.

The contract with this company includes a clause to the effect that nothing whatsoever shall be done in the use of the book which is contrary to the professional practice and to the rules of the American Institute of Architects.

There is little doubt that immense trouble has been taken in the preparation of the plans and designs, and that real co-operation existed all through between the architects who supervised their making. Months were spent in collecting data of requirements, settling the types, and making and criticising the designs while in course of preparation. In England much of this spade work has, of course, been done, but it is doubtful if the public realize how much of it has been done by architects. In America, if this book receives the publicity it seems to deserve, the public can have no doubt in its mind to whom it owes a debt of gratitude.

If the book is successful it may even find its way over here; it would, at any rate, be interesting to see some of the plans published in this journal.

* * * * *

Apropos of Mr. Webb's foregoing article the following summary of a discussion which took place at the American Institute of Architects upon the report of the committee on Small Houses will be of interest.

The chairman of the committee, Mr. Edwin H. Brown, at the conclusion of the report moved the resolution :—

“ That the American Institute of Architects, in Convention assembled, hereby endorses and approves the formation and proposed operation of The Architects' Small House Service Bureau of the United States, Incorporated, and encourages it to carry on its programme with all dispatch and energy.

“ It further directs the Board of Directors of the American Institute of Architects to follow the work of the Bureau in detail, and, at its discretion, to take such active part in the management and control of the Bureau as it may deem advisable.

“ It further suggests to its Chapters that they take an active part in the formation of Regional and Branch Bureaux and do all in their power to make the work of the Bureau a complete success.”

The President: The resolution is before you. May I be permitted a comment upon the report to which you have just listened?

I told you yesterday morning that the Institute had honoured some of its committees charged with what it thought were forlorn hopes. We said to them, "Go ahead; we cannot finance you; we cannot help you, but we hope you will do something."

This committee goes ahead, and this is the result. I said they had gone to victory. I believe they have. The chairman in his report suggested that he would like to have every one of you buy a copy of the plans, or some of the plans. His thought was that you should test the completeness of their preparation to meet the demand that is made. I would like to amend that suggestion by saying that every one of you could well afford to have in your office a set of these plans, perhaps not to instruct you who are competent and accredited architects in how to make plans for a small house, but as a useful object lesson to the younger draughtsmen in your employ, to show how this sort of thing ought to be done. The plans, the specifications, the entire preparation of it is an admirable piece of work. I had the pleasure of inspecting some of them in Minnesota last winter, and of seeing a number of them since, and I think it is a splendid achievement. The Institute may well be proud of what has been done.

Mr. Holsman: I have had some experience in the matter of small house designing, where it has to do with individual ownership, and I think this is an admirable thing for the American Institute of Architects to do, to give proper attention to the design of small houses, and I heartily concur with the first paragraph, which reads as follows:—

"The architect, if he is to maintain his position as the designer and supervisor of buildings, must pay attention to the problem of a small house, the home of the family of small income and simple tastes."

Gentlemen, with all this admirable work that has been done magnificently, when it came to my attention a month ago I was a little surprised to find that the name of no architect appeared on any of the designs which were promulgated by the Small House Bureau, under the auspices of the American Institute of Architects. The writer of this report evidently feels that the architect still ought to maintain his position as the designer and supervisor of buildings.

This is the point I want to emphasize here. Is there not some way the American Institute of Architects can recognize the fact that every building is designed by some person, that architecture is not rendered by a corporation, that at least the fine art of architecture is not practised by a corporation?

Moreover, while we are doing a public service, do we not want to do a service to the profession, or to the professional architects as individuals? It is recognized in the first part of this report that when the name of an architect appears on the drawings, when the small house is built, or when the man builds a small home for the first time, probably, and comes in contact with a smart young architect, he makes a contact with a professional man, and when he comes to build a larger building, a factory, or another residence of a larger size, he remembers that personal contact, and he goes to that man, who has probably advanced considerably since the first time he came in contact with him, to get him to do the balance of his work.

Mr. Pfeiffer: Objection has been raised that by this service you may remove the possibility of practice from those who now make a speciality of rendering service for small house builders. There is absolutely nothing in the plan which prevents such a specialist from organizing a new district. He is invited to do so, and I am sure he will receive all assistance, all kindness, all the collective experience of the Minnesota district to aid him. I do not see why there is objection to the plan suggested by Mr. Brown. Instead of individual responsibility, there is responsibility of a combination of professional men, under the auspices of the American Institute of Architects, and what better can the country want?

Mr. Litchfield. A great many of us for years have wondered what could be done to improve the small house architecture of the country. We have only to take an extended journey in any direction to be overcome with the poor character of the small house. This organization, which is proposed, offers a practical solution of a problem which ought to be very much at the hearts of all of us.

But there is one question which, it seems to me, has not been answered, and I hope Mr. Brown will have the answer. It seems to me that this corporation is going to be a great success. They will do a very large business. I should like to know whether it is a benevolent or a semi-benevolent corporation, and if it is not, whether the Institute is to profit by it, and if not, who?

Is it an organization proposed for the purpose of practically enabling the architects of the country to do this class of work at a reasonable return, or is it an organization which is primarily instituted to do a great work in the uplift of taste and living conditions? Perhaps it is both.

If it is the first, that is to say, if it is an organization so arranged as to permit the architect to give his service at a reasonable return, is it something which ought to be financially fathered by the Institute? If it is a semi-benevolent organization, should there not be some understanding that the charges are to be only sufficient to pay the expenses?

Mr. Brown: I did not want to go into too much detail before, because the whole matter has been carried out along the lines presented to the Convention last year.

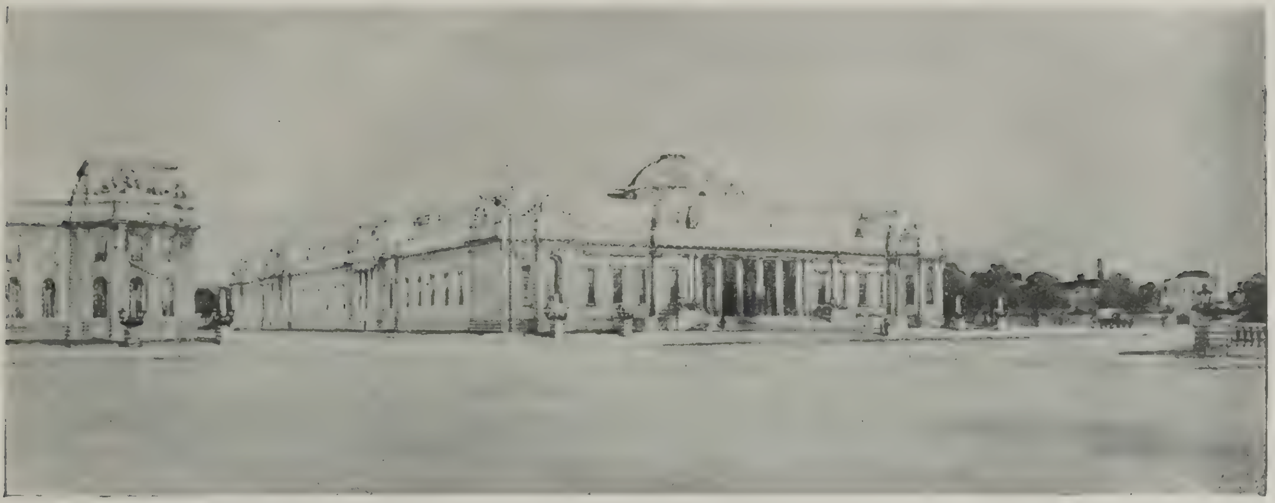
However, in the certificate of incorporation, dividends upon the stock are limited to 8 per cent. The regional bureau stock is to cost $100 a share, which a man must pay to join the Bureau. The United States bureau stock, the central bureau stock, is to cost $10 a share, and a man must pay $10 for one share to join the bureau.

Each man joining is supposed to join both a regional bureau and the central bureau, and his investment is $110. He can make 8 per cent. on $110. You can figure that, probably, as quickly as I can, as to how much he will make out of that.

The price for the sale of the plans has been set at a point where it is thought it will pay the necessary expenses of the operation of the whole proposition.

The certificates of incorporation of both the regional bureaux and the national bureau state that if the returns from this go beyond this dividend of 8 per cent. upon the small capitalization, all the surplus shall be turned into, first, improving the service, to give as complete service as possible, all the things we cannot do now because we have not any money; then, after we have reached the point of perfection there, as nearly as possible, we shall keep pulling down the cost of that service to the small home owner.

It is a benevolent proposition. It is a very benevolent proposition on the part of the Institute, and at the same time it is not a bad business proposition for any architect who goes into it, because it provides a means of paying him enough for the work he does, so that it will be of interest to him to devote his best talents to it. If he does not do the work, he does not get any pay. If he works a lot, he will get paid for the work he does on a perfectly fair basis, and the Board of Directors of the American Institute of Architects, without being involved financially, without having any legal responsibility therefor, can say, "You are paying these men too much," or "You are doing it this way or that way," and they can stop it, or make it go any way they please. They can see that it is benevolent, and it has the unusual advantage of a benevolent association which will pay the people who are doing the work enough to make it worth their while to devote some time to it.



THE ORIGINAL DESIGN SUBMITTED IN OPEN COMPETITION BY THE ARCHITECTS.

The Welsh National Museum

By W. S. PURCHON, M.A., A.R.I.B.A.

DURING the last few weeks considerable interest has been aroused in Cardiff by the removal of the hoarding round the Welsh National Museum and the consequent revealing of the whole of its southern façade. The effect of this on the general appearance of the Cathays Park group is so striking as to have caused considerable local comment from both architects and non-professional critics.

On Friday, October 27, the Right Hon. Lord Treowen, C.B., C.M.G., presided at the fifteenth annual meeting of the Council of the Court of Governors of the Welsh National Museum, and was supported by the Right Hon. Lord Pontypridd, D.L. (the first president), Mr. Illtyd Thomas (treasurer), the Right Hon. the Lord Mayor of Cardiff (Councillor F. H. Turnbull), Sir Goscombe John, R.A., and about thirty members of the Court hailing from all parts of Wales.

The members of the Court of Governors were afterwards entertained to lunch by the Lord Mayor of Cardiff, and in a subsequent speech Lord Treowen congratulated the surviving architect, Mr. A. Dunbar Smith, on having endowed Wales with such a monument of his genius.

Following the lunch the members of the Court proceeded to an informal inspection of the building and of the valuable collections of Welsh antiquities, pottery, geological, biological, and natural history exhibits and art treasures which have already accumulated.

On Saturday morning, October 28, at 10 a.m., without any flourish of trumpets, the doors of this great building were opened to the public for the first time, and during that day some three thousand persons visited the Museum, while in the two-and-a-half hours during which it was open on the Sunday afternoon the building and its contents were examined by 1,700 visitors.

In view of the opening of the Museum a brief note on its history may not be without interest. Some twenty-seven years ago a few enthusiasts raised, in the House of Commons, the question of the provision of a Welsh National

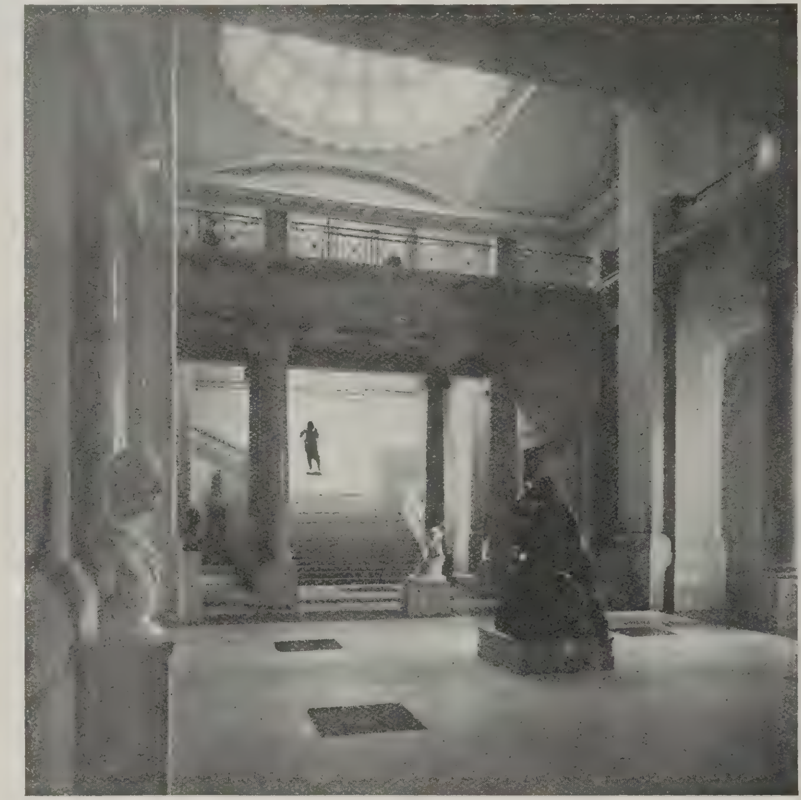
Museum, and after long discussion the matter was brought to a head on March 10, 1903, when a resolution approving the scheme was moved by the late Mr. William Jones, seconded by Mr. J. Herbert Lewis, and supported by Sir Alfred Thomas (now Lord Pontypridd) and others.

On March 19, 1907, the Royal Charter defining the objects of the Institution and its mode of government was granted by His Majesty King Edward VII.

An open competition for the building resulted in the submission of one hundred and thirty designs, the first place being awarded to Messrs. Smith and Brewer by the assessors, Sir Aston Webb, Sir J. J. Burnet, and Mr. E. T. Hall. Building operations commenced in 1910, and on November 6, 1911, His Majesty King George V granted a supplemental charter extending the powers previously sanctioned, and was graciously pleased to signify his special interest in the Museum by laying the foundation stone on June 26, 1912. Work continued steadily until 1915, but then, owing to the war, building operations ceased, and were not resumed again until 1920.



THE WEST END OF THE ENTRANCE HALL.

In the City Hall there is an extremely interesting model of the complete design for the Museum, and a comparison of this with the actual building shows that the foundations for about half the building have been put in, that nearly a quarter of the superstructure, in an incomplete state, including the whole of the southern front, has been erected, while [the portion now completed and opened to the public is about one-tenth of the complete scheme, and is situated in the south-west corner of the block.

The building will ultimately use very completely a site about 4¼ acres in extent. In the early stages of the preparation of the design an attempt was made to set back the west front in line with the façade of the University College of South Wales and Monmouthshire, so that the space between the Museum and the City Hall would more nearly balance that between the latter and the Law Courts. This had, however, to be abandoned as impracticable, as it reduced excessively the space available for the Museum, and it seems clear that any possible objection which may be raised to this advance in front of the general building line set by the college façade in

Museum Avenue may be overcome by a balancing projection in future buildings at the northern end. The southern front is in line with the City Hall and Law Courts, and the heights of the plinth, cornice, and parapet of those buildings have been followed, but no attempt was made in the final design, and wisely so, to approximate more closely to their design.

The leading motive of the plan is a large interior court 307 ft. long by 134 ft. wide, surrounded by the public galleries on two floors, while outside the public galleries is the space for the reserve collections with a mezzanine floor between the ground and first floors. This arrangement of the public galleries allows of the freest possible circulation on the ground floor, enables the maximum use to be made of the central garden, and permits of two floors of ample height without carrying up the external walls higher than those of the adjoining building.

The magnificent entrance hall under the dome and two fine rooms to the west and east, intended for a children's museum and refreshment-room respectively, occupy the south front, while immediately opposite the entrance is to be the Welsh Natural History Pavilion, designed for the display of the habitat groups in specially lighted alcoves. At the north end of the central court there is to be a similar pavilion for history and antiquities, while between them, in the centre of the basement, will be the aquarium. The lecture theatre, with its separate entrances, exits, and cloakrooms, is arranged on the east side, while in the north-east corner of the site it is proposed to erect an open-air theatre, constructed entirely of stone, and intended primarily for Welsh national folk-songs and dances. In the completed scheme the total superficial area in the public galleries and in the reserve galleries will be 81,000 ft. and 50,000 ft. respectively.

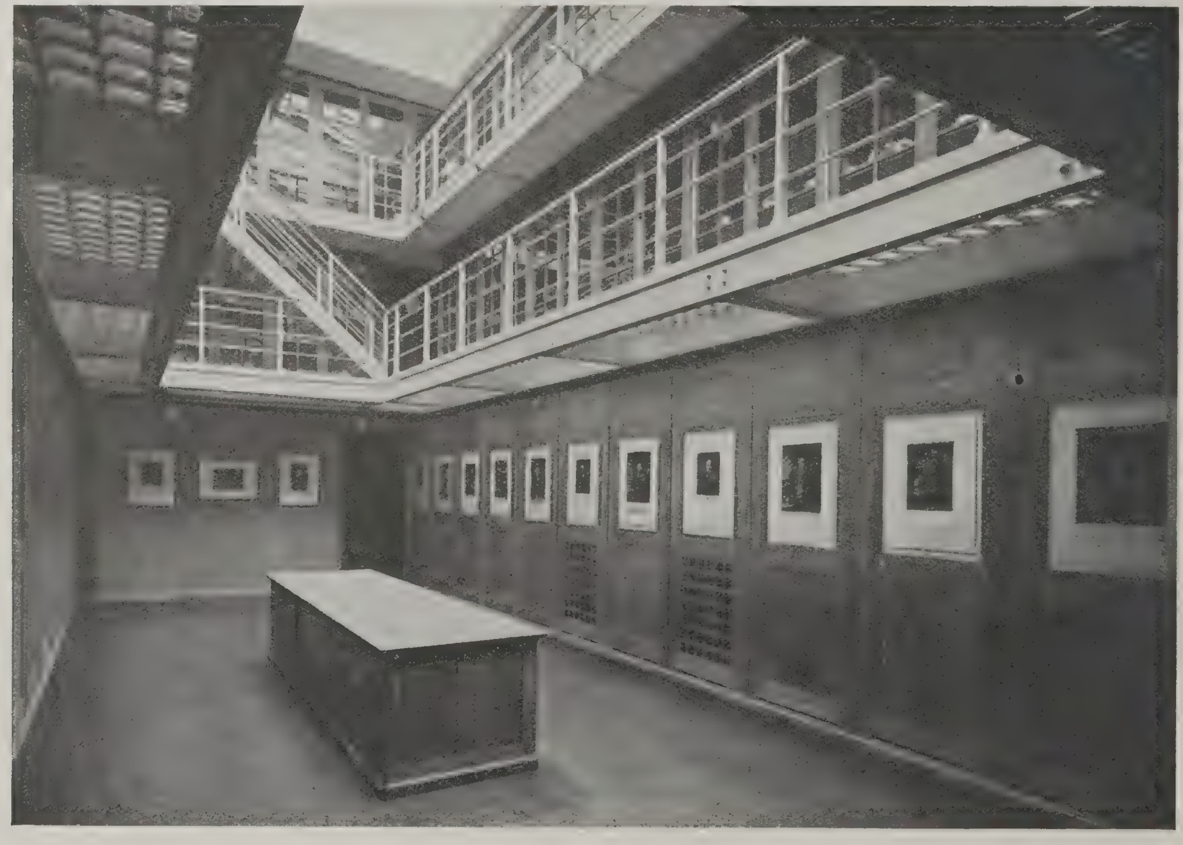
The administrative block, with library, committee-rooms, and offices, is arranged round the dome on the second floor; the basement is occupied by workshops, stores, and cloakrooms; and the sub-basement is used only for engineering plant, pipes, and the great ventilating trunks which carry the air to and from the vertical ducts in the walls.

A combined system of inlet and extract ventilation has been adopted, the fresh air being admitted through water-screens in the basement, and then forced by electric fans through ducts leading to the various rooms. The vitiated air is similarly drawn through ducts to the extract fans and thence discharged through main extract shafts leading to the top of the building. In cold weather the fresh air is warmed by passing over steam-heated batteries. The only chimney is the shaft from the boiler-house.

It is interesting to note that in the original perspective projecting bays, somewhat similar in outline to those of the City Hall, were used at the ends of the southern façade; that these were abandoned at a later stage, as shown by the model; while the windows shown in the latter in the end bays of the side elevation have been omitted with great gain to the strength of those façades.

In the early perspective the dome was less lofty and single columns were used in the entrance portico in the centre of the south front. This is now ably treated with a coupled Doric order, and is flanked by pavilions crowned by four groups of sculpture, the western pair, representing the Prehistoric and Classic periods respectively, being by Gilbert Bayes, while the eastern groups, executed by Richard Garbe, represent the mediæval and modern periods. The two groups on the western façade (facing the City Hall), representing mining and shipping, are the work of Thomas J. Clapperton, and are remarkable for their extraordinarily high architectural quality. The lions and dragons buttressing the dome are by A. Bertram Pegram.

In conclusion, it may be said that not only is the National Museum of Wales one of the noblest buildings in the country, but it will also rank as one of the most important educational influences of the Principality, for by its collections specially arranged to meet the needs of investigators, students, and school children, as well as by its loan collections and library, it will be the natural complement and helpmeet of the University of Wales, with its constituent colleges and numerous other educational institutions. It is sincerely hoped that the interest which has been aroused by the opening of the Museum will lead



THE NATIONAL MUSEUM OF WALES, CARDIFF: RESERVE COLLECTION OF PRINTS AND WATER-COLOUR DRAWINGS.
SMITH AND BREWER, ARCHITECTS.

to such an accession of funds that further portions of the building may be completed.

Messrs. Joseph Armitage, George Alexander, and Harold Stabler were responsible for the general modelling work.

The contractors for the foundations up to 6 ft. above the ground level were Messrs. E. Turner and Sons, of Cardiff, while the superstructure has been erected by Messrs. H. Willcock & Co., of Wolverhampton. The consulting engineers for the steelwork were Messrs. Reade, Jackson, and Parry.

The sub-contractors were as follows : Val de Travers (asphalt) ; Portland Stone Firms (stone) ; John Freeman and Sons & Co. Ltd. (granite) ; Glengarnock Iron and Steel Co., Ltd., A. Dawnay and Sons, Ltd. (steelwork) ; H. Willcock & Co. (fireproof floors, partitions, and cast lead roofing) ; Martin Van Stratten, Art Pavements and Decorations, Ltd. (wall and floor tiles) ; Henry Hope and Sons, Ltd., Crittall Manufacturing Co., Ltd., John Williams and Sons (Cardiff), Ltd. (casements and casement fittings) ; Mellowes & Co., Ltd. (patent glazing and fittings) ; H. Willcock & Co., H. J. Cash & Co. (plumbing and sanitary work) ; A. Emanuel and Sons, Ltd. (sanitary ware) ; Bassant Bros., Ltd. (wood flooring) ; Fenning & Co., Ltd. (monolithic column piers, with carved capitals throughout the ground floor and decorative work to staircase, paving, steps, and skirtings, etc. throughout the various galleries ; Korkoid and Ruboleum Tile Co., J. Howell & Co., Ltd. (linoleum flooring) ; Fred Price & Co. (1920), Ltd. (electric wiring) ; Joseph Armitage (plaster work) ; H. Willcock & Co. (print room fittings) ; Crittall Freeman Bronze, Ltd. (bronze entrance doors) ; F. Geere Howard, Ltd., H. W. Cashmore & Co., Ltd. (electric light fixtures) ; Charles Smith, Sons & Co., Ltd. (door furniture) ; J. W. Singer and Sons, Ltd., Gardner, Sons & Co., Ltd. (handrails, balusters, etc.) ; Kingsmill Art Metal and Electrical Co. (gates) ; Arthur Sanderson and Sons, Ltd. (wall hangings) ; H. J. Cash & Co., Ltd. (heating and ventilating) ; Guynan and Son, J. Howell & Co., Ltd. (blinds) ; J. W. Gray & Co. (lightning conductors) ; Dreadnought Fireproof Door, Ltd. (fireproof doors) ; J. J. Hill and Son, John Norman, Ltd. (specimen cabinets).

Mr. R. Howard Fletcher, B.A., was consulting electrical engineer and Mr. T. J. R. Kiernan, B.Sc., consulting engineer for the heating and ventilating.

After the toast of " The King " had been honoured,

Mr. Charles Aitken, proposing " The Club," expressed much pleasure in addressing " the carefully selected company that had passed through the needle's eye of the Executive Committee and ' The London Mercury.' " Mr. Aitken observed that if they could organize effectively against the perpetration of architectural horrors they would be doing a very useful public service. He suggested that the Club might act as a consultative body for the benefit of architects themselves, offering a friendly expression of opinion on designs before they were put up. He commended the course that Mr. Ralph Knott had taken in making use of the decorative painter at the County Hall.

Mr. G. Gilbert Scott, replying, said the public could not get away from architecture, so they might just as well take an interest in it, and this was no doubt the idea behind the Club. But there was a danger of too much talk. In the Middle Ages there was less thinking and talking and more doing. Perhaps if we stopped thinking and talking and felt a little more we might do better work. In the past the arts were predominant ; but the great force of science had swept over the world, and the arts were now taking second place. An important point about the Club, continued Mr. Scott, was that it was not a mutual admiration society. It was going to have a great influence on public opinion in the matter of architecture. The correspondence in " The Times " on war memorials was due in some measure to the Club. The Press was at last waking up. Mr. Scott confessed that on the question of design he valued the opinion of the man-in-the-street much more than that of the "high-brow." An ignorant committee had an uncanny knack of putting the finger on the weak spot of a design; and, although one might try to bluff them, one felt instinctively they were right.

Mr. Oswald P. Milne, proposing "The Guests," said it was a great encouragement, amid the excitement of a General Election, to see so many distinguished guests present at that dinner. If they could find time to come to a gathering of that sort, it showed that architecture was more important than politics. Many people, continued Mr. Milne, regarded architecture as an anachronism in modern life. During a recent dinner of his old school he met an old friend who told him of a mutual acquaintance who had become a chartered accountant, made a fortune, and retired when only just on the wrong side of forty. His friend's conversation clearly showed that he regarded chartered accountants as much more important members of the community than architects. But buildings would remain long after ledgers had disappeared.

THE ARCHITECTURE CLUB MENU CARD.
FROM A DRAWING BY KEITH MURRAY.

Professor W. Rothenstein, replying, put in a vigorous plea for the modern movement in painting. The English, he said, was by far the most original painting now being done in Europe; and it was a duty incumbent upon them all to see that the best men got the praise and the work. But was this being done? In his experience it was not. It was unfair that men of parts should have to stand aside and not be used. It was absurd to accuse these young men of being Bolshevists. The imperative duty was constantly to praise good work.

Mr. Hilaire Belloc, who also responded, observed that to the outsider to-day there was chaos in architecture. Anything could be built, but nearly always you would find a past style. This was due partly to the lack of a common philosophy, partly to the facility with which material things could be accomplished, and partly to the fact that the ordinary man no longer had the power of demand. In his part of the country, for instance, people wanted the old kind of cottage, but were compelled to put up with such things as head-room, cubic space, and stagnant and fetid air up against the ceiling. Mr. Wells, in his "History of the World" ("a large subject," commented Mr. Belloc, drily), had a powerful phrase which he had got, he believed, from the Chinese: "There are times of confusion in the story of the human race." That applied to architecture to-day. Nothing was stable. But confusion would not last: fatigue would inevitably result. Some sort of law would return. The trouble was that the power of demand was in too few hands. There was no part of London that could not be rebuilt at that moment, if there were a desire to do it; but people would at once begin to talk about expense. "Nonsense!" cried Mr. Belloc. "'Take it from me,' as Moses said as he came down from Sinai; you can rebuild anything you like without impoverishing the community or making it economically poorer. Begin right away by making some part of London monumental. It can be done."

Mr. J. C. Squire said he now proposed to give them a few facts, as such things had not so far been very conspicuous; and with this he coupled especially the name of Mr. Hilaire Belloc. (Laughter.) The Club, continued Mr. Squire, was indebted to Mr. Max Ayrton for the gift of the menu card with Mr. Keith Murray's drawing upon it (reproduced on this page). Mr. Ayrton had their best thanks. Dealing with the progress of the Club, Mr. Squire said it had been decided to limit it to 300 members—one-third architects, one-third writers, and the remainder persons interested in architecture and capable of supporting the cause; 150 had already been elected, another 150 would be elected at the rate of not more than ten a month. In the first 150 they had a full quota of architects and writers, but there was still room in the third category. The Club, he continued, had already done much good. They had had an outburst of notice of architecture in the Press such as had not been seen in a lifetime. The club had its scouts in almost every important newspaper office in the country. Dealing with prospective events, Mr. Squire announced that for the Spring Exhibition the Duke of Westminster had kindly promised the loan of Grosvenor House for a fortnight, free of charge. Referring to the recent sale of Stowe House, Mr. Squire reminded his hearers that the famous avenue there had been acquired by a member of the Club, Mr. Clough Williams-Ellis, who the next day had an offer for it from a timber merchant! Mr. Williams-Ellis was quite willing to pass on his honourable burden to someone else. Here was an opportunity for the great landlords of Buckinghamshire to acquire the avenue and restore it to the house. Mr. Squire mentioned that the Club had taken steps to raise a sum of £500 to put the garden temples and ornaments of Stowe into good repair.

Sir Lawrence Weaver, proposing "The Future of the Arts," said that that future, so far as they were concerned, appeared to be that they should meet and dine four times a year, while Mr. Squire appealed for a sum of £500! He disagreed with Mr. Scott that we talked too much and that little talking was done in the past. The most interesting conversation he had ever missed was that which took place when Sir Christopher Wren went with John Evelyn and Samuel Pepys to see Chelsea Hospital. Mr. Belloc, said Sir Lawrence, was an optimist if he expected to see a unified style of architecture. What they must expect to see in the future was a style made up of tradition and invention in just combination. Mr. Charles Marriott, replying, said he had no faith in any definition of art that excluded the man with the hammer and the man with the hoe.

Some London—and Other—Problems

Mr. Paul Waterhouse's Presidential Address to the R.I.B.A.

IT is customary to have a subject, but why it should be called a subject I do not know. If a subject is a thing or person in subjection, the word is inappropriate to the theme of an address. For, so far from being the obedient servant of the speaker, it is his tyrannous master, or if in any sense beneath his feet, it is as a devil-possessed carpet beyond whose borders he dare not tread, and whose pattern is a kind of maze that regulates his dance.

So if to-night I seem more of a wanderer than the keeper of a beaten track, my excuse is that, relying on the derivation of the word subject, I mean to keep the thing in subjection.

London is ever with us. Architecture is ever with us. The two are but synonyms for mystery and charm, for doubt, hope, wonder, and infinite consolation.

No traveller can help comparing his London with other capitals; and if, as is happily true, he always comes back to London to find a welcome and to realize fresh beauties, he none the less is aware that there are some things in which London falls short of the spirit, the habits, the ideals of other places.

Some while ago there was a debate as to what should be the motto of the London County Council armorial bearings. My own suggestion was "Keep off the Grass."

In suggesting it, I suggested no reflection on the County Council itself, but rather on a spirit which seems to threaten all those who find themselves in charge of our town. It is a spirit which, happily, is on the wane, and I believe that the County Council itself is contributory to its gradual extinction. I hardly know how to define it except by example and analogy. The simplest example is Paris. Paris, like us, has a river—a wilder, larger, less tameable river. But would anyone believe, who had not seen it, that in spite of embankments in solid masonry, higher and even more solid than our own, big trees of forest growth grow between the embankment and the river's edge?

Those who have seen these trees and that shore know also that men may, and do, go and fish on that river bank, and that the parapets of the embankment are beset—I might say decorated—by a mile of bookstalls.

Here are two things impossible in our London: the permission given to a great rural force to continue the force of its rural nature in the heart of town culture, and the permission given to the free-lances of an ancient trade to play their business otherwhere than in orthodox shops.

I know all about the excellent reasons which govern our behaviour, and all the sensible arguments which can explain it. "The Thames banks are muddy, not shingly." "Access to the water leads to suicide and accidents." "Trees wouldn't grow by the water's edge." "Our river is tidal; theirs isn't." "Irregular trade once permitted would extend all over London." But all these arguments are not really to the point: the fact is (and we *know* it) that if we woke up one morning and found that the Thames had become the Seine, we should have those trees cut down, we should send those fishermen to the police court, we should close the access to the banks, and Parliament itself would legislate for the removal of those bookstalls. And why? Simply because the whole thing is too free and easy for our ideas of propriety.

The fact is, I suppose, that we have a kind of protestantism or puritanism in our ideas of town propriety, and we certainly cherish (avowedly or not) a sense that there is a normal kind of rigour which suits a town, out of which country (which is to us a sort of abnormality) must be excluded. That is why our suburbs are largely hideous.

Put it another way. Paris is a large—a very large—country town. London, however much you were to reduce its size, could never be a country town. It does not differ in degree, but in kind.

Richmond Park, barring a certain superfluity of railings, may be looked on as being almost a miracle. That anything so like untouched nature should exist so near London is almost scandalously delightful. It is, I suppose, about the limit. Imagine another night-time transformation: conceive Richmond Park taking the place of Hyde Park. What would happen in the morning? I think it would be at once closed for necessary alterations.

Versailles is the same distance from Paris as Hounslow is from London. Drive from Versailles to the capital through St. Cloud, and you will not dare to tell me that the miles of unfenced woodland through which you pass would be permitted on the Hounslow Road.

There is undergrowth in the Bois de Boulogne, literally undergrowth. If it were to spring up in Regent's Park what would happen? Miles of unclimbable iron hurdles, and a penny on the income tax to pay for them.

The man, if there is one, who has walked along the banks of the Regent's Canal from its harbour mouth to the Great Central goods station; the men who go into Neville Court trembling for fear lest the great and tender treasure there be gone; the few who have found the one only spot on the Middlesex side of the Thames where one can wet foot on the river's edge: these men will know what I mean by that little touch of unrestraint which, with the best intentions in the world, we smother.

If you have ever made a water-colour sketch of St. Mary's Church, hard by the apparently prehistoric dyke which is really the north sewer outfall; if you have ever gazed at the cattle on the Beckton Road flats; if you remember the Piranesi-like wonder of St. John's Square, Westminster, in the 'eighties, or have been unable to tear yourself from Clerkenwell Green, you will know what I mean but cannot express.

There are great times coming for the Surrey side. The County Council office—which I frankly admire—is a pledge of that. The planning of that shore territory has got to be dealt with by somebody, or by some "body," or by chance. May it come to pass that whether the task is entrusted wisely to an individual or expensively to fortune, the result may contain some elements of that freedom which is a joy to poets, an inspiration to artists, and an aid to life.

Region-planning makes one think of axes—not axes to grind, but axes of alignment. I suppose the most famous of axes is that which, starting from the statue of Lafayette, does an unbroken flight of two miles to the Arc de l'Étoile, which, though its visual existence ends there, starts afresh for a four-furlong run to the Porte Maillot, and having there reached the boundary of Paris, takes breath for another 2,000 yards along the Bois de Boulogne, and, to show that it is not exhausted, does a gratuitous rush of nearly a mile to a mound on the farther side of the Seine. We cannot do such things in London—perhaps we do not want to; but there is no reason why we should make such havoc as we do of some of our small opportunities. It is an ill business hunting for ugliness in our dear London, so I will give only a hint or two. A pair of the best statues in London, that of the agricultural Duke of Bedford and the classic figure of Charles James Fox, face one another at the distance of a street which is 250 yards in length. At or near Fox's effigy common necessity called for the existence of a lamp-post and a swan-necked stand-pipe for feeding water-carts. Mere stupidity would suggest that one or both of these blemishes should be placed on the axial line; rather less stupidity would have placed one horror clear of Fox to the right, the other to the left. Stupidity *in excelsis* would naturally rise to the idea of placing both so as to obscure the view of the toga-robed statesman, each within a foot or so of the axial line.

Shall I confess that it was stupidity *in excelsis* that won the day. It is rather pedantic to suggest that statues serve no purpose but to be seen. Nevertheless I do suggest it.

When the Guards' Memorial in St. James' Park was first proposed the scheme was let loose on the public by the means of an article in "The Times," accompanied by a careful-looking plan. This plan clearly showed that the intended monument, which was of ridiculous lateral extent, was to be so placed that the view through the Horse Guards archway would permit the vision of one side of it only.

I wrote to "The Times." The author of the illustrated article at once replied that it was a well-known fact that plans accompanying articles of this kind were not drawn to scale. I admired his powers of defence.

It is the judicious observance of axial lines that gives charm to neighbouring non-axial arrangements. An axis all but respected is of no more æsthetic value than a catch missed in the deep field.

A word of mine let fall just now about the County Council House set me thinking of acoustics, and I couple the two ideas without any but the most sympathetic thought for Mr. Ralph Knott. I would never blame any architect for an acoustic failure in this present year of grace, but I trust that in a year of two's time such failures will be deserving of blame. I am in hope that members of our Institute, in consultation with experts in sound law, will before long reach such an interchange of national experience as will elevate our present groping insecurity into the region of scientific certainty.

I once built a committee room which was to be a model of acoustic excellence. Into it I crammed every device known to the handbook of that age as leading to perfect sound conduction. What is more, I cut out of it every known cause of acoustic disturbance. The achievement was a triumph of failure. As cures, curtains were only the slightest of alleviation, eight electric candelabra united by chains seemed, instead of baffling the sound waves, positively to vibrate to the voices of the outraged committee men. But peace came at last by the purchase of an eighty-guinea carpet of thick pile. I know, probably you know, that a pulpy wall-paper goes a long way to remedy the trouble, and I am myself experimenting—on a real building, worse luck—with a system of roughened surface.

But, after all, the best buildings for sound seem to be those in which echo is made our friend and not our foe, buildings in which, as in the old Exeter Hall, echo was timed to reinforce every syllable instead of fighting for dear life with the succeeding one or possibly with the next word. I look forward greatly to more light on this ancient bogey.

It was amusing to note that the correspondence in "The Times" on this subject floated away from the topic of our acknowledged darkness not to light, but to the confused noise of scientists belabouring one another on the general nature of induction from observed phenomena.

During my past year of office the architectural waters of Edinburgh and London have been stirred to their depths by three commotions, one in the northern capital, two in the south. The Edinburgh storm was an affair of tramway wires. Those who have wandered about Edinburgh in early dawns will have regretted in recent years that the trafficless quiet of the twilight was disturbed by a noise as of the clucking of innumerable hens. This was produced by the ceaseless toil of the underground cables chafing under enforced idleness and waiting for the far noisier burden of the tramcars.

Lured by the wish to be rid of this hindrance to poetic thought—or by other wishes—Edinburgh decided for the abolition of underground traction, and pending the invention of a "wireless" system the municipality found itself faced with the problem of wire suspension. I was asked to join a movement for protesting against the attachment of the wires—or, rather, of the wires that support the wires—to buildings, on the ground that the so-called "rosettes" or attachment blocks were outrages against architectural decency. The alternatives to rosettes are posts. Now, tramway posts are of two kinds. One sort, when disposed for duty, looks, unfortunately, like a random accumulation of sanitary vent pipes: the other sort is tainted with wrought iron of the kind which owes its prestige solely to the fact that in Victorian days there was a crusade—quite unmerited—against cast iron.

In order to make up my mind on this subject I adopted the line that a question of æsthetics can sometimes be as well decided by the eye as by the brain, so having heard that both rosettes and posts could be seen in full bloom at Leith, I went to Leith. There the question decided itself. I had to choose between yards of municipal "art" scroll-work and a small slab of practical metal. I chose the latter and had, I believe, all the best people in Edinburgh against me. I had never differed from a single Scotsman on any subject before.

London's two thrills have been the Bank of England and Higher Buildings. No one in this room needs any enlightenment upon the nature of these two problems. To take the Bank first. I may explain that it was solely as your President and as the assumed representative of a certain aggregate of cultivated—I didn't say cultured—opinion that my view on the subject was sought and published.

The facts, as I see them, are very simple, though the problem is very complex. The Bank, a very beautiful and greatly beloved building, is too small—vastly too small—for the Bank's business.

The Bank's business is of admitted importance; it is, in fact, of such great and national importance that the business man's answer to the problem, viewed without relation to the pleasures and affections of the heart, would be, "Rebuild the whole thing from the ground and from far below the ground."

But you cannot, in a decent country, view even money matters wholly apart from these "pleasures and affections."

Next there come two very interesting factors in the case. The site of the Bank is so consecrated by sentiment, necessity, convenience, and habit to the Bank's business that any idea of abandoning the site and choosing a new centre is entirely out of the question. Moreover, were this course adopted we should have to face the further problem that the abandoned buildings would have to become one of three things: (1) The home of some tenant whose needs they would fit unaltered; (2) the home of a tenant who would alter them; or (3) a historic monument. The first is unlikely, the second would be disastrous, and the third is contrary to the spirit of architecture.

What I call the other factor in the case is brought about by the low height of the Bank buildings.

The raising of the walls on the frontages to anything approaching normal city height would lead to interference with the prescriptive rights enjoyed by ancient light owners in all the surrounding streets.

This apparent disability is really a help towards the harmonizing of contending motives.

The Bank must increase in size, it must remain *in situ*, it must not violate its well-known architectural countenance, it cannot easily or reasonably heighten its exterior walls, but it can, and I should say must, build buildings of increased height inside the *enceinte* with which the genius of Soane engirdled it.

That there should be a necessity for altering any of the internal courts or any of the interior halls and rooms which are part of its beauty is indeed deplorable, but the deplorers of such internal change are but a millionth part of those who would or should suffer by any destruction or mutilation of the exterior. The right rule appears to be that the whole of the engirdling wall should be left undisturbed, expressing in the future as it does express to-day the very spirit of protection or custody, and that if it is impossible to retain unchanged any of the open courts which are among the less-known beauties of the interior there should at least be preserved as many as possible of the banking chambers which align the frontage to a depth of some 40 ft., leaving the new higher buildings to rise at such a distance from the façades as to render them a kind of keep within the castle. For my own part I deprecate the superposing of any upper growths on the frontage walls themselves, feeling that what Soane designed as horizontal and self-sufficient should not be made a substructure to any upward composition, however ably designed.

And now, with your leave, a word on the Higher Buildings problem. The opinions even of individual architects differ on this subject, but this Institute as a general body spoke on the matter in terms which were as remarkable as they were unmistakable. Why remarkable? Because architecture is an art whose business it is to clothe utility in beauty. What does our motto say? Utility for the citizens, beauty for the city. It is our business to balance the utility and the beauty lest either should over-weight the scale. When a man is faced in these balancing exploits with a difficult decision, it not infrequently happens that a coin or two in one scale or the other will help the mind's decision. The Institute's mind must have been fully open to the fact that if it were to throw its influence into the Higher Buildings cause it would undoubtedly open the way to increased opportunities of earning money. In other words, every self-interested motive lay for architects on the side of Higher Buildings. Now, the President is the one man in this Institute who doesn't normally vote, and he does as little as he can in the way of influencing others, so that perhaps he may, without indecency, say what he thinks about a vote taken in his presence; and I take this opportunity of saying (naturally without any reflection whatever on those who voted in the well-meaning minority) that the decision given by this body against the promotion of higher buildings in London was a remarkable and very high-minded example of truth to artistic purpose in face of very cogent and material counter arguments.

Do not let me be misunderstood. It was not a question of moral right and moral wrong with money on the Devil's side. It was a question of æsthetics in a very broad sense, and the side which was willing to sacrifice opportunity for an ideal won.

It is by virtue of my claim to speak without a fixed subject that I spring from Higher Buildings direct to the portrait of Mr. John William Simpson.

Our intention, in the series of portraits to which this painting will to-morrow belong—the series is already assuming the proportions of a respectable picture gallery—our intention, I repeat, is to acquire, often, I fear, at the cost of some generosity on the part of our good brothers the painters, a collection of first-rate works of art as first-rate memorials of architects who should be and may be first rate. Happily it has been our good fortune up to the present moment to be able to offer as sitters to the portrait painter men whose achievements and fame have been worthy of his work. Our distinguished brother-architect, Mr. Simpson, retaining during his years of presidency some traces of that modesty which it is the obvious duty of a president to set aside, may probably have been prone to decry his own claims. It is our pleasant duty this evening, in welcoming his portrait, to welcome him also to this familiar gathering and to assure him of our pleasure in taking possession of so good a representation of so good a president. Having regard to that modesty which since his departure from the chair he has been at liberty to resume I will be careful of what I say, but as his successor and as a member of his Council, I suppose I am as well qualified as any one else to speak of the unceasing vigour of his work for the Institute. The Council can never have had a better chairman. His conduct of debate was always firm and fair, his treatment of difficulties always judicious. But these are merely domestic qualities. Mr. Simpson went much beyond them. His constructive policy was bent upon the improvement of the Institute's position, and we know with what enthusiasm and zeal he laboured in a line of action which many of us thought it dutiful to advance. Nay, more. Mr. Simpson, before, during, and since his presidency, has always had at heart the relationship which should exist between our English architects and those of friendly countries on the Continent. Equipped with special gifts of intercourse with France, we acknowledge him as the father of that Franco-British union which has already brought the priceless gift of friendship to many men on both sides of the Channel.

Again, we know and realize that during those years which seemed to be devoted almost exclusively to the affairs of our Society, Mr. Simpson was blessed and encumbered with the cares and pleasures of a large practice. How a man with the handicap of several months of ill-health was able physically to cope with so many duties all generously fulfilled is more than some of us can understand. But the task was accomplished, the health was happily restored, the rest—if the renewal of increased professional work can be called rest—was won, and if Mr. Simpson should prove to be the last to whom the honour of belonging to the present series of portraits is accorded, he will have the satisfaction of knowing that he has won his position on the line not merely by the great skill of the painter, but by his own deserts. In thanking Sir Arthur Cope for the brilliant performance of his task—and it is my wish here and now to move a formal vote of thanks to him—we welcome the new possession as the presentment of one who, besides being a gifted and very productive architect, showed during his year of presidency, and, indeed, in many other years, a dutiful devotion to this Institute, and an initiative in that devotion which have been the admiration of his friends, the despair of his rivals, and the encouragement of his successor.

DISCUSSION.

Mr. Simpson said it was a privilege to second the vote of thanks to Sir Arthur Cope, proposed by the President, and referred to the intimate friendship of 40 years' standing which had existed between himself and the artist. The portrait was a beautiful piece of work. He was faced with two portraits of himself, and it would be a poor compliment to the artists to deny the resemblance, but the value of a work of art depended not on the subject but on its treatment. The little things he had been able to do for the Institute were of small value, but he thanked the Council for the honour they had conferred upon him, and the members for their loyal support.

Sir Frederic Kenyon said that it was an honour to propose a vote of thanks to the President on such an occasion, and wondered why he had been selected for the purpose. Was it because no architect could be expected to propose a vote of thanks to another architect, or was it because architects constituted a mutual admiration society? He spoke as a member of the general public, representing the clients of architects, who had to live in and look at their works. He wished every success to the Wren bicentenary celebrations, and suggested a large conspiracy of arson, which would give architects an opportunity of rebuilding London. Speaking of axes he said that the British Museum might be brought into line with Waterloo Bridge by pulling down a few hotels, and with Piccadilly Circus by straightening out Shaftesbury Avenue. Sir Frederic emphasized the present unsettled state of English art, and the lack of tradition, and suggested the revival of the atelier system as a remedy.

Among the guests at the Council Dinner, held before the meeting, were :—The Rt. Hon. The Earl of Crawford and Balcarres, K.T., P.C.; Sir Amherst Selby-Bigge, Bart., K.C.B., and Lady Selby-Bigge; Sir Francis Newbolt, K.C., and Lady Newbolt; Sir Frederic G. Kenyon, K.C.B., and Lady Kenyon; Sir Lionel Earle, K.C.B.; Sir Hercules Read; The Rev. E. C. Pearce, D.D., Vice-Chancellor, University of Cambridge; Dr. H. H. Waring, F.R.C.S., Vice-Chancellor, London University; Mr. Cecil Lubbock; Mr. E. J. Partridge, President, Society of Architects; and Mr. John W. Simpson.

Mr. H. V. Lanchester's Presidential Address to the Town Planning Institute.

THOSE who formed the group responsible for the inception of this Institute will, I am sure, endorse the statement that events have taken us along an intricate and difficult route very divergent from any we were able to visualize at that time. The problems that have presented themselves have proved so different from those which could have been foreseen that I feel the Institute has justified its existence in a way that would have been impossible had its early years been spent in smoother waters. First and foremost I attribute our position to the broad and logical spirit in which the Institute has considered its work, and the absence of any narrow professionalism or jealousy in every decision that it has taken. Recognizing as we do four professions as having a primary interest in our field of operations, we have found the linking up of them not only mutually advantageous to the outlook of each, but also conducive to a better appreciation of the scope of our work as a whole, while the conjunction of these four has led us to look still farther and to visualize the numerous activities that impinge more or less closely on our own, such as those of commerce, manufacture, education, social life, and others that will immediately occur to you. This expansion of our field of view has placed us in the position that the town planner, however determined he may have been to make himself solely a skilful practitioner, finds that he can only do this by becoming a philosopher and a psychologist.

Racial jealousy and class antagonism, consequent on the upheaval of 1914, are seriously affecting the results of our work, and will for some time handicap our efforts. The exceptional conditions have, however, provoked a number of experiments which, whether successful or otherwise, have made for flexibility in the general latitude towards ideas that might have had little chance of consideration under a less disturbed régime. This last is a valuable asset, but, in order that we should reap the benefit of it, it is imperative that a spirit more conducive to co-operation between all sections of the community should be fostered. The whole theory of our activity is that of a new humanism supplying the place of an outworn individualism and coordinating the lives of all who have a part in the civic structure. Therefore it is for us to point the way to a solution by which all shall secure the maximum advantage attainable in every branch of life and incidentally to inculcate that the true wealth does not depend on the distribution of material property, but on the life that is offered to the community as a whole.

If this were recognized there would be less of the irritation and jealousy produced by the restrictions of poverty, for poverty is relative and is usually measured by what other people spend, so that with opportunities all round for freedom in activities, recreation, and education, the sting of poverty would be extracted.

I know this is a state of things not easily come by, not so much by reason of lack of resources as on account of the heritage we have of a large class that has hitherto been driven into a dark and dismal channel of life from which there is no rational escape. Release can only come to such a class by degrees, and mainly through the younger generation.

A serious defect in our social organization arises from the inflexibility of executive faculty that it has imposed. When all workers have been rigidly trained to one occupation and one only, any change of conditions must result in unemployment and consequent hardship. Were it possible to have a larger element of those in every branch of work possessing a second or even a third string to their bow, communal life would run much more smoothly. I am not forgetting the old adage "Jack of all trades," but I remain convinced that if, say, one quarter of those engaged in each trade were permitted a certain latitude of endeavour, we should be able to adapt ourselves more easily to the inevitable fluctuations of demand.

We all cordially recognize the efforts of the societies that are working with us in advocating town planning in its various aspects and in securing a more widespread comprehension of the benefits that this branch of art, or, rather, this co-ordination of the arts, can confer on us. Their function is not identical with ours, but is of the very greatest value to us in leaving us freer to concentrate our attention more definitely on the technique of our work than we could venture to do did we feel that there were no others prepared to carry the flag of the propaganda.

Do not imagine that I am trying to narrow our outlook or discourage my co-workers from taking a part in any form of action that they feel qualified for. But it will make for economy of effort if sub-divisions of function are clearly recognized, and in so dividing those belonging to our Institute, as indicated by our constitution, we may achieve the soundest possible technique and the most effective methods by which the wide-spreading aims of our art can be translated into material form.

Now let us consider how best to advance the art which has taken such a hold on our imaginations. It is not a new one, indeed, it is one of the oldest in the world, and its conditions, at first, like all arts, accepted unconsciously, have been restated from age to age, according to the ideas of the times. Just as in philosophy and in religion the formulæ becomes obsolete and futile, so in sociology and its demands, when changes make these formulæ ineffective the organism dies and can only spring to life again under a new dispensation suited to changed conditions.

A new visualization has been afforded to us, and we should be less than men if we failed to take advantage of it. What we are engaged on is not merely the exercise of a profession according to the usually accepted standard; it is a co-ordination of the work of all the professions, and if those more definitely represented in this body are obviously required to shoulder the imaginative and executive functions, it is good to feel that we do not exclude anyone who can make a contribution to our ideas from a standpoint outside these.

In the degree to which we are able to assimilate and appreciate these ideas will our own work be successful or otherwise. Even in the more limited range of what may be termed active membership a quite important series of function may be defined, all of which impinge and overlap. Let me offer the following as a definition of the work of our four groups :—

Imaginative Art	The Architect
Imaginative Science	The Engineer
Economic Science	The Surveyor
Justice	The Lawyer.

We must all have realized that without the full representation of these, all dominated by the underlying demands of human welfare, the results will fall short of our ideals, and though many have tried to extend their personal range as far as possible in order to do justice to this work, there is no one who can fail to have felt at times that he would have welcomed the aid of the other branches. My own belief is that it is best to design a scheme on the broadest possible lines and then to set to work to challenge its general features by such tests as are available.

During the life of this Institute a much wider scope for the activity of the town planner has received general recognition. In the early days of town planning it was seldom regarded as possible to proceed otherwise than by the control of private enterprise; then the emergency measures due to war conditions brought in the public bodies and large concerns, under the assisted schemes, and we are now in a position to compare the results of the two methods and their subsidiary varieties. In one respect these public schemes have been of immeasurable value, in that they have raised the general standard of design and show a homogeneity not attainable under other circumstances.

While I need not assure you that, for my own part, I have always felt a keen interest in the maintenance of the characteristics and traditional aspects of our great cities, I feel that without doubt the time is approaching when they will need to undergo very definite reorganization if they are to maintain their efficiency from both the industrial and social aspects. What these changes will be it is difficult to foreshadow, and I will content myself with pointing out a few questions in which we might be well advised to keep an open mind.

Perhaps the most obvious is the extent to which flight will develop as a means of transit and the possibility of providing suitable landings and connections between these air lines and populous centres; but this, though likely to be much in the public eye, affects the mass of people less than the improvement of existing transit and transport, which is still, for two reasons, not fully organized. One reason is our heritage of obsolete plant and methods, the other a lack of co-ordination in controls. Our roads, tramways, and railways are often competitors, and are, consequently, often fighting an uneconomic battle where combination would result in an improved system. Take London as an example. It appears as if a great deal could be done in accelerating and simplifying transit by unifying the tubes and the suburban electric lines to a much greater extent than is being done at present. The possibility also of a night shift on these for transport purposes might also be worth investigation. There are other points that arise in connection with this question that have been by no means thoroughly explored, and other cities demand special treatment according to their organization and physiography. These matters have too often been regarded as outside the range of the town planner, but there are definite indications that the organization of transport will secure increasing consideration with a view to a more efficient combination of the various means employed, and the consideration of this question comes within the scope of our activities, inevitably demanding close attention from us in the near future, such attention as has been given to the problems of zoning during last session, and which has done much to make clear the nature of the demands for regulating the allocation of areas for specific purposes.

The question of maximum heights for buildings has recently been the subject of rather warm discussions. Now, looked at from an abstract point of view, there is no reason why buildings should not be very much higher than is at present generally accepted in this country, provided that the space around them be proportionately increased; but there are two objections to any material change in an established town: first, the provision of increased open space presents almost insuperable difficulties in view of the vested interests in occupied sites; and, secondly, the period of change would be long drawn out, and during that period the variation in size and scale would be fatal to general harmony and architectural dignity.

Again, we have to remember that many of our members are working in remote parts of the world, confronted with problems very different from those we have at home. Housing, sanitation, and traffic present very distinctive features in India and in our tropical colonies. We have to accept a much more economical scale of housing as reasonable where for ten months of the year it is possible, and, indeed, advantageous, to sleep in the open air, but the established type often leaves much to be desired from the sanitary point of view, and while we struggle to remedy this, the conditions prescribe that our efforts take much simpler and more primitive form than is customary at home. There are numerous endemic and epidemic diseases to be battled with, and the popular view being too often that these are "Acts of God," a term that even at home is grotesquely made to apply to any untoward happening, we have often an uphill fight to secure sympathy for remedial measures, however obvious and simple these may be. Commercial methods, also, are more primitive and wasteful in time and transport, though in these economic pressure is exercising an increasing influence.

I will now pass on to another aspect of our work that has an immediate claim for consideration, in view of its importance in the social scheme. For long the terms "congestion" and "congested areas" have been employed without a very definite idea as to what they represent, and there is an undoubted difficulty in dissociating too dense an occupation of areas from the insanitary conditions that often accompany this. Statistics suggest that a density of more than seventy persons to the acre is detrimental to health, but it is open to question whether this is a reliable figure, and there are a number of factors that ought to be investigated if we are to possess a clear view of the right distribution of the inhabitants of an urban group. Such investigations will, it is intended, form the basis of our discussions during the ensuing session, as will be evident from the programme laid down, and I think it may be confidently anticipated that the proposed papers and meetings will result in a much clearer view of this important section of our work.

In subsequent years there will be many other branches appropriate to special consideration on similar lines. I wish to make an emphatic appeal for the view of our art that sometimes, I cannot but feel, gets pushed too much into the background amid the complex demands of hygiene and economics. I mean the view that the most important thing about a city is that it should be beautiful, and beautiful in a characteristic way, not merely conforming to some adventitious ideal of beauty, but developing a peculiar beauty of its own, based on something belonging to its position and its activities. I have been in many cities and do not know one that does not offer distinctive characteristics which spur the imagination towards making it, not a second-rate imitation of something else, but an entity having a character which might mark it as distinct from others, such as we recognize in every city holding a notable place in the world. It is true that in some places the hints are vague and weak, but they can be found if sought for, and raised to a higher power of expression. Perhaps at a future date I may have the opportunity of illustrating what I mean from the cities of the East, where much of my work has lain, but the principle is no less true as regards those of Europe and even those in stolid England.

Such an attitude towards a city does not, I maintain, conflict in any way with the logical interpretation of needs; it is a help rather than a hindrance, in that these needs have to a great extent created the character, and our aim is merely to give more intensive and imaginative expression in harmony with the logical development, and the two are so welded together that they reinforce each other, and secure consistency in the design as a whole. As in purely architectural design we cannot have the best without an expression of purpose, so in a town falsified design cannot be good, and the imposition of artificial conceptions, whether grandiose or picturesque, is to be deplored; but no town is so organized that it may not achieve dignity and interest. We still lag behind some other countries in not demanding that the first stages of a scheme shall deal with the city as a whole, and this militates against the possibility of securing a characteristic form of expression such as I have indicated; but year by year general opinion is becoming more favourable to the extension of the idea of city design, and we have every reason to hope that in the not distant future we may have opportunities to employ the knowledge we are acquiring in the broadest and most effective way.

The Society of Architects

The Presidential Address of Mr. E. J. Partridge

THE Society of Architects held their opening meeting of the session last Thursday, when the new president delivered an address.

He said: Having been elected to the highest honour which it is in the power of the Society to confer upon any of its members, I recognize that many important duties and responsibilities will devolve upon me and I shall have to act, when occasion arises, as the official mouthpiece of the Society. In the meantime, the members will no doubt expect that I shall, at the commencement of my year of office, express my personal views on various points relating to the profession generally, and to the Society of Architects in particular.

One of the most important matters which in my opinion requires our earnest consideration, both individually and collectively, is the necessity of ensuring increased recognition by those interested in building, viz., our employers and clients, whether actual or potential, of the important part played by architects in the scheme of national service as servants of the public entrusted with the production of buildings which will, in every particular, efficiently meet the requirements for which they are designed, whether for private, municipal, or commercial enterprise, or for educational or religious purposes, or for the housing of the people.

MR. E. J. PARTRIDGE, F.R.I.B.A., F.S.I.

It is therefore incumbent upon the architect in his own interests, as well as in the interests of the community, that he should so carry out his work in every detail, whether artistic or utilitarian, that potential employers will recognize that the services of an architect are a necessity to the building owner and not, as is sometimes the case, particularly in regard to smaller works, a luxury. This leads up to the question of architectural education, in which great developments have been made during recent years. The established practitioner must improve and increase his knowledge by the continual study of the many problems which now arise in consequence of the great change in the conditions of modern life. With regard to architectural education in the early years of professional life, the old system of pupilage, which is not altogether without its good points, and was at one time considered the only proper way of entering the profession, is being rapidly superseded by the architectural schools, and it should not be forgotten that the Society of Architects was the pioneer in establishing in this country, in 1913, the first atelier of architecture for the purpose of promoting improved methods of architectural training in Great Britain. The work commenced by the Beaux Arts Committee and carried on ever since with the assistance of the Society, was at the time the subject of much hostile criticism, but the fact that the method then advocated has since been widely adopted by the architectural schools, and that other ateliers have been established and co-ordinated under the auspices of the Royal Academy Atelier Council, is sufficient to justify the claims of the Society that its efforts have resulted in revolutionizing and improving the architectural educational system in this country.

There never was a time when architects had such opportunities as exist at present for education in professional matters in all stages of their careers. Apart from the financial support which the Society gives from time to time to other kindred educational bodies, it has itself evolved and established a system of educational competitions in design and other subjects, for the benefit of its members, on lines which enable those at a distance to participate equally with others nearer to headquarters, and there is a scheme in preparation the object of which is to afford those members who, because of distance and other reasons, cannot take advantage of the facilities afforded to the architectural schools in the larger centres, some guidance and assistance in their efforts to improve their qualifications.

But the Society does not exist solely for its members, and in education as in other matters it takes a much wider view, and one of its most striking successes has been the institution of the Victory Scholarship Competition in design, open to any British subject. This year, upwards of sixty candidates entered for this competition from all parts of the Kingdom, and those who were able to see the designs and to listen to Mr. Robert Atkinson's recent criticism thereon, will realize the value of this competition to all those who participated in it, whether successful or not in obtaining any award. One result of this competition was to emphasize the remarks which I have previously made in regard to the designing of buildings, inasmuch as while many of the drawings submitted exhibited beauty and harmony in design and clever planning, some of the most conspicuous in this respect failed to realize one essential requirement, that relating to the assembly and dispersal of vast crowds of people and of vehicular traffic, a defect which shows that the competitors failed to solve the problem in its entirety, and, therefore, the building could not be considered as satisfactorily providing in all respects for the purpose for which it was designed, viz., a stadium for Olympic games.

Having provided for the education of the architect, it is in the interests of the public that all who wish to enter the profession of architecture should first be called upon to qualify themselves and to prove their qualifications under a statutory examination before admission to a register under an Act of Parliament. The Society was founded nearly forty years ago for the purpose of obtaining the statutory registration of architects, and although, owing to its growth and activities, it has developed in other directions as well, it has not lost sight of its main object, and is always pressing forward to its consummation. The sooner efficient registration is effected, the sooner will begin the weeding out of the unqualified man to the advantage of the public and of the profession.

It was some two-and-a-half years ago that the R.I.B.A. Council formed the Unification and Registration Committee, the most comprehensive body ever gathered together within the architectural profession for one purpose. The Society of Architects was invited to become one of the constituent bodies and very gladly accepted the invitation, and its representatives took a very active part in the proceedings. The Society had previously, from its knowledge of past difficulties in regard to the amalgamation question, suggested a federation of interested bodies for the purpose of securing registration, and this was the basis of one of the two schemes placed before the Unification Committee for its consideration and approval. After full and open discussion, the Committee eventually expressed its preference for a scheme which was in essence, so far as the Society of Architects was concerned, a proposal for the absorption of that body by the Institute, and the Society, anxious for unity, acquiesced in the vote of the majority and heartily supported the principle of the scheme selected, and was in the midst of negotiations with the Institute Council on questions of detail, when it became apparent that a divergence of opinion had arisen amongst the Institute representatives on the Committee, not only on questions of detail, but of principle also, so that whereas the proposal of the majority was for unification as a preliminary to registration, a minority on the Institute side took the opposite view, viz., that registration should be accomplished first. This difference of opinion was reflected in the election of the Council of the R.I.B.A. in June last, when, with only a few exceptions, an entirely new Council was formed, and one of its first acts was to intimate to the individual members of the Society on the Unification Committee that its work was at an end and their services no longer required. This was followed some time afterwards by an intimation to the Society as a body to the same effect, notwithstanding the fact that the Unification Committee was still sitting to arrange details of the scheme and had not completed its report. It has since been stated in the professional journals that the Institute Council has formed a Registration Committee of its own, and is making arrangements for the early presentation of a Bill to Parliament. It is well known, however, that Parliament will not give a hearing to any proposal of the kind which is not supported by all interested bodies, and members of the Society may rest assured that their Council will take whatever steps may be necessary to see that the interests of its members are not affected adversely by any proposals which may be put forward by any other body in regard to a matter which affects the whole profession. Personally, I hope and believe that the Institute Council will presently take a wider view of the situation and that we may once more work in harmony with it in this direction as we are doing in others.

Another matter of general interest to the profession is the production of a form of contract which shall be accepted by all parties to that contract. At the present time, as you all know, there are many different forms in existence, and in most of them it appears to have been the aim of the person drawing it to obtain some advantage over other parties to the contract. It surely is not beyond the power of reasonable men to devise some general form which shall be fair to and acceptable by all parties, and if each party will consider the question from the other fellow's point of view, as well as from his own, I feel sure that such a form will be produced. There is now sitting for this purpose a committee composed of representatives of all bodies concerned, and although their deliberations will involve much time and thought it is hoped that the object for which the committee was formed will ultimately be attained.

I will now return to a matter more directly affecting the Society, and one in which I invite the personal assistance of every member in every class in the Society, viz., the necessity for a large increase in the membership. The Society, as I have already pointed out, was established for a definite object, and it is for the purpose of achieving that object, and not for the glorification of the Society, that we must have the support of every qualified architect as such; it does not matter whether he is already a member of any other kindred institution or not. If any qualified architect is in sympathy with the Society's objects, particularly in regard to statutory registration of the profession, then I think it is his duty to seek to join the Society in whichever class he may be eligible for, not merely for the privileges of membership, which are considerable, but in order that he may help on the work of the Society. It is because the Society advocates an Act of Parliament, which would provide for the recognition of every bona-fide architect who is qualified for admission to the profession, that the Council of the Society decided some time ago so to reconstitute the Society as to make it a registering body capable of including within its membership all architects who are eligible. Within its ranks there is scope for the pupil, the assistant, and the practitioner, and it will be found that there are many architects at present outside the ranks of the Society who are in sympathy with its aims, and only require the case put to them personally in order to secure their support. In connexion with this I would remind members that they will be conferring a benefit upon the members of their staffs if they encourage them to join the Society and to compete for the awards which are so freely offered, in addition to other advantages.

With regard to the new Journal of the Society the Council has spared no expense in providing a publication which will serve to link still more closely the members of the Society, and particularly those at a distance.

Here I may suggest that at present the Society is comprehensive rather than representative, but it is well known that five or six men bound together and actuated by a fixed purpose can accomplish almost anything they set their hands to. There is thus no limit to the progress which can be made by a body of fifteen or sixteen hundred men all intent on one objective, and by means of the exercise of a little enthusiasm we can not only continue to be comprehensive, but can become so representative as to be able with still greater weight and force to impress our will upon those whom we seek to influence in the direction of the reforms which the Society advocates, and more particularly its main object, the accomplishment of the statutory registration of architects.

Proposing a vote of thanks to the President, Mr. T. S. Darbyshire agreed with him on the importance of obtaining an increased recognition for architecture on the part of the general public. The profession had only itself to blame if it persisted in hiding its light under a bushel. Architecture, as an art, was neglected in the public schools, and until it was incorporated in the curriculum he believed the lack of interest would continue. He hoped that the year would see the solution of the registration problem.

Mr. H. A. Aitken, seconding, congratulated the Council on the new Journal, which would, he thought, be a great help to architects in every way.

Mr. Sylvester Sullivan, speaking on behalf of the Council, promised the President the support for which he had asked. He thought that public recognition was on the increase, and referred to recent correspondence in "The Times." A building, he thought, had no *right* to beauty unless it arose from it and was part of it. It could not be applied.

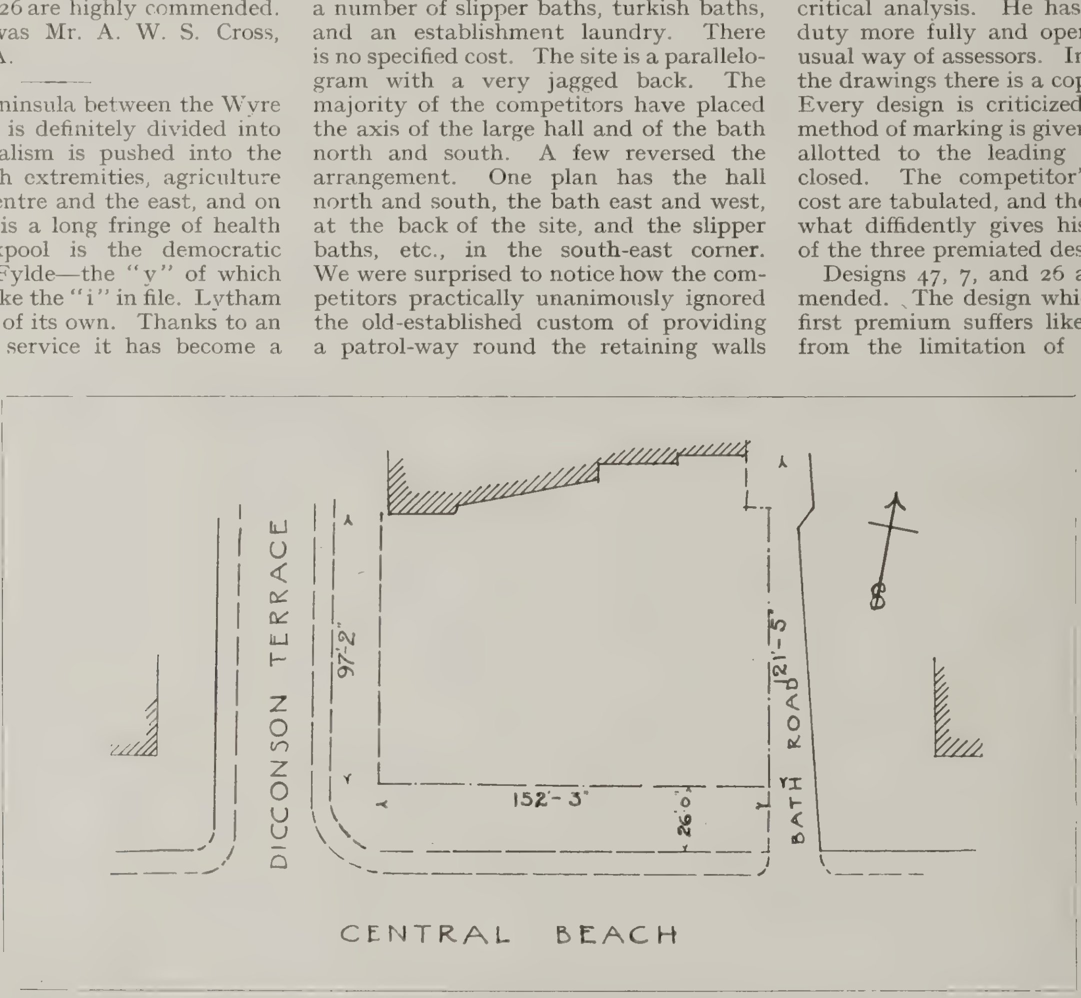
Mr. Sadgrove also spoke, and Mr. Partridge, in reply, mentioned that the Journal was anxious to obtain information as to the costs of current buildings. He hoped that members would co-operate in supplying this.

Lytham Public Hall and Baths Competition

A Criticism

THE awards have been made in the above competition, and are: First, Hubert A. Thomas, A.R.I.B.A., Fred G. Barker, L.R.I.B.A., Liverpool; Second, Messrs. Mennie and Smith, London; Third, Marcus A. Type, Birmingham. Designs 47, 7, and 26 are highly commended. The assessor was Mr. A. W. S. Cross, M.A., F.R.I.B.A.

The Fylde peninsula between the Wyre and the Ribble is definitely divided into zones; industrialism is pushed into the north and south extremities, agriculture embraces the centre and the east, and on the west there is a long fringe of health resorts. Blackpool is the democratic capital of the Fylde—the "y" of which is pronounced like the "i" in file. Lytham has a character of its own. Thanks to an excellent train service it has become a bedroom of Manchester much as Hoylake has of Liverpool. The atmosphere is high-class suburban. There are trees overhanging the railway lines, gardens in front of the station, trees shading the streets, and the station road is called "The Green Drive." The streets are exceptionally wide with broad flagged sidewalks. On the sea-front there is an endless chain of villas, each with its little garden in front. Between the villas and the sea-wall is a vast expanse of turf, apparently miles long, and averaging 150 yd. wide. All the older buildings are faced with a very dark red brick, which has a pleasant texture, and stone is very sparingly used but with good effect. Except for a house or two where the stone has been painted an aggressive white, there is hardly a jarring note in the whole length of the front. The environment of the competition building, therefore, may be summed up as spaciousness, dignity, and reticence.



PLAN OF THE SITE.

Great credit is due to the promoters for the excellent way in which the drawings are displayed. They are arranged in a well-lighted room situated on the very site of the proposed building.

The conditions ask for a hall to hold 1,500, a smaller hall preferably under the large hall, a large swimming bath and a number of slipper baths, turkish baths, and an establishment laundry. There is no specified cost. The site is a parallelogram with a very jagged back. The majority of the competitors have placed the axis of the large hall and of the bath north and south. A few reversed the arrangement. One plan has the hall north and south, the bath east and west, at the back of the site, and the slipper baths, etc., in the south-east corner. We were surprised to notice how the competitors practically unanimously ignored the old-established custom of providing a patrol-way round the retaining walls of the swimming pond. Anyone who has studied the site will have felt that at all costs the central beach front must be symmetrical and have a fairly level skyline. Not a quarter of the competitors have realized the nature of the problem, or perhaps it would be kinder to say, have produced a correct solution.

The promoters are to blame for the low standard of the designs. The site is far too small for all the scheduled accommodation. Over seventy architects deposited a guinea and obtained the conditions; forty-seven submitted designs. The difficulty of packing the box choked off 33 per cent., and proved too much for everyone. The clerk to the U.D.C. declares that some legal bogy causes the building line to be set back 26 ft. from the road. An examination of the site failed to give any clue, and there are countless instances of a civic building gaining in dignity by standing a little in front of its domestic neighbours. Either that bogy must be scotched or the accommodation reduced; otherwise Lytham for all time must be content to have a badly-proportioned hall with cramped and gloomy accessories.

Mr. Alfred W. S. Cross, the assessor, has had a difficult task, on which he has concentrated his well-known powers of critical analysis. He has discharged his duty more fully and openly than is the usual way of assessors. In the room with the drawings there is a copy of his report. Every design is criticized in detail: the method of marking is given and the marks allotted to the leading half-dozen disclosed. The competitor's estimates of cost are tabulated, and the assessor somewhat diffidently gives his own estimate of the three premiated designs.

Designs 47, 7, and 26 are highly commended. The design which has won the first premium suffers like all the others from the limitation of the site. The large hall, 80 ft. long, is divided into seven bays; the inner side of the horseshoe gallery projects three bays, say, 35 ft., and the head room under is just 11 ft. The angle from the cinema operator's room is so acute that pictures will be disagreeably foreshortened. The entrance to the great hall is 26 ft. by 12 ft. 6 in.; in it are packed three pairs of outer and two pairs of inner swing doors, a pay-box, the commencement of two flights of stairs leading up and two flights leading down. The chairs in the great hall are in blocks of fifteen; the stage recess is only 12 ft. deep; the space between the nosing of the stage and the nearest row of chairs is 2 ft. 3 in. There are three tiers of seats at the sides of the gallery, and as many as thirteen at the back. The authors have made the smaller hall 56 ft. wide and only 15 ft. to the ceiling. The beams carrying the great hall over have a span of 44 ft., and, therefore, with only ¾ in. depth per foot will project about 3 ft. The assessor considers that the winning plan excels all the others in its

MENNIE AND SMITH, ARCHITECTS.

vital parts, such as the boiler-house, that it equals the rest in the planning of the halls, and is hardly inferior in elevation or in planning of the baths. In the authors' voluminous report they estimate the cost of the special plant at £7,330 and the cost per cubic foot partly at 1s. 9d. and partly at 2s. 6d., which makes a total of £84,146. Averaging 2s. per foot cube all in, the cost is £81,700. The authors have constructed a symmetrical brick front. They boldly show the gable ends of the two larger rooms, and have squeezed in between them a central entrance surmounted by two tiers of windows, several of which give light to w.c.'s. There will be great difficulty in concealing the soil pipes internally; if shown externally the front will be ruined. The façade has many small blemishes which we hope can be eliminated. A flock of lamps, a mass of petty detail, and raking joints between stone and brickwork carry us back to the closing years of the Victorian era. The best that can be said is that a highly monumental front would probably have been too heroic for the site. The façade to Bath Street is much the best of the three elevations. Dicconson Terrace, which closely follows Bath Street, has not quite the same dignity. Mr. Cross suggests that if the great gables to the south were omitted, the little dome over the entrance would gain in dignity. We should prefer the width of each gable to be reduced by 10 ft., and the central features increased accordingly. The first premium, therefore, is due not to outstanding merit, but rather to deficiencies in the competing designs. We recommend Messrs. Thomas and Barker to stand on the sea wall and study the Queen's Hotel, the nearest largish building to the site. The proportions, the detail, and the materials are all in wonderful harmony with the situation and the purpose for which it was built.

The design placed second is full of difficult and expensive construction—for instance, the floor and one wall of the great hall are on girders with a span of 40 ft., and we failed to see how the roof over the great hall could be carried. The elevation has leanings towards the monumental, and gives promise of better work to come. Mr. Type is distinctly fortunate in winning a premium; his elevations are completely out of tune. Designs 26 and 34 have been attractively drawn. The elevations of Mr. Bright Fraser (15) and Messrs. Field and Pearson (18) have considerable merit. Perhaps more than any others Messrs. Cooke and Davies (20) have caught the spirit of Lytham. The concluding lines of Mr. Cross's report are only too true: "In this competition there are very few designs of an artistic nature combined with good setting out and departmental planning of a high standard."

Following, we give the concluding portion of the assessor's report, the preceding portion being devoted to a criticism in detail of each set of designs:—

"In accordance with the conditions of the competition I hereby award the premiums to the authors of the following designs: Design No. 17, first premium, £105; design No. 6, second premium, £52 10s.; design No. 13, third premium, £26 5s.

"In addition to the above, I consider that the authors of the following designs should be highly commended for the quality of the work they have submitted in this competition: Design No. 47, fourth; design No. 26 and design No. 7, fifth.

"As to the relative cost of the three premiated designs, I have checked the authors' figures in each case and priced the cubic contents of each design on the uniform basis of 2s. per cubic foot, with the following result: No. 17, £81,700; No. 6, £70,000; No. 13, £80,000, as against the competitors' own estimates which, as stated in the critical notes on the various designs, are as follows: No. 17, £84,146; No. 6, £69,000; No. 13, £74,000.

"With regard to No. 17, I think the south elevation would be much improved if the gable ends of the public hall and swimming-bath could be dispensed with and replaced by hipped roofs. This would allow the central dome to dominate the long façade to a far greater extent than it does at present. And perhaps it would be possible to simplify the window treatment of this front with the view of obtaining a more monumental effect. No doubt you will seek the advice of the successful architect on these points.

"Finally, I should like to draw attention to the fact that in addition to the designs I have selected, or especially commended, there are a few others which, although artistically equally worthy of recognition, have not been mentioned, either in consequence of defective departmental planning or on account of some fundamental mistake in general arrangement. Unfortunately, however, in this competition there are very few designs of an artistic nature combined with good setting out and departmental planning of a high standard."

MARCUS A TYPE ARCHITECT.

The Etchings of J. M. W. Turner

TURNER'S etchings at the Cotswold Gallery, 59 Frith Street, have made one of the most interesting exhibitions of the year.

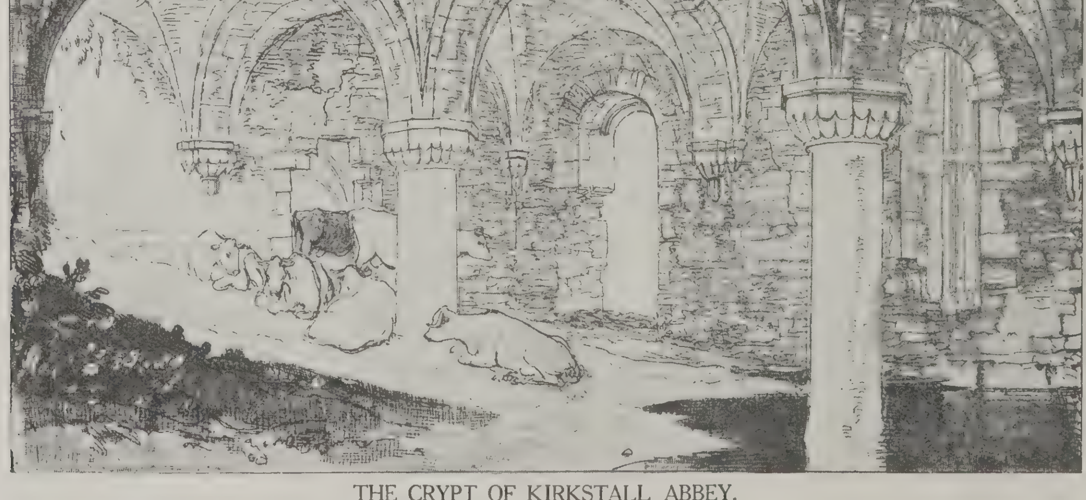
The artist did not intend them to be put on exhibition, nor did he consider them as finished works of art, for they were executed to act as the groundwork for his mezzotints and aquatints; but for this very reason they are particularly valuable. They are valuable because, from their nature as etchings—as drawings in line—they are bound to reveal, in the plainest manner, their creator's strength and weakness; for what he might conceal by a flourish of the brush he could not possibly conceal by a flourish of the etching needle. But they are still more valuable as human documents, as guides for the mind and temperament of the artist, and as tokens of the extent of his artistic genius, because, unintended as they are for the public eye, they cannot be other than the spontaneous utterances of the unconscious artist. It is a common saying that if you want to understand a great writer, you must get to know not his masterpieces but his private letters. Here you have Turner's notes and private jottings before you; and I may say that they make very good reading.

To begin with, Turner's etchings, as may be seen by the one illustrated here, have none of the impressionistic licence of his later oil paintings. They are, on the contrary, prosy, almost pedantic, in their expression, though they never stumble or hesitate. His drawing, too, falls to incredible depths when he tries to draw animals or human beings; nor can he shake himself free of the conventional eighteenth-century tree with its sloping trunk, carefully deformed branches and fringe of banana leaves at the end of each twig. On the other hand, his clarity of idea and his ability to express it, not only with clarity but with that dexterous precision which leaves no mark upon the plate that cannot perfectly vindicate its existence; his vision, his simplicity, his "imaginative completeness," as Mr. Finberg, in his preface to the exhibition catalogue, calls that power of Turner's which makes of his most trifling drawings entities, organisms—these are most marvellously depicted in his etchings. It is these qualities, indeed, which determine Turner's great genius. You would say that the lens of his mind had to be exposed to a definite mental image before that process could begin that ended in the print upon paper. It seems as though he were unable to put his pencil to paper until some definite picture had been realized in all its completeness and richness in his mind.

His simplicity, too, as displayed by his "Inverary Castle and Town" (38), his "Ville de Thun" (24), his "Dunstanborough Castle" (25), his "Crypt of Kirkstall Abbey" (27), where he realizes with intense appreciation the circular shapes of the Norman arches, is of the highest order of genius. In the hands of a lesser man such simplicity would degenerate into dullness, for ostensibly there is only a narrow margin between imaginative simplicity and the barrenness of stupidity. But with Turner this plain speech is his triumph. He sits on the hill near the Observatory above Greenwich, and with tedious prosaic composure draws the hospital and the river beyond, with its shipping in the docks, and beyond that again the whole of London spread out like a map. The scene appears neither to frighten nor exhilarate him; he merely jots down, in his dull way, a few deliberate spots and marks, whereupon the whole City of London becomes visible, teeming with life and sound. The crowded shipping "loses itself in endless obscurity."

As in his "London from Greenwich," so in all his etchings he has given us a glimpse of a profound imagination, glowing, unsubstantial, richly various. His lines infer a thousand sounds, scents, vistas which they do not limb. He leaves a blank in a landscape, and instantly the fields, forests, rivers, hills, which he has not delineated, come crowding upon the mind in all their variations of colour and form.

In one of his essays, Hazlitt draws a picture of Coleridge which is unexcelled as portraits go. "Mr. Coleridge," he says, "has 'a mind reflecting ages past:' . . . . He who has seen a mouldering tower by the side of a chrystal lake, hid by the mist, but glittering in the wave below, may conceive the dim, gleaming, uncertain intelligence of his eye: he who has marked the evening clouds uprolled (a world of vapours), has seen the future of his mind, unearthly, unsubstantial, with gorgeous tints and ever-varying forms. . . . He has only to draw the sliders of his imagination, and a thousand subjects expand before him, startling him with their brilliancy, or losing themselves in endless obscurity." It is the same gorgeousness of imagination which has placed Turner amongst the great artists.



THE CRYPT OF KIRKSTALL ABBEY.
(From an Etching by J. M. W. Turner, R.A.)

Popularizing Architecture

Both the Royal Institute and the Society of Architects are to be congratulated on the improvements they have recently made in their official journals. In fact, in the mere matter of appearance, both have been "improved out of all knowledge," as the colloquialism goes. The Society's Journal makes a very courageous attempt to attract the general public, and, having attracted it by its handsome exterior, to interest it by popular but sound treatment of architectural subjects. It has assumed the title "Architecture," to which the former title "The Journal of the Society of Architects" is now made subordinate.

Architecture in the Lay Press

Acoustics

"HAVE architects, when designing halls and churches, any sound principle to guide them in considering what the acoustic properties of these buildings will prove to be? Or is the outcome pure chance? There have already been numberless complaints about the great hall in the London County Council's new home, that has taken so many years abuilding; and now the Education Committee has decided to desert it on this very account and to hold its meetings in one of the committee rooms. One cannot for a moment suppose that Mr. Knott neglected the acoustic side when designing this vast and splendid chamber. It must be a gamble. The new Old Bailey courts are abominable, Pearson's splendid church in Red Lion Square has been a trial to those who have preached in it ever since its erection. Yet, so one is told, the acoustics of the courts in the new Sessions House on the other side of the river are as perfect as they could be. What is the secret?"—"The Daily Chronicle."

A Pedigree House

"Philip Webb, the architect from whose genius sprang the modern English domestic architecture, designed in 1868 for Mr. George Howard (afterwards Lord Carlyle) a house at No. 1 Palace Green, Kensington. The movement developed through Norman Shaw and on to Lutyens, and to our eyes the Webb building in its exterior does not look important.

"Nevertheless it is a pedigree building, and it is with regret one hears that, having been acquired by a big commercial firm in Kensington, it is likely to disappear before very long to make way for a commercial building. The famous eries of panels painted by Burne-Jones or Lord Carlyle to decorate the house were removed several years ago, but there are still some examples of painted decoraion and gesso work and panelling that ell of the quality of that famous art evival of the sixties and seventies.

"At the passing of this house one reflects hat its builder (with William Morris) ounded the Society for the Protection of Ancient Buildings, which has now reached he forty-fifth year of its valuable work. hould there not be a society for the proection of modern buildings of quality?"— Manchester Guardian."

The Customs Slum

"The Port of London offices recently pened are a magnificent home for their nhabitants. The cost has no doubt been onsiderable, and will be borne directly or ndirectly by the public, yet the business men of London do not complain. But ithin a stone's-throw is a building ousing a great Government department hich is cryingly inadequate to its work. Not far from these offices are the headuarters of his Majesty's Customs, which s a couple of stones'-throws away on the ver, hidden among the maze of little nes south of Eastcheap. It is a great ontrast. The Custom House was built 1817, at a time when the total Customs venue was ten million a year. It was signed to deal with purely Customs venue work on a comparatively small ale. Since then the revenue has increased beyond imagination, till now it is over three hundred and thirty millions a year. Not only so, but the business has been complicated by the taking over of an entirely different service—the Excise. Still further complications have been introduced by a mass of social work such as that attendant on the Old-Age Pensions.

"The inquirer proceeding to the Custom House finds himself in a maze of corridors and rooms, many of them designed as store rooms. They are dark, stuffy, inconvenient and overcrowded. The Long Room itself, once the glory of Government offices, is inadequate to contain its branches. Its floor is encumbered by a series of unsightly pens, and yet the merchant must wander hither and thither before he can perform his business."—A Customs Officer in "The Daily News."

Nameless Craftsmanship

"Ever since the Duchess of Rutland wrote to us to protest against the prevalent habit of ignoring the designer of a war memorial on the occasion of its unveiling, we have received numerous letters asking for more public recognition of the names of craftsmen, especially sculptors and architects, and suggesting that their works should always bear upon them the signature or a similar indication of the hand that created them. If composers and poets attach their names to their music or their verses, why should not an architect who is responsible for a church or a municipal building be allowed a similar right? There is, indeed, every reason why he should be given it; if only because brick or stone is bound to be more durable, whether as an object of beauty or an eyesore, than most pieces of fugitive music or casual verse. If a distich in a magazine can be followed by the writer's full name in larger type than the distich itself, it ought to be a point of honour to allow an architect a corner in which to record his identity. That is but bare justice to his effort, even if he and it come in time to be execrated by posterity. A candid architect, it is true, may perhaps declare that since he cannot make his name as prominent on a building as a writer can make his on a page of print, an obscure tablet, unless it happens to be of the same unique kind as Wren's epitaph, will be of no use to him, or that his style is his signature legible to all who can read it. But the public, it is thought, ought to be trained to praise or to dispraise, if necessary, both the creation and the creator.

'The hasty multitude
'Admiring entered, and the work some praise
'And some the architect.'

But that was a colossal structure and an exceptional occasion. Should lesser works always bear the maker's name? The poets' practice, where the sonority of a signature may effectively shout down an epigram, has already been mentioned; but it has its parallel in more material craftsmanship. One of the oldest scraps of archaic Latin is preserved on a brooch, which proclaims even to this age that 'Manius made me for Numasius,' and another on a vase explains, among other things, that 'Duenos made me.'—"The Times."

Library Planning and Design

"We have never known a library which, in the course of a few years, has not proved itself to be too small even with a rigorous weeding out of old stock. It is an advantage from every point of view to have the whole of the public departments on the ground floor. It may not be practicable to do this, but every effort should be made to secure enough land to make it possible. The advantages are, amongst others, less risk of accidents to borrowers and staff; much better oversight; ease of future alteration; dignity of appearance; effectiveness of ventilation; and a more even distribution of light. This is not to say that the building will look squat and shallow. The upper floors can be used for offices, stores, workrooms, and caretaker's apartments. We suppose few librarians would choose to live over the premises, while in most cases, it will be agreed, it is advisable for someone to be resident. It follows, therefore, that provision should be made for a resident attendant. . . . It can be taken for a general rule that the books in the lending library should be one to every three of the total inhabitants, rising in, say, twenty years, to one and a half inhabitants to each book. That is, a town of sixty thousand inhabitants would have a library containing twenty thousand volumes in the adult lending library, increasing to forty thousand volumes. This forms a standard by which to measure all the other departments."—"The Librarian."

The Adelphi

"The proposal to demolish the Adelphi and to build on its site 'a great Masonic Temple' is one which every devout Londoner will regard with horror. It is true that the quaint, old-world area, looking sleepily over the gardens to the river, has been badly treated of late years. The huge hotels which flank it on one side and the very hideous station and railway bridge on the other, are quite out of keeping with it; and it is, on the other hand, probable that the Masonic Temple would be a fine building quite worthy of the site. But would it be worth while to restore a vanished harmony by sacrificing the one good thing which has been allowed to stand in an unsuitable setting? We have little enough of Old London left. Some of the most beautiful of the City churches are threatened, and, on grounds of expediency, we may have to reconcile ourselves to their disappearance; but the same grounds do not exist for the substitution of a Masonic Temple for the quiet streets —reposeful even in their names—and the dignified houses which compose the finest architectural legacy that London has from the Adams. Both art and history, as well as that only half-realized fondness which the Londoner has for things of the past, would be outraged by the adoption of the proposal; and for once we are impelled to thank heaven for the existence of 'G. B. S.,' and for the fact that he dwells in Adelphi Terrace. If anybody can be expected to fight, tooth and nail, against eviction, whatever the pretext may be, he is the man!"—"The Westminster Gazette."

Land Settlement and Rural Housing

SIR LAWRENCE WEAVER, K.B.E., Second Secretary and Director-General of Land Settlement of the Ministry of Agriculture, gave a Chadwick Public Lecture on Land Settlement, Rural Housing, and Rural Industries, at York, The Lord Mayor presiding.

The lecturer outlined the history of the decline in the number of small holdings in England during the last thirty years. He sketched the economic causes of a movement so damaging to the national interest, and the various efforts, statutory and otherwise, to correct it. In the twenty-six years ending in 1921 there has been a net loss of 21,000 holdings exceeding one and not exceeding fifty acres in England and Wales, although since 1908 there were nearly 30,000 new statutory holdings created, including those provided between 1919 and 1921 for ex-service men. Sir Lawrence Weaver gave an account of the stewardship of the Ministry of Agriculture and the county councils, who have, since the armistice, settled over 17,500 on the land. This has meant the acquisition and equipment by county councils of 280,000 acres of the best agricultural land, or 437 square miles, an area bigger than the administrative county of Cambridgeshire, at a capital expenditure of about fifteen and a half millions.

The hygienic conditions of the new cottages built on the self-supporting holdings were described, and the lecturer claimed that despite due regard to economy they represented a new and better standard of yeoman's home, in which the improvements were due to careful planning and wise use of materials rather than to increased costliness of type.

The lecturer showed a series of slides of typical cottages erected under the Land Settlement Scheme, illustrating general principles of "fitness for purpose" in such details as combined wash-house and bathroom, a new type of rural drainage for sink wastes, raft foundations for Fen country cottages, etc.

Continuing, Sir Lawrence Weaver reviewed the cottage holdings of Belgium as a type of the co-ordination of industry and agriculture, and gave an account of similar holdings created under the Government's Land Settlement Scheme for disabled ex-service men. He examined the policy of the German Government since 1875 in establishing middle and minor industries, including pure handicrafts in rural districts as supplementary to agriculture, and the new effort being made in England by the establishment of a Rural Industries Intelligence Bureau to create such minor industries, especially for disabled men. The lecturer also gave an account of the remarkable and economic results achieved by tuberculous men at the Papworth Colony, Cambridge, and the new attempt to establish "foreign fancy turnery" at the Preston Hall Colony. He also touched on the definite achievement of the Women's Institutes and the Village Clubs Association in raising the standard of hygiene in rural districts, and on the hopeful development of the allotment movement as bridging the gap between town and country.

He pointed out, however, that any national movement for the closer association of agriculture and industry meant a programme of building and improved transport, which national economy forbade at present, whether in the form of more cottage holdings or garden cities, but claimed that statesmen would need to develop some policy on the lines indicated by Belgian and German models, but purged of many bad features belonging to both, when it again became possible to develop any scheme of social reform.

Architecture and Public Opinion

AT the first general meeting of the session of the Birmingham Architectural Association held at the Society of Artists' Rooms, Birmingham, Mr Rupert Savage, F.R.I.B.A., the President, gave an address, dealing with the influence on architecture of popular opinion.

Mr. Savage said that architecture is one of the most important demonstrations of national character, and its achievement may be considered a reflex of popular sentiment.

If we consider the great epochs of building activity, we find that the nobler developments of architecture are coincident with great political and commercial activities. The architectural splendours of Greece and Rome were the outward expression of intense national energy. The great public buildings were frequented by the common people, and the public squares and market-places were a source of pride to the citizens generally.

In the Middle Ages the predominant sentiment of religious fervour and civic pride found expression in ambitious churches and public buildings, while at a later period the masterpieces of the Renaissance were the outcome of an immense revival in the realm of scholarship and culture. It cannot be doubted that these great architectural achievements were due in no small measure to a popular desire for some visible demonstration of wealth and power. It must surely be a source of wonder to many that we are to-day unable, or unwilling, to emulate the great works of the past.

It must be remembered that many of he great constructions of the earlier enturies were rendered possible by the use of servile labour. Then, again, the simpler scale of living among all but the wealthiest class released for great constructional works labour now employed in manufacture; while, lastly, there was a conscious desire on the part of the people, or their rulers, for some abiding evidence of their own greatness.

The present generation does not realize the poverty of its environment. A sort of mean materialism frustrates all the efforts of the altruistic spirit.

The poor modern building of the recent past seems to have overlaid and effaced traditional work in most English towns in a greater degree than appears in many Continental towns. Even in new and partly developed countries, such as Brazil and Argentina, the cities are being planned on an ambitious scale, and we find that the inhabitants of these fine cities are quite conscious of the value of their inheritance.

In this country the great restraining influence on architectural design and town-planning has been the worship of so-called "efficiency." We rightly demand that our buildings and streets shall be conveniently planned; but we show great reluctance to make any sacrifice to mere beauty.

A big effort has recently been made to improve the housing conditions of the working class, but in these undertakings the cult of ugliness prevails.

The responsibility for the past must be shared by the public and the profession. The public knew nothing of good architecture, while the architects were for the most part inadequately trained and educated. During the last few years there has been a marked improvement in both respects, but before we reach a satisfactory standard two conditions are indispensable—public appreciation and professional efficiency.

The ignorance and indifference of the public in matters architectural is largely due to lack of publicity. It is possible editors may think that the public is not interested in the subject, but it should be remembered that the popular interest displayed in other arts is largely stimulated and developed by the enlightened criticism of the newspaper press.

While preaching to our fellow citizens we must remember that if we demand increased confidence in ourselves and respect for our art, we must do our utmost to deserve them.

Much has been done in recent years t systematize and improve the training o young architects, but in order to furthe our efforts for professional improvement and to give the public that confidence which we desire, we need some form o compulsory qualification, and we fee that this may best be attained by an Ac of Parliament restricting the use of th title "Architect" to those holding diploma from some responsible body suc as the R.I.B.A.

Our aim is not wholly selfish; we desir not only to gain public appreciation o our art and a better status for architects but to hasten the abolition of all that i mean and squalid in our present environment, and to encourage the gradual upbuilding of cities which shall be worth of a great nation.

At the close of the paper a vote o thanks to the President was proposed b Mr. H. T. Buckland, F.R.I.B.A., seconde by Mr. G. Salway Nicol, F.R.I.B.A., an carried unanimously.

Education and Registration

MR. FRANCIS JONES, F.R.I.B.A., in his presidential address to the Manchester Society of Architects, said that during the past year the school of architecture had been taken over entirely by the University, and the whole of the work would, in future, be carried on in one separate building, under one general direction, instead of in several buildings up and down the town, and subject to different authorities who did not always see eye to eye. At the School of Art the Corporation had also organized a complete syllabus for those who are not taking the University courses. One must be grateful for all efforts made for architectural education, and he felt that they were very much in debt to the Corporation who, until the University instituted a Chair of Architecture, were entirely responsible for architectural education in Manchester. In his own experience the late Mr. Richard Glazier was untiring in his efforts to assist architectural students in every possible way, and he hoped the Corporation would understand their motives in urging that the University should assume complete control of their architectural students. It was because they felt that, in addition to the artistic and technical subjects, the students' general education should be carried to a higher standard, and that the proper architectural spirit could best be fostered in a self-contained school where the students had all similar interests and where they would learn as much from each other as from any other source. He hoped the University and the Corporation would still co-operate sufficiently to prevent wasteful overlapping. The architects have collected £600, and, in addition, about £5,000 has been left to the school by the wills of former members of the Society. They must do more, and he appealed to them to subscribe liberally to the M.S.A. School of Architecture fund.

It was their duty to enlighten all and sundry, and they had joined with the Institute of Builders and the R.I.B.A. in arranging public lectures at the University to that end—the more interest the public took in architecture the better the architecture would be. If the public demanded a higher standard they would assuredly get it. With regard to registration, he said :—Registration is, I think, desired by most members of the profession—certainly it was the policy of the old Council, and most certainly it is the declared objective of the new one. So far we are all agreed. Again, who should the controlling body be ? Doubtless the R.I.B.A., and up to this point even we would, I think, be in agreement. Then why these tears ? Where does the canker gnaw ? The ultimate goal of all seems to be the same ; the ultimate is a higher standard of modern architecture in England. Yet here we are with two parties at the Institute ready to tear each other's eyes out because, though they both want the same thing, they want to get it by different ways. If we get registration, unification must follow, but it is almost if not quite impossible to get registration without unification in some form or other first.

Registration only is no use to us—you can register anything such as slaughter-houses, patent medicines, letters, or plumbers—we want education and registration ; if we have that, someone must decide how much education before registration, which really means there must be a general control. Who is to be that general control ? Naturally, one would say the R.I.B.A.

But will a man who is a member of a body not allied to the R.I.B.A. agree to that ? Or would a man who has practised as an architect for many years, but is attached to no society, agree to it ? Probably not. We must therefore get this other body and this unattached man to join in with us in some way or other. And this is the difficulty—amongst the practising architects not attached to the R.I.B.A. are many capable and efficient architects—we should all welcome these to the R.I.B.A., but there are also many who, although they have practised for many years, are neither capable nor efficient, and could not reach the standard worthy of registration. These men have made their living for years by designing and erecting buildings, and no Government would pass a bill which would debar them from carrying on their business. But the supply of new men of this type would cease the day of the passing of the registration bill ; their ranks are filled from time to time by clerks of the works, clerks from builders' offices, quantity surveyors, clerks from district council offices, and so on—all without architectural training, and this supply will continue to pour in men to practise in competition with those who have gone through a long course of training in the architectural school and architects' offices. The sooner this supply is stopped at the source the better for the contents of the architectural reservoir from which our supply of buildings is obtained. The cost of clearing the reservoir is the admission of the present doubtful supply until such time as the whole supply will have to pass through the filter-beds, or, in other words, examinations.

This must happen in any profession which has been an open one before it became a closed one. Before medical examinations were compulsory for that profession all sorts of people obtained a living, or part of their living, through giving medical advice, and when registration of doctors became compulsory, all and sundry—quacks, herbalists, and so on—assumed the dignity of medical men ; similarly with the law. If you have to have a bad tooth out the sooner you go and get it over the better. The sooner registration is accomplished the better for everybody, the better for the young architect materially, the better for the country architecturally.

Manufacture and Testing of Portland Cement

THE second of the series of public lectures at the Northern Polytechnic Institute was given by Mr. H. R. Cox, M.C.I., works secretary to the Associated Portland Cement Manufacturers, on "The Manufacture and Testing of Portland Cement."

The lecturer stated that up to 1885 the bulk of the world's cement was made in Kent and Essex. This was the birthplace of the industry. Later it was discovered that many other districts contained the materials from which good cement could be made.

There are now two methods of manufacture in general use, known as the "wet" and the "dry." The wet is applied to naturally soft materials, and the dry to such substances as limestone and shale. It is somewhat easier to make good cement by the wet than by the dry process. The "wet" process involves chalk digging by hand, or steam-navvies, and clay digging with grab dredgers. The chalk and clay are brought to the washmills in wagons each holding a definite weight (five to ten tons), one ton of cement requiring one and a half tons of chalk and half a ton of clay. The washmills are in batteries of six with screens between each having holes of an increasing degree of fineness down to $\frac{1}{40}$ in. diameter.

The proportions of chalk and clay are carefully regulated by the chemist who takes samples from the washmills every half-hour. The slurry leaving the washmills is so fine that barely 3 per cent. is retained on a sieve having 32,400 holes per square inch. The slurry is now pumped to storage and mixing tanks of about 66 ft. diameter and 10 ft. deep.

In the "dry" process the materials are crushed and then dried, the dryers being steel cylinders 50 ft. to 70 ft. long by 5 ft. to 6 ft. in diameter set at an incline and having a furnace at one end, the dry material is then elevated to hoppers and again ground and mixed. From these mills the material goes to silos, 40 ft. high by 14 ft. diameter, the silos being made so that the material may be mixed or changed as necessary.

The next stage, in either dry or wet process, is burning or "clinkering" in a rotary kiln, a cylinder up to 250 ft. long and 10 ft. diameter inclined to the horizontal $\frac{1}{2}$ in. to the foot, and revolving once per minute. It is lined with fire-brick about 9 in. thick. At the lower end is a large hopper containing powdered coal so fine that only about 8 per cent. is retained in a sieve of 10,000 holes per square inch. This coal is blown into the kiln and bursts into flame. The temperature reaches 700 deg. C., and afterwards 1,400 deg. C., and the slurry is clinkered. The whole process is under the complete control of the operator. The white-hot clinker falls into a cooler, and is then ground and passed through a sieve.

From the grinding mill the cement passes to a tube mill. This carries on the grinding process by means of a series of steel plates and tough flint pebbles and steel pellets. This produces cement which gives a residue of only about ¼ per cent. on a 10,000 mesh sieve.

This fine cement sets very quickly and needs regulating. Until a few years ago 0·5 per cent. to 2·5 per cent. of gypsum was added, but the regulating now takes place by a method of "hydration" invented by Mr. Bamber, which is carried out by blowing steam into the tube mill while grinding is going on. Cement was invented about 100 years ago. It is now made in almost every country in the world, ingredients being, silica, alumina, and a small quantity of magnesia, iron, and other elements.

The details of the methods of manufacture vary, but all follow the general lines given above. 80 to 100 h.p. is required to drive the plant and two tons of raw material and half ton of coal per ton of cement. An elaborate system of testing is in operation at all stages, and chemists are continually taking samples at various stages in the manufacture. The salient feature of all tests is the degree of skill required upon the part of the tester if accurate results are to be obtained. This applies equally to such an apparently simple operation as sieving as it does to chemical analysis.

The lecturer then detailed the tests required by the British Standard Specification, and indicated such points as the exact percentage of water that should be used in mixing, the operation of the Vicat needle, and the details of cement briquettes for tensile tests.

When cement has been obtained from a reputable manufacturer and is guaranteed to conform to the British Standard Specification, the lecturer stated that any substantial variations in the tests should be carefully scrutinized. In many cases they are the fault of the tests and not of the material itself. The colour of cement is no indication of its quality; the weight again is unreliable.

In obtaining cement for special purposes it is always advisable to describe the circumstances to the manufacturer and to ask him to provide a cement to suit these requirements.

At the close of the lecture a demonstrator mixed cement for a setting test, soundness test, tensile test, neat and with sand, and showed how sieving should be carried out.

Mr. G. A. Gardner, M.C.I., referred to percolation of water through cement concrete.

The lecturer stated in reply that some amount of bridging takes place, but cement properly mixed is quite impervious when set. In setting it is (1) amorphous and (2) crystalline. This action has a closing effect upon the pores. Water sometimes carries lime, etc., into the fine capillary channels in the concrete and tends to close them up.

Mr. T. Scott, A.R.I.B.A., referred to expansion of cement not air-slaked, and the need for air-slaking. The lecturer stated that air-slaking was no longer necessary owing to hydration during manufacture. Cement which is hot on delivery may simply have retained some heat from friction in grinding. Several students then asked questions relating to points that had been referred to in the lecture.

The next paper will be read on November 16 at 7.0 p.m. by Mr. F. W. Gayer, past-president London Master Builders' Association. Subject: "The Organization of Building Works."

Town Planning and Estate Development

Discussing the subject of "Compulsory Town Planning and Future Estate Development," at a meeting of the Auctioneers' and Estate Agents' Institute—the president (Mr. James S. Motion) in the chair—Mr. John A. Rosevear said the expense of promoting and carrying a scheme through to final approval need be merely a comparatively small amount, and was met from the ordinary district rate of the local authority. It would be realized that a scheme, when approved and operative, did not necessarily entail the immediate construction of the roads and work upon open spaces, nor the erection of public buildings, etc., as planned in the scheme, but merely set apart such areas for future construction as the needs of the district arose, and controlled the future development in accordance with the final map as approved by the Ministry of Health. In reality a town-planning scheme was of the truest economy. It provided for and enabled future widenings of roads to be effected as the necessity arose, instead of the extremely high cost in compensation for demolished buildings and trade disturbance having to be paid, which had been the experience of most towns, not to mention the metropolis and its suburbs, with the consequent heavy increase in local rates.

Mr. W. R. Davidge, F.R.I.B.A., congratulated Mr. Rosevear on the note of co-operation which he had struck. He felt that was the note land agents wanted to hear, and they realized too, he felt, their own interests as much as local authorities, and that their own notions should get into town planning and get in fairly early. He felt that the new procedure was very much simpler than the old, but still there was too much red tape about it. This was a matter of business which could be talked over in the early stages with the landowners concerned, and what he felt was that if landowners adopted Mr. Rosevear's suggestion and put their heads together and advanced their own schemes, they could considerably expedite matters. He thought tribute should be paid to the action taken by the Surveyors' Institution, which produced the recent general order which simplified the interim development of land and prevented that sterilization which was such a troublesome business with the last Act. The Town-Planning Acts, as interpreted by the Ministry, only applied to land that was available and likely to be used for building purposes. The Ministry were apparently advised that the inner area was not likely to be used for building purposes. On that he would ask them to take a walk down Regent Street. They must consider the inner portion, and it was one of the points that would have to be taken into consideration.

Mr. H. V. Lanchester, president of the Town-Planning Institute, remarked that they had got a whole lot of elaborate regulations about the number of houses, and the area they were to cover, and the height the houses were to take. He had always wanted to put this in one lump, that on an acre they should have so many cubic feet of building, say, 200,000 or 300,000 cubic ft., that was not to be exceeded. Give people a certain amount of freedom, whether they built three stories or two stories or whether they covered one-fifth or one-quarter of their area, and there might be a limitation that they might not cover more than a third of the area. But beyond that it seemed to him they got freedom and much more flexibility and much more simplification by simply putting cubic contents. It might not make for beauty, but they could deal with that afterwards. They could only get beauty if people wanted beauty. He thought the taste for decent, pleasing-looking houses had grown up in the last ten years to a most remarkable extent. They could not expect always to secure beauty by a critical attitude, although, of course, they could eliminate the very detrimental developments. He sympathized with Mr. Davidge's reference to Regent Street, and thought we wanted a lot more comprehensive and imaginative plans with regard to the linking-up of the existing cities with the new areas. He felt that at the present time London was rapidly reaching a point at which it was becoming inefficient, and they would want very much more, whether by town-planning or some other Act. They would want to step into London and some of our other big cities and give more scope for a city that could be run efficiently and economically. Otherwise some of our big cities would go under.

Sir Aston Webb's Dream

"London of the Future" was the subject discussed at a dinner which took place under the auspices of the Imperial Industries Club, at the Hotel Victoria. Sir Aston Webb (president of the Royal Academy) was the guest of the evening, and Sir G. H. Chubb (president of the club) occupied the chair.

The chairman said that he was a Cockney born, and had lived in or near London for many years. He had seen great changes, especially in the buildings, but the alterations and changes had been greater during the last few years than during the last century. He thought that that was very largely due not only to the expansion of business and larger and better ideas, but to the better type of architecture. In spite, however, of what had been done, London could not be compared in some respects with many modern continental cities.

Sir Aston Webb gave his impression of the London of the future in the form of a dream during which he was taken to the top of St. Paul's 100 years hence, a guide pointing out to him the many improvements which had been effected. For instance, the River Thames had been purified and had become a favourite resort of anglers as in Queen Elizabeth's time, when the river was so full of salmon that articles of apprenticeship invariably contained a clause that apprentices should not have salmon for meals more than three times a week. Then there was a fine embankment on the Surrey side of the Thames on which was erected the great hall of the London University; all the railways were underground for fifteen miles from the centre of London; the great gloomy railings which surrounded the parks were put back; and great roads ran through the metropolis.

CALLENDER'S

"Ledkore" (AND LEAD BITUMEN)

A **DAMPCOURSE** with a Lead Basis.

"LEDKORE"

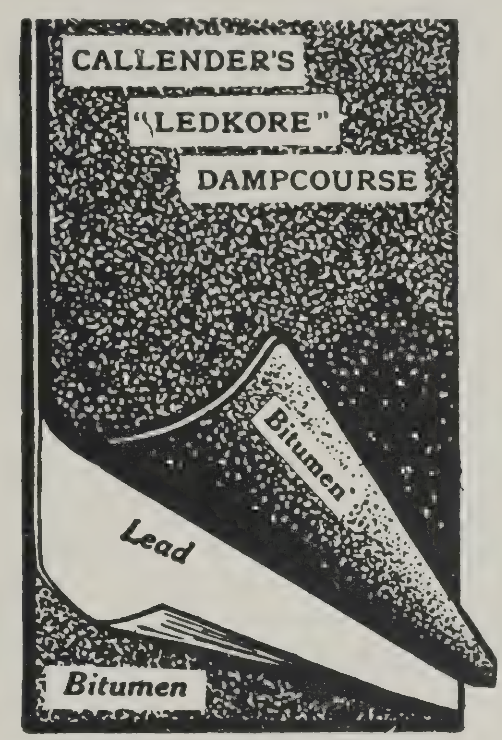
CONTAINS NO COAL TAR OR PITCH.

* *

CANNOT CRACK OR SQUEEZE OUT.

* *

ELASTIC, INDEFECTIBLE.



"LEDKORE"

is

ABSOLUTELY IMPERVIOUS AND PERMANENT.

* *

Sent out in Rolls, 24 ft. long, all usual wall widths, 4½ in. to 36 in.

* *

IN THREE DIFFERENT GRADES according to thickness of lead used.

From **6d.** per foot super.

Composed of Successive Layers of Densely Compressed Material of Pure Bitumen built round a Core of Sheet Lead.

ARCHITECTS WHO FAVOUR A DAMPCOURSE WITH A LEAD BASIS SHOULD

SPECIFY LEDKORE.

Write for Booklet 50 "CONCERNING DAMPCOURSE," giving full particulars with list of Special Contracts carried out in which "LEDKORE" has been used.

Send for Sample to

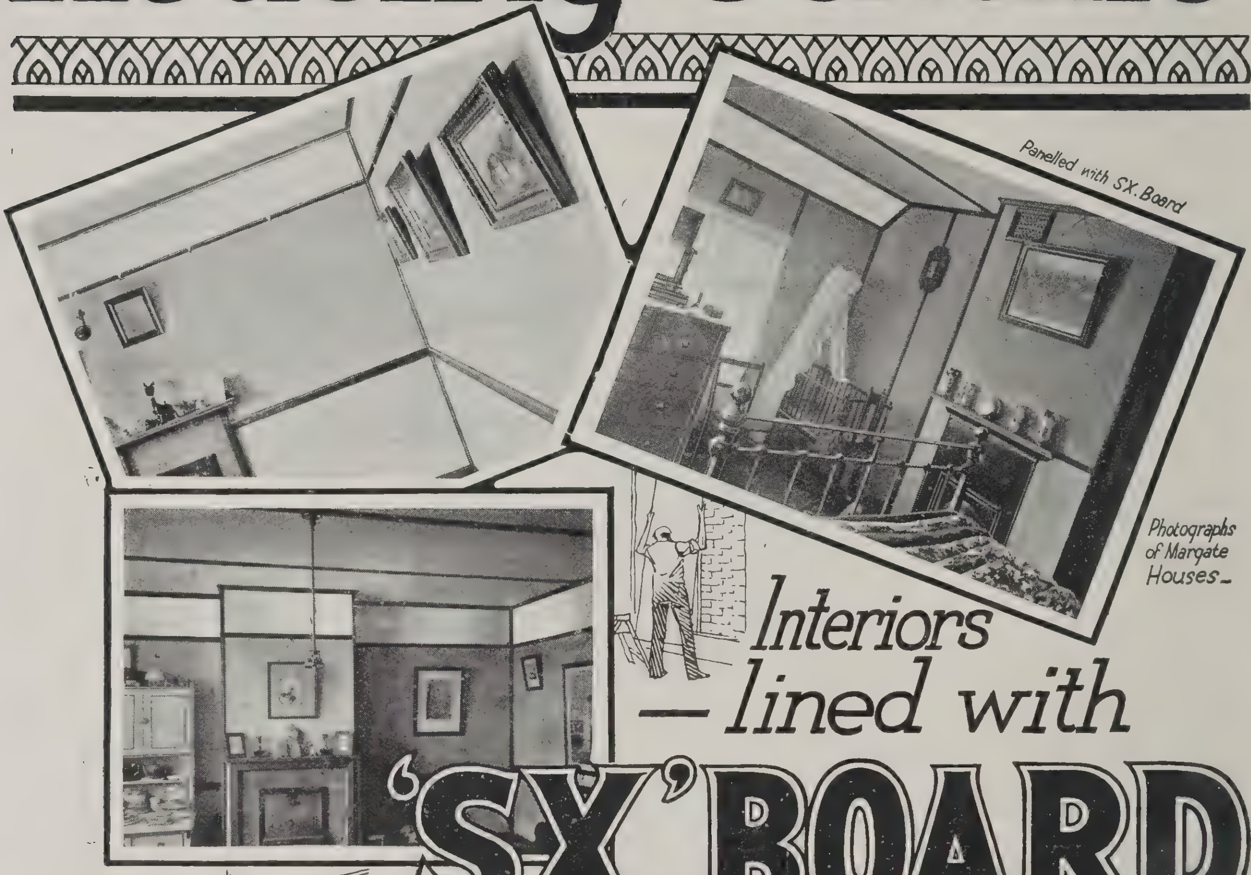
Housing Scheme



Interiors —lined with 'SX.' BOARD

THESE photographs showing how "SX" Board was applied to walls and ceilings in an important Housing Scheme clearly demonstrate the practicability of "SX" Board as an alternative to plaster. The fact that "SX" Board is unaffected by vibration and therefore cannot crack or fall is an important feature. A house lined with "SX" Board can be decorated and occupied immediately. There is no waiting while wet walls dry—this is another notable advantage. In view of the early revival in building which is anticipated in many quarters, the advantages of a good wallboard such as "SX" merit careful consideration.

The Week's News

New Sea Wall for Lowestoft.

£100,000 is to be spent on a sea wall Lowestoft.

New School at Tilbury.

To cost £7,000, a new school, for 304 rolars, is to be erected at Tilbury.

Redecoration of the Mansion House.

The Mansion House is to be redecorated the new Lord Mayor at a cost of £1,139.

£15,000 *Girls' School Extension.*

Farringtons Girls' School, Chislehurst, to have a new assembly hall and classoms at a cost of £15,000.

East Ham Town Hall Extension.

Among the schemes for helping East m's unemployed is the extension of the vn hall at a cost of £7,500.

Hastings-Bexhill Promenade Scheme.

A proposal which will result in the king-up of the Hastings and Bexhill omenades is under consideration.

Cheaper Houses.

Fifty houses are being built at Holbeach, colnshire, costing £320 each, to let 6s. per week.

Croydon Tramway Reconstruction.

Croydon is to reconstruct the tramway ween Norbury and Purley at a cost of 2,000, plus £55,000 for repaving.

Painting by Direct Labour.

Painting and repairs by direct labour West Middlesex Hospital came to £189. e lowest tender was £199.

Flats at Bethnal Green.

The foundation stone of a block of nty flats, which are being erected in s Street, Hackney Road, has been laid the Mayor of Bethnal Green.

Halifax Housing Scheme.

The Halifax Town Council have reved sanction to borrow £250,000, for purpose of carrying through a housing eme, free from Government control.

Christ Church, Westminster.

hrist Church, Westminster, on the of the "new" chapel in which Crom-'s horses were stabled, is to be reed at a cost of £2,000.

Recommencing Practice.

r. G. Val. Myer, A.R.I.B.A., of the late of Fair and Myer, of 39 Furnival et, E.C., has returned from India, recommenced private practice at Marylebone Lane, Wigmore Street, . Telephone number Mayfair 7067.

Temporary Bridge for Newport.

ne "temporary" bridge, which is to sed for the next ten or fifteen years e a new town bridge is being built ss the River Usk at Newport, has formally opened for public traffic. relief bridge, which has cost 000, carried the traffic over the nes when the new Southwark Bridge being constructed.

Beckenham Cottage Hospital.

Beckenham residents are being appealed to for the money necessary to enlarge the local cottage hospital, and so provide buildings more in keeping with the needs of the district.

Westminster Station Improvement.

Plans have been prepared, and work is about to start on the reconstruction of the Westminster Station of the District Railway. Under the scheme, which has been approved, there will be direct access from the street entrances in Bridge Street and on the Embankment, and the use of the private subway leading to the House of Commons will be facilitated by the reconstruction of the entrance.

The British Empire Exhibition (1924).

An invitation has been received from the Executive Council of the British Empire Exhibition for members of the R.I.B.A. to visit the exhibition grounds at Wembley and to inspect the various buildings now in course of construction there.

Members and Licentiates may apply to the secretary R.I.B.A. for tickets of admission, which will enable them to visit the exhibition at their own convenience. There are frequent trains from Baker Street and Marylebone Stations.

R.I.B.A. Associates' Committee.

At a meeting of the Associates' Committee held at the Royal Institute of British Architects recently it was agreed that: "Having regard to the fact that the Main Committee on Unification and Registration had been dissolved, no useful purpose would be served by the continuance of the Associates' Committee, and that it should therefore notify the general body of Associates, by whom it was appointed, of its dissolution, and inform them at the same time that the results of the Committee's labours could be seen on application to the Secretary R.I.B.A."

Bicentenary of the Death of Sir Christopher Wren, February 25, 1923.

The first meeting of the Grand Committee will be held on Wednesday, November 22, at 4.30 p.m. at the R.I.B.A. The business of the meeting will be to consider arrangements for the Commemoration Programme. The Grand Committee includes Sir Aston Webb, P.R.A., Mr. Paul Waterhouse, P.R.I.B.A., Mr. Andrew T. Taylor, Sir Lionel Earle, Sir Banister Fletcher, Sir Hercules Read, Professor A. R. Hinks, Mr. Mervyn Macartney, Dr. H. H. Turner, Major-General W. D. Bird, and representatives of the Universities of Oxford, Cambridge, and London, of the City of London, and of all the appropriate learned societies, guilds, and schools. Tea will be served in the Common Room of the Royal Institute at 4 o'clock.

The Society of Architects.

The following members were elected at the last meeting:—

As a Fellow: Anderson, James Rae, M.S.A., Karachi, India.

As Members: Cunes, Albert, 86 Park Road, Exeter; Gilder, Framroz Nowroji, Indian Students' Hostel, Keppel Street, W.C.1, and Bombay, India; Ledbury, Joseph William Nelson, 21 Clifton Road, Winchester; Piggott, John Robert, 61 Hartshill Road, Stoke-on-Trent.

The National Housing Policy.

The National Federation of House Builders draws the attention of all candidates and voters in the coming General Election to the necessity of a National Housing Policy being adopted, which will produce houses with the greatest rapidity, and with the least expense to the public purse, and puts forward the following as a suggested National Housing Programme. All restrictive legislation should be withdrawn at the earliest possible date; all local authorities which build houses in the future should be compelled to charge economic rents except for the clearing of slum areas; if any State assistance is granted for housing it should be granted equally to all agencies building houses of a good type; every endeavour should be made to encourage the people to invest their savings once more in house property; all methods of encouraging the citizen to purchase his own house should be examined and adopted if they promise to add to the available housing accommodation; local authorities should revise their by-laws in order to cheapen the cost of building and road making so that houses can be let or sold at a reasonable figure; local authorities should be empowered to lend money on mortgage to responsible builders developing estates and erecting houses of approved types.

Competition News

"The Modern Hospital's" Contest for Small Hospital Plans.

Superintendents of small hospitals and hospital workers and architects generally, have manifested interest at the announcement of the architectural competition for small hospital plans to be conducted by "The Modern Hospital," which was made by President George D. O'Hanlon at the opening session of the twenty-fourth annual conference.

This $1,000 competition has as its dual purpose the stimulation of small hospital construction, which is efficient in arrangement, suitable for small communities, and creditable in architecture, and the provision to boards of trustees of small hospital floor plans that will combine simplicity of design and good taste with a compact arrangement of the various departments of the hospital now regarded as essential to the efficient and scientific care and treatment of the sick.

The competition calls for a set of plans of a general hospital of from thirty to forty beds. Registration for the contest must take place by November 15, and the final date for submitting designs is January 15, 1923.

Copies of the conditions can be obtained from the Secretary, R.I.B.A., upon application.

Old Cranleighan Society Cricket Pavilion Competition.

The R.I.B.A. Competitions Committee have been in negotiation with the promoters of the competition and the conditions are now in order. The veto of the Royal Institute is accordingly removed, and members are at liberty to take part in the competition.

(*For List of Competitions Open see last week's issue.*)

Reinforced Concrete Road Construction

The scientific application of reinforced concrete to road construction was first introduced by the B.R.C. Engineering Company in 1911, since which time it has passed through the normal stages of growth of any new idea and now stands as a recognized feature of road construction. B.R.C. road constructions are divided into three classes of work, which serve different purposes; these are road foundations, complete roads, and tramway foundations.

B.R.C. road foundations are used under surfaces of stone setts, wood blocks, asphalte, and tar macadam. These require a permanently level bed, in order that they may themselves remain level. A B.R.C. foundation provides the level bed. The standard B.R.C. foundation is concrete, 6 in. thick, reinforced with No. 9 B.R.C. fabric. This is sufficient for the heaviest modern traffic in any ordinary ground. In very bad ground thicker concrete and heavier reinforcement may be necessary, and in very good ground the thickness of concrete may be reduced.

Complete B.R.C. roads are the combined construction of reinforced concrete foundation and concrete surface built together as one. Although they are generally sprayed with tar, the drag and grind of the traffic is transmitted quite closely to the actual concrete, and the surface concrete must have a very hard wearing stone as aggregate. Where suitable stone is obtainable locally it is used throughout the concrete and the road is called a "one course road"; where such stone has to be imported a softer and cheaper local material may be used for the bottom portion of the concrete, and the harder material for the top 1½ in., the top being laid within twenty minutes of the bottom. Such is called a "two course road." Complete B.R.C. roads are generally 6 in. thick, reinforced with No. 9 B.R.C. fabric laid 1½ in. from the bottom. This construction has, during the ten years which have elapsed since its introduction, been found sufficient for all ordinary cases. On very bad ground, such as soft peaty land, thicker concrete and heavier reinforcement has been used, but for ordinary purposes nothing further is required than the simple construction of 6 in. concrete with a layer of No. 9 B.R.C. fabric. The concrete is claimed to be sufficiently strong in itself to withstand, without special reinforcement, the shearing stresses and the slight tensile stress which may occur at other parts than at the bottom. In soft peaty ground the tensile stress at the top of the concrete is increased, and No. 14 B.R.C. fabric is then laid 2 in. below the top in addition to the No. 9 at the bottom.

In concrete less preparation is needed for the foundation. It simply requires to be brought to the necessary level without any special ramming or rolling. The concrete is strengthened by the fabric and transmits the weight of foot traffic over such a larger area of ground that the intensity of pressure on the ground is extremely small. The concrete is 2 in. thick, reinforced with No. 14 B.R.C. fabric laid half an inch below the surface.

The company have issued an interesting book of photographs arranged to provide in a pleasing form some evidence of B.R.C. roads constructed during the past ten years, showing the extent of the development which has taken place. Practical experience gained during that time has been added to the theory which led the company to the first tests, and the results up to date are embodied in the latest B.R.C. specifications.

The accompanying illustration shows Glenboig Road, Airdrie, a single-course concrete road 6 in. thick, reinforced with B.R.C. fabric ref. No. 9. The road was constructed in August 1921, and traffic since then has included the passage of a sixteen-ton tractor engine with steel tyres several times per day. Underlying the road there is a bed of peat bog 40 ft. thick. There is not a sign of any subsidence, crack or wear in the concrete. This road, considering the nature of the foundation and the weight of the load, provides additional evidence of the efficiency of a single layer of No. 9 B.R.C. fabric placed near the bottom of the concrete. The road was constructed under the direction of Mr. W. A. Chapman, road surveyor, County of Lanark, Airdrie. The address of the company is 4 Iddesleigh House, Caxton Street, Westminster, S.W.1.

The R.I.B.A. Exhibition of Working Drawings

The exhibition of Architects' Working Drawings now being held in the Galleries of the Royal Institute closes on November 22.

The exhibition, which is open between the hours of 10 a.m. and 8 p.m. daily (Saturdays 10 a.m. to 5 p.m.), is intended primarily for students of architecture; they are able to examine the drawings that a practising architect hands to a contractor, and thus will be afforded an insight into the methods adopted in a modern architect's office.

A special students' evening will be held at the exhibition on Friday, November 17, at 8 p.m. All students are cordially invited to attend. The architects wh
have kindly lent the exhibits—or the
representatives—will be requested to
present in order to explain the drawin
to students. Refreshments will be pr
vided, and no cards of admission are r
quired.

London Master Builder
Sports Association

The history of this organization is
follows :—

At the commencement of the footb
season in 1921 Mr. Dudley Bartlett, t
managing director of Perry & Co. (Bo
Ltd., convened a representative meeti
and offered to present a cup for ann
competition. Several invitations we
sent out, and the firms now appearing
the league table are those who respond
to such invitation. Last season's winn
were Holancube. All contracting fir
are cordially invited to join, and sho
get into communication with the H
Secretary, 56 Victoria Street, S.W.1. F

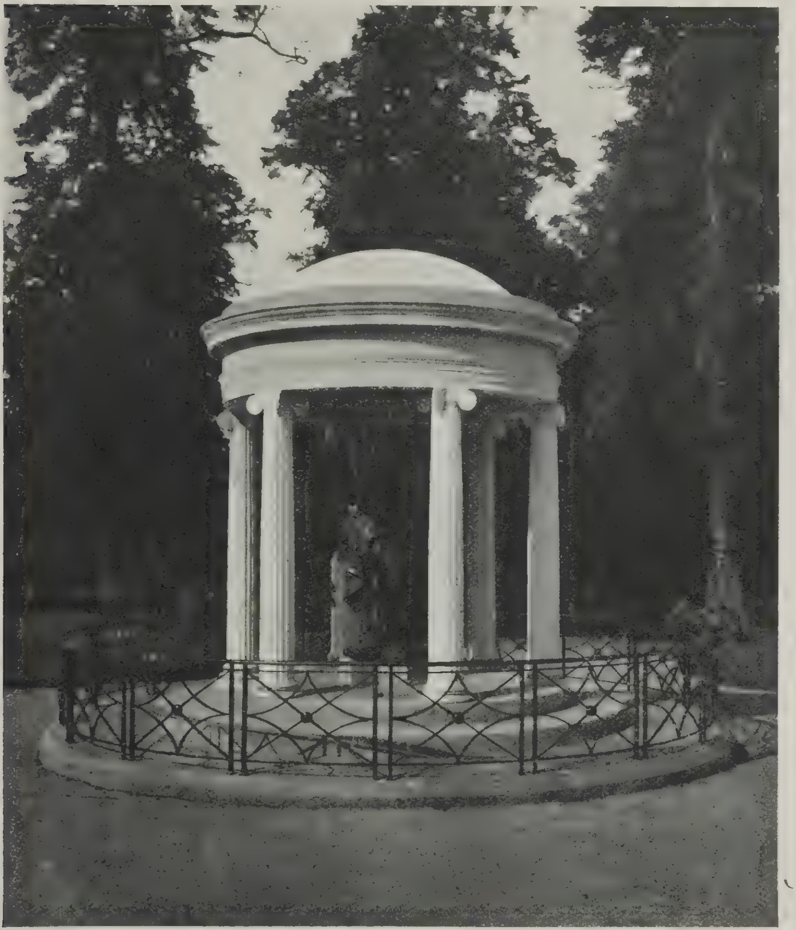
THE ARCHITECTS' JOURNAL & Architectural Engineer

With which is incorporated "The Builders' Journal."



SHROPSHIRE WAR MEMORIAL.

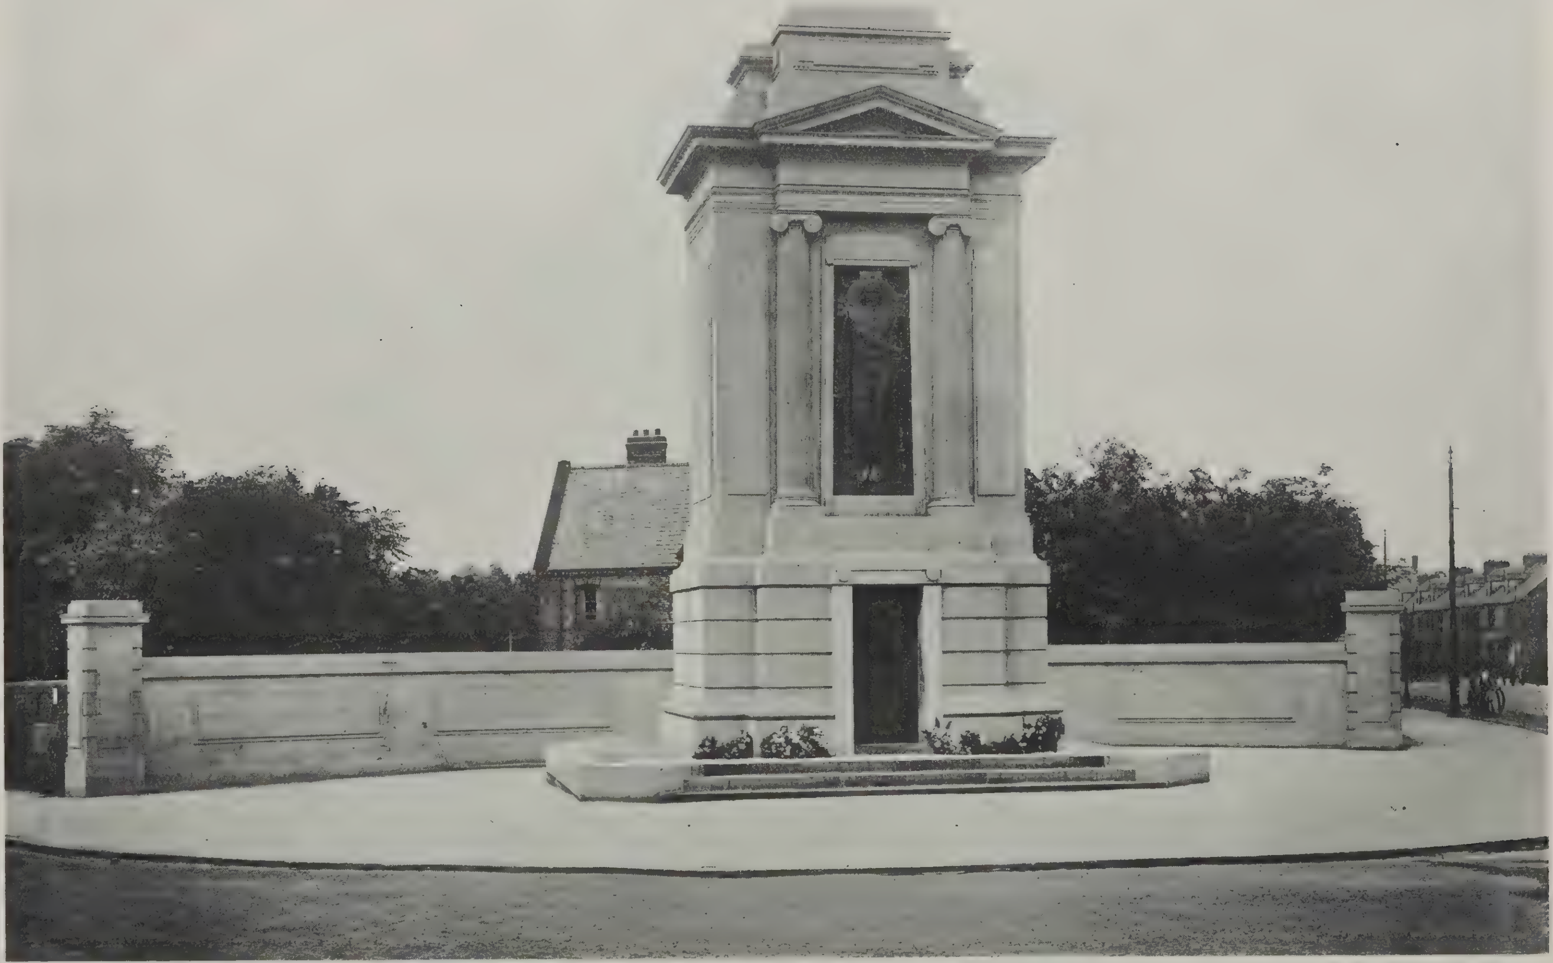
This memorial has been erected in the "Quarry" at Shrewsbury, near the River Severn. Messrs. George Hubbard and Sons were the architects. The temple, of Portland stone, is enclosed by bronze railings, and the dome is supported by six columns. The figure of St. Michael is the work of Mr. Allan G. Wyon, sculptor. The floor of the temple has been richly embellished with the County and the Regimental arms on a gold mosaic background, and the seals or arms of the six boroughs of the County are embossed on the inside frieze. A special feature of the memorial is the concealed lighting, which may be turned on at night. The monument bears the inscription: "To the Gallant Men of Shropshire who fought for God, King, and Country, 1914–1919."

(*See also page* 742.)

27-29 Tothill Street, Westminster, S.W.1.

War Memorials. 31—Gateshead

John W. Spink, Architect



The bronze panel upon the principal front of this memorial is modelled strongly in low relief, and depicts a warrior in an attitude of "Defence," the cross behind being slightly burnished. In the base of the cenotaph, is a Room of Remembrance, in the centre of which stands a stone lectern. Around the top of the lectern is carved "Their Bodies Are Buried In Peace But Their Name Liveth For Evermore," and upon it rests the volume containing the names of the fallen. Immediately above, suspended from the vaulted ceiling, is an ever-burning lamp, emblematical of undying memory. Upon the portal to the door is inscribed "Mors Janua Vitae." The door,

The Future of Housing

THE problems involved in town planning, housing, and slum clearance are of an importance that should be sufficient to raise them far above the turmoil of party politics; where the health of future generations is in the balance, men of goodwill should unite and throw their full weight in the scales against the intolerable evils that have arisen through past thoughtlessness and neglect. Recrimination is useless, and the man who inveighs blindly against failures on the part of the Government, and has no constructive policy for the future, is not assisting any more than the man who still petulantly abuses a past generation of speculative builders. Ignorance is the greatest foe to progress, and, on the subject of housing, ignorance still prevails. Until architects and builders are prepared together to take the initiative, and inspire the community to take an intelligent interest in housing, the greatest of our present-day questions, we shall not solve the problems it entails, our towns will continue to present exhibitions of chaos, and our slums will remain breeding grounds for crime, sickness, and revolution, necessitating a worse than useless expenditure upon prisons, hospitals, and asylums.

Mr. Stanley Hamp's Presidential Address at the Architectural Association has once again raised the important question of co-operation between architect and builder, and he emphasized the charge that the architectural profession missed a great opportunity in allowing the State official to interfere in a matter that should have been settled between the architect and the builder. As a constructive proposal, Mr. Maurice Webb suggests that we should follow America's lead, and that architects should issue "type plans," somewhat on the lines of the book issued by the Ministry of Health, but of a more complete and comprehensive nature. Again, Mr. Manning Robertson, writing in the R.I.B.A. Journal of November 12th, 1921, proposed an arrangement, to be arrived at between architects and builders, under which architects would act as consultants and receive a small "royalty" on each house; the architect not to be responsible for supervision, or anything beyond providing lay-out, house plans, and a skeleton specification. No doubt numerous other forms of co-operation could be devised. The important point is that the architect has his quota to subscribe towards civilization, and it is his business to give it. The true artist cannot withhold his help from his fellows because the terms of remuneration that are applicable are not all that he might desire. The builder, for his part, should realize that the architect is capable of contributing something of æsthetic and practical value, and that the joint work of the architect and builder will, of necessity, be more creditable than that proceeding from either separately.

The necessity for an amendment in the architect's scale of fees, in favour of the builder of small houses, arises from the apathy of the architectural profession at the time when the existing scale of fees was being compiled. In those days it was erroneously assumed that housing and architecture were two separate things, and that the former was not within the architect's province. It is sometimes argued that, since architects are naturally not expected to charge for work that they have not done, an architect can, under the present scale, make his own arrangement for lower fees to correspond to reduced work. This argument is unpractical, because builders know nothing of such elasticity, and neither does the average architect, who has probably only given superficial attention to the scale of charges.

No matter what course is adopted, it will be necessary to convene a meeting of representatives of architects and builders thoroughly to thrash out the question, and to decide on some scale of remuneration for architects that builders could accept as "economic"; for the builder would probably be the first to admit that architectural amenity is in itself desirable, and, in view of a growing public discrimination, that it will also result in increased rent and selling value. It is illogical for architects to grumble at the uneconomic aspect of Government housing, and at the same time to place an uneconomic tariff on their own advice.

A body jointly representing architects and builders could exercise a more insistent pressure upon the Ministry of Health and upon local authorities in getting by-laws brought up to date, in cutting out obsolete requirements, in reducing redundant road charges, and in arriving at adequate safeguards to obviate admitted past evils, such as lack of space and sunlight. Town planning will do a great deal, but nothing of a compulsory nature can compensate for the lack of outside driving force that is lamentably evident at present. Government interference is a deplorable expedient, and the first State housing scheme has come to a halt; we are, however, deceiving ourselves if we feel confident that it is necessarily defunct. Unless private enterprise can come forward with a definite policy, and can guarantee the maintenance of a high standard in lay-out and design, proving that it can and will erect houses in something approaching adequate quantities, the Government, sooner or later, will have to step in again. We cannot stand still. We have a terrific leeway to make up, the number of dilapidated houses to be replaced is continually increasing, while hundreds of acres of festering slums await rebuilding, the latter in any case being beyond the reach of private enterprise.

While we have little doubt that the problem of providing convenient and healthy homes in pleasant surroundings for small middle-class families can well be solved by the architect and builder in consultation, the case of the real "working-class" house is unfortunately different. The 176,000 houses now being completed by the Government have nearly all gone to the middle-class man (who needed them as badly as anyone else), because he alone could pay even the low rents charged, but we must be prepared to face a far greater difficulty when it comes to housing the real "working class." Architects and builders would be doing their country a signal service if they would apply themselves to the reconciliation of the maximum wages that industry can afford to pay, with the minimum rents that can economically be charged for the simplest housing consistent with the decencies of life and with healthy and contented inmates. The experience gained by the Ministry of Health, by local authorities and their architects, and by progressive firms and syndicates, should be examined and sifted until we have found the solution of this problem, which can hardly be of a definitely insoluble order.

The housing question is of intense importance to architects, since it opens up to them a new country, one which may or may not be inviting as regards remuneration, but in respect to their art and its effect on the lives of this and future generations must be of paramount significance.

Reconstruction in Victoria Street

With the extensive alterations to several buildings of first-class importance in Victoria Street, Westminster, the architectural character of that teeming thoroughfare will be greatly improved. With the transformation now initiated and likely to be considerably developed in the near future, Victoria Street will soon be the Bond Street of Westminster. Hitherto its buildings have hardly risen to the dignity that so finely situated a street, with its vista of the Abbey, the Houses of Parliament, and glimpses of the river, St. Thomas's Hospital, and the London County Hall, certainly ought to possess. Its main characteristic, indeed, has been a mere monotony of dull uniformity, depressing to behold. Architects have long recognized its possibilities, however, and apparently they are now to enjoy a welcome opportunity of making Victoria Street more worthy of its situation. It should certainly be one of the finest streets in Europe, and apparently those who are controlling the present alterations are stimulated and inspired by that idea.

Adelphi Terrace

Even those who may be excused for tempering with certain reservations their admiration for the work of the brothers Adam are feeling uneasy at the persistent rumours of alterations in Adelphi Terrace. It is the one spot where Adam house and street design can be seen at once succinctly and comprehensively. Adelphi Terrace, indeed, represents an important phase of town-planning in London, as being the first real attempt in that kind, as well as supplying the root idea of a Thames Embankment. Besides, Adelphi Terrace is *per se* of a unique architectural character, and no lover of architecture could complacently see that character marred. Yet there are many disquieting rumours such as that which appeared in "The Daily Chronicle" one day last week, to the following effect : "The threat that a large part of the famous Adelphi Terrace and the region of little streets running down to the Embankment are to be demolished in an immense housing scheme gives rise to the hope that 'if the worst happens' the past will still be kept vivid in street names." That would be, indeed, a poor compensation for the disappearance of one of the most notable architectural features of London, and, for the credit of its citizens, the "worst" should not be allowed "to happen" to Adelphi Terrace, nor anywhere else.

Anonymous Architecture

The Duchess of Rutland, who started in "The Times" the very interesting debate that, under the heading "Sculptors and War Memorials," has included several protests against the similarly enforced anonymity of architects, has written a further letter, in which she warmly acknowledges the sympathetic interest aroused by her first communication (October 21) on the subject. The Duchess fears, however, that the main point in that letter "has not quite been appreciated." Except in a letter from the President of the Royal Society of British Sculptors, Her Grace declares, "no one has quite grasped it. He has put, in clearer words than mine, the protest which I made against the injustice and unfairness which sculptors and, I will now gladly and earnestly add, architects have suffered at the hands of the British Press." The President goes on to say : "They seem to have made it a custom to omit the name of the sculptor when reporting the unveiling of any public memorial." As our previous notes on the subject will show, our own impression was that this was the gist of the arguments. We are in full agreement with the Duchess's hope for "appreciation for the worker in the 'historic present,' which the unveilers might be asked to remember and the Press to record, with courtesy and unfailing certainty." Her Grace's letter concludes with a very sensible suggestion : "May I venture to hope," she says, "that in future those who officiate at the unveiling of a memorial will request that the sculptor and architect, however unknown, should be presented to them at the opening of the ceremony ?" It is surely a very serious omission, amounting to a breach of decorum, not to make this presentation; and it ought always to be made, as her Grace of Rutland suggests, at the beginning of the ceremony, not at its fag-end.

Who's Who in the New House

So large an industry as that of building should surely be more numerously represented in the House of Commons. Yet, in the admirable series of brief biographies appearing in "The Times," one looks in vain for extensive accessions to the ranks of the several denominations of builders, and there are a few very regrettable casualties. Sir Tudor Walters, for example, lost his seat for the Brightside division of Sheffield; and all architects will also sincerely regret the defeat of Major H. Barnes, F.R.I.B.A., in his gallant fight to retain his seat for Newcastle-upon-Tyne East. Major Barnes had so rapidly achieved distinction in the House that his (we trust merely temporary) absence from it will be felt as that of a rising statesman as well as of one of the surprisingly few architects who have won their way into the House of Commons and "made good" there. Rather oddly, the announcement of the misadventure at Newcastle-upon-Tyne was immediately preceded by the result of the polling at Dartford, where Mr. G. W. S. Jarrett, architect and surveyor, won a seat handsomely from a Labour member. So far as the full results of the elections reveal the *personnel* of the new Parliament it would appear that Mr. Jarrett will sit in splendid isolation as the only architect elected to the new House, where, however, building interests do not end with the architect member. Mr. J. W. Lorden, "governing director of a firm of building contractors," retains his seat for North St. Pancras by the substantial majority of 1,011; Mr. F. J. Privett, who has won a seat at Central Portsmouth by the slender majority of seven, is described as "a builder and contractor at Portsmouth and Haslemere"; and Mr. D. G. Somerville, the managing director of Messrs. D. G. Somerville & Co., Ltd., constructional engineers, won a stiff fight at Barrow-in-Furness by the substantial majority of 1,927 against a formidable Labour candidate; while Mr. E. G. Price, who gained a seat at Shoreditch, is "the head of the firm of B. Goodman & Co., housebreakers and contractors, and is one of the largest employers of labour in the borough of Shoreditch. He is also a Warden of the Paviors' Company." At Oldham Mr. S. Smethurst, whom we take to be identical with a Past President of the National Federation of Building Trades Employers, polled 23,200 votes, and would no doubt have won a seat but for a "split vote." With the political composition and complexion of the new Parliament we have nothing to do, beyond remarking that the new House would seem to comprise more business elements than the old, to the obvious advantage of the entire community.

Joking Apart

(A Monthly Causerie)

Architecture and "The Man-in-the-Street"

LONG ago it was St. George who stood for Merrie England; early in the eighteenth century St. George gave way to John Bull, and we may now observe "The man-in-the-street" gradually, but surely, dispossessing John. St. George is, in these days, either forgotten or, if remembered, so violently sneezed at that I will say nothing about him; and we are all, I think, so well acquainted with John Bull—who first saw the light in a satire from the pen of the famous Dr. Arbuthnot two hundred years ago—that it is unnecessary to describe him, yet I cannot deny myself the mischievous pleasure of exhibiting the familiar figure of John as he stands aglow in the searchlight Mr. Masefield turns upon him. I quote from the essay contributed by the author to the volume titled "Ruskin the prophet." Mr. Masefield says: "I have seen many images of John Bull, but none showing him as a person who would think, or pray, or fight, or be courteous, or chivalrous, or merciful, or practise any art, or sing, or be delightful, or make love, or do a decent day's work, or have an enlightened idea, or be tolerable company under any circumstances whatsoever. He is always an animal man standing in the way."

John Bull, also, although Mr. Masefield does not mention t, lacks any sense of humour; but too much has been said, or the picture is unfair to John, who has redeeming qualiies: courage, for instance, and honesty, and an obstinate oyalty to the principle of fair play. What his views on rchitecture may be cannot be imagined—it would seem mpossible he should have any. In this matter the man-inhe-street is an entirely different "proposition"—as our usiness acquaintances would say. He has decided views; n fact, his views are the most conspicuous thing about im. He is compacted of views on every subject, and is a erson to reckon with.

The man-in-the-street is, of course, an abstract conception; he no more typifies any actual man in any street han John Bull typifies any actual state of life. The two gures stand for popular angles of view. What John Bull hinks is supposed to be the bias of the country, and we obtain a reposeful satisfaction in associating ourselves with point of view which eliminates perplexing subtleties, flat ers our complacency, and justifies our prejudices. "The an-in-the-street," as he is represented to us, has all ohn's deficiencies, but none of his redeeming qualies, and prides himself on being impervious to reason, rtifies himself with ignorance, and justifies himself narrow obstinate prejudices. He is an intellectual olshevist shouting "Highbrow" at the man whose pronce it is to know and to think, and for him wisdom consts of a cynical distrust of human nature and a dullitted pursuit of the main chance. This is the conception hich we may set up in place of John Bull, vice St. George, tired.

It would provide matter if someone with plenty of time spare would make the necessary crafty investigations d draw up a statement setting out exactly what the public, pified by the man-in-the-street, thinks about architects. is undoubtedly a fact that very few people indeed have y idea what an architect is for. This is because they have her never had the curiosity to wonder, or because that riosity has not been strong enough to carry them beyond e point of idle speculation. The confusion of mind in ne persons on the subject of the duties of the architect y may employ is so complete that the poor man has been own to feel vague on the subject himself. He has the sensation of being spun around and told to catch whom he may, when a prospective client says, "I want you to build a nice house for me, but I want you only to design the *outside* of the house. I will do the inside as I know exactly the house I want." The lady who so expresses herself has, however, advanced a long way towards the knowledge; she has reached a point where the architect is definitely associated with design. This is unusual. The majority—speaking of the public as a whole—associate the architect with the trap of the scullery sink that will not pass sand used for cleaning pots without surgical aid—by which I mean to express that it is the mechanical imperfections of a dwelling-house that first present the idea "architect" to the man-in-the-street. He is aware of "architect" as a person connected with building, and when he becomes a householder the shortcomings of his speculative-built villa are laid to the door of "the architect." No architect has had any hand in the building of the house, but a scapegoat is wanted and "the architect" fits the case to admiration. Why is not the recess by the fireplace big enough to take the new wardrobe? Why is not the electric light placed where I want to put the dressing-table? Why do the taps drip, and the slates slip down the roof, and the doors bang, and the stairs creak? The answer is—"the architect." He is the culprit. He is the person who is accountable for all the stupidities, uglinesses and inconveniences in buildings. It does not occur to the public that the architect only differs from other men in having special knowledge of building, or that the tasteless designs and shoddy construction sown broadcast over the country are due, not to architects, but to the ignorant taste of the public itself, who, if it employs an architect at all, commonly selects a spurious one.

Under conditions in which he is chiefly identified as the "man who makes the chimneys smoke," it seems remarkable that the architect should be employed as much as he is. This fact depends upon another pet illusion of the public, namely, that all builders are dishonest. It has specially held by the idea that every builder will scamp the drains unless he has an architect sitting, like the old man of the sea, on his shoulders with legs locked in a strangle-hold on his throat. This is extremely lucky for architects, many of whom have won great credit from the conscientious toil of the experienced old bricklayer crouching in the trench to joint the pipes, by taking the client for a stroll along the brink and assuming the whole of the credit for the meritorious proceedings going forward below. The architect is a person, then, who sees that the man-in-the-street gets his money's worth out of the builder who would otherwise cheat him, but it is very rarely that the real work of an architect —the thing that he gives his nervous energy to, is in the least understood. With so many discouragements lying in wait for those who embark on the career of architect it is remarkable that so many should practise. The explanation may be in the qualifications for a career as an architect. Deafness is a well-known qualification, and has produced some distinguished men; chronic indigestion has also guided more than one youth to the threshold of success, and it is now generally accepted that architecture is one of the very best professions in which to have epileptic fits. Broadly speaking, however, the usual factors decisive of an architectural career are an apparent incapacity to do anything else, supported, perhaps, by a weak taste for drawing, which is made conspicuous by the absence of evidence of other mental vigour.

KARSISH.

The Houses of Well-known Architects

1. Sir Reginald Blomfield's Residences at Hampstead and Rye

EVERY architect must have dreamed of the day when there would walk into his office The Perfect Client—one who had money, and to spare; who asked only that the mansion should be built and that nothing should be put before him but the bill. A faint flush of pleasure can be imagined to spread over the face of the dreamer at the thought of no longer being "cabin'd, cribb'd, confin'd" by sordid considerations of cost, by the requirements and "ideas" of the client, and by the many "changes of mind" of the client's wife—but such a commission is secured only in one's dreams.

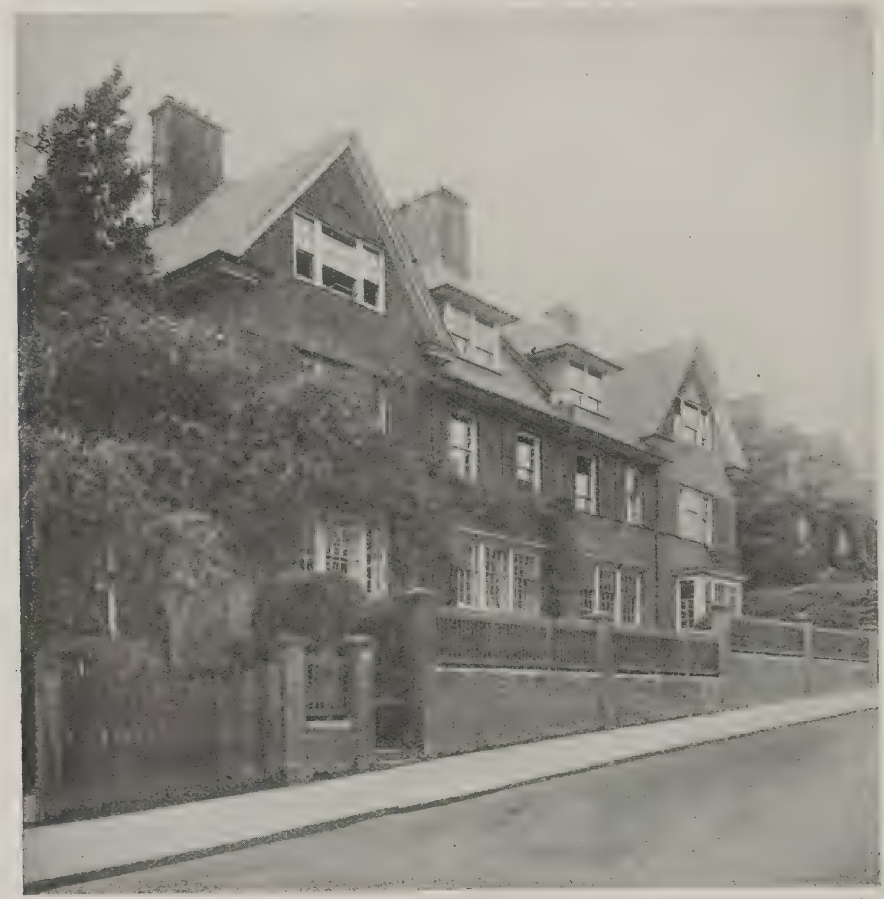

Photo: "Architects' Journal."

SIR REGINALD BLOMFIELD'S HAMPSTEAD HOUSE.

All artists are, of course, bound by similar considerations; the actor must please his audience—the gallery; the playwright is restricted by the limits of the stage, and to succeed must—even as did Shakespeare—introduce unwanted lines to please the mind of the age.

However, the house which an architect builds for himself may be said to hold forth possibilities. Here at least he may give free rein to his imagination; here he may bring down to earth castles which have hitherto been suspended in the air; and now, with himself as client, he may at last have his fling.

The self-designed house of a great architect cannot fail to be of interest to all who have eyes to see. It is a *journal intime:* it may be as revealing as the "Autobiography" of Cellini himself! It is, of course, not given to every architect to design even his own domicile: if you would satisfy your curiosity as to where lived X, that great Gothicist, you might be led to a block of flats in Maida Vale; W, the well-known domestic man, you shall find miserably housed in one of a long row of depressing villas; R, the famous Classicist, has found shelter among the homely cottages of a garden village. Obviously, it is a matter of means, as well as of inclination, and where the architect's dwelling is an unsought-for architectural mask, one must look deeper—beyond, even, the pattern of the very wallpaper—if one would discover the secret leanings of the artist's soul.

One remembers a verse or two from a little poem on the subject by Mr. Thomas Hardy:—

There is a house with ivied walls,
  And mullioned windows worn and old,
And the long dwellers in those halls
Have souls that know but sordid calls,
  And daily dote on gold.

* * *

In blazing brick and plated show
  Not far away a "villa" gleams,
And here a family few may know,
With book and pencil, viol and bow,
  Lead inner lives of dreams.

SIR REGINALD BLOMFIELD'S HOUSE AT HAMPSTEAD.

"POINT HILL," RYE—

FROM THE MILITARY ROAD. FROM THE LAWN-TENNIS COURTS.

We open this series of "The Houses of well-known Architects" with Sir Reginald Blomfield's homes at Hampstead and Rye, and purpose to give at intervals the houses of other prominent members of the profession.

Hampstead has been chosen by many architects for their London residence :—In Well Walk, it will be remembered, dwelt the late Temple Moore; the late Sir Gilbert Scott's house ("Admiral's House") has a tablet affixed; Mr. Raymond Unwin occupies an old farm-house that is mentioned in the local histories; and the number of lesser-known architects who dwell there must be legion.

Sir Reginald Blomfield's Hampstead house is one of a pair in Frognal, built about thirty years ago from his own designs, the one up the hill being for his own occupation, and the lower one for the late T. J. Cobden Sanderson, the well-known book-binder, craftsman and writer.

The materials are red brick and Whitland Abbey slates, and the design was intentionally kept simple and plain, the principal aim being convenience in working. The alcove in which Sir Reginald is sitting was originally a loggia on the first floor opening out of the study, but was closed in some years ago in order to house an ever-increasing number of books.

The position of "Point Hill," Rye, is, in its own way, unique. The house stands on high ground outside Rye, and overlooks Romney Marsh and the Rother. "On a clear day," says Sir Reginald, "one can see the cliffs of Dover, and at night the lights of Folkestone,and the flash of Grisnez over the horizon." The real quality of the house is the way it lies along the top of the cliff, and this is well shown in the general view from below, showing the gazebo lattice bridge and house at the top.

Owing to its position and the thickness of the summer foliage, it has been impossible to take a near view.

The house was originally a three-room cottage, which was enlarged by Sir Reginald to a nine-bedroom house, with three sitting-rooms, bath-rooms, etc.

The Whitgift Hospital, Croydon

A Practical Suggestion

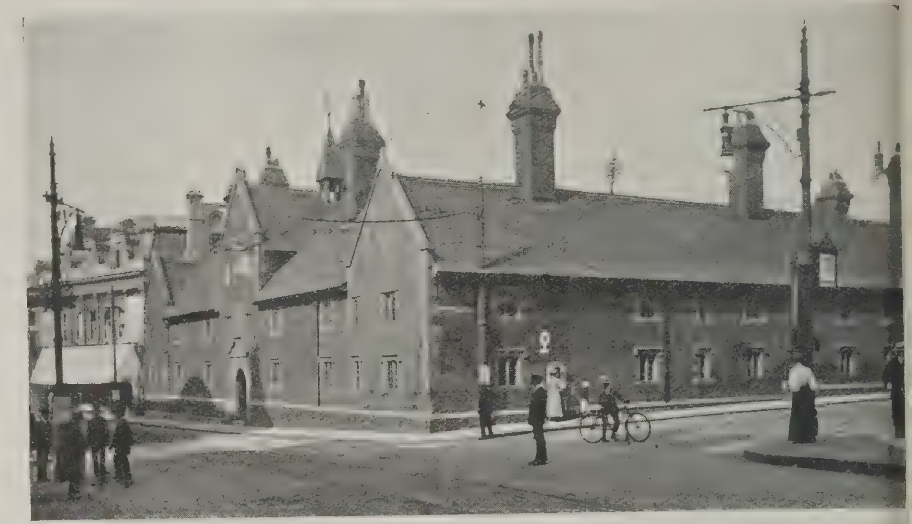
By H. V. MILNES EMERSON, A.R.I.B.A.

TO the observer of the present-day traffic in the High Street of Croydon, it is apparent that some solution will have to be found at no distant date to relieve the congestion that occurs at the junction of North and South End, George Street and Crown Hill. This is due to the bottle-neck formation of the roads at this point, aggravated by the sharp turn that occurs in passing from George Street to Crown Hill, combined with the steep slope of the latter commencing directly at North End. On drawing No. 1, showing the existing roads, it is clear that the main obstruction is the position occupied by the Hospital of the Holy Trinity, more generally known as the Whitgift Hospital. This building when erected in 1596–1599 formed the frontage line in North End and George Street, but the widening of both these thoroughfares within recent years, without due regard to the position occupied by the Hospital, has left the building projecting into the roadways.

When the widening scheme was first undertaken the obvious course would have been to make the Hospital the starting point and to have carried out the widening of these thoroughfares by setting back the buildings on the opposite sides of the roads as and when the opportunity occurred.

However, somebody blundered, and it would serve no good purpose to discourse upon this point. Rather is it important that means should be found to carry out the necessary widening and at the same time prevent the destruction of the Hospital.

Proposals have been made from time to time dealing with this problem, but all the schemes so far brought forward have proposed the removal of the property on the opposite sides of the roads, or the construction of new roadways to divert the traffic from this particular spot. It is obvious that these schemes, necessitating the removal of a large amount of property, would prove costly, and still leave the Hospital more or less an obstruction.



VIEW FROM THE MAIN ROADS.

Now, if it is possible both to widen the roadways and retain the Hospital, at a reasonable cost, such a solution should be acceptable to those who are for or against the removal of the Hospital building, and the scheme which I now bring forward is to move the building bodily back some 40 ft. north-east of its present position, as shown upon drawing No. 2.

By doing this the roadway is at once opened, but, more important, this historic building would still be retained upon practically the same site, and perhaps be made still more historic by being the first building of its character to be removed bodily in this country.

Apart from this building and the old Palace, little remains at the present day in Croydon in a tangible form to connect the town with its historic past, and it would almost amount to sacrilege if this perfect example of Elizabethan architecture, which has been associated with Croydon for the past 325 years, should be destroyed.

In America it is not unusual to alte the position of buildings, many of a much larger size and weight than t
Whitgift Hospital. One of their late
achievements was the shifting of an eig
story building with the side-walks inta
whilst business within the building w
in no way interrupted, not even the li
being stopped.

The setting back of this building is
much smaller proposition, and, althou
I am not aware of any work of this s
being undertaken in this country,
would present no undue difficulties,
the substratum is good, evidenced
the present stable condition of the str
ture, and Messrs. Heron Rogers a
Pettit, consulting engineers, of 181 Que
Victoria Street, E.C.4, with whom I ha
conferred upon the matter, are in agr
ment.

Underpinning would be carried out
the usual manner, and a steel fra
inserted in sections, supported w
blue brick piers in cement upon concr
foundations, until the rolling stock
been inserted. The next operation wo
be excavating and levelling the whole
the site to the required depth, and lay
the reinforced concrete raft, which wo
carry the rails, wheels, and carriages,
latter being somewhat similar to
modern railway coach chassis. The
riages would be fixed to the steel fra
carrying the building. From this fra
would project the sole plates for the
pose of receiving the raking shores
are required for supporting the w
each opposite pair connected with tie
where necessary. The door and win
openings would be shored as usual,
the chimney stacks would also be secu
if required, or alternatively they could
removed and rebuilt, if, as I understa
they are of modern construction.

At the N.W. and S.E. corners of
building the steel frame would be
structed as shown upon drawing No. 4
order to receive the electric motors, wh
operating upon a cogged tract and w
ing upon a very low gear, would su
the necessary power to move the buil

at a very slow rate to the new position. Alternative power could be supplied by hydraulic rams. Owing to the slope of the ground from east to west, the building, when in its new position, would be raised by means of jacks, whilst still upon the steel frame, in order to bring the ground floor above the level of the adjacent thoroughfares.

The concrete raft would now form the foundation for the building, the frame, carriages and tracks would be removed and replaced with brickwork and damp course, new drains and sanitary arrangements would be installed, and the building made fit to stand in its altered position for all time.

It will be seen by comparing drawings Nos. 1 and 2 that by placing the building in the position shown on plan No. 2, the difficulty of increased width to the cross roads is overcome, these being now made some 65 ft. wide. The project entails the demolition of a minimum amount of existing property, viz., two shops in George Street and the remaining old premises in North End, belonging to Messrs. Alders, which have already been scheduled for removal by the owners. By the removal of the two shops in George Street, Messrs. Alders' premises in that street would abut upon the new walk around the Hospital, thus enabling this firm to have a continuous frontage from North End to George Street. At the same time this new walk would considerably relieve the pedestrian traffic.

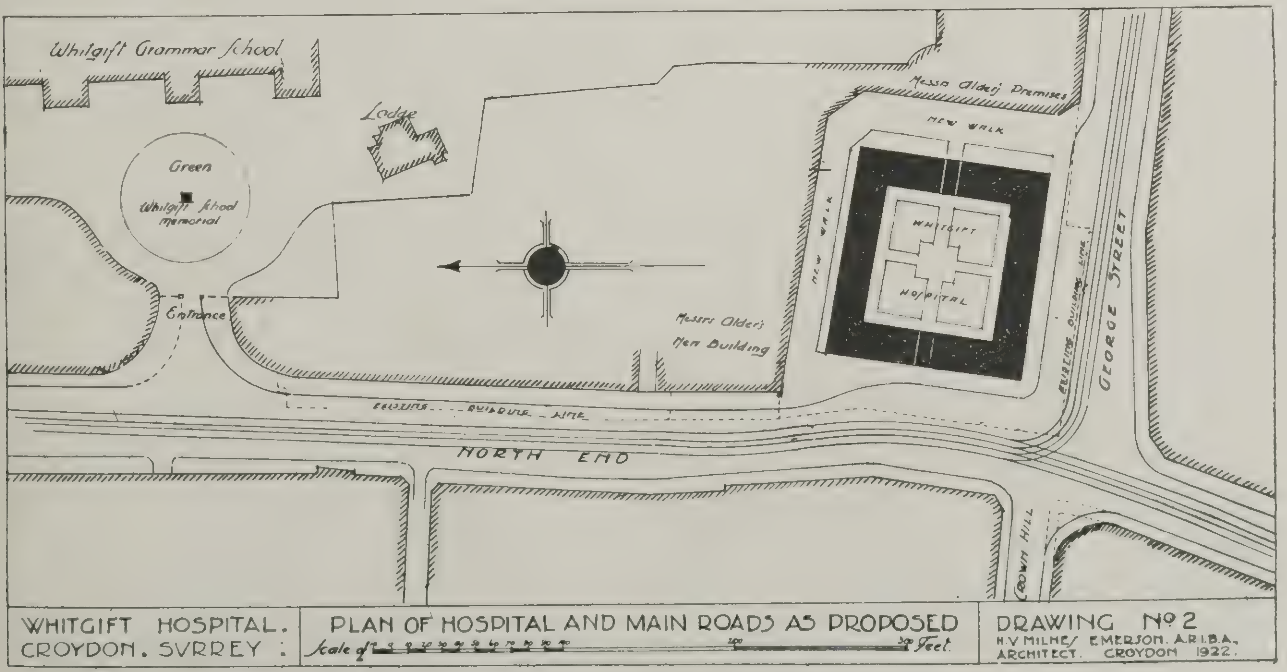
In addition to the widening of both North End and George Street, it will be noticed that the north side of Crown Hill would be in line with the north side of George Street, thus doing away with the present obstructed view of traffic approaching in either direction.

Apart from the purchase of the property to be demolished, the cost of the work should not be greater than £20,000 to £25,000, a sum that will compare more than favourably with the expenditure that would be incurred in carrying out any of the alternative schemes, including the proposed demolition of the Hospital. The project also provides the very necessary widening of both thoroughfares, provided by no other scheme, excepting the demolition of the Hospital building or the extensive and extremely expensive removal of property on both sides of North End and the south side of George Street, and a modification of the gradient of Crown Hill.

This proposition provides for the least possible expenditure compatible with a complete solution to the problem. The Hospital building remains intact upon the larger part of the original site, and, as I have suggested, the scheme should meet with the approval of those who wish to retain the Hospital in its present position and those who would destroy it in order to widen the thoroughfares.

Garrow's "History of Croydon," published in 1818, contains some deeply interesting information relating to the foundation and building of the Whitgift Hospital.

"We now come," says the writer, "to an institution which, while it confers honour and distinction upon the town of Croydon, exhibits a venerable testimony of individual piety and munificence. The



Hospital founded by Archbishop Whitgift conveys to us in its history a delightful representation of benevolence, liberality, prudence, and humility combined."

The Archbishop having obtained letters patent for building the hospital, with license of mortmain, from Queen Elizabeth dated November 22nd, in the thirty-eighth year of her reign, began it on January 17, 1596, and finished it on September 29, 1599. It appears that this distinguished prelate was extremely desirous that his charitable work should be completed in his lifetime; he knew that a man's own experience of temporal things was the best proof of their existence; and he could fully estimate the difference of value between an actual donation during life and a bequest to be enforced after death. "This yeere," says Stow (speaking of the year 1600, in which the schoolmaster's house, adjoining the Hospital, was completed), "the most reverend father, John Whitgift, Archbishop of Canterbury, did finish that notable and memorable monument of our time, to wit, his Hospital of the Holy Trinitie, in Croydon, in the Countie of Surrey, by him there founded, and builded of stone and brick, for reliefe and sustentation of certaine poor people. As also a fair school house for the increase of literature [now demolished], together with a large dwelling house for the schoolmaster, his use, and these premises he through God's favourable assistance in his own life time performed and perfited, for that (as I have heard him say) he would not be to his executors a cause of their damnation, remembering the good advice that an ancient father hath left written to all posteritie; it is a way far more safe for a man to doe good and charitable deeds by himself, than to hope that others will do the same for him after his death."

The reverend Samuel Finch, who was Vicar of Croydon at the time this Hospital was founded, was employed by the Archbishop to make contracts, to superintend the workmen, and see that his plan was put into execution. This he performed with great diligence, paying them regularly every week. In a book preserved in the manuscript library at Lambeth, and entitled "the particular accounts of the building of Trinitie Hospital in Croydon, and the statutes and ordinances belonging to the same," is contained a very minute schedule of the expenses attending it; the sum total of which up to September 29, 1602, amounted to £2,716 11s. 11d.

The statutes of this Hospital inform us that it was founded for the benefit of at least thirty persons of both sexes, and so many more under the number of forty, as the revenues of it will permit; and to every poor brother and sister was to be paid the sum of £5 per annum, besides wood, corn, and other provisions.

The Hospital is a handsome edifice built, as before-mentioned, in the form of

a college. The chapel is a small, neat structure, of a most unassuming appearance; it is, however, enriched with a fine portrait of the venerable founder painted on wood, under which are these two lines : "A breathing portrait of the Primate see, Who built this Chapel to the Holy Three."

Over the outer gate is an upper room called the treasury, in which were deposited in remarkably strong and secure boxes a variety of papers relating to the Hospital, including Queen Elizabeth's original grant to the Founder and the Archbishop's deed of gift of the several estates with which he endowed the Hospital.

The Archbishop entrusted the erection of the Hospital and the school buildings to Samuel Finch, Vicar of Croydon, and to mark his gratitude he left him an annuity of £6 13s. 4d. for life in consideration of the great care and pains he had taken about the building of this Hospital.

The following extracts from letters written by the Rev. Samuel Finch to the Archbishop and his Mr. Wormall at Lambeth, give a very interesting insight into the erection and completion of the Hospital.

In a letter dated Friday, February 8, 1596, he says :—"My humble dutie remembred unto your Grace. Yesterday, being Thursday, Wolmer the bricklayer was here to vewe your worke. And he sayeth that he cannot be here himselfe; but he wyll appointe one from Westminster to be here, who will not come under xviiid the day, and his laborer xiid. . . . The yarde ys all defenced in, stronge and saffe. This day we make an ende in pullinge downe as yet. Nowe we take morter makinge in hande, clensinge and levellinge of the grounde; and by Monday come sevenighte, Hillarie saith, we shall be ready for the foundacon and bricklayer. . . . Blease hath begunne the grounde worke nexte the highway leadinge to London; and findinge that grounde made and false, digged the trenche alonge the door, and ware little or nothinge combred with water, and finding firme grounde, they have filled up that trenche, with great flinte and small stone, and brick batts and rubbishe not confusedly, but orderle layed in, and rammed stronglye, course upon course, stronge and sure. We have provided cartes to fetche us great flinte and chalke for the buildinge, and small for fillinge; because the lower ground is not soe good and firm as the upper, and the waite of the worke may not be trusted only upon bricke; and four loads of flinte, which come to xs. will save one thousand of bricks at xvis. . . The laborers have digged up iiii skulls and the bones of deade persones in the trenche that they are nowe in digginge, nexte the highway leadinge to the Parke."

The following is part of an interesting document :—

"I send you here the Copie of the condicon of the Free-masons bonde.

"Nicholas Richardson and Christopher Richardson, Citizens and free-masons of London, and Gabriell Anscombe, of Charlton. . . ."

"The condicon of this obligacon is such, that if the above bounde Nicholas Richardson, Christopher Richardson and Gabriell Anscombe, They or any of them, do bringe, or cause to be broughte, to that place of the aforesaid Croydon, where his Grace's hospitall is buildinge, soe muche good and seasoned free-stone as shall be sufficiente for those dores and windoes belonginge to the said intended hospitall as shall be made of free-stone; and shall worke the same, and sette them up in such necessarie and readie manner as that the worke or building be not stayed or hindered through there defaulte, the dores being wrought fayre and comelie as suche dores ought to be. . . .

In a letter dated March 7, 1596, the following reference to the bricks used is interesting :—

"Rednap came hither this day; and assone as ever he came into the yarde, and sawe the bricks, his harte was deade; he went to them, and chose here one and there, and knockt on it and saith, 'he hoped there war better to be founde in the Parke.' To the Parke we came, and there went from clampe to clampe, and here we found and there some one or more good, but not to the purpose of his owne expectation. Fain he woulde have excused himselfe, but his handie worke spoke against him, and we ware soe rounde with him, that he burste out into taeres, sayinge, 'he was never the like served in anie worke; he was ashamde of it, he could not excuse it; yt was the wickednesse and deceitfulnesse of the yearth. And albeit he coulde not thoroughlie make amends, yet he could be contente to doe what lay in him, but not of that yearth.' Well, then to the lome pitts beyond Dubber's hill we came, neere Halinge-gate, where bricks had been made in tyme past. . . ."

Instructions being sought regarding the arms, etc., over the gateway, the following directions were sent by way of answer from Mr. Wormall :—

"For the foregate of the Hospital at Croydon.

"The Armes over the doore must be without helmet and mantelling; and must be the armes of the See of Canterbury, viz., the Pall in pale with the nowe Archbishoppe's armes; and the yeare of the Lord under them, viz., 1597. Over the said armes a free-stone square, with these words in great letters, viz., SANCTAE TRINITATI SACR. On the bare places over the gate (called as I think) the ashlar, this sentence following to be written in great capital letters, viz. :—PRO 28. QUI DAT PAUPERI, NON INDIGEBIT."

The Whitgift Hospital is an invaluable possession, both architecturally and historically; and it is the duty of the inhabitants of Croydon to see that the threat to its existence is brought to nought. The suggestion for its preservation contained in this article is entirely practicable, and is put forward as a reasonable solution of a very difficult problem.

Institution of Structural Engineers

AT the last meeting of the Institution of Structural Engineers, Mr. W. Marriott, M.Inst.C.E., read a paper on "Concrete on British Railways, together with some Notes on the Durability of the Natural Cements used by the Ancients." Mr. Marriott said that he had for many years been an enthusiastic user of concrete, and had never lost an opportunity of studying the question in all its bearings, making journeys abroad nearly every year to see some examples of foreign work. He was first attracted to it through reading of Monier's experiments in Austria more than forty years ago; in fact, many years ago, when he commenced his railway career, he was with a firm that had done a good deal of foreign work, and who were among the first exponents of concrete in this country.

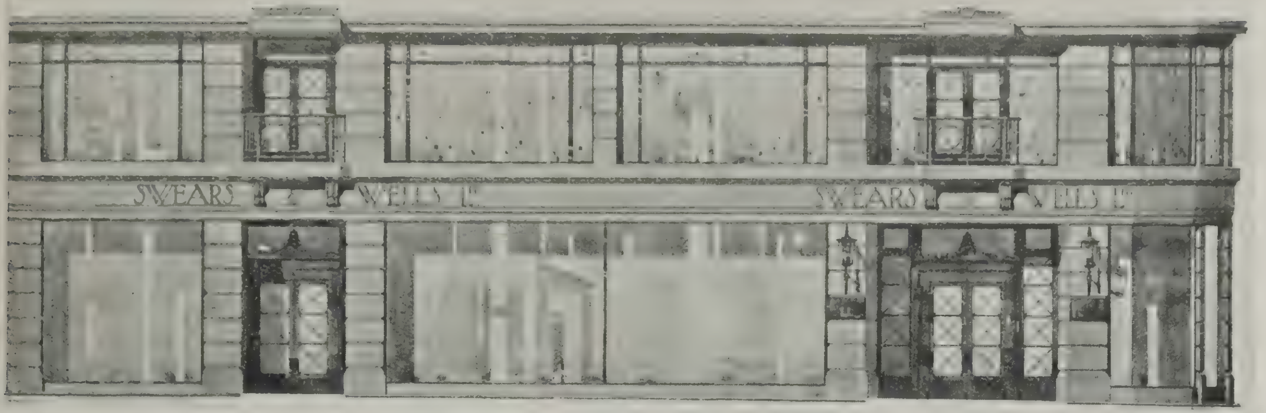
Proceeding, he said : We endured a great deal of opprobrium, and our concrete was not up to modern standards, or to present-day knowledge, but as the proof of the pudding is in the eating, bridges built then have stood, and are standing today, in as sound or sounder condition than they were on the day they were constructed. There are not many engineers who can say they have bridges in concrete nearly fifty years old on which not a penny has been spent on maintenance. In those days there was no steel in the concrete as reinforcement, as we now understand it, as the floor systems were generally formed by rolled iron joists which took all the weight, and were embedded in concrete mainly for protection.

The only difficulty we have had with concrete has been that when we have had to pull down buildings, etc., for enlargement, so solid and sound were the structures, they were very difficult to remove, and the fact has also been noticed that the joists where they have been covered or embedded in concrete were as good as the day they were put in, and in many cases had even got the mill bloom still on them.

Since those days, whenever permissible, the speaker has built scores of bridges of concrete, using, however, a brick facing as being cheaper than shuttering, and even going so far as to build in lime concrete, with excellent results, as was proved when one of these bridges near Cromer had to be taken down recently, the lias lime being as hard as a rock.

The use of pre-cast reinforced concrete in bridgework also offers many opportunities for economical construction. It is quite possible—and the speaker has done so—to make concrete girders for short spans complete and ready to lift into place. In other cases, where the steel girders are encased in concrete, the floor system is economically made of arch blocks. These arch blocks are pre-cast, and can be run into place as fast as men can handle them. They are then covered up with concrete *in situ*, and trains can be, and have been, run over within twenty-four hours. They form a bridge floor which is economical in first cost, and also in maintenance, especially where trains are continually running underneath; no temporary woodwork or centering is required, a good coat of lime white every now and then being all that is necessary. There are many ways of designing bridge floors. Some engineers prefer a flat slab. The speaker consider that the arch is more scientific and economical.

New Shop Front for Swears & Wells



ELEVATION OF THE COMPLETE SCHEME.

THE remodelling of the ground floor of Messrs. Swears and Wells's premises in Oxford Street, London, together with the introduction of new shop fronts, etc., has recently been completed to the designs of Mr. Keith Arnold.

It was desired to secure the maximum space for display compatible with structural necessity and architectural design. In the details a marked Egyptian influence in the shape of the doors, the design of the door handles, and the lamps and window signs will be noted.

The accompanying elevation shows the original scheme, embracing the first floor, which it is proposed to complete at a later date. The materials used were: Roman stone for the piers and fascia; bronze metal for the entrance doors, shop fronts, blind lathes, lamps and signs, and walnut for the window enclosures.

Messrs. Haskins, Ltd., of Walthamstow, carried out the work.

Enquiries Answered

The Editors cordially invite enquiries from readers who require information on architectural, constructional, or legal matters. Answers to enquiries are in all cases the work of experts ; and while every care is taken to make the replies thoroughly reliable, the Editors cannot hold themselves responsible for any inaccuracies that may inadvertently occur. Correspondents whose difficulties involve possible legal proceedings are strongly urged to consult their solicitors before taking action on any advice that may be given. Examination questions cannot be answered. It must be understood that, as a rule, both question and answer will be published in these columns. The name and address of the querist must always be given, not necessarily for publication. Correspondents are requested to be as brief as possible, and to write on one side of the paper only.

Load on Garage Floor.

"Motor" writes : "In designing a floor for a public garage what should be allowed per square foot for superimposed load? The floor will not support lorries or buses, but will be used by the heaviest of private cars—which I suppose is the Rolls-Royce. The cars will probably drive into the garage fully loaded with passengers. It will be a concrete floor."

—Assuming that a Rolls-Royce motor car weighs about 2½ tons, that the axles are about 10 or 12 ft. centre to centre, and the wheel track about 5 ft. wide, the floor should be designed for a minimum point load of 15 cwt. on any part that can be reached by the wheels, and 1 cwt. per foot super on the remainder.

HENRY ADAMS.

Formula for Reinforced Concrete Lintels.

"Associate" writes : "In your issue for December 15, 1920, Professor Henry Adams replied to a query by 'C. F. M.,' giving a formula for depth of concrete and area of reinforcement. I should be pleased to know whether the sizes obtained by this formula have to be increased for a lintel carrying the weight of a floor and, if so, to what extent." The query and reply of Professor Adams read as follows :—

"Please give me a rule-of-thumb formula for calculating reinforced concrete lintels and beams by which I can readily reckon the height and depth of concrete and area of steel required. The formula is only intended for use in economically designing window and door openings and the like."

"—Let L = clear span in feet, b= breadth of lintel same as thickness of wall in inches, d=net depth of lintel in inches above the centre of reinforcement. Steel reinforcement 1 per cent. of area of concrete above reinforcement. Then approximately $d^2 = \frac{L^3}{12}$ or $d = \sqrt{\frac{L^3}{12}}$. Example 4 ft. opening in 9 in. wall. $d = \sqrt{\frac{4^3}{12}} = \sqrt{5\cdot 33} = 2\cdot 236$, say, 2½ in., and giving 1½ in. cover to the reinforcement it makes the total depth 4 in. The reinforcement in this case would be $\frac{2\cdot 5 \times 9}{100} = \cdot 225$ square ins., or, say, two ⅜ in. rods properly turned up into a hook form at the ends. The general principles of economical design in reinforced concrete may be summed up as follows : Slabs and beams supported by columns are more economical than slabs and beams only. Keep slab thicknesses small by introducing a sufficiency of beams, and thus keeping the span small. A low percentage of slab reinforcement is more economical than a high percentage, but a thin slab is more economical than a thick one. Keep beams deep and narrow, not exceeding, however, a proportion of three to one. Reinforcement of beams should be in few rods of reasonably large diameter. There is very little to choose in ultimate economy between single and double reinforcement. One per cent. reinforcement may be taken as a standard of economy in either case. Have pillars just sufficient to carry the loads. For economy in pillars the laterals should be spaced closely. The economy of different proportions in the design will depend upon the relative cost of the materials. Remember that engineering efficiency is not always architectural efficiency."

—The approximate rule given for reinforced concrete lintels allowed for no load beyond the brickwork above them, which may be taken as comprised within an equilateral triangle having the clear span as base. If the lintel has also to carry the weight of a floor it should be calculated as an ordinary reinforced concrete beam. Given the span=L in inches, first find the total load=W in lbs., then the maximum bending moment in lb. inches=$\frac{WL}{8}$. The moment of resistance of a reinforced concrete lintel or beam is 95 bd^2, where b=breadth in inches, d=effective depth from top of beam to centre of reinforcement in inches. Say the span is 6 ft.=72 in.; the total load at 10 cwt. per ft. run, including weight of beam = 60 cwt. = 6,720 lbs.; then the bending moment will be 6720×72= 483,840 lb. inches, and $bd^2 = \frac{483{,}840}{95} = 5093$. Suppose the breadth to be 14 in., then the effective depth required will be $\sqrt{\frac{5093}{14}} = 19$ in., and the total depth allowing 1½ in. cover=20½ in. The reinforcement at ·675 per cent.=14×19×$\frac{\cdot 675}{100} = 1\cdot 7955$ square in., or, say, three ⅞ in. rods.

Testing this conclusion by the ordinary formulæ for reinforced concrete beams we have the following :—

m=modular ratio of steel and concrete =15.

d=effective depth=19 in.

p=ratio of steel to concrete.

k=fraction of depth given by distance of neutral axis from upper surface.

$$\text{Then } p = \frac{A_s}{A_c} = \frac{1\cdot 7955}{14 \times 19} = \cdot 00675$$

$$k = \sqrt{p^2 m^2 + 2p.m} - p.m$$

$$= \sqrt{\cdot 00675^2 \times 15^2 + 2 \times \cdot 00675 \times 15} - \cdot 00675 \times 15$$

$$= \sqrt{\cdot 01025 + \cdot 2025} - \cdot 10125 = \cdot 46125 - \cdot 10125 = \cdot 36$$

$$1 - \tfrac{1}{3}k = 1 - \frac{\cdot 36}{3} = \cdot 88.$$

Then the maximum tension in the steel will be—

$$t = \frac{B}{pbd^2(1 - \frac{1}{3}k)} = \frac{483{,}840}{\cdot 00675 \times 14 \times 19^2 \times \cdot 88}$$

$$= \frac{483{,}480}{30\cdot 02}$$

=16,117 lb. sq. in., the usual stress allowed being 16,000 lb. sq. in.

The maximum compression on the concrete will be—

$$c = \frac{2 \times 483{,}840}{kba^2(1 - \frac{1}{3}k)} = \frac{2 \times 483{,}840}{\cdot 36 \times 14 \times 19^2 \times \cdot 88}$$

$$= \frac{967{,}680}{1601} = 604 \text{ lb. sq. in.}$$

the usual stress allowed being 600 lb. sq.in.

HENRY ADAMS.

Cost of Laying Pipes.

J. C. writes : "In your issue for October 18, in answer to 'A. L.,' it is stated that the approximate cost of laying a 4 in. supply pipe main from the sea, 400 yds. long and 5 ft. below street level, would be somewhere about £250. This works out at about 4s. 2d. a foot run. May I ask if this is correct ? It appears to me to be exceedingly low."

—Upon looking into this matter more closely the pre-war price for 4 in. cast-iron socket pipes, including laying and jointing, was 7s. 6d. per yard run; excavation to lay 5 ft. deep, fill and ram, at 1s. 6d. per cube yard would in this case be 1s. 6d. per yard run, making the total cost 9s. per yard run. The present prices are about 12s. 6d. and 3s., making 15s. 6d. in all, or £310 for 400 yds. If, however, they are laid down existing roadways a sum of, say, £50 should be added for extra labour and making good, plus any special fees. It should be noted that tenders may vary from 10 per cent. below to 20 per cent. above these prices.

HENRY ADAMS.

Fireproofing Thatch.

M. C. writes : "Can you tell me whether there is a way of fireproofing thatch either before or after it is put on ?"

—Reed for thatching may be fireproofed by the treatment of the Timber Fireproofing Co., of Market Bosworth. This treatment rather increases the brittleness of the reed. Straw may be rendered less inflammable by saturation with a solution of alum and size. This is not completely protective, or permanent, in effect, but it will reduce the inflammability of the thatch when it is new, at which time it is most liable to ignition. After weathering some time the thatch lies much closer. It is also protected somewhat by vegetable growth.

E.

The Architectural Association

The Policy of the Schools and the Work of the Students

THE primary object of the teaching at the A.A. Schools is to fit the students successfully to undertake and carry out all architectural work which may devolve upon them in the various stages intervening between the commencement of their careers as junior office assistants and their final establishment as fully-fledged practitioners.

It is realized that some architectural students may never practise, and that nearly all will have to pass through a more or less lengthy period of office training before being competent to practise. The School course is intended to turn out students who will rapidly develop into reliable assistants, and who will have acquired in the School a breadth of mind and training which will enable them to become successful practitioners when circumstances allow.

The Schools do not specialize in training for prize-winning in students' competitions. Although the educational value of such prizes is realized, it is felt that the teaching should develop the students to take these competitions "in their stride," and for this reason no special drawings are prepared for such awards as the R.I.B.A. Diploma Medal. The School work is shown as completed in the studio, without the special elaboration which is customary in competition sets.

The combination of the practical and the imaginative in teaching architecture is as difficult as the combination of these two qualities is rare in the practising architect. Critics on the one or the other score rarely see the work as a whole, nor realize that the student is open to the same human failings as their practising brethren.

The main difficulty in carrying out the policy of the A.A. Schools lies in a too frequent curtailment of the period of study, often through unavoidable causes.

The course is one of five years.

Of students who have completed the full course the Association has received reports which justify full confidence in the method of training which the School adopts. Too often, however, the student is obliged to leave after a period of two or three years, at the most critical stage of his training. The School makes no claims for students who have had to interrupt their studies in mid-career. It is obvious that they are greatly handicapped, and when judging their capacity as office assistants, it is only fair that their architect employers should bear the facts in mind.

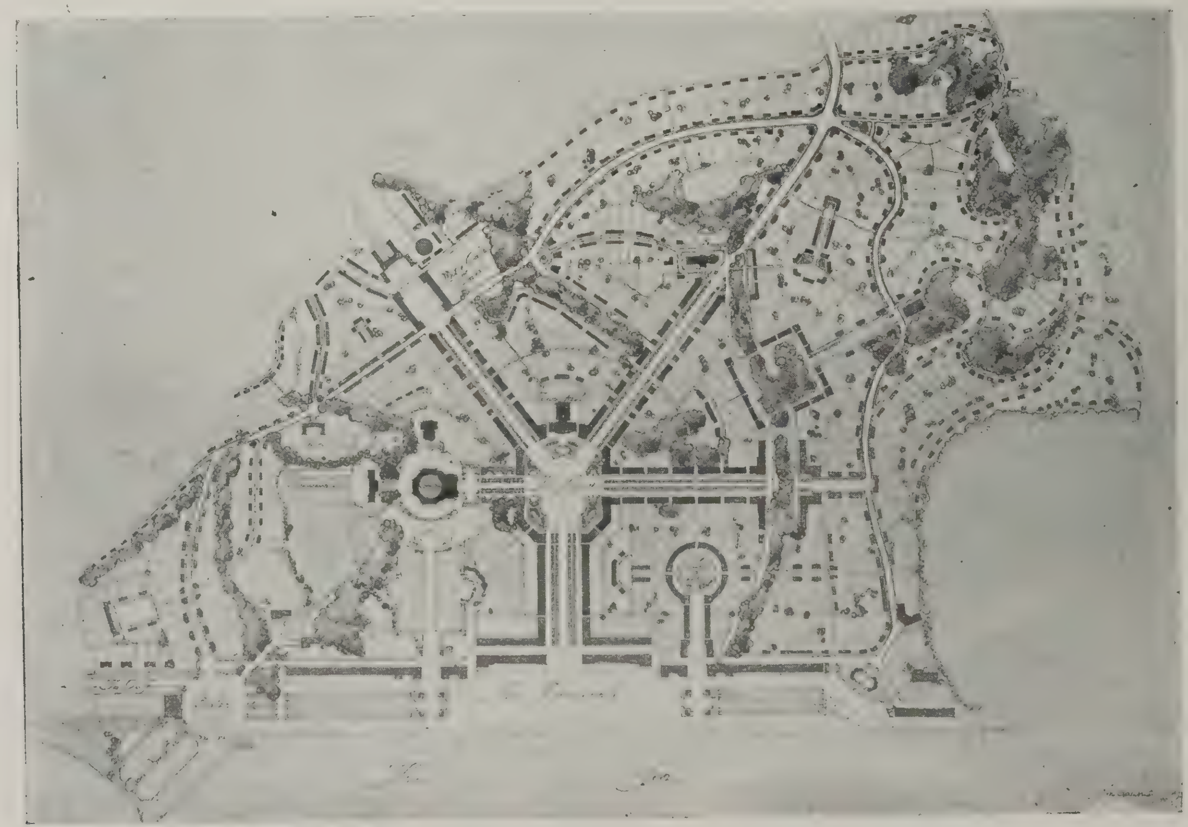
It is the usual practice to publish students' work without any explanation of why the subject was set, or the conditions of competition. Designs and plans are always more interesting when the programme is known, and it is for this reason that the following programmes are published.

The criticism generally levelled against school work is that "the subjects chosen will rarely be asked for in practice; few architects will ever be called upon to design a palace, pleasure island, etc." Perhaps this is true from the general practice point of view, but these problems are specially chosen to illustrate to the student points in planning, composition, expression, and also to develop imagination. The subjects chosen are all parts of a progressive programme, and as the student advances through the school course he finds that the smaller problems are incorporated in the larger ones. Unfortunately, space is not available to show the complete progression; that is, from the first year to the end of the fifth year. It is only at the end of the session exhibition that the course can be traced.

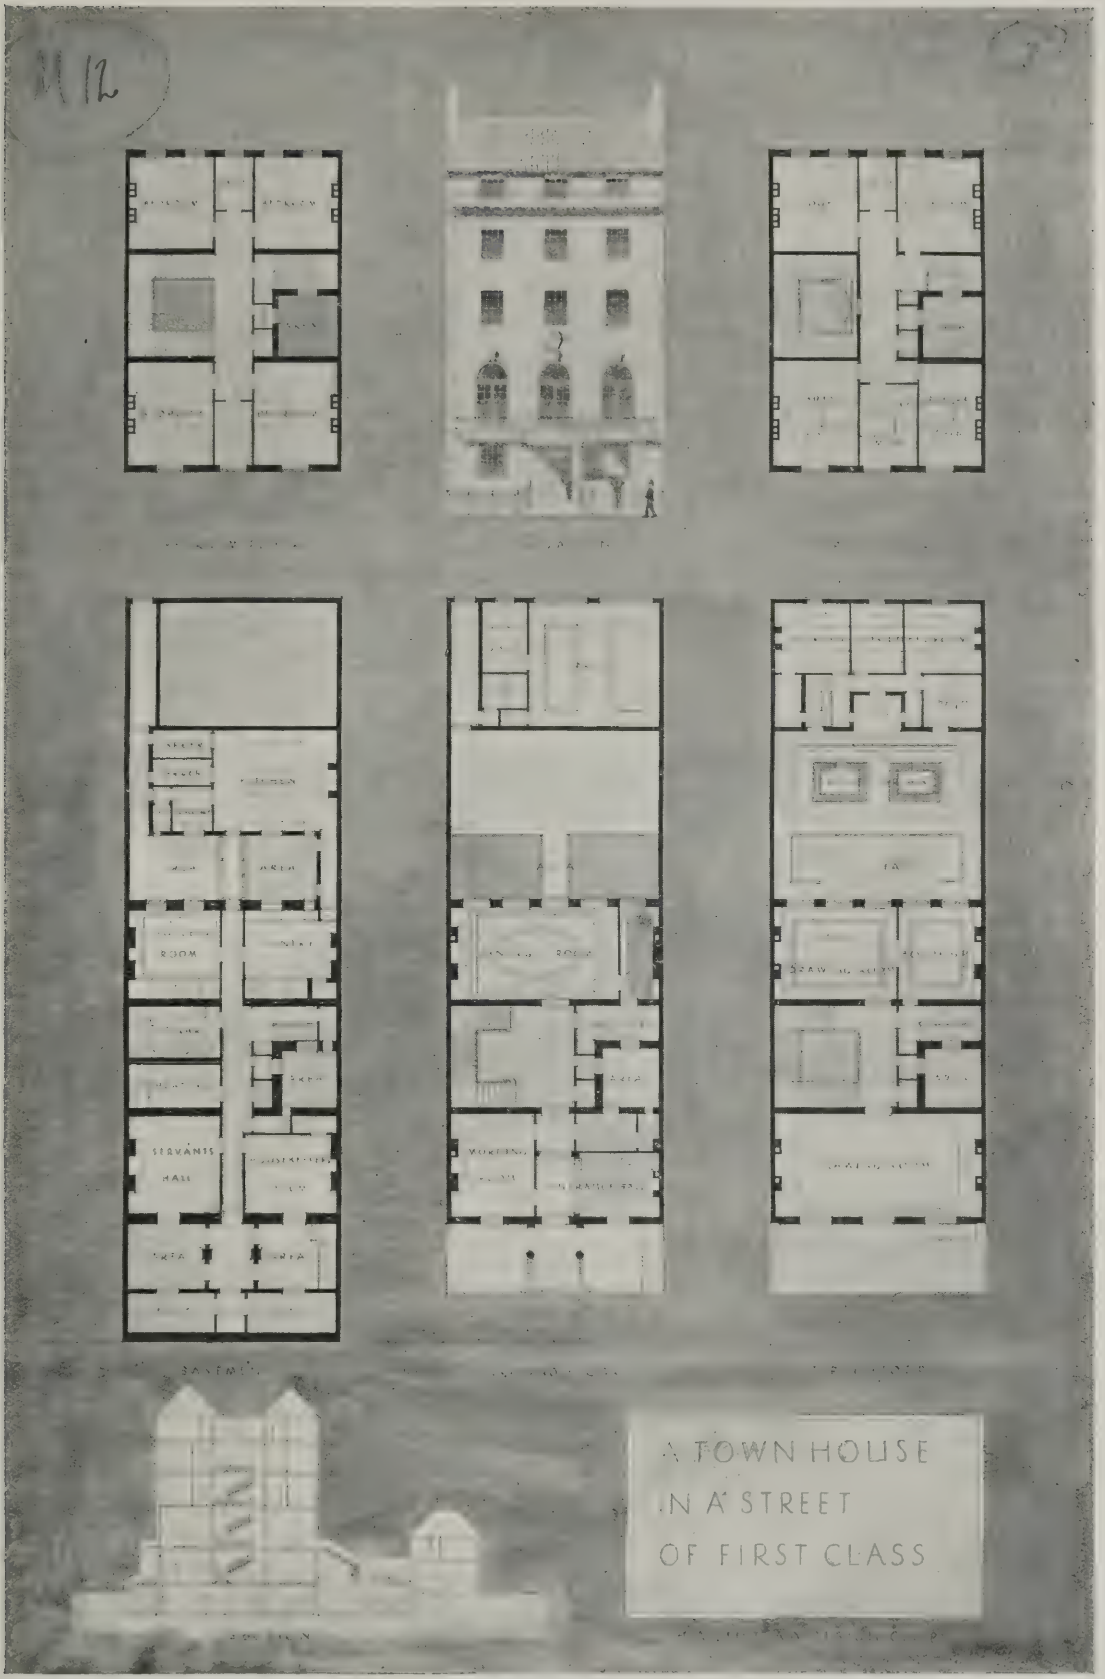
A Newspaper Office.—This subject was set as a straightforward planning problem. Light, ventilation, construction, and decoration had to be considered. At the beginning of the subject a lecture was given by a representative of one of the large newspapers who explained the method of producing a paper and the requirements of the various departments. Working-drawings were made and the steelwork designed; later the decoration of the main entrance hall was set as a subject.

The importance of town-planning has been engaging the attention of the schools for some years. The town-planning course really begins in the third year when subjects dealing with small "lay-outs," monuments, street lighting, and finger posts, etc., are set as two-week subjects or twelve-hour sketches.

Remodelling the approach to Victoria Station was a very practical problem. The site had to be studied and the volume of traffic in the main approaches had to be considered.



'THE LAY-OUT OF A SEASIDE RESORT." MISS I. CHAMBERS.



'A TOWN HOUSE."
MR H. A. CLIST (A.A. DESIGN CLUB).

The Architectural Association Design Club

The programme of work for the session, which extends from September to April, has already been published in THE ARCHITECTS' JOURNAL for September 27.

Schemes submitted for the first three weeks' subject "A Town House," and for the twelve-hours' sketch for "A Garden Room," were discussed by the jury, and subsequently criticized before a full attendance of members on October 24. The programme for "A Town House" on a frontage of 40 ft. in a London square, fully and clearly written, forms a useful detailed record of the typical requirements of an "entertaining" house in London. The working out of the subject was supervised by Mr. H. S. Goodhart-Rendel and Mr. V. O. Rees. In tackling the problems arising in the evolution of the town house and the adaptation of the traditional plan to meet modern requirements, members were fortunate in having the advice and criticism of an architect with an intimate knowledge of the subject from a practical standpoint, and the benefit of the teaching experience of a member of the Architectural Association instructional staff. This co-operation showed an ideal scheme working well in practice and should go far to help students to evolve schemes which will stand criticism both in the light of theory and of the cold hard facts of practical design. The experience of the first subject promises success to the new scheme.

The second subject, "A Cinema," is now being worked out under Mr. H. M. Robertson and Mr. J. Anderson, and the third subject commences on November 25.

There are still a few vacancies for new members. Application for membership should be made to the Honorary Secretary, Mr. H. Chalton Bradshaw, the Architectural Association, 35 Bedford Square.

Programme of First Subject.
October 2 to October 23.

A London House in a Street of First-Class Residential Property.

Most of the best London houses have been built by speculators for no particular occupier; they are designed, therefore, for the average purchaser. It is supposed that the speculator has bought a decayed house in some such locality as Grosvenor Square and proposes to rebuild with a view to sale.

The buyer would occupy it probably during the London season, and a few months in the winter, having his real home in the country—in the auctioneer's phrase it would be an "entertaining house." Proper facilities for very easy circulation through the principal rooms would, therefore, be essential, and provision would have to be made for the convenient disposal of cloaks, etc., on the occasion of parties.

The elevation to be in Portland stone. While there would be no restriction as to style, the house would take its place in an ordinary London street, and there has been always a tradition that whatever richness or splendour there may be within, this should be but slightly reflected on the exterior. The site is 120 ft. deep, and 40 ft. centre to centre of party walls, with a garage on a rear street or mews. There is an area of 12 ft. in front of the building line. The depth of the main block should not exceed 60 ft., but i may be assumed that a back addition would be possible up to the second floor.

Accommodation.

Basement.—Kitchen, pantry with safe, scullery, two larders, housekeeper's room, servants' hall, butler's room, boots, tw w.c.'s (preferably one on front and on on back), space for central heating and hot-water supply, coal space, cellarag (small, possibly in sub-basement), garag in rear street, with men servants' quarter over (butler and two footmen).

Ground Floor.—Porch (with room balcony over with iron balustrade), entrance hall, lavatory and w.c., dining-room (capable of seating twenty people), service, morning room (small—probabl in front—it may serve as ladies' cloak-room at receptions).

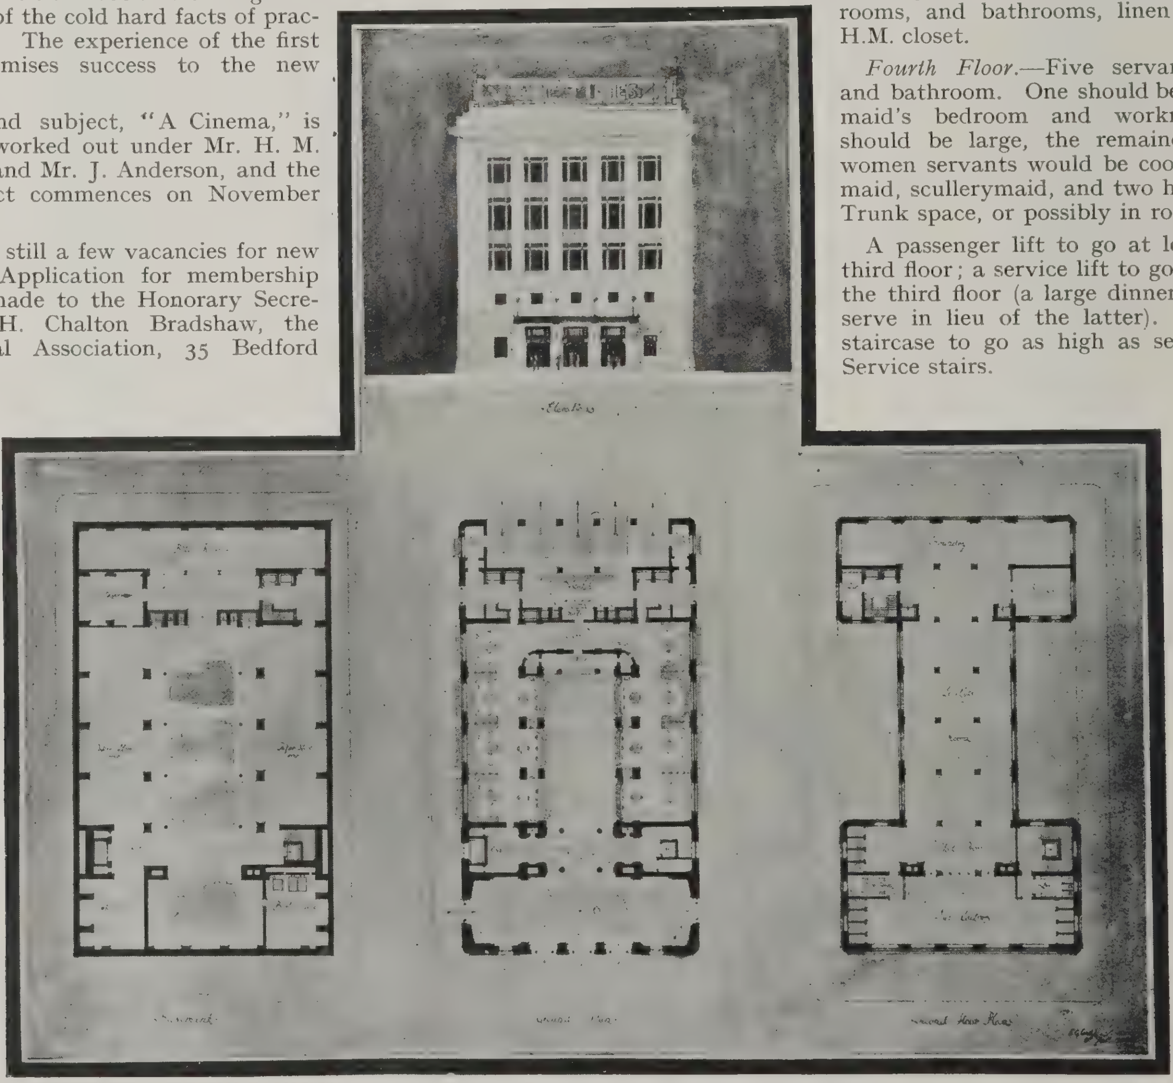
First Floor.—Two drawing - rooms boudoir. The principal drawing-room should be of a suitable shape for dancing The boudoir may also be utilized sometimes in connection with the drawing-rooms.

Second Floor.—Owner's suite consisting of bedroom, dressing-room (capabl of being used as bedroom), bathroom. A second suite of similar accommodation H.M. closet.

Third Floor.—Four bedrooms, or alternatively, two sets of bedrooms, dressing-rooms, and bathrooms, linen cupboard H.M. closet.

Fourth Floor.—Five servants' rooms and bathroom. One should be the lady's maid's bedroom and workroom, an should be large, the remainder of th women servants would be cook, kitchen maid, scullerymaid, and two housemaids Trunk space, or possibly in roof.

A passenger lift to go at least to th third floor; a service lift to go at least t the third floor (a large dinner lift migh serve in lieu of the latter). The mai staircase to go as high as second floor Service stairs.



'A NEWSPAPER OFFICE." MISS E. G. COOKE.

Monthly Subject Programme. Fifth Year.

A NEWSPAPER OFFICE.

This building, which would be the central headquarters of an important daily paper, to be erected upon a rectangular site 160 ft. by 90 ft. The principal façade to be on the main thoroughfare.

Requirements.

Ground Floor.—Entrance hall, staircase, porters', messengers', lifts, and telephones. A large advertisement hall easily accessible to the public, with counter and space for twenty to thirty clerks. Lavatories and cloak rooms for the staff. Service and workmen's entrance with staircase and lift to basement and upper floors, and a timekeeper's office on the ground floor level. Packing and despatching department with easy access to one of the important streets to enable carts to deal rapidly with a large circulation of the paper. Office to be provided for the chief of this department. Cashier's department, comprising a private office and clerks' office (about four clerks).

Basement.—Printing room, about 7,500 sq. ft., for four printing machines and two paper rolling machines. The height of this room must not be less than 20 ft. clear of girders. Large store for paper, and a separate store for printing ink. A lift, 5 ft. by 4 ft. to be provided from the paper store to the street. Engineer's office, boiler house, etc.

Foundry department, approximately 2,400 sq. ft., within easy access of the printing room. Bill room, about 400 sq. ft., for printing posters. Staff lavatories, etc.

First Floor.—Manager's office with secretary's room. Clerks' room, and waiting-rooms near the main staircase. Numerous separate offices for the editor, sub-editors, etc. Lavatories for the occupants of these offices.

Second Floor.—Map room, library, and reporters' rooms.

Third Floor. — Compositors' department, with canteen, lavatories, and cloak room, also a "readers' room."

Note.—The newspaper would be edited on the upper floor, and the news, after being written, sent through pneumatic tubes to the compositors' department, where the type is set up. The type is afterwards sent by special lifts to the foundry, where casts are made of molten lead for the current issue. These casts are then passed into the printing room, where they are placed on a shaping-machine, cooled in water, after which they are ready to be placed on the machines for printing purposes. The printing machines print, paste, and fold the paper in one process.

The papers are sent to the packing and despatching department in bundles, there they are given an extra fold by hand, and then despatched by means of vehicles to their destinations.

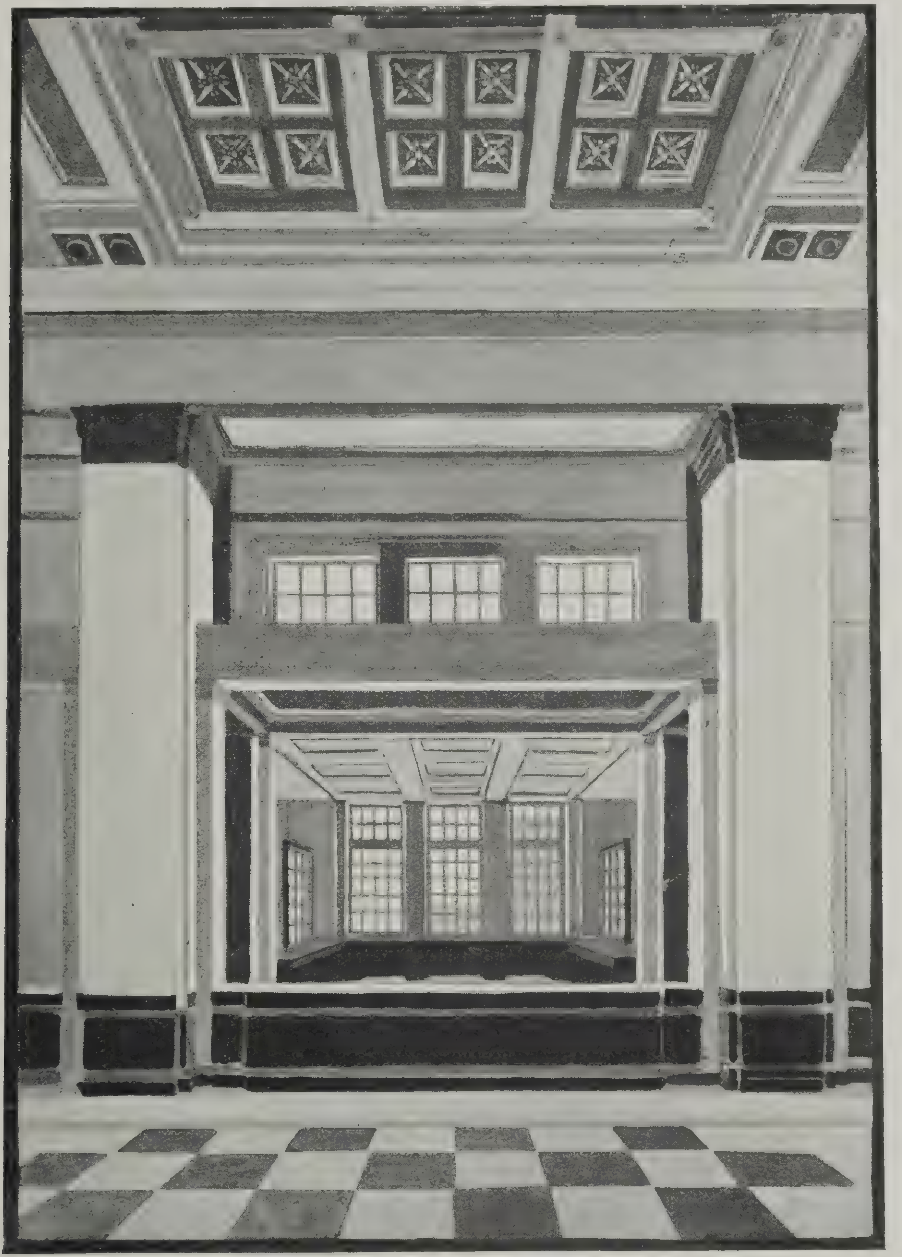
As news comes in at the last moment it is essential that all the departments should be easily accessible to each other by lifts.

Fifth Year.

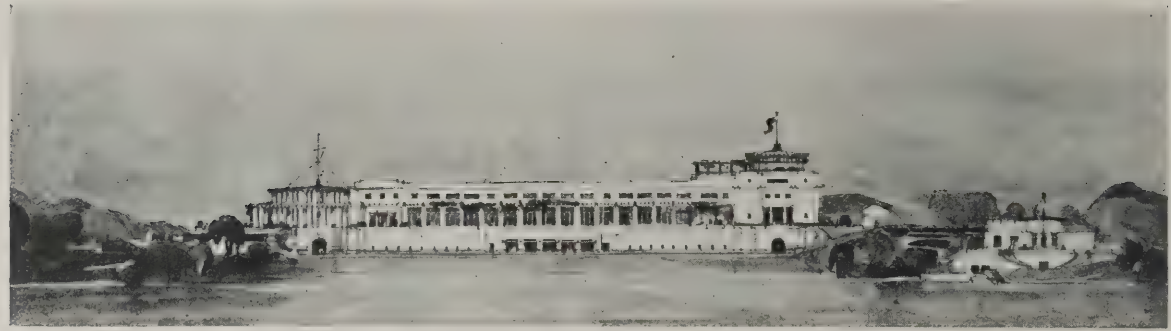
A NEWSPAPER OFFICE (½ in. Detail of Decoration).

Two Weeks.

Prepare ½ in. detail section of the entrance hall, or the advertisement hall, of the newspaper office already designed.



"A NEWSPAPER OFFICE": INTERIOR TREATMENT. MISS E. G. COOKE.



"A PLEASURE ISLAND": FAÇADE. MISS E. G. COOKE.

The scheme must be in colour, and the general lines of the small scale design must be adhered to.

One Month's Programme.

"A Small Seaside Pleasure Resort."

Seaside towns have grown naturally from such sources as fishing, navigation, etc., and have later developed "visitors' quarters" as their suitability to recreative and health purposes became apparent. Others have been built solely for health and recreative purposes; many examples of such places exist on the English coast. This latter type is the subject of the programme.

Situation.—On the south coast of England, with a long and spacious sandy shore.

Contours and Natural Features of Site.—For the purpose of the programme Hampstead Heath is to be taken as the type of country, and the levels and natural features developed as desired, the levels being considered as reduced 50 per cent. The surroundings of the site are downs and heath, and portions of this may be taken for golf, football, etc.

Access.—For the majority of visitors the first impression of the town is obtained in emerging from the station, and a "place" should be provided to give importance to this point and to provide space for traffic. The position of the railway station is to be chosen by the competitor.

Streets and Promenades, and "Places."

The streets should be spacious, and "places" provided for the administrative and other public buildings. It is suggested that the promenade should not be spoiled by traffic, and that the buildings facing the promenade should have a street at the back for access. Facilities for recreation should include concert and dancing halls, swimming baths, theatre, cinema, etc., etc.

The usual municipal services are to be included, also schools, etc., for the resident population. The resident portion of the population is to number 5,000.

The visiting population should be housed in hotels, service, and other flats, and small houses.

This programme is to be taken only as a guide and the competitor is free to elaborate to any extent necessary to produce a fine, though small, pleasure resort of the first class.

Programme: Fifth Year.

"A Pleasure Island."

Four Weeks.

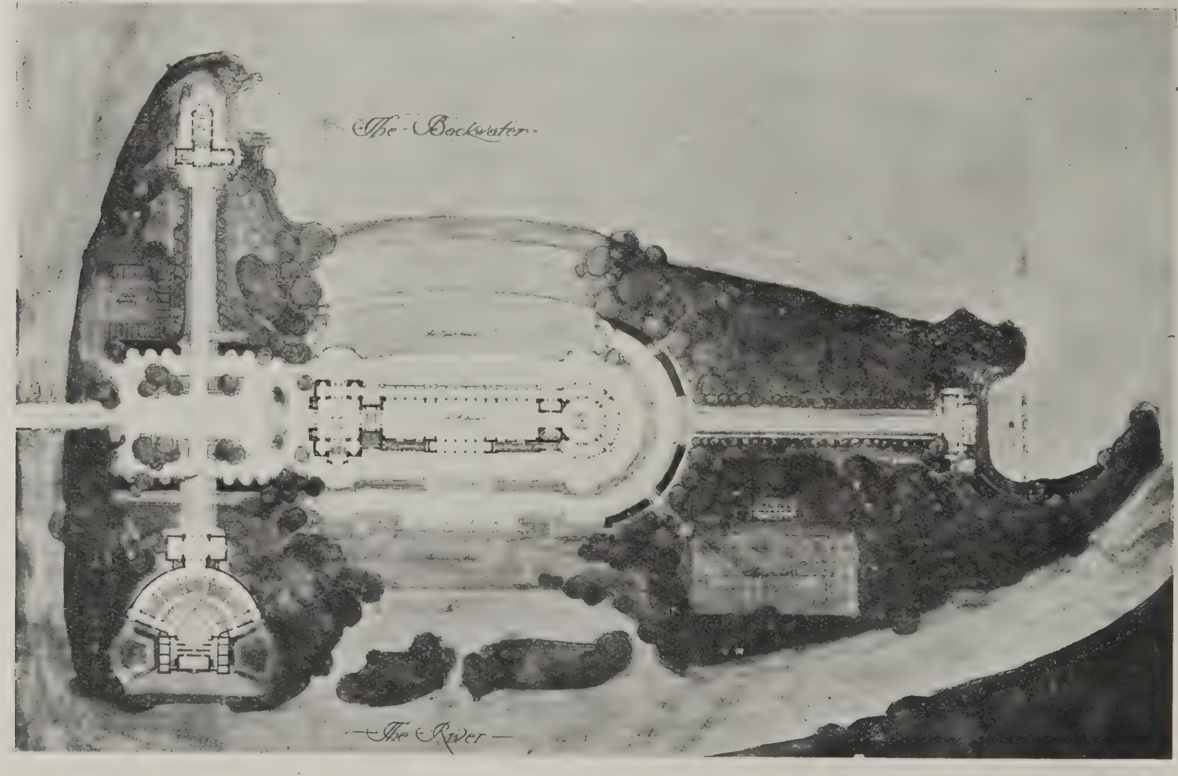
This island lies at the entrance to, and overlooks, a large and beautiful backwater. This backwater has somewhat the character of a lake, and would be a centre for aquatic sports, etc.

The island is to be developed as an important "up river" pleasure resort. Its form is *roughly* triangular, as shown grammatically below, but may be assumed to have creeks and projections as desired. The narrow stream separating the island from the mainland will have a bridge over, which will be the only approach by land. The length of the island parallel to the river should not exceed 1,000 ft. The longest dimension at right angles to this should not exceed 800 ft. The following accommodation is to be provided :—

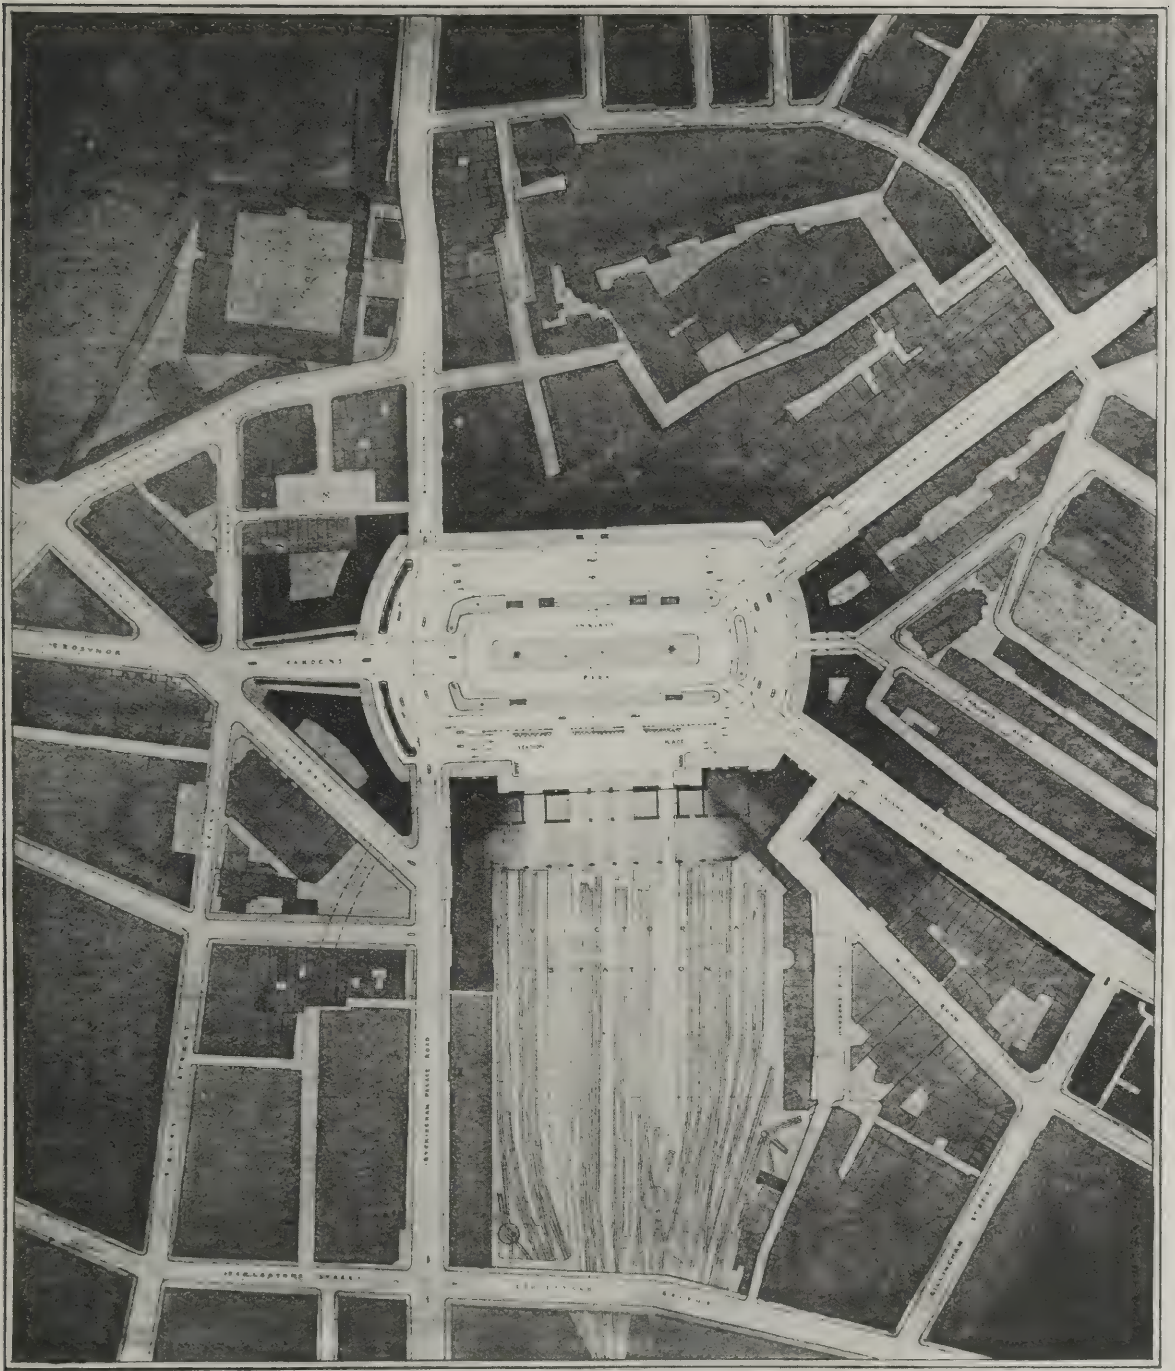
Ample car space and garage for those arriving by land, with accommodation for refreshments for chauffeurs.

Ample boating accommodation, landing stages, etc., for those arriving by water.

Boating.—The island should contain a boating club house, with club rooms,



"A PLEASURE ISLAND" PLAN. MISS E. G. COOKE



"A REMODELLING OF THE APPROACH TO VICTORIA STATION"
MISS E. G. COOKE (A.A. DESIGN CLUB).

changing rooms, refreshment room, boat houses, etc. In connection with this it should be borne in mind that the backwater is sufficiently large for races, regattas, etc.

Bathing.—The island should contain accommodation for bathing, with dressing boxes, etc., for each sex (100 in all).

Café.—The island should contain a really first-class café restaurant with accommodation for 2,000 people.

Dancing.—A "Palais de Dance" should be provided to accommodate 500 dancers. This may be in connection with the café if desired.

Tea Gardens.—Adjoining the café, and served therefrom, should be large and spacious tea-gardens with lawns, pergolas, terraces, etc., if desired.

Theatre.—An open-air theatre is to be provided to accommodate 1,000 people, with the necessary dressing accommo- tion, lavatories, etc.

Tennis.—A pavilion and accommo- tion for five tennis courts.

Gardens.—That part of the island r occupied by buildings is to be laid c with gardens, walks, etc.

The levels may be assumed to be desired, i.e., the island may be hilly comparatively flat.

The Bee Hive; or The Revelations of an A.A. Student

Although you might not suspect it as you go by outside, No. 35 Bedford Square—the A.A. premises—is a veritable bee-hive. That exterior is very deceptive, and were you to step inside for a space you would soon realize it. It is a very self-contained bee-hive with many compartments and a set of standards very much its own, but with the great difference from the ordinary bee-hive that the leading light is a king bee and not a queen bee.

The swarm arrives at or about 10 o'clock each morning for the purpose of preparing the architectural honey, and makes its first settlement at the signing-on register. "Got a pencil, Buster?" This comes from Rooth, who never thinks of owning one. He signs on, bounces up the stairs, bursts into the studio, talks rubbish for one minute, and then gets right down to his drawing-board. Two hours afterwards he emerges. "I've done it! Lutyens couldn't fit up a better plan than that, and what's more, I'm going to have a large red roof on it!" Rooth is very fond of large red roofs, and likes to hear himself shout occasionally; he doesn't think much about feelings or feel much about thoughts, but he knows what he likes and tells you if you'll listen. He is quite a type of the A.A. student, although on the young side.

By saying Rooth is a type I don't mean we all possess his good qualities. Some are middle-aged, some are younger than he, some are colonials, some are dark-skinned, some are foreigners who can hardly talk English, some are English who can hardly understand one another, some are quiet and some never stop talking.

Chu Tsing Chow comes from Japan, Scherotkin from Palestine, Napolitanio from Sicily, and Blinks from Pimlico. And then there are the women—twenty-eight of them.

Here it should be said that it doesn't matter if you come from Balham or Knossos. So long as you say distinctly in a firm voice that you consider it a very fine place and worthy to house your immortal soul you are received with open arms.

With the exception of a few ornamental drones, all these people lead a most strenuous life. First they sort themselves into five different groups, each in its own studio. In the first year are the freshers, resplendent with clean smocks and bright ties, toiling over geometry books and isometric brickbats. It is their privilege to be well dressed, adornment of the person being a senior art to architecture. Below is the second year, a shade more serious, delving for plums in the Græco-Roman pudding. The third year is quite different. They are having a wonderful time, for they are doing *free* design; it's good modern expression now—they are nearly fully-fledged architects. The fourth year are seen, but not heard, and there's no wonder. The sort of problems they have to tackle take an ordinary person weeks to understand. The fifth year is set apart and very exclusive. It is very difficult to know what they do, but they always seem very busy doing it, and emerge with a calm and dignity which fills us with awe.

Most of our time is spent working out problems, for each of which we are allowed several weeks. The process is for us to work a solution; show it to a master who cuts it to pieces; work up another one; show it to a master (a different master) who cuts it to pieces; work up another scheme, and so on. About two days before the end of the period allowed we combine all the worst elements in our various designs, draw them carefully, and then splogg colour all over. These works of art are collected, marked by a jury of masters, and then criticized in public.

Once a week in the second and third years we have to make twelve-hour sketch designs. We like these. They, too, are "crited" in public. ("Crit" comes from the Greek root "to rend," "to tear.") In the crit all our pet fancies and little conceits are broken on the wheel. It's rather like a jumble sale—you never know your luck, for you may get a first mention or a withering broadside.

We all have different times for doing our best work. Some like the morning, some the evening; some like the beginning of the subject, others the end; some never have any time at all. But there are few who don't have to set to pretty fiercely on the last two days of a subject. This means working until very late, and perhaps all night.

Lectures, of course, are given, and you can learn a tremendous lot from them if you don't sleep.

Upstairs is the library, where we can read about Wren, Michelangelo, and others we are going to eclipse, or look pictures of Roman temples. Or agai we can sleep on the couches if we a brave enough to incur the displeasure the librarian.

But as to the other side of affairs- sometimes rashly called the lighter side- there are many ramifications. There the buffet and the restaurant, whic despite its rather stilted atmosphere, has most elastic menu. Over in the corner a large table sit a varied group of you and wide-awake men. These are o masters. Most of us eat our fill 1 o'clock, but those who come down lat have the privilege of gazing on the re architects who now commence to arri from their offices around.

The social and athletic affairs are under the direction of the "Student Committee." These words you have utter with bated breath, for it is a prou and dignified committee administerin a profound and wise rule. Nothing to with students takes place without direct or indirect consent. While tackles with ease and grace the weightie problems, nothing is too humble for attention.

As regards athletics, there is a spor ground at Elstree with rugger, socce and hockey pitches, where on Saturday we take our weary and worn souls, colle a few scars, and come back like roarin lions. Sometimes some of the wome play lacrosse on another ground, an although they don't say much, we alway know when they have by the way the hobble into the studio next mornin In the summer we all join forces and pla tennis. On Wednesday nights we have dance.

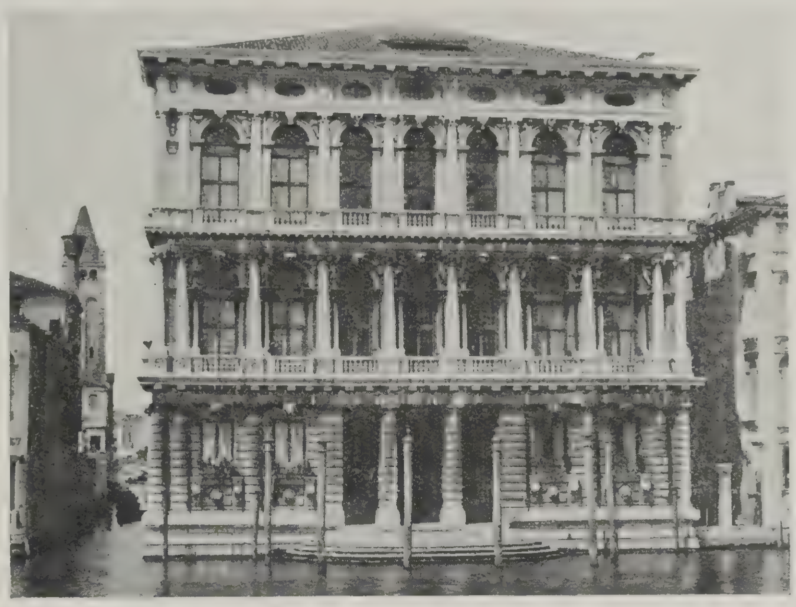
The social *tour de force* is the annua pantomime. If you haven't been to on you should go to the very next. You' hear a lot of things you won't understand but that doesn't matter—in fact, that' half the point. However the fellows wh run it make it such a good show I can' understand. It seems as if they pour ou a wealth of stored-up art and subtlet accumulated during the whole of th year. You mustn't mind the noise fro the gallery—that's where visitors don' sit. The next panto is in preparation but as yet only the authors know wha it is going to be, but you can count on being a good show. We hope you will al turn up in force to see it.

F. E. BENNETT.

he Orders and their Application by the Italian Masters

CHARLES GOURLAY, B.Sc., F.S.A. (Scot.), Professor of Architecture and Building, The Royal Technical College, Glasgow

(*Concluded from November* 1, *page* 620.)



REZZONICO-BROWNING PALACE, GRAND CANAL, VENICE (1650). LONGHENA, ARCHITECT.

HE north portico of the church of St. John Lateran, Rome, by Domenico Fontana, erected in 1586, sists of two arcaded loggias, one above other, the lower being Doric and the er Corinthian. It is a very fine aca- ic composition. The adjoining Palace, the same architect, is an example of Florentine style in Rome, no Order g employed, but the sense of an er permeates the whole design.

he courtyard of the Borghese Palace, ne, was begun in 1590 by Flaminio zio. Its arcade is charmingly treated wo stories with coupled Doric columns w and coupled Ionic ones above. s design shows how freely a Master can the Orders; that he is in no way nd by their proportions, but uses e nevertheless to enable a good design e produced.

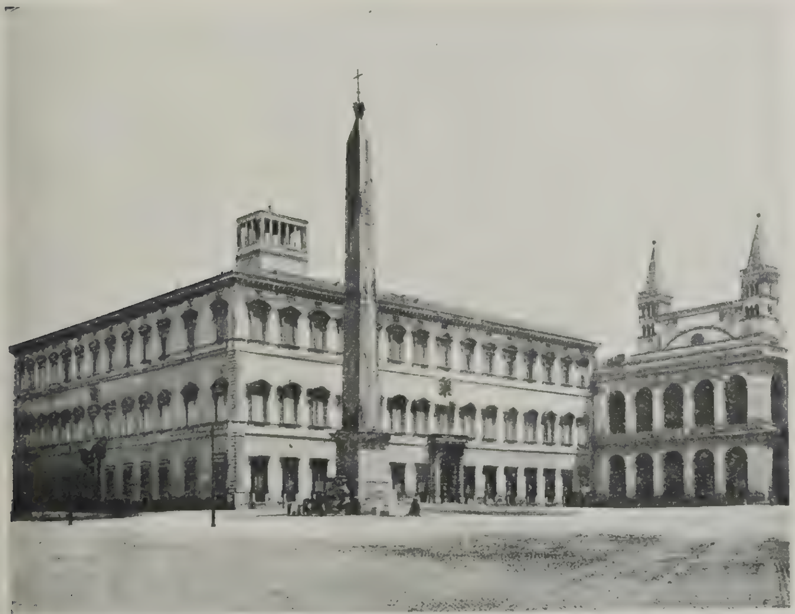
he west façade of the Duomo Nuovo, scia, begun in 1604, by Giovanni tista Lantana, has two Corinthian ers placed one above the other, and is ssed in the centre while its pediment fine example of one being broken back.

n the façade of St. Peter's, Rome, by o Maderna, dating from 1605–12, the nthian Order is applied as attached mns and as pilasters combining two ies of openings, and it has a high attic y. The magnificent dome, by Michel- elo, has coupled columns surrounding drum. The Piazza colonnade by nini, dating from 1629–67, is a well- wn instance of the omission of triglyphs in the frieze of the Doric Order owing to the difficulty of spacing them to suit the distance apart of the columns and to obtain square metopes.

The Rezzonico-Browning Palace, on the Grand Canal, Venice, which was erected by Longhena about 1650, is a perfect specimen of the late Italian Renaissance. The Doric Order employed in the lowest story has rusticated shafts, and is placed in a rusticated wall. The upper Order is Ionic, with round-headed windows between the columns, and the uppermost is similar except that the Order is Corinthian. The whole elevation is a fine illustration of the superposition of Orders and arcades. The fine staircase with its balustrades, forming part of the interior of the Monastery of San Giorgio Maggiore, Venice, by Longhena, dating before 1675, is placed in a large hall having an Ionic Order arcade below, with columns coupled in the thickness of the wall, and above, a wall treatment in the Corinthian Order.

The exterior of the church of Sant' Agnese, Rome, is considered by some authorities to be the greatest work of the architect Borromini, but the campanili are by Carlo Rainaldi. In this fine composition, dating from the middle of the seventeenth century, the Orders are largely used. The Venetian windows in the wings are rather distinctively treated.

There are two churches on the Piazza del Popolo, Rome, dating from 1662, both designed by Rainaldi, but completed by Bernini and Carlo Fontana. The one is dedicated to Santa Maria di Monte Santo, and the other to Santa Maria dé Miracoli. These churches are not quite similar to one another, although they appear so. They are well designed for their situation, and their bell turrets balance happily on each side of the Via del Corso, which is one of the chief streets in Rome.



THE NORTH PORCH, ST. JOHN LATERAN, AND THE LATERAN PALACE, ROME (1586). DOMENICO FONTANA, ARCHITECT.

The Trevi fountain, the most magnificent in Rome, is a very fine composition in the Italian Orders, probably by Ferdinando Fuga, and dates from 1735–62. It is erected against the south side of the Palazzo Poli. Attached Corinthian columns are employed in the central mass, and the same Order is used as pilasters in the wings. The whole elevation is an excellently proportioned design.

The importance of the study of the Italian Orders of Architecture at the present day to all engaged in the design of buildings can hardly be over-estimated. A thorough knowledge of them enables everyone to understand architectural design better, to appreciate their application in modern architecture, and, beyond practical reasons, enables all to find a source of great interest and pleasure in observing when travelling the great variation in proportion and details in the Orders employed in the buildings which line the traveller's path. Further, by study of selected examples of the Orders an excellent architectural taste may be developed, and this is the most valuable educational advantage to be gained by a study of the Italian Orders.

COURTYARD OF THE BORGHESE PALACE, ROME (1590). FLAMINIO PONZIO, ARCHITECT

Notes from the Schools

The Glasgow School of Art.

The Henry Jarvis R.I.B.A. ex-Service studentship has been transferred from Mr. W. McCrea (who has finished his day course) to Mr. G. G. Howard.

New Appointment.

Mr. G. D. Gordon Hake, A.R.I.B.A., has left the Architectural Association School to take up the Headmastership of the Royal West of England Academy School of Architecture, Bristol. His new address is 1 The Paragon, Clifton, Bristol.

Royal Academy Schools of Painting, Sculpture, and Architecture.

Lectures on painting, sculpture, etc., are given by members of the Royal Academy and other authorities on special subjects; and the visitors who assist the keeper, Mr. Charles Sims, R.A., are appointed from among the Academicians and Associates. Scholarships and prizes amounting to £1,000 per annum are offered in all the three arts, including travelling studentships of £200 each per annum tenable for one year. Students are admitted at any time and at any age, but only those under twenty-eight years may compete for scholarships, prizes, or medals in painting, and those under thirty years in sculpture and architecture.

Applications for admission must be accompanied by specimens of work selected at the discretion of the applicant. If the work shows a high standard of merit, the applicant will be admitted as a probationer for a period not exceeding three months, and thereafter, if approved, as a student for a term of years. Arrangements are made for intermixing the studies in painting, sculpture, and architecture, and there is a studio for decorative work on a large scale. No fees of any kind are charged.

The works required are: In painting, any specimens of work in drawing and painting; in sculpture, at least one model in the round, some drawings of any kind, and any other work at the applicant's discretion; in architecture, a portfolio of drawings, designs, and sketches.

Forms of application for admission may be obtained from the Secretary, Royal Academy, Piccadilly, London, W.1, to whom all communications should be addressed.

TREVI FOUNTAIN, ROME (1735-62). PROBABLY BY FERDINANDO FUGA, ARCHITECT.

University of London.

The University Extension Board of the University of London have arranged six courses of lectures on the history and architecture of London, to be delivered *in situ*, and conducted by Mr. Allen S. Walker. They will take place at fortnightly intervals on Saturday mornings and afternoons, and on Wednesday and Thursday afternoons. The places to be visited include many of the City churches, Canonbury Tower, Greenwich Palace, etc. In view of the bicentenary of the death of Sir Christopher Wren, a special course has been arranged to visit places connected with this architect, including Morden College, Blackheath; St. James's Church, Piccadilly; Hampton Court Palace, etc. Further particulars can be obtained from the University Extension Registrar, University of London, South Kensington.

Liverpool Architectural Society (Incorporated).

The Honan Scholarship—a travelling scholarship of the value of £50, for one year, open to members of the Liverpool Architectural Society (Incorporated) under the age of thirty years—will be awarded for the best design for rebuilding St. Luke's Church, Bold Street, Liverpool

Little Things that Matter. XVIII—Pavings and Steps

By EDWIN GUNN, A.R.I.B.A.

RED quarry pavings are improved immensely in appearance when they are laid with joints of ¼ in. and upwards. This is done easily if ordinary plasterers' sawn laths are laid temporarily n the joints when the tiles are bedded, the open spaces afterwards being flushed up with mortar after removal of the aths. I have seen a hotel courtyard which had been paved with 9 in. quarries, and where the hardwood strips used in this way had been allowed to remain. Even this gave quite a good effect as well as a very sure grip for walking.

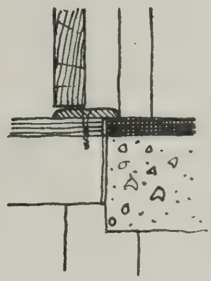


FIG 61

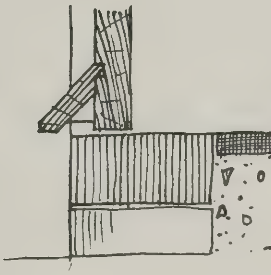

FIG 62

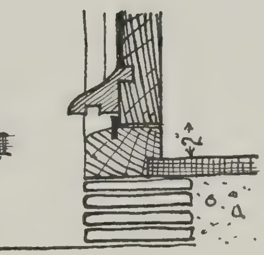

FIG 63

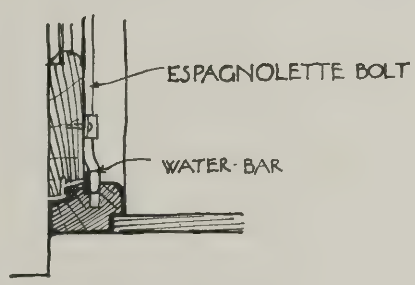

FIG 64

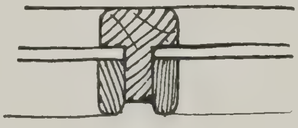

FIG 65

The wide joint has two advantages other than those with regard to appearance. The tiles that are not quite true to size can be used without their irregularity being apparent; and a space which does not exactly coincide with a definite number of tile-widths can be covered without cutting the tiles by an adjustment of the joints. Perhaps it is needless to insist on the superior look of quarries "laid square" and unbonded over the methods (once current) of 'diagonal" laying, or bonding, which necessitated the use of half tiles of triangular or oblong form.

The fearsome arrangements of checker n red and buff or red and blue which once graced the suburban forecourt happily no longer please. What is true of paving tiles is true also of wall tiling, especially if the latter is not laid with the finest possible joints, and arranged checkerwise without "bond," i.e., with joints continuous both ways. Where it is desired to finish glazed wall tiling with a rounded edge it is better to use tiles of the ordinary size and shape upon which the edge is formed rather than a separate strip. Dutch and Belgian tiles are commonly obtainable in this form, but in English tiles usually I have had to accept the separate "bullnose." It seems unlikely, however, that the round-edged tile is not made by someone in this country, too.

Brick floors are still used in many parts of the country, but I am convinced that it is a mistake to bed these down on cement. Even when they are laid on concrete I much prefer them in a bed of sand, as this permits the hollow-worn portions readily to be replaced. Where concrete or cement paving is laid, it still seems necessary to insist on the wisdom of dividing the surface by joints or "controlled cracks," rather than to allow the inevitable cracks to follow their own sweet will. *In situ* paving subject to temperature changes should not be laid in larger areas than, say, 6 ft. square without joints. The sections should be of convenient size, and should be laid alternately between guides or forms made up of wood strips. On removal of the strips, tarred paper should be placed against the free edges of the sections first formed, and the intervening spaces filled in.

At certain doorways in most houses a change in flooring material, say, from quarries to boards, occurs. A satisfactory junction is not made easily, as the edge-line of the quarries is rarely absolutely true, and the wood floor will most likely shrink away so as to leave a more or less open crack. I prefer to cover the junctions with a ½ in. oak threshold of the same width as the thickness of the door plus its stop. This threshold is fully rounded on both edges, screwed to the wood floor, and lapped over the tiles as Fig. 61. It enables the door to fit close at the bottom, and still pass a carpet or mat.

One of the most ineffective things in use is the weathermold or board, as commonly applied to external doors. Only too often it delivers the water which runs down the door just where it is not wanted —on a projecting step level with the floor, ready to be blown under the door, as it is. After this has happened until it cannot be tolerated longer, a water-bar probably is inserted in a groove cut in the step, and over this the occupants trip in moments of forgetfulness.

The important thing to rectify is the relation of the step cr threshold to the weatherboard. Fig. 62 gives a satisfactory arrangement for a brick step which is flush with the floor, and Fig. 63 shows a frame with an oak threshold raised to clear a doormat. It is noteworthy that few people will trip over a substantial threshold, though many fail to notice an independent water-bar. Incidentally I much prefer a raised threshold to a mat sinking.

Fig. 64 shows the construction of a cell of a French casement which is made to open outwards (as, of course, no properly "French" casement would do), as in the case of a room opening on a loggia. I have found this arrangement reasonably draught-proof. A good way of fastening is by an espagnolette bolt, fixed to the last-closed of the pair of rebated doors, wedging over the weather-bar. Trouble will be saved if the bolt is actuated by a lever handle having an up-and-down motion; the ordinary oval turning-handle is apt to jamb the fingers of an incautious user against the opposite half of the door.

With regard to glazing, there is not much to say; two little points, however, are important. First, be very careful about introducing bullions on a south aspect. I have known of cases where curtains have been ignited by these acting as burning-glasses focusing the sun's rays; second, where glazing is fixed with loose beads a better effect than usual is obtained if the ordinary bead is fixed projecting beyond the centre fillet as Fig. 65.

Hot Water Troubles.—I am obliged to Mr. E. C. Tasker, A.R.I.B.A., of Scarborough, for directing my attention to an error which crept into Fig. 58A in Number XVII of this series. I most stupidly drew the diagram showing a stopcock on the *by-pass* return from the hot tank, whereas it should have been on the normal return. Probably others noticed this slip also—to make matters quite clear, the diagrams sent by Mr. Tasker are reproduced—No. 2 being the correct arrangement.

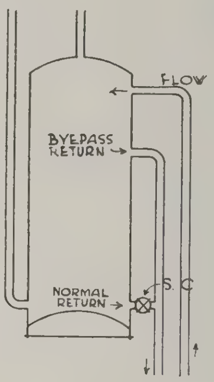

FIG. 2.

Reinforced Concrete Calculations for Beginners. III

By Prof. HENRY ADAMS, M.Inst.C.E.

(*Continued from October* 18, *page* 524.)

THE next most important matter is to be able to calculate the maximum stresses in any simple reinforced concrete beam under a given load. This involves a preliminary understanding of what is meant by bending moment and resistance moment. Any moment consists of a force multiplied by a leverage, and is measured usually in lb. inches, that is, the product of the force in lbs. by the leverage in inches. The bending moment on a beam supported at the ends and carrying a uniformly distributed load is $\frac{WL}{8}$ where W is the total load in lbs., including the weight of the beam itself and what it carries; L the span in inches from centre to centre of the bearing surfaces. The resistance moment is the ability of the beam to resist a bending moment, and the two must therefore be equal. Suppose we consider the beam previously used in illustration, with a breadth of 12 in., an effective depth of 22·625 in., and reinforcement of four $\frac{3}{4}$ in. rods. If the beam has an effective span of 20 ft=240 in., its weight in lbs. will be found by multiplying the span in feet by the full sectional area in sq. in., viz. 20×24×12=5760 lb. Suppose we want this beam to carry a superimposed load of 6 tons=13,440 lb. Then the total load will be 19,200 lb., and the maximum bending moment

$$\frac{WL}{8} = \frac{19200 \times 240}{8} = 576{,}000 \text{ lb. ins.}$$

The formula for maximum tensile stress lb. per sq. in. is $t = \frac{B}{p.b.d^2\,(1 - \frac{1}{3}k)}$ where B=bending moment in lb. ins., p=ratio of steel to concrete, b=breadth in ins., d=effective depth in ins., k=fraction of depth at which NA occurs. These values have already been found, so that we can now substitute them for the letters and say,

$$t = \frac{576{,}000}{\cdot0065 \times 12 \times 22{\cdot}625^2\,(1 - \frac{1}{3} \times \cdot355)}$$

$$= \frac{576{,}000}{35{\cdot}205} = 16{,}361 \text{ lb. sq. in.}$$

The formula for maximum compressive stress is $c = \frac{2.B}{k.b.d^2\,(1 - \frac{1}{3}k)}$; substituting figures for the letters we have

$$c = \frac{2 \times 576{,}000}{\cdot355 \times 12 \times 22{\cdot}625^2\,(1 - \frac{1}{3} \times \cdot355)}$$

$$= \frac{1{,}152{,}000}{1922{\cdot}7} = 599 \text{ lb. sq. in.}$$

The usual limits are 16,000 lb. sq. in. for the steel, and 600 lb. sq. in. for the concrete, but when the L.C.C. Regulations are revised the allowance on the steel will certainly be raised, and the above stress will then be within the limit.

Seeing that there is no direct means of arriving at the size of a reinforced concrete beam, it is necessary to assume the dimensions and then calculate the sufficiency. For this reason it is most desirable to know how to find an approximate size, and then to know which part of the dimensions to modify.

When the concrete is to be stressed to 600 lb. sq. in., and the steel 16,000 lb. sq. in. the moment of resistance will be given by $95.bd^2$, whence the required beam can be determined and exact calculations made..

For instance, in the above case we wanted to carry a distributed load of 6 tons over a span of 20 ft. which would give a bending moment of

$$\frac{WL}{8} = \frac{6 \times 2240 \times 20 \times 12}{8} = 403{,}200 \text{ lb. in.}$$

Assume the beam itself to weigh half as much as the external load, then the total bending moment will be $403{,}200 \times 1\frac{1}{2} =$ 604,800 lb. in., i.e. $bd^2 = \frac{604{,}800}{95} = 6366$ sq. in. Trying a width of

$$12 \text{ in.,}\ \frac{6{,}366}{12} = 530, \text{ and } \sqrt{530} = 23{\cdot}022 \text{ in.}$$

for the effective depth, and the beam might be designed on this basis, with ·675 per cent. reinforcement.

The average strength of 1 : 2 : 4 concrete is

	TENSION. lb. sq. in.	COMPRESSION. lb. sq. in.
1 month	160	1,600
3 months	240	2,400
Working stress	60	600

(*To be continued.*)

Exhibition of Working Drawings at the R.I.B.A.

ON Friday last a students' meeting was held at the R.I.B.A. to view the exhibition of working drawings. here were a fair number of students resent, but not so many as one would have ked to have seen. These meetings are of reat interest and value to the student, not o much for what they teach, but for the pportunity they give of free intercourse etween the students and the responible architects who so kindly come to peak of their drawings. These meetings appily are of an informal nature; the peakers are not armchaired upon a ostrum, neither are the audience regimented in rows, but both speaker and udience are free to talk to each other—o explain and to inquire. It is not often hat the student has an opportunity of sking the well-known architect why he id this or that and of receiving an nswer first hand. It is ignorance which makes us so harsh in our judgments.

The young architect in his slow up-sing from oblivion to prosperity may be aid to begin architecture by finishing it. or is it not true that when the young man begins in an office after his school raining his first work is "Full sizing"—he "Finishing" state of a building? fter a while (if he is industrious) he will ork down to half-inches—the elastic state f a building—and so gradually, after many years, back again to eighth-scale rawings, the nebulous state of a building. When he is his own master he may o still farther; he can scribble on the ack of an envelope a whole building no igger than a postage stamp. So it is hen, the smaller the man the bigger he orks; the bigger the man the smaller e works.

The present exhibition included the drawings of the following works: Eyford Park, Gloucestershire, by Mr. Guy Dawber, an interesting country house of the larger kind. The Chapel of the Knights of the Thistle, by Sir Robert Lorimer, A.R.A., showing the "setting out" of the ribbed vaulting. The Royal Automobile Club, Pall Mall, by Messrs. Mewès and Davis and Keynes Purchase. Working eighth-scale drawings of some houses in Hampstead Garden Suburb. Drawings of bungalows and other work at Delhi, by Sir Edwin Lutyens, R.A. The New Catholic Church, Northfleet, and the Memorial Chapel, Chester Cathedral, by Mr. Gilbert Scott, R.A.

Both Mr. Gilbert Scott and Mr. Gage, of Messrs. Mewès and Davis, were there to explain their respective works. Mr. Gage, speaking of the Royal Automobile Club, and pointing out the original sixteenth-scale drawings, remarked that there was very little departure from the original scheme in the final drawings. He said that the plan was the outcome of one or two definite requirements, such as the large swimming-bath in the basement and the large dining-room. The plan is too well known to need description, but it should be of particular interest to students, for it has all that quality of fine design and silhouette of the so-called "Academic" plan, yet it is a most logical and straightforward solution of a modern programme.

There are certain features in the lower basement that are interesting, such as the Turkish bath and its ventilation, and the racquet courts. This basement is below the sewer level, and it contains not only the swimming-bath and the Turkish bath, but lavatories besides, so all the drainage is pumped up to the sewer level.

Mr. Gage spoke of certain customs in his office in the matter of working drawings. One was that a theodolite survey of the site was always taken beforehand to save subsequent alterations in the drawings. Another was that all dimensions were taken from centre lines. One also noticed that the beds were indicated in the bedrooms on plan, a practice which would avoid a good deal of afterthought and unpleasantness.

Mr. Gilbert Scott, speaking of Northfleet Catholic Church, said that strange as it may seem nowadays, the church, when built some years ago, only cost between six and seven thousand pounds. It was, in fact, a very cheap job, and everything had to be cut down to save money. The walls were as thin as they could be, tracery, arches, and stone generally were very sparingly used, and lintels over the window-openings were reinforced concrete stained to a colour in keeping with the brick. The church, although on the Gothic style, was almost entirely in brick, 2 in. bricks, five to the foot, with wide joints. It was interesting to note that the half-inch working drawings had no figured dimensions on them. The explanation was that all the horizontal dimensions were adequately given on the working plans, and as the brick courses were clearly marked, all heights were "so many bricks high."

Turning to the drawings for the Memorial Chapel, Chester Cathedral, which showed the evolution of the design from the original client's sketch to the large, full-size drawing, Mr. Gilbert Scott spoke of the manner in which the drawings are done in his office. He said that with Gothic detail it was difficult to get another to do what was in one's mind, so he himself usually drew out the most important points in the detail.

Correspondence

Architects and Housing

To the Editors of THE ARCHITECTS' JOURNAL.

SIRS,—With reference to your article in our issue for November 15, on "Archi-cts and Housing," any suggestion which ill further the idea that architects can e usefully employed on designing even e smallest of houses, particularly those be erected by the speculating builder, to be welcomed.

I have before me a volume published 1757 by Abraham Swan, architect, in hich are given many designs, together ith details, for small houses. Judging y the wealth of charming houses of that eriod, which one finds in even remote arts of this country, one must conclude hat the designs for many of these small ouses were taken from, or influenced by, is and other pattern books.

May I give an extract from the preface A. Swan's book? "For I observe e Designs which have been published others, have, for the most part, been rand and pompous; which, though they ay be excellent in their Kind, will but seldom come into Use, as being only proper for very large Buildings." Farther on he says: " . . . and if the Hints which I have here given may be improved by some better Genius, in forming better Designs than any of these, I shall sincerely rejoice in it." Which shows that he had not only the courage of his opinions, but a desire for the improvement of his Art!

A modern pattern book of small—and generally speculative—houses, somewhat as suggested, might be of great value provided that all the designs were by artists qualified by experience in that work. There do exist modern pattern books which in many cases show only too plainly the absence from them of such proviso.

As regards the question as to whether the suggested designs should be signed by individual architects; this is a question which probably does not matter in the least as far as the art of architecture is concerned, but it is generally conceded that to be quite fair it is right to "give the poor devil his due."

Yours faithfully,
ARTHUR WELFORD.

"The Architect's Niche"

To the Editors of THE ARCHITECTS' JOURNAL.

SIRS,—I was interested to read the discussion in your issue for November 8 on Mr. Stanley Hamp's presidential address at the A.A., with regard to the architect and housing. I am in entire agreement with those who urge that, as a body, we should do more to assist in the solution of this vital problem. Mr. Maurice Webb, in the course of the discussion, contrasted the American architects' fees at £4 per house with our own fees, which, he said, amounted to about £30. I do not know on what data Mr. Webb bases this comparison. Unless he is thinking of small schemes carried out two years ago, when prices were at their maximum, few architects can have been paid anything like an average of £30 per house in connection with the recent Government's efforts. For a very large scheme of my own, carried out when the Class A house cost about £900, the fees worked out at just half the figure quoted by Mr. Webb. Since prices have come down so much, if an architect is engaged to carry out a modest project of 40 working-class houses at a cost averaging £400 each, the fees on the Ministry Scale would come to £13 per house. Larger schemes would work out at a lower fee per house. These fees, of course, included full supervision, preparation of working drawings, and details, and settling accounts. Presumably, Mr. Webb has in mind cases where a speculative builder would only require the architect to prepare the plans and obtain the Local Authority's approval of them. In such a case the architect would obviously not expect to get full fees. He would probably charge half fees for such services, amounting in the case of 40 houses to some £6 10s. per house. If the number were more, the amount would be £5, or even as low as the fee charged by our fellow architects in America, which, apparently, is looked upon by Mr. Webb with such favour!

I think we ought to be rather careful as to what line we take with reference to preparing standard plans at a nominal fee for the use of builders in wholesale manner. My experience leads me to believe that standardized plans are seldom satisfactory to the builder or architect, or to the future inhabitants of the houses. Unless the architect has some control, not only over the plans, but of the working drawings during building, his details, and the little matters on which he naturally sets some store, may be frequently departed from, on the score of expense or trouble. Apart from this consideration, is it not an unwise policy to lead our friends in the building trade, and the public generally, to think that an architect's services in the preparation of plans and designs are only worth a casual payment—such, for instance, as the builder might pay for one of the grates he uses? When it comes to other technical matters—legal, for instance—the builder, as a matter of course, pays his ten or fifteen guineas for the preparation of the conveyance or lease, and solicitors would not dream of taking less, although the repetition of deeds entails less trouble than the repetition of plans.

I do think we ought to get down t serious business on this question c assisting in the housing problem, an offer our services to builders on reasonabl terms, but, in the course of doing s let us take great care to ascertain exactl what services we render, and arrang payments for them which are in relatio to the skill involved and to the dignit of our profession. Builders who hav been in the habit of consulting housin architects, usually appreciate, and ar prepared to pay adequately for, lay-ou and house plans, because they know i these days that their customers in tur are prepared to pay the small extra pric for dwellings which are efficiently designe and constructed. The Ministry of Healt Scale, now incorporated in the R.I.B. Schedule of Fees, is certainly not excessiv on present prices for the work involve and I suggest that it would be unfortuna if it were given out that any institutio representing architects was prepared advocate a much lower basis of paymen

T. ALWYN LLOYD.

Contemporary Art

The Ilya Repin Exhibition

Do not expect to see sensationalism at the Leicester Galleries just now; you would be disappointed. Russians, as a rule, provide this fare with ease and abundance, but Repin, whose paintings solicit our attention, is neither a youngster nor a fire-eater. His art, somewhat old fashioned as "movements" go these days, is nevertheless interesting, and greatly so because it explains one side of that most complex and baffling phenomenon, the Russian mentality; the mentality of the "Intelligentzia," which was so stirred after the liberation of the serfs in 1861.

It was at this period that the literary and artistic leaders, turning from Teutonic abstractions to Russian actuality, pronounced the dictum that *Beauty is Life*. Radiant ideas of progress permeated all classes of society. With that passion for absolutism so typical of the Slavic mind, it is scant wonder that the emancipation of art should follow rapidly upon the liberation of the serfs, and Repin reached his early manhood at about that period, when most artists of his age gathered together to air and strengthen their views and their art. Their passionate nationalism assuredly exceeded their artistic sensibility; yet, one must never forget that they came into being during a vigorously realistic and utilitarian epoch, an epoch that witnessed the publication of Piserer's amazing "Annihilation of Æsthetics," and similar diatribes against the formal canons of Abstract Beauty.

Le Beau, c'est la vie was, in fact, by some, amended to read: *Le Beau c'est le laid*, with its unforseen and long-standing codicils still operating mischief with some modern painters. Therefore, in its every accent, the artistic legacy of Repin typifies the man's own particular age and epoch. It definitely incarnates the *signum temporis*, the spirit of the time, in the same manner as does the fiction of Dostoyevsky and Tolstoy.

You will, therefore, not be surprised to see, beside a good many portraits, many pictures with a purpose, what Germans call "Tendenzbilder." These paintings depict scenes of national life. Most of them do take their point of departure from the facts of every-day existence, and to this peculiarity of selection Repin owes both the weakness of a necessarily atrophied artistic impulse and the strength of a forcible, if limited, vision. Rarely does he wander from the realm of specific observation. Face to face with his subject, he, at his best, is a vigorous and ready craftsman, jealous of essentials and indifferent to all that does not directly contribute to the individuality of the sitter. The accessories are always simple and thoroughly in character, and now that I seem to refer to his portraits, nowhere has he succeeded better than in his likeness of Tolstoy, whose troubled features he has limned so often. The example shown at the Leicester Galleries, "Count Leo Tolstoy" (13), is very convincing. Tolstoy stands, both hands slipped behind the belt girdling his white tunic. The sad and dreamy expression of the eyes, the tremendous mouth, the flat, wide-nostrilled nose, the magnificent, if unkempt, spread of beard, all that rough and powerful physiognomy which made the prophet of Yasnaya Polyana so arresting to look at, is here caught and put down, and as a portrait this is as good as it could be. It is certainly far better than the "Alexander Kerinsky" (15), which is marred by too theatrical a display of lights and shades. The "Portrait Drawings and Sketches" betray the craftsman grown a little careless and slipshod at times, but always bent upon obtaining simply and quickly a very adequate likeness.

The Hampstead Society of Architects

One of the pleasantest characteristics of a general exhibition of paintings is its eclecticism, which by bringing into action many contrasts lightens the task of bot eye and mind, but to yield its fulles eclecticism should be checked by watchful sense of selection. This, th Hampstead Society of Artists has faile to set in motion at the autumn exhibitic of its members' work, now held at th Walker Galleries, with unfortunate r sults.

A lot of little water-colours of du tit-bits have been allowed to creep in ar hang themselves on the walls. Most these are obviously the efforts of amateu of all grades.

However, there are fortunately brig exceptions. One does come across con petent pieces of painting. Mr. A. va Aurooy's "Pierrot" (3), for instance, h a winning quaintness of arrangement ar presentation, rendered more evident ar fresh by undoubted skill. Mr. Phil Cornish, in his "Spring in the Haz Coppice" (6), has hit upon a very chas and discreet piece of landscape to whi he has done full justice. There is he displayed an effortless understanding tone-values in lurid contrast to son near-by wall-fellows. In "Castle Roc Lynton" (18), Miss Jessie Mothersole h done justice to a very pleasing rhythm greens and greys. "Halcyon Days," Mr. H. J. Jarman, is so obviously imitation of Russell Flint that it fair hurls itself in the class of vicarious pa tiches.

It is a pity that Miss Amy Squi should have insisted to the bitter end making a sketch of the "Interior of t National Gallery" (25). Mr. Percy Da has a pretty "Motherhood," which tak one back to the mannerisms and suga prettiness of Greuze.

Mr. A. Belcher, A.R.I.B.A., does his be to uphold the dignity of architectu sketching.

His "Doorway off Mark Lane" (3 is a pleasant enough little affair, timi but happily shown. There are ma others, but over most of them broods th spirit of Anecdotes and Strictly Limit Localism.

G. HOLT.

Mr. D. G. Somerville Elected M.P.

MR. D. G. SOMERVILLE, the managing director of Messrs. D. G. Somerville & Co., Ltd., constructional engineers, whose photograph appears on this page, has been elected to represent Barrow-in-Furness in the new Parliament. Mr. Somerville is a native of Edinburgh, where he was born in 1880. He was educated at George Watson's College and at the Heriot-Watt Engineering School — two well-known Edinburgh institutions. On leaving school, he entered the Edinburgh works of Messrs. Redpath, Brown & Co., the well-known constructional engineers, where he received the training which was to be the foundation of the business he subsequently established later on in London.

Commencing in a small way as an engineering contractor in Victoria Street, Westminster, he gradually worked up the important and extensive businesses with which he is now connected. On the outbreak of war his firm—D. G. Somerville & Co., Ltd.,— undertook large and important contracts for the British, French, Portuguese, and American Governments in the war areas on the Continent. In England they built the large camps at Sheerness and the Isle of Wight, besides other buildings at Farnborough, Lydd, Didcot and Southampton, also in Ireland. This work was in addition to numerous steel buildings for the Admiralty at various important points.

MR. D. G. SOMERVILLE.

In 1915 branches were opened in France, the first hospital at Wimereux being built by his firm, various works at Calais, Dunkirk, Boulogne, Havre, Paris and other places being subsequently undertaken. One of the largest military hospitals in the world was built for the American Government on a site near Bordeaux.

Through the Entreprises Somerville, a French registered company, important cemetery works for the Imperial War Graves Commission have been undertaken. This firm, of which Mr. Somerville is a managing director, is also responsible for a great amount of reconstruction work, notably the rebuilding of the municipal buildings, and large factories and private houses in St. Quentin.

On the visit of the King and Queen to the British war cemeteries in May last, Mr. Somerville was presented to their Majesties.

The general contracting works in England are too numerous to detail, but mention may be made to the Mappin Terrace for the Zoological Society, and various wharves on the Thames and elsewhere, and numerous large housing schemes and factory premises. His firm is now engaged on two important building sites in Regent Street. He is also the managing director of the Somerville-Barnard Construction Company. Mr. Somerville is a member of the London School Board Lodge of Freemasons.

In Praise of Terra-Cotta

NOWADAYS it seems almost incredible that once upon a time terra-cotta was looked upon askance by architects. That was partly the effect of insidiously propagated prejudice, but was more often the result of a genuine mistrust of the material, because the art and science of producing it had not been perfected in this country. Manufacturers had not then reached the high degree of excellence in form, colour, and finish to which the processes of terra-cotta mixing, moulding, and kilning have since attained.

Architects, as soon as they ascertained that the material had become thoroughly trustworthy in these respects, began, and have continued, to specify it very freely, adopting it fearlessly for some of their most important work. Several architects of the greatest eminence have become quite enthusiastic advocates of terra-cotta. Its essential characteristics had long been perfectly familiar to them. They were well aware how much more durable it is than wood and stone, both of which, as crude natural products, are subject to natural decay, from which it is often necessary to preserve them artificially with protective washes.

Architects knew very well also that terra-cotta has the valuable advantage of being much lighter than stone; of being, as a fundamentally plastic material, more easily moulded to beautiful shapes; and, further, of being procurable in many delicate shades of colour—not applied with washes, as they would have to be in the case of either wood or stone, but colour integral with the material itself, and varying with the district from which the clay was obtained. "'Tis in grain, sir," as that beautiful lady in Shakespeare said in answer to a bantering remark that the colouring of her face was too lovely to be natural.

It is a valuable advantage that the colouring of terra-cotta—again like that of the beautiful lady—has not to be renewed at short intervals.

As to shape, clay being plastic and mouldable beyond all things else, whereas the softest of stone is rigid to the chisel, there is no need to stress the point as to the superior docility with which terra-cotta obeys the hand and will of the artist, nor to insist on the superior economy of terra-cotta in repetitive work. A few yards of egg-and-dart moulding, for instance, would obviously be much less expensive to cast than to carve; if the "repeats" were of terra-cotta, they would be modelled once for all, with considerable saving on the cost of labour.

That terra-cotta is enormously more durable than stone is not mere assertion, based on the theory that terra-cotta, being non-absorbent and impervious to the acids which penetrate stone, will not, like stone, crumble, flake, and disintegrate. Terra-cotta's immunity from decay is an established fact, fully confirmed by the examples of terra-cotta objects of enormous antiquity to be found in almost every museum. More to the purpose as proofs not only of the longevity and durability of terra-cotta, but of its having commended itself to architects for adoption in notable buildings of indisputable dignity and repute, even as it had commended itself to the Romans of old, are the examples of terra-cotta incorporated in the building at Hampton Court Palace, Sutton Place, Guildford, Layer Marney, Essex.

Each of these monumental buildings being a standard and criterion of good taste in architecture, the free use of terra-cotta in them is a splendid testimonial to the architectural respectability of the material, as well as a conspicuous proof that the esteem in which it is held by architects of repute is no new or passing fad, but a classical tradition. Terra-cotta, therefore, is not only of venerable antiquity, but of highly respectable æsthetic associations, which sanction its use in the best buildings.

Many eminent architects of recent times have been glad to recognize in terra-cotta a valuable addition to their resources, whether as an adjunct to other materials or as superseding them—in a façade, for example, in which terra-cotta may be seen in bands or patterns that afford relief to the monotony of a stone, brick, or stucco front; or as an entire facing, either showing a single colour throughout, or diversified with various harmonizing tints, brilliant or subdued, matt or glossy in surface.

It may be confidently assumed that no great city, no considerable town in the kingdom is without more or less numerous, more or less handsome terra-cotta façades. Certainly London is rich in notable examples, among the most conspicuous of them being the Natural History Museum at South Kensington, designed by the late Mr. Alfred Waterhouse, R.A.;

the huge Constitutional Club in Northumberland Avenue; and, equally impressive by its tremendous size, the enormous Prudential Assurance building in Holborn; and, indeed, the metropolis abounds in notable examples of terra-cotta work.

Cinemas, terra-cotta faced or terra-cotta decorated, some of them of a real beauty less easily attainable in any other material, are to be found not only all over London, but throughout the kingdom, and their almost invariable and sometimes quite delightful use of the material, inside or outside, structurally or decoratively, must have done much to popularize it.

Then, to mention at random a few noteworthy provincial buildings in which terra-cotta is conspicuous, Sheffield may well be proud of its fine "Sheffield Telegraph" Office; Sir Aston Webb's Victoria Law Courts in Birmingham are an adornment to that city, even as the Y.M.C.A. building is to Manchester, the Royal Technical Schools are to Salford, and several well-known buildings are to Leeds.

Of course there are others, but there is no need to multiply examples of the tremendous popularity of terra-cotta everywhere to-day. The reason of this popularity should be obvious. The love of colour is a natural instinct in human beings, and so far as the exteriors of buildings are concerned terra-cotta is the only practicable means of satisfying that innate craving.

In "brightening" our cities, terra-cotta is the only building material that is competent to render that honourable service. Its colours or tints are so numerous that the architect may make it the vehicle of delightfully harmonious colour-effects, which will not fade or fail from excess of sunlight, nor shall the soot-laden rain permanently bedim them; for they are "fast colours," and will withstand the most assiduous attentions of any "Gentleman with a Duster," or even with a mop and a hose-pipe.

Not to be ignored is the question of sculptured ornaments. One calls them "sculptured" for want of a better term. They are, of course, not sculptured in the same sense as the work that comes direct from the chisel. Yet when still in the plastic state they must have been modelled and moulded sculpturesquely; and when they have passed successfully through the several processes by which modern terra-cotta is brought to perfection, the sculptor's skill emerges triumphant through ordeals by fire and by water with effects not inferior to those of the best executed stone-carving—in some respects, indeed, heresy though it be to say it, superior to them, because got in a material over which the artist has more complete control.

The plain fact is that terra-cotta gives the artist one of his most free, facile, and fertile modes of expression. Shaping his design—be it monumental group, swag, or small detail of ornament, in the most plastic of all materials—clay—rectifying mistakes as he proceeds he gives it its final shape before it leaves his hands; whereas the final product, were it in stone, would be but a translation of the original model, would be carved in a different medium, perhaps by another hand. Terra-cotta comes out finally just what it was when it left the artist's hands, except that the material is no longer plastic, but so hard, indeed, that neither the weather nor the acid-laden atmosphere of a smoky town would affect it as stone statuary would be affected.

This is not intended as a complete statement of the case for terra-cotta as a material for the adornment of buildings. For the sake of that "artistic reticence of statement" which good architects are so careful to observe in all their works, the claims of terra-cotta to rank as a thoroughly architectural material have not been exhausted in this article. Terra-cotta, however, has one other distinctive merit which cannot with justice be entirely ignored, though one may not dwell on it at adequate length. Terra-cotta seems to possess a positive affinity with reinforced concrete. The two materials are homogeneous and complementary to each other, to a remarkable degree.

The Cathedral of Rheims

Sir Isambard Owen, who for many years before the war, made a study of the history and architecture of Rheims Cathedral, lectured before a large audience at the Royal Institute of British Architects on November 16, a collection amounting to £16 2s. resulting for the benefit of the British Empire Fund to wards the restoration of Rheims Cathedral (the office of which is at 39 St. James's Street).

Speaking without notes, the lecturer traced the history of the great church from the time of the baptism of Clovis, the first Christian king of France, down the centuries to the last terrible onslaught on the cathedral. Details both of the structure and its decoration were shown in more than a hundred magnificent slides, and so vividly did Sir Isambard describe the meaning of the statuary and the manner in which the original architect, whose name has only recently been discovered, planned the structure as a whole and carried out the design without alteration of plan, as was the case in hardly any other great building of early times, that he held the close attention of his audience for nearly two hours.

The lecture was so completely interwoven with its illustrations that it would be impossible to report it verbatim, even did space permit.

The chair was taken by Sir Aston Webb, and the French Ambassador was present.

At the commencement of the proceedings, the hon. sec. of the fund read a letter from the president, the Duke of Portland, regretting his inability to attend and thanking Sir Isambard and the Council of the Royal Institute of British Architects for their kind help.

Competition News

An Economic Competition.

Douglas Town Council have not set an example of lavish liberality in the terms on which they invite " competitive plans, designs, and estimates of cost " for the laying-out the Hills estate. They offer £50 as first prize, and a second prize of £20, and the plans and designs are to become the absolute property of the Council. Moreover, the Council do not engage the successful competitor to carry out the work. One cannot imagine that the competition will be overwhelmingly keen.

(*For List of Competitions Open see our issue for November* 8.)

Mr. W. Haywood on Renaissance Towns

Mr. William Haywood, F.R.I.B.A., delivered the sixth lecture on Town Planning, at Birmingham, " Renaissance Towns " being the subject. The lecturer said :—

The Renaissance may be regarded as a period of transition between the Mediæval and the Modern Worlds, when ecclesiastical and feudal control were loosened, and new ideals were formed.

A revived interest in classic literature in the fifteenth century is closely followed by the architectural researches of Brunelleschi in Rome, and a new manner of design appears in certain units of town planning.

Two great secular buildings, the " Riccardi " and " Pitti " Palaces (1430 and 1440), are among the first of many similar structures built throughout Europe during this period which indicate a condition of society no longer dominated by the Church, and many of these palaces play an important part in town conditions, the building itself being designed in definite relation to its particular neighbourhood.

Radial roads appear for the first time in plans for the development of Rome, made for Pope Sixtus V by Fontana, who constructed the Piazza del Popolo, and from the piazza cut three main arteries giving direct access to widely separated sections of the town. These roads diverge from the great northern gate of the city, and, in association with the Via Flaminia beyond the walls, form a perfect example of what the road entrance to a great city should be.

While Roman roads of this period (1585-9) constitute a departure in town planning by reason of their new method of alignment, and also display a marked axial emphasis and definite architectural composition, they by no means form a complete road system, and it is not until some 75 years later that the schemes prepared by Wren and Evelyn for the rebuilding of London after the fire give us a full assemblage of town-planning elements. No better plan for the same conditions could be prepared to-day than that made by Sir Christopher Wren; rectangular planning is used selectively; radial avenues fan out from the bridgehead into the heart of the city, and the open " place " is for the first time used systematically as a focal point for traffic, yet with concentric relief roads to lessen the danger of congestion and to facilitate distribution.

These relief roads in Wren's plan serve, in a secondary manner, the same function as the great ring roads now advocated for all big cities, the best examples of which have resulted from the conversion of great military zones, imposed upon many Continental cities during the Renaissance. Earlier forms of defence—the simple wall and tower—can usually be traced in the plans of cities which have at any time possessed them, but the highly elaborate triangulated bastion and glacis of the sixteenth and seventeenth centuries when they in turn became obsolete provided perfect conditions for the construction of tree lined avenues, which now serve as ideal ring roads in such cities as Paris and Vienna.

Book Notices

Manual of Decoration

Let it be frankly acknowledged--but e fact is patent—that as a rule our iglish domestic interiors are not arming. Neither to the details nor to e ensemble is sufficient thought given. rniture is chosen, or arranged, without e 'attention to harmony and unity. the decoration, the wrong patterns, the ong colours, the wrong positions and xtapositions are selected instinc- ely, with deplorable results on the neral effect, which is seldom visualised forehand as a predetermined scheme. e sage counsels of that old-time school ssic, " Right Lines in their Right aces," seem to have passed into oblivion. r modern artless, if not fadless, folk em obsessed with an ineradicable ndness for Wrong Lines in the Wrong aces. Chairs and tables, pictures and nels, wall coverings and floor coverings oclaim aloud their owner's incompe- nce to " take thought " in such matters; to parody the poet, æsthetic " evil is ought from want of thought as well as m want of art."

Mr. John Gloag has written, and Mr. J. Warne has illustrated, a book that capable of excellent service in guiding e taste of those householders—a con- ntly increasing number — who aspire get their furnishing and decorating ne decently and in order. That the thor's prime object is to render this vice is clearly expressed in his opening ragraph. " Decoration," he says, newhat tritely, " may be divided into o classes : Period Decoration, which is nded on Historic Style, and general mestic Decoration, which is concerned th the problem of making everyday roundings pleasant and attractive. is with the latter section that this book concerned chiefly, although a chapter aling with studies in period decoration included." The object of the book ld not be defined more tersely, and thing further need be said in praise of e manual than that this object is fulfilled; those who have collaborated in its production—author, illustrator, publishers and printers—having performed their work very creditably.

From this manual the architect and the professional decorator, as well as the householder, may derive useful information and sound guidance, whether or not they admire in every instance the taste shown in the examples illustrated. In such matters, unanimity is proverbially impossible, and, indeed, undesirable. But simplicity being the keynote of the volume the occasions of difference are likely to be infrequent.

"Simple Schemes for Decoration." By John Gloag. Illustrated by E. J. Warne. London: Duckworth & Co., 3 Henrietta Street, Covent Garden, W.C. Price 7s. 6d. net.

A Guide to the Profession

There is surely no other profession to and in which guidance is so necessary to the neophyte as it is in that of architecture; for there is none in which details of the means of preliminary training are so numerous, and so diverse, forming a bewildering maze, hardly less easy to thread without guidance than that at Hampton Court.

How shall the young man, or the young woman, set about entering the profession? But even to this question there are vital questions precedent. Is the candidate " a fit and proper person," as they used to say in election resolutions, to enter and adorn the profession and to prosper in it? Need one undergo a course of training for it? And what exactly is the nature of that training? How long does it last, and what does it cost? Can the candidate, or his or her parents and guardians, afford the expense? Has the candidate the necessary accomplishments and proclivities, the right temperament and ambition? As a career, what are the rewards, risks, pitfalls, disadvantages, of the profession of architecture?

All these important questions, and many more, are either answered, or at least discussed, with knowledge and acumen in this " Guide to the Profession." Its author, Mr. F. R. Yerbury, as Secretary to the Architectural Association, is in a position peculiarly favourable to the collection of all the necessary data for sound guidance, and he is well qualified to state them concisely yet comprehensively, and to marshal them (as he has done) in orderly and disciplined array. His guide safely conducts the neophyte to the threshold of the profession, and beyond it a little, in the assumption that the auspices are there found to be favourable and the prospects satisfactory.

For the book not only discusses the various methods of training for the profession—by pupilage or in one of the many schools of architecture (of which a complete list is given)—but it imparts invaluable hints on turning the training to account on really " commencing architect "—whether as assistant, or as partner, or as principal: whether staying at home or even adventuring abroad Far East or Far West.

What items should be included in the student's outfit; what books he should select as the nucleus for his library; the conditions of training in France; and of study in Italy; all such " preliminaries " are enumerated, and the recital is followed by three most important chapters, dealing respectively with employment for the architectural assistant; and with the various means of setting up in practice, whether independently, or in partnership; and on architectural competitions.

Then, to make his survey of the architectural field as comprehensive and complete as possible, the author includes a chapter on draughtsmanship and rendering, one on architectural etching, and one on architectural photography, the subject last named being, of course, one in which Mr. Yerbury is an acknowledged master. With characteristic thoroughness and practicality, he appends a dozen illustrations of various types of the graphic arts ordinarily employed by architects. These illustrations, admirably reproduced, greatly enhance the value, as well as the appearance, of a volume that is in every respect—in format, typography, paper, and binding—an excellent example of modern book production.

There is, further, a particularly useful chapter on " The Student's London," giving definite information on the whereabouts of architectural objects, including of course, and principally, the famous buildings in and around the metropolis, that may be profitably studied, measured and drawn. In fact, every item that could possibly be of assistance to the inquirer—to the youth seeking to enter, or having already entered the profession, or to his mentors anxious to obtain accurate information as to the prospects it offers as a career for their protégé or protégée, is included in a guide that is altogether a most important addition to the sum total of books that are of unquestionable and perennial utility. The guide is furnished with an excellent index.

"Architectural Students' Handbook." A Guide to the Profession of Architecture. By F. R. Yerbury, Secretary to the Architectural Association. Illustrated. London: The Architectural Press (Technical Journals, Ltd.), 27–29 Tothill Street, Westminster, S.W.1. Price 10s. 6d. net.

Business Premises in Castle Street, Dundee

FRANK THOMSON, Architect

IN designing this building—for Messrs. Alex. Stewart & Son, of Dundee—the architect encountered many difficulties owing to the limited space available for the street front and the entrance hall. The building is situated between two existing buildings, and the fact that the "whole-height" entrance hall and staircase, and the attached offices were being treated in a decorative manner, made it necessary that the façade should be endowed with some features of interest and distinction. With this in view the front has been carried out in fine axed Persley granite enriched with bronze wreaths, and the entrance gates and the large window over are of ornamental wrought-iron work enriched with solid cast bronze. The gates are glazed with clear plate glass, and the large window is filled with cathedral glass with the border and the firm's crest at the top in stained glass.

The entrance hall is 52 ft. long, 15 ft. wide, and 29 ft. 6 in. high. The floor is of marble, the octagons, which are 2 ft. across, are of Napoleon marble, and the small squares and borders are of black Belgian marble. In the centre is a representation of a nautical compass carried out in bronze and inlaid enamel.

The panelling, the vestibule screen and the wide staircase are carried out in wainscot oak. The raking balustrade, and the level balustrade on both sides of the landing—which crosses the whole width of the hall—are panelled with ornamental wrought-iron work, with a modelled and solid cast bronze coat of arms in the centre of each panel. These panels vary in every instance and represent the countries and governments with which the firm do business. Each coat of arms is shown the same on both sides of the panel. The ceiling is barrel vaulted and richly treated with specially modelled fibrous plaster. The electric light bowls are of alabaster, and those in the hall are specially large, being 3 ft. in diameter. In the entrance hall is the Roll of Honour, which is of cast bronze with cream-enamel letters inlaid, and the company's trade mark in blue enamel.

The corridor leading to the office premises is enriched with fibrous plaster and oak work, with two stained glass windows in the side wall. A waiting-room on the ground floor level has also a representative stained glass panel, and is treated in enriched fibrous plaster. The principal's room and the secretary's room are panelled with wainscot oak, the ceilings being of enriched fibrous plaster, and the bowls of the electric light fittings are of alabaster.

The contractors were as follows: John Nicoll & Son (mason work); M'Tavish, Ramsay & Co. (joiner work); R. Melville (plumber work); Alexander McRitchie (plain plaster work); D. & G. Law (slater work); Lindsay and Scott (plain glazier work); Joseph Thompson (painter work); Thomas Russell & Son (steel work); A. L. Peacock & Co. (heating installation); A. Westwood & Son (electric lighting); George Carnegie (granite and marble work); Alexander Fair (wood carving); David Dickie & Son (ironmongery), and Richard Buist & Sons (furniture and furnishings), all of Dundee.

Other contracts were:—H. H. Martyn & Co., Ltd., Cheltenham (fibrous plaster work, ornamental wrought-iron work, bronze, and stained glass); Messrs. F. & C. Osler, Ltd., London (electric light fittings); Messrs. Henry Hope & Sons, Ltd., Birmingham (steel casements). The Napoleon marble in the entrance hall was supplied by the Hopton Wood Quarries.

The Week's News

East Ham Town Hall.

A proposal for the extension of the East Ham Town Hall buildings, at a cost of £7,500, is under consideration.

New Church at Scarborough.

A tender of £7,900 has been accepted for the building of the new church of St. Columba in the North Ward.

£10,000 *for St. Paul's.*

The Ecclesiastical Commissioners have promised a contribution of £10,000 to the Preservation Fund of St. Paul's Cathedral.

No Memorials on "Village Green."

At Offerton, Cheshire, the council have refused to allow the local War Memorial Committee to erect a village institute as a war memorial on the village green.

The Late Mr. H. T. Gordon.

The news of the death of Mr. Henry Thomas Gordon, F.R.I.B.A., at his residence, Parkfield, in his seventy-seventh year, was received with great regret last week.

Mexico's New Bridge.

The sum of 300,000 pesos (£30,000) is to be expended upon the construction of a new international bridge between Mexico and the United States at Piedra Negras, in the State of Coahuila.

Metropolitan Railway Extension.

The successful tenderers for the extension of the Metropolitan Railway to Watford are Messrs. Logan and Hemingway, of Doncaster. The new line will cost about £300,000.

Pottery Village Unearthed.

During sewerage development work at Wisley, not far from the Royal Horticultural Society's gardens, a complete pottery village of the Stone Age has been unearthed, together with pottery.

The New Ironmongers' Hall.

Mr. Sydney Tatchell, F.R.I.B.A., surveyor to the Ironmongers' Company, has been appointed architect for the design and erection of the company's new hall in Aldersgate.

London County Hall Extension.

The L.C.C. have decided to proceed with the "raft" foundation of the County Hall extension, so that later on the new wing can be constructed at a total cost of £800,000.

New Assembly Hall for Chislehurst.

Mr. T. R. Ferens, of Hull, has given £15,000 to defray the cost of a new assembly hall and class-rooms for Farrington's Girls' School, Chislehurst. It is proposed to raise another £15,000 in order also to erect an additional residential house.

Memorial Chapel at Durham.

The Dean and Chapter of Durham have instructed their architect, Mr. Caroe, to proceed with the construction of a Military Memorial Chapel in the south transept of Durham Cathedral.

Architect Lord Mayor.

Mr. W. C. Fenton, F.R.I.B.A., was installed as Lord Mayor of Sheffield on November 9. He is the first architect who has ever filled that position in Sheffield.

Restoration of St. Mary's, Shrewsbury.

The work of repairing and restoring the ancient spire of St. Mary's Church, Shrewsbury, has been begun by Messrs. Thompson, church-builders, of Peterborough. It is estimated that £5,000 will be required to complete the work.

Lincoln Cathedral Repairs.

To Lincoln Cathedral repair fund, which now amounts to £15,200, the Ecclesiastical Commissioners, who own considerable property in the county, have promised £2,500 on condition that £50,000 is raised.

Extensions to Church at Askern.

Work has been begun on extensions to St. Peter's Church at Askern, Yorkshire. There will be a new choir vestry, sacristy and organ chamber, and a heating system will be installed. The architect is Mr. E. T. Fox, of Barnby Dun, near Doncaster.

Inigo Jones Gateway.

The Inigo Jones gateway, which once formed part of a palace at Oatlands Park, built by Henry VIII, is to embellish a public-house. The gateway was discovered when the Pelican, an old inn near Weybridge, was being pulled down for rebuilding. The owners of the Pelican are rebuilding it on their own premises.

A New Building Society.

Delegates from over fifty London building societies meeting at Holborn Restaurant, decided to form a Metropolitan Building Societies' Association, and appointed Mr. Harold Bellman, of the Abbey Road Society, to act as hon. secretary.

Professional Practice.

Mr. H. E. Rolley, A.R.I.B.A., A.R.C.A., has taken over the practice of Messrs. Gething and Son at Kingsley Hall, Kidderminster. Mr. J. Morris Gething died recently. The practice was commenced by the late Mr. Gething's father in 1853. The firm will be carried on under the name of Gething and Rolley.

Change of Address.

Mr. G. Alan Fortescue, A.R.I.B.A., has removed his office to 41 Glasshouse Street, Piccadilly, and will be glad to receive trade catalogues.

Mr. Ellis F. White, architect and surveyor, of Carnarvon, who previous to 1914 carried on his practice at 17 Bridge Street, has removed to St. Paul's Chambers, Colwyn Bay, where all communications should be addressed.

Memorial to Mr. Temple Moore.

A faculty has been granted in the York Consistory Court to the Vicar of Goodmanham Church to remove from its present position in the north-west window a figure representative of St. Paulinus, and to reset it in the eastern window in the north wall of the chancel, and to add the following inscription: "A.M.D.G. This Window commemorates the work of (or help given by) Mr. Temple Moore, Architect, during the restoration of the Church 1894 to 1920."

The Egyptian Houses of Parliament.

Considerable progress has been made on the new Egyptian Parliament House in Cairo. Preliminary plans were not approved until August last, and the buildings are to be completed by March 1, 1923. The cost will be approximately £75,000. The architect is Mr. B. R. Hebblethwaite, A.R.I.B.A., and the drawings have been entirely prepared in the architectural office of the State Building Department.

St. Paul's Bridge.

Further arguments in support of the proposed new bridge across the Thames to relieve congested traffic in the City are given in a report issued by the Bridge House Estates Committee. Their proposal to proceed with the building of St. Paul's Bridge at a cost of £1,050,000 was rejected in July by the City Corporation. In their new report letters from the Ministry of Transport, the police and others in favour of the bridge are quoted.

National Building Guild.

An application came before Vice-Chancellor Lawrence, K.C., at the Lancashire Chancery Court, at Manchester last week, for the appointment of a receiver in the matter of the National Building Guild (Limited), Upper Brook Street, Manchester. Numerous building contracts in the North of England are connected with the Guild. The application was on behalf of the Union Bank of Manchester, that Mr. H. Terras, chartered accountant, be appointed receiver and manager of the Guild. The Vice-Chancellor made the order as asked for.

Shropshire and Gateshead War Memorials.

In connection with the Shropshire war memorial—illustrated on the title-page—the contractors were Messrs. Kirkpatrick, and the bronze railings were executed by the Birmingham Guild.

For the Gateshead war memorial—illustrated on page 708—Messrs. Tate, Brown & Co., Heworth-on-Tyne, supplied the Heworth Burn Blue Stone, and the stone carving was executed by Mr. J. W. Ogleby, of Newcastle; the sculptor for the bronze panel was Mr. Richard R. Goulden, by whom it was designed and modelled, and cast at the foundry of Mr. A. B. Burton, at Thames Ditton, Surrey; and the electric light wiring was carried out by Messrs. Embleton and Barker, of Gateshead. Messrs. Alexander Pringle, Ltd., were the contractors.

A Correction

We much regret that, in an Editorial note in our last issue, it was inadvertently stated that Mr. E. J. Partridge, the new President of the Society of Architects, was a Fellow of the R.I.B.A., and that he was articled to Mr. M. E. Macartney. These errors arose through a misreading of biographical data. Mr. Partridge served his pupilage with Mr. W. E. MacCarthy, and became an Associate of the Surveyors' Institution in 1890, and a Fellow of that body in 1894.

The Strand and the Adelphi

Mr. John Slater, F.R.I.B.A., in the course of a paper read before a meeting of the Royal Society of Arts last week, said: We are concerned with a very narrow strip of London between the city boundary at Temple Bar and Charing Cross, about half-a-mile in length and 250 yards in width from the north bank of the river up to Covent Garden, and in telling the story of this little piece my remarks will have to be much condensed to bring them within the reasonable limits of an evening lecture.

We all know the Strand—the busy thoroughfare between the City and Westminster—which Charles Lamb loved so much. Originally, as its name implies, the Strand was simply the river-bank from which the foreshore sloped down to the lapping waters of the Thames, but in old times the level of the road was much lower than now and the foreshore was very different. I can show you a portion of one of the ordnance maps on which I have indicated the old foreshore, and you can see where the various landing stairs were situated. In those days the river was the great highway, and the road—so badly was it kept up—was nothing but a by-way, the earliest houses that were built all having their fronts to the river, and their backyards and stables towards the road. We have it recorded in 1315 that "the way from Temple Bar to Westminster was so bad that the feet of horses and of rich and poor alike received constant damage, particularly in rainy seasons, and the footway was interrupted by thickets and bushes." In 1353 the roadway was well-nigh impassable so deep and muddy was it—*profunda et lutosa*, as the old chronicles say. In 1532 an Act was passed "for sufficiently paving the streetway between Charing Cross and Strand Cross," and even as late as the reign of George III the channel which ran along the middle of the road was often so deep and slippery as to be a constant danger to carriages and horses. So lonely and dangerous was the locality in early times that no one thought of living there, and it was not till the end of the thirteenth century that there were any dwelling-houses in the Strand.

Originally nearly all the south side of the Strand was occupied by the Inns, as they were called, of the various Bishops.

Although the majority of the streets leading out of the Strand are post-Reformation, there are three of very great antiquity. They are Milford Lane, which probably commemorates the existence of an old windmill; Strand Lane, where there is still existing an old Roman bath, the water flowing uninterruptedly; and Ivy Bridge Lane. All these led down to landing-stairs.

Having finished our peregrination of the Strand, we must now return to Durham House, on the site of which we are assembled this evening. Pennant says it was originally built by Anthony de Beck, Bishop of Durham, in Edward the First's reign, and if so it must have been almost contemporaneous with the Savoy Palace, but, at any rate, it was enlarged and almost rebuilt by Thomas Hatfield in 1353, and continued to be the London residence of those prelates till the reign of Henry VIII.

In the eighteenth century there appeared upon the scene four brothers, Robert, John, James, and William Adam, sons of a Scotch architect, the author of the "Vitruvius Senticus," who had influential friends, and soon got a large practice in London. They promoted a very ambitious scheme, which was no less than doing away with the sloping ground from the Strand to the river for the whole distance between York Buildings and the Savoy, and raising the area to the Strand level, laying out new streets and forming a fine terrace facing the Thames. The property had passed into the hands of the Duke of St. Albans, from whom it has descended to Mr. Drummond, the present holder, and the brothers negotiated a lease for ninety-nine years from Lady Day 1768 at a ground rent of £1,200 a year. One cannot believe that any of the brothers in the slightest degree appreciated the gigantic magnitude of the task they had undertaken. The total area of the site was over 140,000 sq. ft., and the Strand level was about 40 ft. higher than the old wharves just above high water-mark. Thus it was necessary to construct a series of enormous arches, springing from huge brick piers, the foundations of which had to be taken down to a solid bottom. The whole of John Street and Adam Street are on arches built over other streets at a lower level, and under these again are arched vaults. The houses on each side of John Street and Adam Street, the Adelphi Terrace and Robert Street, are all constructed in this way. The Adams seem to have hoped that the Government would occupy all these subterranean arches for storing ordnance and other things, but they were disappointed. Much of their financial difficulties arose from this. The arches are now used as wine stores, and they constitute one of the most curious and interesting sights of London, reminding one of much of the work of Imperial Rome. The arches are all groined and the work was splendidly executed, much of the brickwork being now as good as ever.

This is not the occasion to discuss the work of the Brothers Adam: this has been done very efficiently by Mr. Arthur Bolton in his recently published monumental work. They have left their mark not only in the Adelphi, with which their names will be for ever associated, but in many other parts of London and all over the country, and there can be no doubt that their work stands out as the predominant architectural feature of the eighteenth century. Robert and John were the principal designers, but William Adam has left us in London one charming little bit of building. I have mentioned Coutts' Bank in the Strand. These premises ran down to William Street (now a part of Durham House Street), and Thos. Coutts wanted to connect them with another house on the south side of the street, which he also occupied. Accordingly he got an Act passed by Parliament (39 Geo. III, c. 1) authorizing him to throw a bridge across the street to connect the two buildings. This was designed by William Adam, and, fortunately, it still exists, but only by sufferance of the London County Council. I wonder how many Londoners have ever seen it. The interior of Coutts' house was also enriched by the Adams, and Coutts had sufficient influence with them to stipulate that in their lay-out of the Adelphi buildings a gap should be left through which Coutts from his parlour could get a view of the river.

Mr. Milburn on Topical Matters

Mr. T. R. Milburn, F.R.I.B.A., in the course of his presidential address to the Northern Architectural Association, said: I read a few days ago that every man is endowed with sixty qualities. These were not detailed, but I gathered that if you nourished and used your qualities you would develop efficiency; and to be able, you must think right and remember, and, surely, one of the most difficult faculties to cultivate is remembering what is important and losing hold of what is of little value.

These thoughts come to me as I address you for the second time as your president. I feel the responsible position that you have elected me to. I hear the views of the foremost members of the profession, with whom, owing to my position as your president, I come in contact, and am tremendously impressed with their earnestness and ability I see as I go over the country the wonderful works now being erected in London and our other large cities, and self-examination should make us say: "Am I doing in proportion to my talents as well as others?" I assure you that this office of president of your association offers great facilities for broadening of views and directs thoughts to the serious problems of our profession.

Unification and registration must in the coming year engage our earnest attention, and I would ask: "Is not our aim something more than to shut up the unqualified man who calls himself an architect?" That is only a phase of our profession and a circumstance of the hour. Our aim should be to qualify him to be an architect, to make him fit to be one of us, and if this is not possible, to aim at his successor becoming one of us and a unit of a united profession. My idea of unification and registration is to *unite* first, and I have already put my views before the Institute through the Council of Allied Presidents—that all is not done that might be done by the Institute. I consider that a roll call should be made by the Institute and Allied Societies of all practising architects and their staffs, and that all pupils and assistants should be approached and appealed to by the Institute officially to qualify for membership. I know a great deal is done in this way by principals, but not always, and a continued movement by the Institute would be bound to be attended by good results. I think if this were done we should get so much larger a membership that registration would follow easily. This appeal, I may say, has attracted the notice of the Cape Institute of Architects, whose secretary has written to say that the Cape Institute has been particularly interested in the scheme to further the inducement for every young architect to qualify for the Institute.

The elections, however, have overturned the policy of the Council of the Institute, and we, as members, must be loyal to a majority. If 50 per cent. of voting members returned a majority for the present registration proposals for the

Institute, and 50 per cent. of the members did not trouble to vote, then it is clearly the duty of the governing body to frame a policy to conform with the majority voting. This is being done, and no doubt we shall shortly have laid before us a Registration Bill for consideration. But I still maintain that a united profession is the higher aim. Meeting as we have to-night means unification; every little help we give to each other means unification; the friendly acceptance of our little defeats one over another helps unification; the encouragement and help extended to those under our care means unification; the aid we give to our local associations, our loyalty to the Institute, and the care we take with our daily work all make for unification and registration, or registration and unification, whichever you prefer.

One of the dangers that I see in our profession is overcrowding. The avenues leading up to the practising architect are now inviting and alluring; the various schools now well established in all centres, the lure of scholarships, the attractiveness of the profession, growing public interest, housing, fair and open competition, all tend to attract more men to follow the art. We are rather worse off than doctors and lawyers, because the overcrowding tends to encourage public authorities to run their own architects' departments, to the disadvantage of the practising architect. However, there is always room for the industrious, as well as the best; and, after all, what a really interesting, clean, and wholesome profession it is! None of us, I suppose, are really ever dull or bored with our work—always change, half in and half out, always new problems to be overcome, and the joy of our visits to old buildings, and our ability to trace the history and age from a pillar or two, a bit of foundation or a base, and, in our imagination, reconstruct them.

And now I would like to give an account of my stewardship during the past year. I must confess to making a bold bid to be relieved of my office at the end of the first year in favour of a younger man, but I was over-ruled, and so address you for the second time.

I think the Allied Societies should turn their serious attention to the nomination of a provincial president. I am sure such a move ought to be possible without offending the susceptibilities of the London men. There are talented, well-known, and capable men of our profession in the provinces, and providing you select a candidate not too far removed from town, there ought to be no serious objection to working arrangements. Surveyors, medical associations, and other professions all at times choose provincial men, and I think the example might be followed occasionally. The suggestion would, however, need the whole-hearted support of the Allied Societies and the benevolent approval of the London men.

Viewing local affairs, we in this district are still labouring under severe industrial depression, and we should, as an association, watch closely our interests. A great amount of the housing work that should have come our way has passed over our heads in favour of local surveyors, and some corporations and local authorities are apt to ignore the claims of the architect. I may instance a war memorial committee (closely allied to the corporation of a northern town, when four to five thousand pounds was collected) inviting two corporation officials and the art master to submit designs for the war memorial in a competition limited to the three, and the memorial is now being erected to one of the designs. My point is that some architects have made a deep study of memorials, and the best results are obtained by employing architects who are versed in form, detail, grouping, sculpture, and style, which go to make up a beautiful composition, and at any rate they might be invited to compete. When town councillors, in their November struggle to be re-elected, boast of money saved through the employment of their own staff to carry out important work, their statements should be analyzed and account given of establishment charges, a very important item if it is missed out of the calculation.

Progress in Lighting

The opening meeting of the Illuminating Engineering Society was, by custom, devoted to reports of progress and the exhibit of various novelties in lighting. Mr. W. R. Rawlings (past-president of the Electrical Contractors' Association) presided.

Mr. L. Gaster (hon. secretary) in presenting his "Report of Progress during the Vacation" made special reference to the third report recently issued by the Home Office Departmental Committee on Lighting in Factories and Workshops, the aims of which would, it was hoped, be dealt with in various forthcoming papers before scientific societies and trade associations. He mentioned that a summary of the discussion before the Society on "The Lighting of Public Buildings" had appeared in the journal of the R.I.B.A., and drew attention to the paper on "Illuminating Engineering in relation to the Architect" (read before the R.I.B.A. by Mr. L. M. Tye). Much attention was devoted to various aspects of lighting at the recent convention of the Illuminating Engineering Society in the United States. A specially interesting recent installation in that country had been the use of "artificial daylight" in the Milwaukee Art Gallery, the distribution of light being so devised as to avoid troublesome reflections from the glass of pictures. The great importance of precise scientific measurements of light in connection with ancient light cases, etc., had been illustrated by a recent important access of light judgment in Bradford, which was fully reported in THE ARCHITECTS' JOURNAL.

A report was submitted from the committee on progress in electric lamps and lighting appliances. Attention was drawn to the diminution in price of lamps, and to the recent introduction of 100/130 volt 30-watt and 200/260 volt 40-watt gas-filled lamps. Other developments included the extended use of gas-filled lamps with opal bulbs in small sizes; the lamps with tinted glass bulbs furnishing light of a colour closely resembling daylight, and, therefore, suitable for colour-matching operations; and improvements in projector types of lamps for kinematograph and floodlighting applications.

The exhibits at the meeting covered a wide range. Captain Stroud exhibited the Tuck illumination photometer, a portable instrument from the United States, which appears very simple and convenient, and described the Holophane "Filterlite," a form of prismatic glass lighting unit of a pleasing and decorative pattern. Mr. Hobson showed a very compact form of inspection lamp for use in hospitals, which could be conveniently carried in the hand and would yield a spot of light of uniform brilliancy, such as was needed in examining patients in ophthalmic hospitals. Mr. W. Plummer showed the latest form of Ceag miner's lamp, the chief feature of which is the elimination of pillars with consequent elimination of troublesome shadows and improved distribution of light in practice. Mr. S. O. Pearson demonstrated a very interesting phenomenon that occurs when the new neon lamps are shunted with a condenser under suitable conditions. By adjusting the electric circuit the lamps can be caused to "blink" at regular intervals, and the period of the flashes can be varied within very wide limits.

Captain W. J. Liberty gave a description of the lighting arrangements at the new Port of London building, illustrated by photographs taken by Mr. J. S. Dow exclusively by the artificial light available. The lighting is throughout of the semi-indirect type, alabaster bowls of variegated pattern, forming a pleasing contrast with the wood-panelled walls, being used. Captain Liberty also showed a view of the latest high-pressure gas-lighting at the covered tennis courts at Dulwich.

After Mr. J. W. Elliott had briefly exhibited some of the small "Fullolite" (opal bulb) gas-filled lamps in "Astro" metal reflectors, Mr. W. J. Jones showed some new semi-indirect fittings. These consist of a bowl fitting having a clear glass canopy, all moulded into one, so that the fittings are practically dustproof, thus eliminating one of the chief objections to the use of open bowls.

A very charming exhibit was that by Mr. E. T. Ruthven Murray, comprising a series of illuminated signs based on total internal reflection in glass. A glass plate may have any appropriate lettering or design engraved on its back, and the pattern stands out brilliantly lighted when screened tubular metal filament lamps are fitted along the top or bottom of the plate. Some effective designs for use in lifts were included. Finally Mr. Chas. Selz demonstrated the effect of his method of impregnating silk lampshades so as to render them substantially non-inflammable and at the same time improve the diffusion of light. Fabrics so treated are claimed to be much less subject to the prejudicial effect of dust.

The gathering was also of interest for the fact that it was the first meeting of the Society held in the redecorated hall of the Royal Society of Arts, where a white upper ceiling with four semi-indirect alabaster bowls has now been provided.

In terminating the proceedings the chairman mentioned that the next meeting would take place on Tuesday, December 12, when a discussion on "Street Lighting" would be opened by Mr. Haydn T. Harrison.

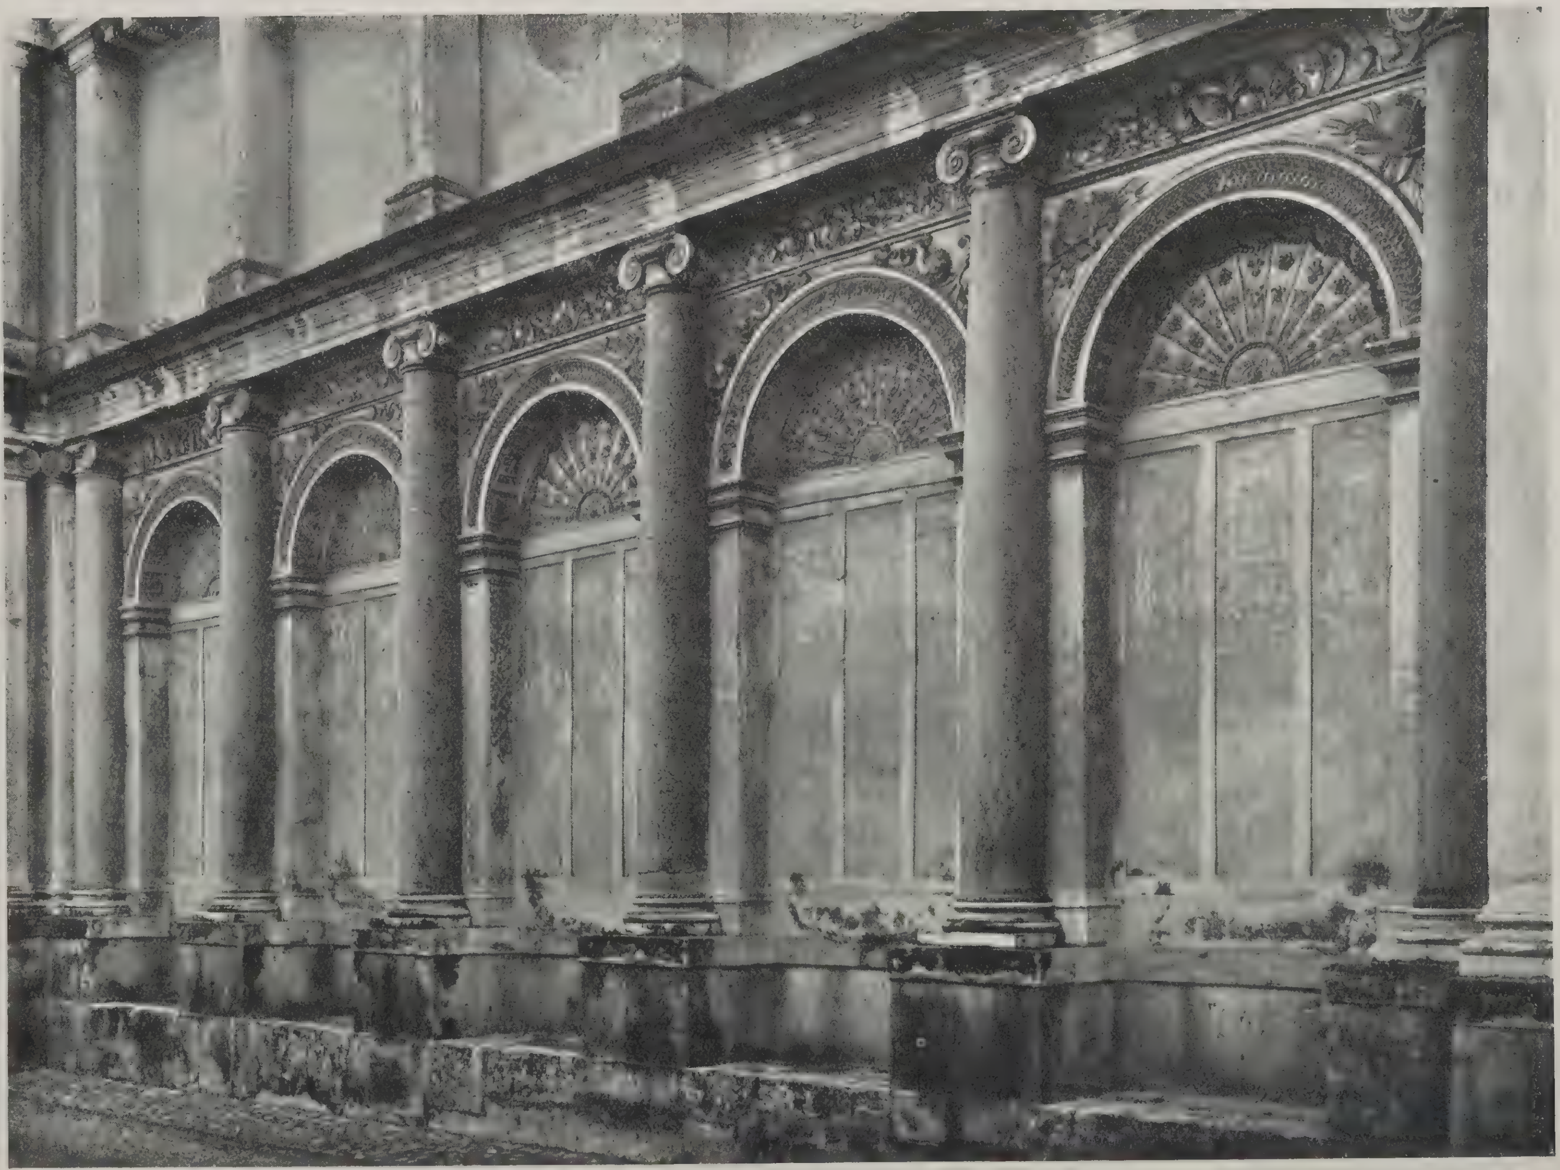
Architectural Details. 37.—Loggia in the Garden of the Villa of Papa Giulio, Rome



The Villa of Papa Giulio, Rome, is a sixteenth-century building, and lies in a charming site about a mile beyond the Porta di Popolo, with a full view of Rome and the windings of the Tiber. It was erected by Julius III at great expense, and most of the talent of Rome was engaged in its erection. The main facade and the inner court are almost certainly of Vignola's design. It is now fitted up as a museum of antiquities

The Organization of Acoustical Research

THE Press has been full of comments on the defective acoustical properties of the new London County Hall, and much severe criticism has been passed on architects for not knowing more of the ject of architectural acoustics. Whether this criticism s justified or not does not matter so much as the fact t public opinion now demands that an architect should able to provide an auditorium which shall be acoustically rect for any given purpose.

he attitude of the Press constitutes a challenge to the resentative architectural bodies to move in the matter, l it would appear that the gage has yet to be taken up cially. This seems a great pity, as the absence of any horitative statement is being interpreted as indifference. sibly the subject is not interesting enough to the general of architects, but if more publicity could be given to at has been and is being done, interest would no doubt n be aroused.

he Schools of the Architectural Association provide a ure course on the subject by Mr. Hope Bagenal, who been an enthusiastic student of acoustical matters in tion to architecture for some time past now and may be rded as an authority on the subject. A very able paper, tled, "Acoustics applied to Buildings," was read by Bagenal before the Society of Architects in April 1921, for some unknown reason, very little prominence was n to it, although it contained a splendid resumé of ting knowledge on the subject.

The Times," in July last, in an editorial column, made suggestion that the R.I.B.A. and the National Physical oratory might combine in carrying out some large- e observations and experiments. Commenting on the cle a few days later in a letter to "The Times," Professor liam J. Pope, of Cambridge University, said that "a e small expenditure of time, money, and intelligence ld suffice to provide architects with knowledge which ld render every hall acoustically perfect." Unfortun- y, the phrase "quite small expenditure" is most vague, the inference that for a few hundred pounds the re- ed knowledge can be obtained is misleading.

eginning in 1895, the late Professor W. C. Sabine, who perhaps, contributed more knowledge of the subject n any other individual of the present century, took more n twenty years of laborious, painstaking research to g even a portion of his programme of investigations to nclusion. A wealthy admirer, Colonel George Fabyan, t for him an elaborate laboratory at Riverbank, Geneva, ois, some thirty odd miles west of Chicago. The con- ction of this laboratory, which contains an absolutely nd-proof chamber, was described in "The American hitect" of July 30, 1919, and is most interesting. The ding, where the researches begun by Professor W. C. ine are being continued by his cousin, Dr. Paul E. Sabine and others, with its equipment must have cost many thousands of pounds. It will therefore be seen that any scheme of research in this country will need a substantial sum of money to place it on a secure financial basis.

"The Times," on July 31, after comments on their first article had appeared, printed another editorial note urging the R.I.B.A. to lose no time in doing something, and again on October 13 another leader, commencing with the accusing sentence : "Architects are still unable to predict with certainty the acoustic properties of the halls and chambers they design," appeared. This last article calls attention to a scheme which is on foot in America to establish an American Institute for Acoustic Research, and goes on to describe the considerable amount of work that is already being done in America. The article concludes most significantly, "We wish well to the American scheme and would give a still more hearty welcome to a similar British scheme."

Evidently, as a national organ of public opinion, "The Times" expresses a feeling of wounded national pride in that this country which has in the past always given a lead in scientific matters should be dropping behind.

Primarily, of course, the matter is not one for architects, but scientists; as Sir William Pope says in his letter "the concern of the architect is to apply all available knowledge to the production of a pleasing and useful building; since no knowledge is available concerning the acoustical properties of a chamber, the blame for faulty acoustics is not his." All the same, architects are not without some responsibility in the matter, and it is up to them to at least make some attempts to ensure that the knowledge they require is being sought after in this country.

There are many qualified persons in this country who should be able to say how and by what means this desired result may best be attained, but in the hope that some suggestions might be acceptable, the following brief outline of a scheme is offered as a basis for forming a research association.

To obtain the best practical results it is essential that the research programme should be drawn up and directed by architects and scientists working in collaboration. The architects to formulate the problems requiring solution, and the scientists to decide on the lines of investigation.

A meeting should be convened at which the scheme might be broadly discussed, and a small committee chosen to report quickly with draft proposals. This first meeting should obviously be as representative as possible, and it is suggested that invitations should be sent to the following :—

Architects.—R.I.B.A., Society of Architects, Architectural Association.

Scientists.—Royal Society, Royal Institution, London University, Cambridge University, Physical Society, Institute of Physics.

Engineers.—Institute of Civil Engineers, Institute of Electrical Engineers.

Government.—Department of Scientific and Industrial Research, National Physical Laboratory.

As someone must take the lead, and the need for the research is to provide architects with information, it is suggested that the Council of the R.I.B.A. shall call the first meeting. When the first meeting has taken place and a committee formed, the scheme will undoubtedly commence to move ahead, but as time is a most important factor, the committee should have an experienced organizer to speed up the administrative routine.

Architecture and Engineering

A writer in "The Times Literary Supplement" sets himself the ancient task of distinguishing between science and art. In addressing himself to it he achieves some interesting *obiter dicta*, some of which it is difficult to follow. When he says that "experience, unlike inspiration, can be handed from one artist to another," there is no denying it, but when he adds, "Architecture, for instance, could not exist without engineering, which tells the architect what he may venture to do and what he may not," the question of fact seems to be in some slight need of elucidation. No doubt the writer means that, to invest his building with stability, the architect must have some knowledge of mechanics; but it is a pity that the essayist seems to confuse the very distinct functions of the architect and the engineer. Of course, the architect must learn in his callow youth how to make his building stand up; but he does not call his knowledge of stresses and strains by the dignified title of engineering. Wren was the most accomplished engineer of his time, yet his reputation is that of an architect; and to say that engineering tells the architect what he may and may not do is needlessly to create confusion in the lay mind. This intercommunication between the professions is only true in the sense of "Says I to myself, says I"; the architect telling himself what he may and may not do. And it is impossible to conceive of his having any occasion to say, like Pooh Bah, "Come over here where the engineer can't hear you."

Converting Houses into Flats

A point of some importance to architects, as well as to builders and property-owners, was determined in the King's Bench Division of the High Court of Justice last week by Mr. Justice Roche. The question at issue was, what constitutes sufficient alteration to comply with section 12, subsection 9, of the Increase of Rent and Mortgage Interest (Restriction) Act? The owner of certain premises at Hornsey sought to get possession from a tenant who claimed protection under the Act. A private dwelling-house had been converted into flats, and the issue that the judge was required to determine was whether or not the premises had been really converted into two or more flats, as required by the Act, and the line taken by the defence was that the conversion was merely colourable, and that partitioning with asbestos sheets, which could easily be removed, made it quite practicable to restore the house to its former condition simply and inexpensively. Mr. Justice Roche, however, in delivering his judgment, seemed to give weight to the fact that "a great deal had been done in the way of providing additional lavatories, sinks, and so forth which was really substantial. These premises had, in his opinion, lost their identity, and although outwardly presenting the same appearance—considering the amount spent upon the reconstruction—it was quite inconceivable that the house would ever be restored to its former state," and he gave judgment for the plaintiff. It is useful to infer, from the terms of this judgment, that cost so largely affects the question of conversion!

Timber and Traction

There is a widespread opinion that slippery road-surfac are nowadays of much less consequence than they we before horse traffic was so largely superseded by motoı The president of the Federated Home-grown Timb Merchants' Association writes to correct or modify this ve natural misconception. He urges that, as we all kno horses are still very largely used in the hauling of timb grown in this country, and still fulfils many other service Horses will not become extinct while, as Mr. Horton say "it is impossible to get timber out of some places witho them." He adds that "there is a general tendency return to the use of horses, as under certain conditio they are a more economical proposition" than mot traction in the timber trade. In constructing roac therefore, it is wise to remember that horses will st traverse them, and do not like them of a degree of glaci like slipperiness that motorists willingly tolerate.

Damage from Pile-driving Vibrations

Once again the legal liabilities that lie in wait for t contractor who undertakes the operations of pile-drivi have been exemplified in the courts. Where formeı stood the premises of the Pearl Insurance Company London Bridge, a large new building is to be erected. give it good foundations, a concrete raft is to be constructe necessitating much pile-driving. As many as 671 pi have already been driven, and many more are wanted. four-story public-house in Thames Street, about 40 away from the pile-driving operations, was, it was alleg so shaken by them that it had to be taken down to t first floor, and the owners and the tenant sought an junction and damages against the contractors who co ducted the pile-driving. The injunction had beco superfluous, but the judge awarded damages, the amou of which was to be left to the decision of the Senior Offic Referee. Commenting on one of the arguments for t defence, Mr. Justice Astbury made an observation that probably destined to be cited as a precedent. "T defendants contended," he said, "that their action w lawful, and that the damage arose in consequence of t weak and unstable condition of the house. They cited fo cases in which judgments had been given which, they sa bore out their contention that the special condition of t house deprived the plaintiffs of a right to damages, but did not think they applied in the present case. In 19 the house was not a delicate instrument which, as su gested by the defendants, would be easily damaged by justifiable action. It was old, and built in an old fashi but on proper lines, and had been repaired in 1919 to t satisfaction of the district surveyor. There was no jus fication for its being shaken down in its declining age an adventurous and powerful neighbour. It was alarming proposition that one should have to consi such a question as, 'When did an old building lose right to protection?'" As the case seems likely to go appeal, we refrain from comment; but the facts speak themselves, and are sufficiently eloquent to warrant th citation here. A full report of the action is given page 774.

Building Guild Difficulties

The National Building Guild is realizing that the mu despised "capitalist system" has some virtue in it, af all. The Guild is badly in need of capital, and would glad to have had in reserve some of the £30,000 or m which it has paid out "for wet times, holidays, and si ness." We sincerely trust that the movement will not extinguished for want of the £50,000 loan that would it going again; if only because its continued existen would probably serve to correct other economic fallaci with respect to capital and labour.

Architects and Housing

By STANLEY HAMP, F.R.I.B.A., President of the Architectural Association

IT was with much interest that I read Mr. Maurice E. Webb's article on "Architects and Housing," which appeared in the issue of the Journal for November 15, and I should like to be allowed to add a few com- ents upon the subject, particularly as Mr. Webb has ferred to a remark I made in my address at the chitectural Association recently.

The subject, as we all know, has been discussed in its any and varied aspects by architects and builders, not mention Government officials, but Mr. Maurice Webb's ggestion is, I feel, the first practical step towards the only d right solution of the difficult problem. He quotes in pport of his views what architects have done in America, d it is a very strong argument indeed, and one which I pe will, even at this late hour, produce satisfactory sults.

In the first place, I think it of the greatest importance at we admit and agree the following premises :—

1. That trained architects are the right persons to design uses, large or small.

2. That the experienced builder is the right and only rson who should be entrusted with the building.

3. That the general public should be taught to recognize e wisdom of employing only the architect and the builder r the erection of their dwellings.

4. That only by the successful collaboration of the three terested parties can a satisfactory solution be found to e all-important housing problem.

I mean by the satisfactory collaboration the full recog- tion by all concerned of that appreciation of the funda- ental principle that we live not for ourselves but for the mmunity. That there is a meeting-ground where, with e desire to help and the desire to give one's best to a good use, the ultimate gain to be derived therefrom is of ite secondary importance.

We, as architects, must be prepared to give in the same y as the builder must be prepared to help, if we are to rive at a solution which will produce the goods, and pro- ice them not only on a sound economic foundation, but th, and in, a true architectural manner, upon which ture generations can look back with pleasure and gratitude those who have honestly tried to meet the needs of their ne.

The need for houses would by now have been much more ccessfully met if the architects and builders had been owed to work together without any form of Government terference. If the enormous capital which has been ovided by the Government and public bodies had been provided by them as an advance at a low interest for ivate enterprise, there is every reason to believe that full vantage would have been taken of such action on their rt, which would have produced in greater numbers uses where they were really required, and at a very much wer cost.

I am quite sure that the British people are sufficiently blic-spirited to have risen to the occasion. There would t have been a single responsible employer of labour, hether coal-owner, cotton spinner, shipbuilder or, indeed, e employer of the agricultural labourer, who would not ve realized the national need for the better housing of eir workers.

I venture to suggest that there would have been a com- titive spirit among all these employers of labour to show at they recognize that the man who works for their ofit is the better for the due consideration of his needs.

We are, fortunately, living in an age when workpeople e realizing that, if ever they are to rise above the beasts the field, they must have an environment which will stain a more hopeful and a happier condition. We are ld, and most of us from experience have found out, that as yet they do not realize that this improved condition does not, and need not, mean a reduction in their output. It is unfortunate that, through the misguided advice of their leaders, they have not yet realized fundamentals; they will do so in time, but it will be only after a period of tribulation. They have, however, a vision, but have yet to learn that to pass into the sunshine they must dispel the heavy clouds of suspicion; until they are prepared to become public-spirited there can be no mutual satisfaction.

It is, therefore, the duty of all those who employ labour to make an effort, even though at first it be misunderstood, to show and prove the principles for which they stand. It has been said many times, and particularly at a time when the working classes were asked to make the greatest of all sacrifices for their country, that a real effort would be made to make this country "a land fit for heroes to live in."

Let us not forget this, particularly as architects, for after all it would be a poor land indeed that would not provide the necessary buildings. This is a wealthy land even now, but no country is so wealthy that it can afford to erect houses that are economically unsound. There is no need for it—there never has been any need for it. The law of supply and demand is a law which underlies all commercial undertakings. The demand has been recognized by all—the supply has been limited by the unnecessary cost, and is due substantially to the wrong methods employed.

It is common knowledge that the Departments responsible began on wrong lines, causing chaos on all sides. They learnt their lesson half-heartedly, and even now do not understand why failure is written over their well-meant efforts.

It is another instance of "too many cooks," and also "the putting of the square peg into the round hole."

The trained architect became the Government official, the builder became the supervisor of other builders. The whole system was topsy-turvy—what else could one expect ? Each blamed the other, and the consequence has been that only those who knew their jobs least were in any sense the gainers.

Now to come back to Mr. Webb's proposal. As I said, it means to me just this, let the architects, even at this late hour, take their proper place, let them be responsible for the planning and designing of these buildings, and let them so do it that it will be to the advantage, and in fact will become the duty, of every one who builds, to build to a design that has been carefully worked out—worked out with a view and knowledge that these buildings, if they are to be erected, must not cost such a sum that, given a substantial financial contribution, at low interest, from the State, they are uneconomic.

There is no adequate reason, if architects fulfil their duties, why a well-designed house should be any more expensive than a building erected to designs prepared by an untrained man.

With close collaboration between the architect and the builder, it would be possible to arrive at a minimum cost, which has in the past been entirely prevented by expensive Government control.

I believe if the Royal Institute of British Architects, who are now taking this matter up, would do so with the full collaboration of the responsible contractors in this country, that such a book of plans could be produced, as was done in America, which would relieve the country of a great deal of unnecessary expense, and prove that the two important communities to advise best were, after all, those people who should at the first have been allowed to supply the demand.

Would it not be possible for the architects throughout the country to form themselves into groups representing different areas, with the object of collaborating with the local contractors, with a view to arriving at the most suitable and economical building which would justify the erection by private enterprise, supported by a generous advance from a Government or local authority?

If such a step were taken by the profession, and worked out somewhat on the lines adopted in America, it would, I am sure, prove to be the first real step toward solvin what is admitted by all to be a great need.

Such a step should be organized under the auspices o the R.I.B.A., and I feel confident that if the professio expressed any desire to promote any scheme of thi nature, it would receive the full support of its leading an governing body.

Modern German Architecture

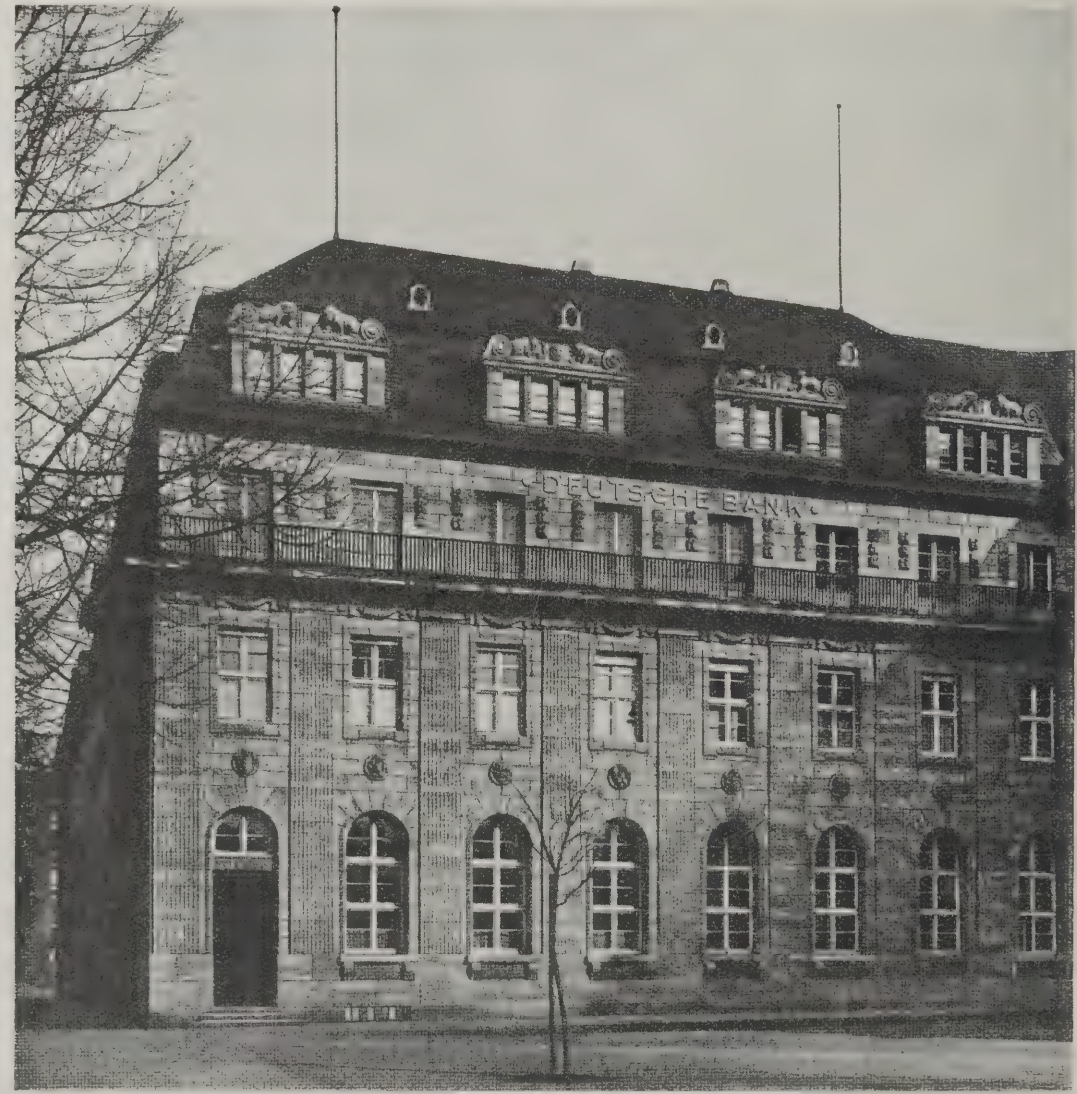
By H. J. BIRNSTINGL, A.R.I.B.A.

ONE of the attendant results of the development of modern scientific discoveries and inventions is the tendency toward the elimination of time and space. The history of the world's past now lies before us for our inspection, and news of any activity upon the world's surface is at our disposal within a few hours of its occurrence. Moreover, the unit for reckoning the length of time required for our own transportation to the ends of the earth has been adjusted from months to minutes.

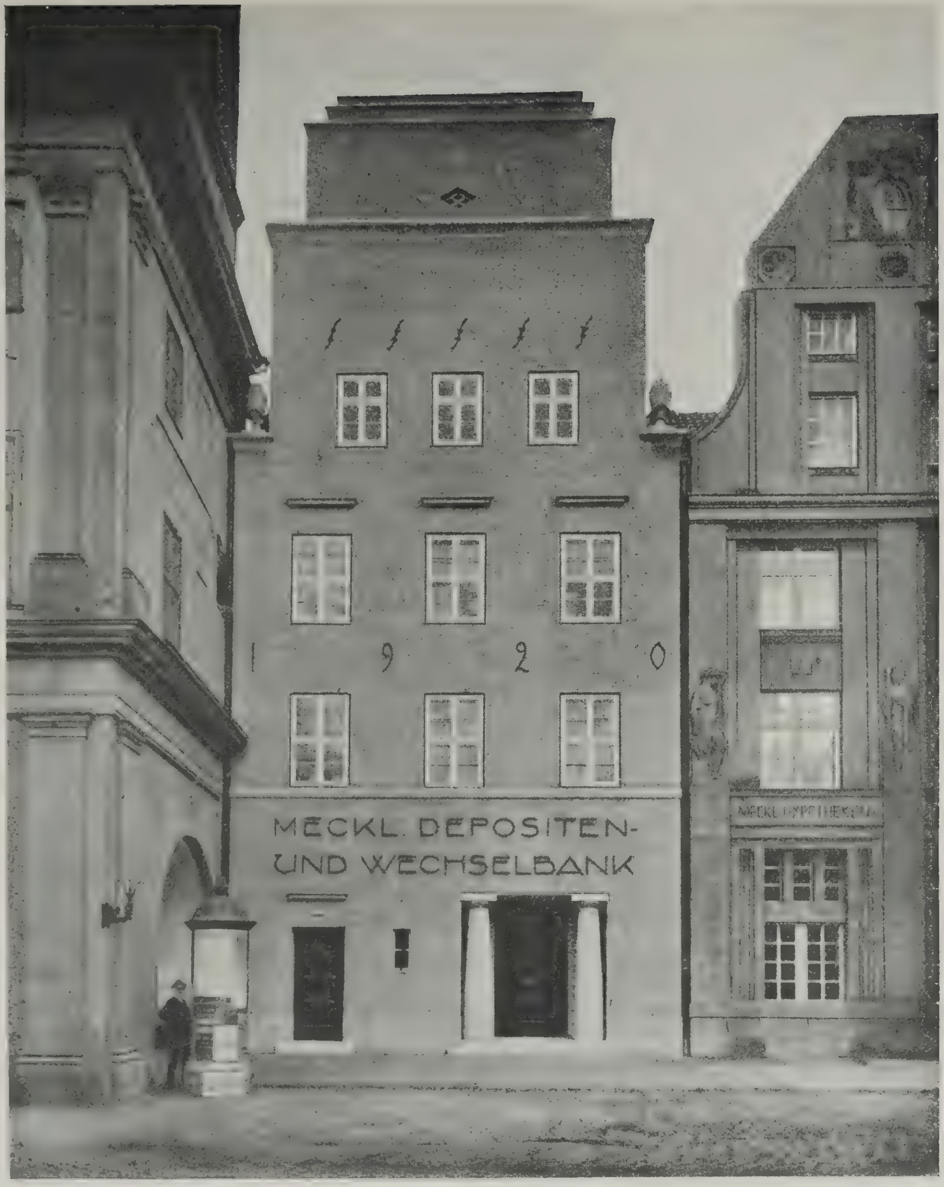
The effect of these developments—which, it must be remembered, have come about with surprising swiftness—must be felt in every branch of human activity; in art no less than in commerce; in literature no less than in politics. Our concern is with art, and here the effects seem to be two-fold. One is a growth of self-consciousness and deliberate selection—both of subject and treatment—resulting in a lack of spontaneity and vitality; the other is a rapid interchange of ideas which breaks down national characteristics In architecture both these effects, with certain strang limitations, are clearly observable.

There is to-day a constant talk about styles and treatment, in contradistinction to inspiration and evolution, an there is an interchange of national idiom, yet for som obscure reason, while the influence of French and America architecture is clearly discernible in our thought and in ou streets, that of Holland and Germany rarely finds its wa across the Channel. And this is all the more strange sinc in these countries architecture is acquiring a vitality tha is elsewhere often lacking.

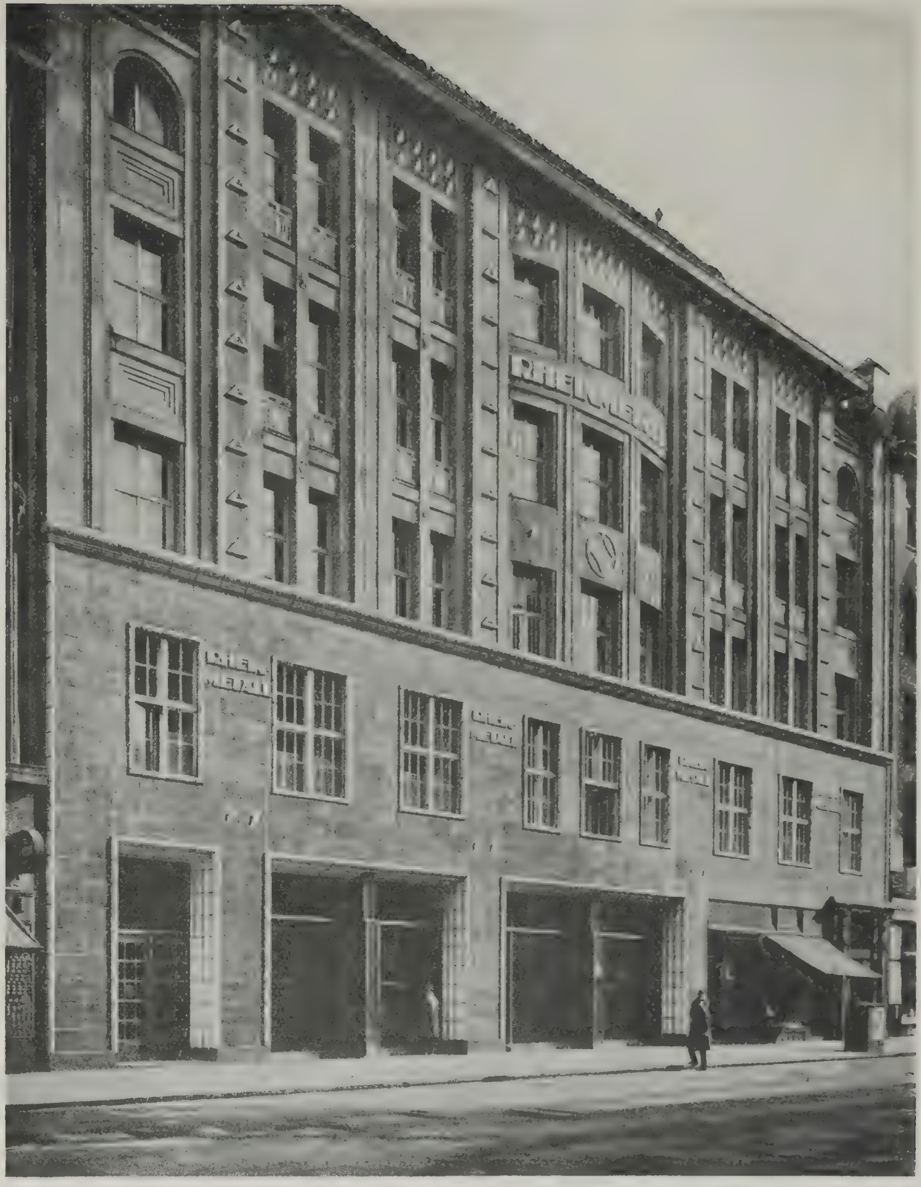
Some fifteen years ago an English traveller in German might have found cause for self-congratulation in thi insularity, since his sense of taste and decorum might hav been subjected to frequent outrage by the presence o certain buildings erected in a style known as *nouveau art*



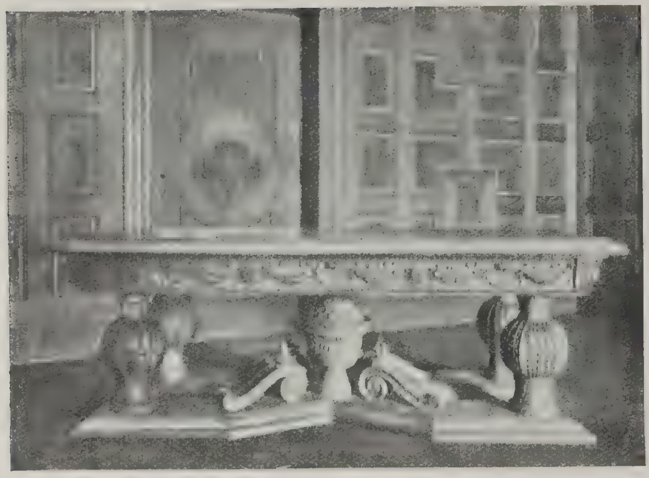
BANK PREMISES AT DARMSTADT. HANS JESSEN, ARCHITECT.



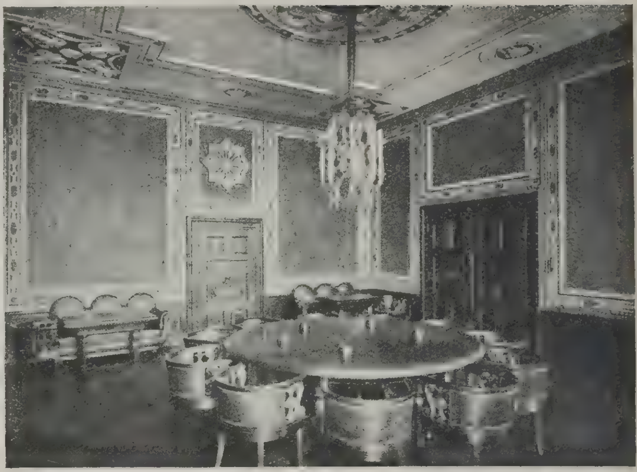
BANK AT ROSTOCK. HANS JESSEN, ARCHITECT.



THE RHEINMETAL COMPANY'S PREMISES, BERLIN. HANS JESSEN, ARCHITECT.



DETAILS OF FURNITURE.



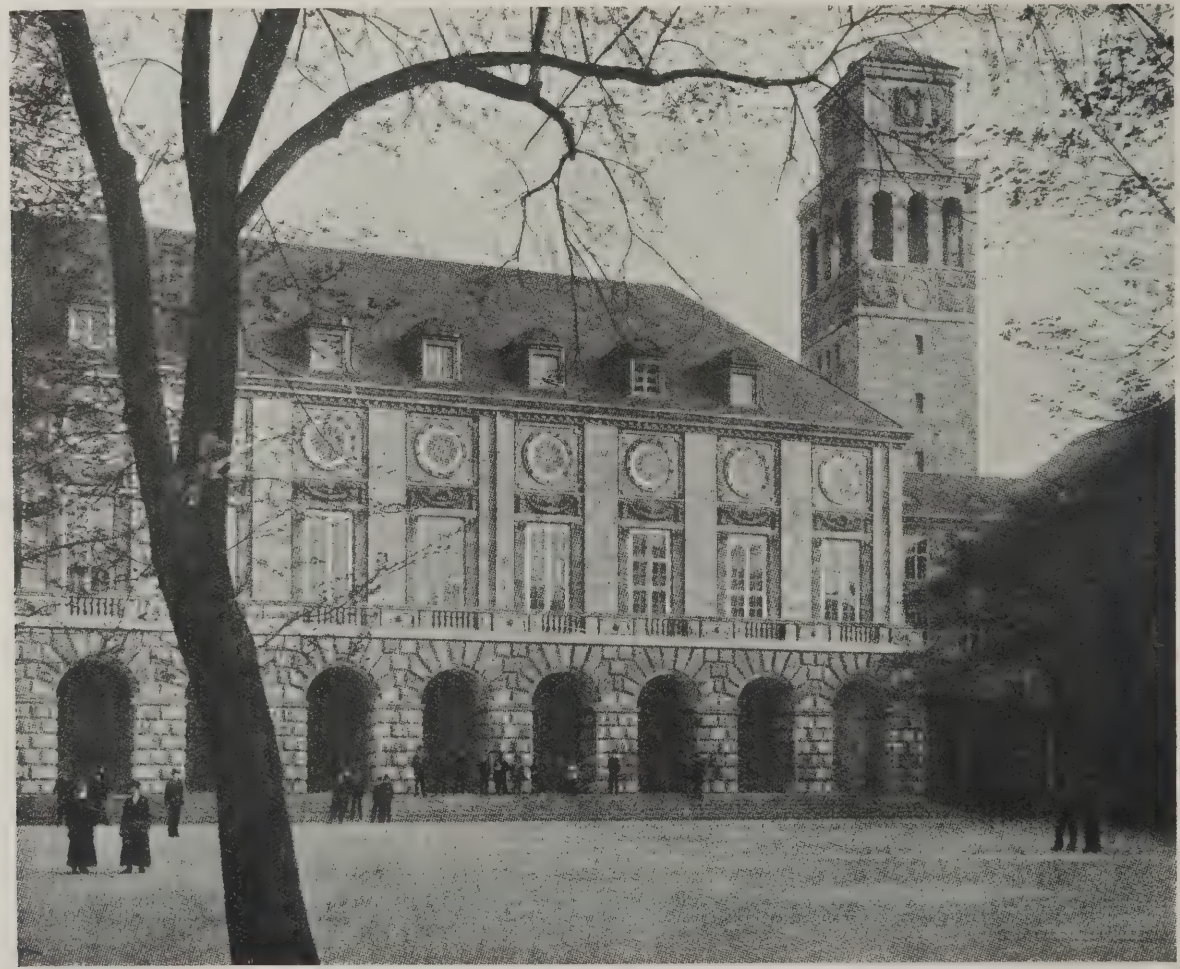
A SMALL COMMITTEE ROOM.

THE TOWN HALL, MÜLHEIM.

These buildings, which seemed to spring up like some miasmic growth, were characterized by a profusion of meandering curves and distortions. The same traveller returning now, however, would find that his congratulations were after all, perhaps, unmerited, for he would see that these erstwhile justly despised abominations have been contributive towards a new and vital epochal style largely purged of its former aggression and vulgarity.

The architecture which Western Europe has for the most part adopted, owes its origin to the Greek Orders, the knowledge of which spread from country to country after the Renaissance. The language of Western European architecture has been expressed in some modification of the classic idiom more or less consistently for the last five hundred years. And to state, as some purists will have it, that the architecture of ancient Greece is unsuited to the environment of a modern manufacturing town in northern latitudes is to ignore the actual sequence of events for the sake of an epigram. To premise the existence of an origin does not preclude development and modification from that origin to suit new conditions and to meet new emergencies. But architecture, like language, if it is to be kept vital must develop spontaneously. A language is kept alive by the introduction of new words and phrases to express the new reactions which arise as the world progresses, and no conscious revival of archaisms, no premeditated selection out of the past—about which we now know so much—would serve the same purpose.

Literature, like architecture, has its purists, who, selecting some period, would fence it in, excluding all growth, addition, or modification, or they would seek to reintroduce certain obsolete words and phrases. And literature, like architecture, has too its iconoclasts, who attempt to ignore the past and to startle by crude novelties. These



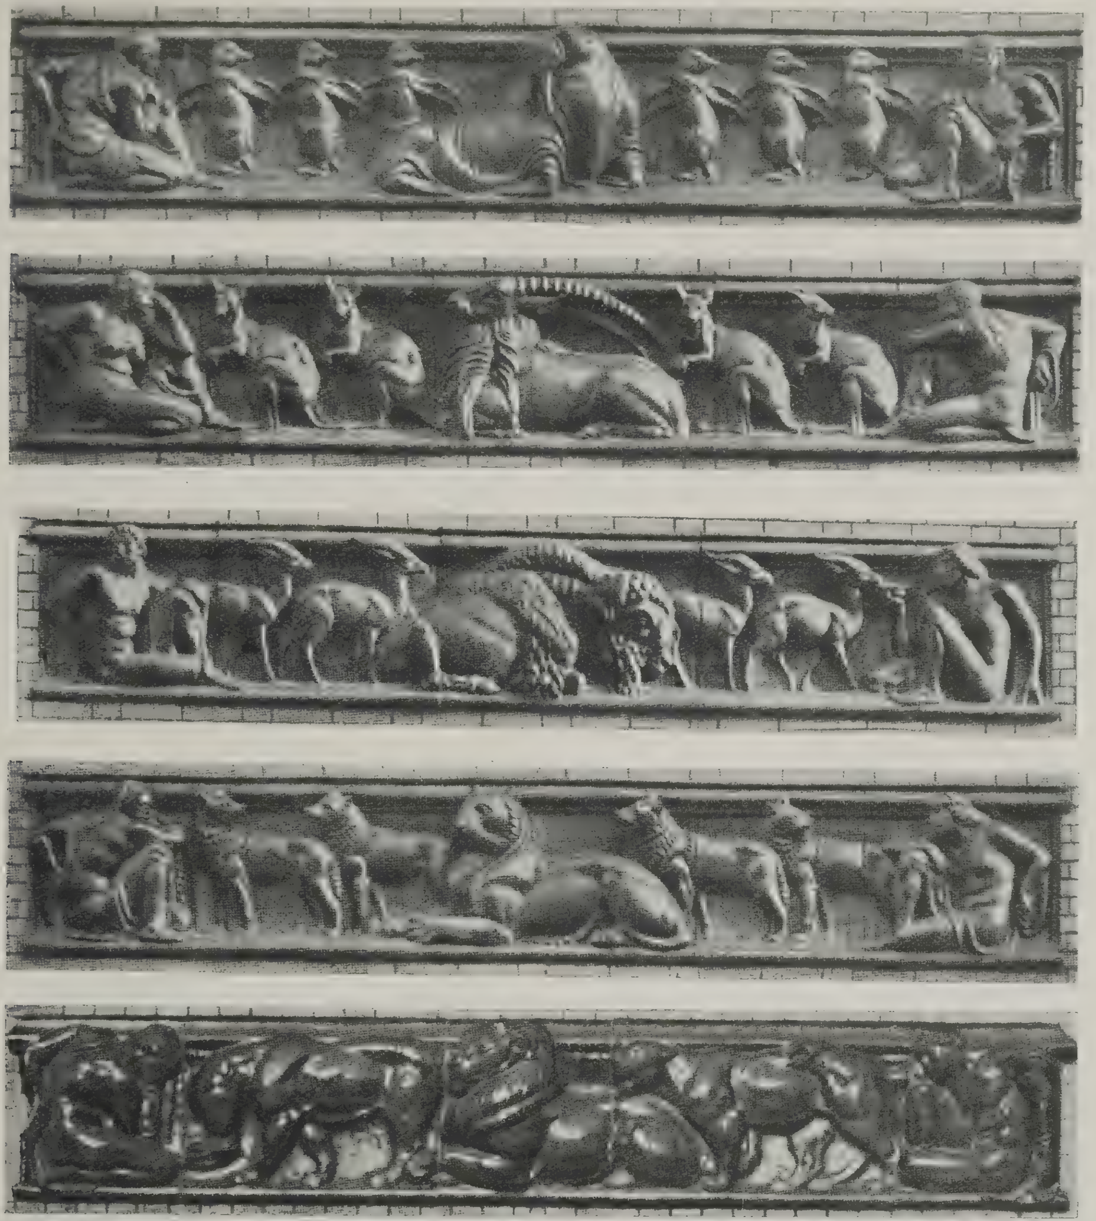
THE TOWN HALL, MÜLHEIM. PFEILER AND GROSYMANN, ARCHITECTS.

re the difficulties which inevitably arise with the growth f our knowledge of the past and our conquest of space.

To such meditations as these it is that an inspection of odern German architecture may well give rise. For the redominating impression, whether or no it be accompanied y æsthetic delight, is that here at least there is a vital rchitecture intimately connected with contemporary re-uirements, conditions, and aspirations; that is unself-onscious, and spontaneous, making full use of modern aterials by treating them according to their particular haracteristics instead of imitating the forms of others. here is, for the most part, about modern German work a rtain completeness and cleanness; there has been no arching through text books—of whatever scholarly igin—for choice bits of detail to be applied to blank aces, as icing sugar is applied to a cake. Each building a problem calling for a particular solution, and this lution is bound up with the purpose of the building and ith the selected material. The past is not ignored, but the esent seems to grow naturally from out of it, so that there an unbroken concatenation.

A matter of particular interest is the extensive use of ncrete, which has certainly influenced modern design. e plasticity of the material, its strength, both in com-ession and in tension, and (what we seem entirely to ore) its beautiful surfaces are all turned to good account. is used on all classes of buildings; on small houses and cottages, where, as with us, it is enlisted as an aid towards the easement of the housing shortage, but where, unlike us, the desire for economy at any price has not been made the ultimate value of success; on larger houses, where in addition to the more usual structural purposes it is cast for balustrades, garden seats and ornaments, chimney pots; on commercial and public buildings, where its particular qualities are employed to give an unusually bold sweep to a staircase or cantilever gallery. In certain buildings, particularly large stores and warehouses, there is a marked growth of verticality, and a kind of Gothic tendency is discernible. Instead of a main or superimposed order, moulded piers run the full height of the building to a widely overhanging but simply moulded cornice surmounted, perhaps, by a pantiled mansard. The position of the floors is indicated by moulded or decorated panels. The decorations themselves are often crude, but at least there is about them a vitality, and they often express the vigour and unrest of modern life with far more accuracy than the most delicate rendering of the correct classic detail.

In most of the buildings their classical descent is easily discernible, the familiar elements are there, but a subservience to archæological correctness has not been allowed to hinder a natural and spontaneous development. There is no obsequious respect for the past, and yet there is no repudiation of it. In judging architecture, by reason of its intimate connection with life, it is impossible to adopt



THE WOLF NEWS AGENCY BUILDINGS, BERLIN: DETAILS OF SCULPTURED PANELS. HANS JESSEN, ARCHITECT.

any absolute standards, and to some extent it must, or should—and its success is to some extent a measure of this—be an indication of national traits and characteristics. In this way we may not only account for, but indeed expect, a certain pomposity and heaviness, and this it is that is so often disagreeable to us who are accustomed to more lightness and humour.

A feature which distinguishes much German architecture is the use it makes of the various subservient art forms, there exists a collaboration with painter and sculptor such as we are now beginning to aim at and rarely achieve. This it is which is largely responsible for the sense of coherence and completeness that emanates from much of the German work. Indeed, architecture is a part of the contemporary art movement; a most important part, and the position of the architect as collator of diverse artistic forces is realized and appreciated. Much of the interior decoration shows a preference for bold polychromatic effects, but these always fit into the general scheme, and suggest not so much an extraneous and subsequent application as an integral part of the original conception.

Germany is rich in baroque and rococo architecture, and its influence is clearly discernible in much of the modern work, particularly in interior decorations where, together with certain traditional forms of geometrical panelling, it is synthesized into new forms. In most of such work a considerable softening can be noticed in comparison with that of the first decade of this century. The crudities of the Wiesbaden Kurhaus are no longer repeated. Architecture is often seen to act in a restraining capacity, keeping the plastic arts within reasonable limits and checking the more unruly spirits whose sole object is to astonish.

A superficial resemblance to Gothic, which has already been noted in the verticality of treatment, is found again in the use which is made in decoration of animal and vegetable forms. It is realized that honeysuckle and acanthus are not the only plants that can be conventionalized into a running ornament; moreover, there is a tendency to reintroduce the habit of varying the capitals and the like, to give each a particular interest instead of relying on endless and perfected repetition of one design. In this way an almost infinite variation is obtainable which gives a new interest to street architecture; an interest which is felt and appreciated by the general public.

This co-operation on the part of the general public—and an intelligent interest certainly amounts to as much—is an important factor in Germany. There is a constant interaction between architects and the public making for a living and human architecture. And this interest is by no means confined to architecture, but concerns itself with the less important matters of daily life; for this reason the general standard of such things as the dust wrappers of books, posters, cigarette packings, and the like, is particularly high. In Germany, indeed, we see the value of an aroused civic consciousness to matters which make for æsthetic amenity. It is another aspect of the subordination of the individual for the benefit of the community, which has been such an essential factor in the production of the various successful town-planning schemes.

No account of the contemporary architecture of any country would be complete without some allusion to housing. Despite intense economic difficulties Germany has made a brave attempt to ease the housing shortage, and much of the work is of a high quality. There does not seem to have been a determination to sacrifice good building for cheapness.

A common practice is to construct the walls up to first-floor level of brickwork or concrete, placing the first floor itself in a mansard roof with timbered gable ends. The houses are often cellared. Sometimes the ground floor is raised about three feet above the ground level, the entrance being on to a half-landing going up to the ground floor and down to the cellars. The bedroom accommodation consists of two or three rooms, but very rarely four as with our B4 type of house. There is ample storage, and the houses generally have an air of spaciousness. Except in very isolated positions, electric light is provided, run on open wiring. In larger schemes there is often very effective grouping, and at times some daring effects are obtained by blank surfaces and a concentration of windows at certain points;—an arrangement which is favoured by both Dutch and German architects, and which has a curious affinity with the wooden German toys which are still the delight of half the world's childhood. There is not the same tradition in the use of brickwork, or in domestic architecture generally, in Germany as in England, so that novel uses of these materials do not surprise and shock, as they might well do in our own richly endowed country.

Æsthetic appreciation is largely a matter of habit and convention, and it must therefore not be allowed entirely to dominate our judgment of architecture. Assessed by broad standards, there is much that is worthy of admiration and emulation in modern German work, notably its completeness and its intimacy with modern contemporary life (that some may see fit to despise and deplore the age in which they live is another consideration, but that in such cases architecture should be exempt from inclusion in such a general condemnation is rather to its discredit than otherwise). Although hitherto its influence has not been felt in England, there are signs of a change. The recent International Theatre Exhibition showed the alert attitude of German architects towards the theatre, and the exhibition of English students' work in Holland is indicative of an interchange of ideas between the two countries, and architecturally, as geographically, Holland and Germany are not far removed.

Whalley Abbey

When abbeys are bought and sold there seems something almost sacrilegious in the transaction. One does not like to see such buildings turned to secular or vulgar uses, as too commonly they are. It may be safely assumed that Whalley Abbey, though bought and sold, has escaped all degradation save that which over-fastidious minds may choose to see in the process of barter; for it has become the property of the Church of England, who contemplate using it as a conference house, a small theological college, or a home for the Bishop of Blackburn (for the housing question is acute even among Church dignitaries), and surely none of these uses would cause its venerable stones to cry out aloud against profanation. It is said that the earliest parts of the abbey date from 1330, and that the main abbey buildings and the cloisters are, in auctioneering language, "in an excellent state of preservation." Even if they were not, the grouting machine would soon make them sound.

Houses on Bridges

Mr. Thomas E. Collcutt, P.P.R.I.B.A., revives in "The Daily Telegraph" a proposition he made in 1906 for building houses on bridges. In that year his suggestion had special reference to proposed new bridges at Charing Cross. His objective now is the proposed new St. Paul's Bridge, which, he urges, should be constructed 50 ft. wider than at present contemplated, and should be built upon with business premises. The objection that the building of houses on a Thames bridge would spoil the beauty of the river by obstructing the view he meets with the contention that, "looking either from Blackfriars or Southwark Bridge, a new St. Paul's Bridge could be treated so as to produce a magnificent architectural picture," and that "a bridge with houses cannot spoil the view of the river, but, on the contrary, would add to its beauty by a feature of architectural magnificence, adding, also, to the wealth of a great city." Of course, Mr. Collcutt does not claim originality for the substantive idea. The London Bridge which was begun about 1176 by Peter of Colechurch, and completed in 1209, had houses on each side, connected together by large arches of timber, which crossed the street. In 1212 it was destroyed by fire, and later London Bridges were destroyed, respectively, in 1471, 1632, and 1725, and the houses that were on the bridge in 1756 were then pulled down.

The Point of View in the Study of Architecture

By EDWARD WARREN, F.R.I.B.A.

THE first of a course of lectures on architecture, in connection with the Oxfordshire Society of Architects, was given in the Town Hall on Friday, November 17th, under the chairmanship of the President of Magdalen.

Mr. Edward Warren, F.R.I.B.A., who dealt with "The Point of View in the Study of Architecture," said that at a moment like this, when we were faced with national and social considerations of an order considered by many to outweigh even the claims of Art, the inauguration of a series of lectures upon Architecture, the Mistress of the Arts, might seem ill timed.

But Art was long and her needs were permanent. One of the most pressing of those needs was the serious and well directed study of them, and this must go on though governments changed and general elections supervened. For the rest, the Scheme of Architectural Lectures, which, as President of an Association embracing the Architectural Societies of Oxfordshire, Berkshire, and Buckinghamshire, he had been called upon to inaugurate, was evolved, and the date of that inauguration fixed, before the political barometer showed any signs of immediate disturbance.

A group of architects, many of them Oxford men, others more or less intimately connected with Oxford, and all keenly interested in the furtherance of architecture through he training of the present, and future, generations of architects, and the widening and deepening of the sympahetic knowledge of the art of architecture in the minds of educated men, had, for several years, looked to Oxford as a great educational centre peculiarly endowed, morally and materially, for the study of that art.

Others of the great Universities of Europe and America were teaching, and had long taught, architecture. Some of them, though relatively few, were situated in beautiful owns. Was there one that, within so condensed a compass, ould outrival Oxford in local charm and architectural haracter?

The one rival to Oxford in these islands, in so many ields intellectual and athletic, and possessing, it must be admitted even there, *some* rival claims to Architectural distinction, Cambridge, had for several years devoted very erious attention to the teaching of architecture, and had gone so far as to grant degrees in that art—farther, he might ay in parenthesis, than we would venture to suggest to Oxford.

To the world in general, he asked, what mental image did he name of Oxford evoke? To those even who merely knew the city by pictorial presentment, as a town of towers and spires, of colleges and quadrangles, and of dominant nd dignified university buildings divided by ancient treets and ways, interspersed with trees and gardens, girt by little rivers and entered over ancient bridges.

To those who intimately knew and loved the city —and the terms in this case were almost synonymous —especially to those who had passed some of the most mpressionable years of their youth within her walls, he image was an architectural image. The instinct o which the beauty and dignity of these buildings were due was a sure instinct, that of expressing the nobility of "true religion" by noble architecture, and the dignity of "sound earning" by the dignified housing of scholarship. Oxford eing what Oxford is, could they doubt for a moment hat she had unconscious influence on all receptive minds, which rendered her pre-eminently fit for the conscious and arefully ordained training of students of the great art f which she was so conspicuous an exemplar? She umbered amongst her sons the great name, the greatest ndeed amongst British architects, of Christopher Wren, as well as such names as John Ruskin and William Morris. The influence of the latter had been revolutionary, or rather revivifying, and had spread throughout the civilized world. He was, perhaps, trying to convince the already convinced as to the pre-eminent fitness of Oxford for a school of Architecture. Their lectures then were, they hoped, forerunners of such a school, and they had the immediate hope that they might be accompanied by classes in architecture, construction, and design, primarily intended for young men studying architecture with a view to its practice, whether members of the University, or pupils, or assistants in the offices of Oxford architects, but open to all serious students who would follow a definite course of training. The lecturer then dealt with the style, or manner, of buildings in different countries, and went on to say that style, or manner, of building had arisen, naturally, from building necessities and materials, and this he held to be strictly true of all real styles or constructive manners, but it did not, of course, cover adopted, or half adopted, fashions in architecture, or attempted revivals of ancient manners. In England, and markedly in Oxford, the native, local style of building lingered long after the half-hearted adoption of a foreign manner, known as that of the Renaissance, and derived from the French, the Flemings, and the Germans, who were copying the Italians, who were copying, more or less, the remains of Roman buildings and Greek statuary, which they were rediscovering. The acceptation in this country was for a long time slow and half-hearted, and, throughout England, and more particularly in the West, there were many curious and interesting instances of survivals of, and reversions to, the native manner of Gothic architecture, but none, so far as he was aware, more marked than in Oxford, which had been called the "home of lost causes," and had certainly been so in regard to native Gothic architecture, when that was already a lost cause elsewhere. To the student of architecture, continued the lecturer, and especially to those who were studying it with a view to its practice, that deepening of consciousness as to all forms of buildings and their accessories was inevitable and necessary. They must have a point of view and a critical one; they must acquire a fair knowledge of the constructive history of their craft, as well as of the recognized and accepted rules of modern construction. Some knowledge also, not necessarily deep, but accurate as far as it went, of social history and its manifestations in architecture was absolutely necessary. Domestic architecture in especial was the most vivid illustration of social history. Architecture as an illustration of history, and history as an explanation of architecture, were such fascinating studies in themselves, that the true student of either would inevitably be drawn to the other. But no mere historical, or archæological reading, would lead them far in the understanding of architecture without the earnest study of its basic principles, its constructive needs, and their expression in proportion, balance, and harmony, its protective necessities, and their acceptation and treatment as contributive accessories of design.

Architecture throughout all ages was much more influenced by the needs and desires of individual races or human groups, than by borrowed tradition or successive fashions, though superficially it had been greatly influenced by these. The measure of that influence could only be gauged through history, and that most important, highly specialized, and illuminative branch of history which was archæology.

Archæology to the creative architect was, like fire, a good servant but a bad master. It helped him immensely in understanding the form and purport of ancient buildings, and the symbolic or decorative details of their ornament; it might greatly help him towards interpreting their structure, by its teaching as to the ascertained nature, preparation, and use of materials. So far it was an admirable aid, a good servant.

But the misguided man who accepted the dicta of archæology as authoritative rules for the design or ornamentation of his work had got a bad master, and was doomed to artistic slavery and sterile dullness.

Historical and archæological study would never make an architect, but their neglect would deprive him of that note of scholarship in his work which appealed to the scholarship of educated people, and of that immensely increased interest in his own art which so much enhanced the happiness and value of his life.

To make full use of the "Open Book," the illustrated sequence of architecture presented by Oxford, one needed some knowledge of general, and a good deal of building, history. That sequence was singularly complete since the date of that inestimable boon to British architecture, the Norman Conquest.

"I do not attempt to describe these buildings," concluded the lecturer, "they are before you, the chief illustrations of the 'Open Book.' I merely desire to draw your attention to their educative sequence and the great and privileged opportunity of study they present to Oxford students of architecture."

Good manners in architecture were at least as important as in anything else, and were especially so in towns and on sites in streets or groups of buildings.

This gate, together with the piers, was added to the Treasurer's House in the eighteenth century when the front of the building was altered. It is one of the many fine examples of smiths' work in York. Two interesting features of the brick coping are the deep weathering and the dog-tooth course. The Treasurer's House is a mediæval building, the original exterior of which was built by Sir George Young about 1620. Alterations were made to the interior of the building in 1695 to 1700.

Africa House, Kingsway

TREHEARNE and NORMAN, Architects

WITH the erection of Africa House the last site in Kingsway is taken up, and the thoroughfare is now completely lined with buildings on both sides. This process of filling in has been proceeding since 1905, when the Kingsway was first opened to traffic. Even now the island site between Aldwych and the Strand is not completely developed, both sides of Bush House still remaining vacant. These, however, are expected to be occupied very shortly by the wing appendages to the main Bush block.

Messrs. Trehearne and Norman, who have designed many of the new buildings of Kingsway, are also responsible for Africa House. This building is undoubtedly the most striking of their designs; it sounds quite a new note in commercial architecture, not only for Kingsway but for London.

In general conception it has a good deal in common with modern American work; there is the same sense of scale and proportion, the same reticence in elevational treatment. The use of a huge Order embracing the two lowest stories, and the setback of the two topmost floors, are also reminiscent of current Trans-atlantic practice. From Kingsway this setback is very effective; but towards the rear, the building falls by rapidly diminishing stages to the height of only two floors, and the composition loses coherence. This unfortunate "falling-away" is not a wilful declension of the architects, but an unfortunate necessity due to the exigencies of "ancient lights." But unless one has approached the building from Lincoln's Inn its rearward disability is not noticed; towards Kingsway the structure presents a bold imposing front.

Due emphasis has been given to the principal entrance which, occupying the height of two floors, is fitted with some well-designed wrought-iron gates. The architectural surround to this entrance has quite an Egyptian feeling, which is heightened by a pair of sphinxes above the first-floor cornice level. A point about which there may be some difference of opinion is the breaking of the continuity of the façade by the interposition of columns as a central feature between the third and seventh floors. The continuance of the window treatment would possibly have been more effective in the elevational sense, besides providing a more satisfactory support for the mass of sculpture above the main cornice. Whatever small points of criticism may be raised, however, the building remains a notably fine addition to the commercial architecture of the Metropolis.

The building was erected during a period of great labour difficulty and anxiety, but, even so, the contract was completed within a time comparable with others carried out in less difficult times. The outer walls of the building are of Portland stone and brickwork, and where

THE PASSENGER LIFTS IN AFRICA HOUSE.

it is necessary to carry weight blue bricks have been used. There is no steelwork in these outside walls.

Below the ground floor all the work is in mass concrete piers with B.R.C. reinforced concrete floors and stanchions, and at the ground floor level the supporting columns are of solid stone stressed up to 16 tons per foot.

Inside the building there are two marble staircases each having a bronze cast and chased balustrading from the entrance hall to the first floor. The marblework to the entrance hall is first and second statuary marble with Belgium black and pale sienna with *lapis lazuli* bands and borders to staircase dado, etc. In the directors' offices and boardroom the scheme of panelling has been carried out in selected African mahogany; so maintaining the African atmosphere as stressed by the carving on the front elevation of the building.

Much care and thought were expended by the architects when designing the building, to ensure that the main passenger-lift installation should be the very best obtainable; many new and ingenious features in modern lift practice were decided upon. The result is an excellent lift service. The two main express passenger lifts are situated in the entrance hall, and run at a speed of 300 ft. per minute. Both lifts serve nine floors and travel a distance of 100 ft. approx. They are operated by attendants by means of special switches in the cars. The controllers are fitted with latest improved decelerators, which ensure perfect slowing-down on reaching the floor levels, and eliminate all trace of that objectionable jolting often experienced in most high-speed lifts.

A very pleasing feature is the way in which the threshold at each floor is illuminated. This is automatically done when a passenger rings for the lift, and extinguished as the car leaves the landing.

The indicator system is ingenious. An illuminated indicator is fixed in the car and shows the attendant at which floor his car is required. The great feature of this system is that the attendant cannot tamper with the indicator, and it can only be extinguished when he has gone to the particular floor, taken his passengers aboard, and closed the landing gate.

The indicator is then automatically extinguished on the car leaving the landing. In addition, a special illuminated floor indicator is fixed in the entrance hall which automatically shows the position of both lifts at any time.

A further improvement is the way in which the safety locking apparatus is arranged on the landing gates. In addition to the ordinary safety arrangements (i.e., the lifts cannot be operated until all gates are properly locked, and no gate can be opened until the car is opposite the landing), the lifts are fitted with a special automatic device to do away with all knocking of lock-levers as the car passes the various landings. This is a most necessary improvement where a large number of floors is concerned.

The usual devices to ensure perfect safety—such as safety gear and high-speed governor gear—have also been employed.

The tiling consists of 10 in. squares of buff colour, with 2 in. black lines between. About 5,000 sq. yds. have been covered, and the total weight is approximately 40 tons. The tiling has been laid on a concrete floor, which has proved eminently satisfactory for the purpose, and, of course, the great benefit of such a floor is that not only is it sanitary, but very silent.

Practically the whole of the excavations have been re-used in the foundation after having been washed, crushed, and converted into concrete. About 400 men have been continuously employed on the job, and the value of the builder's plant alone has amounted to about £40,000.

The following quantities of materials were used in the erection of the building over a million and a quarter bricks; over 50,000 cub. ft. of Portland stone; over 40 tons of lead; over 7,500 yd. of rubber flooring; and over 25,000 ft. super. o glass.

Mr. F. B. Nicholson was the consulting engineer for the electric light and power installation, and Mr. A. H. Barker fo the heating and ventilation.

The general contractors were Messrs Bovis, Ltd., and the sub-contractors were as follows: Edw. Wood & Co., Ltd., o Manchester (steelwork); Medways Safety Lift Co. (main passenger lifts and electri goods hoist); Waygood-Otis, Ltd. (stai lifts); Nine Elms Stone Co. (stonework) Luxfer Co., and C. E. Welstead, Ltd., o

TWO INTERIOR VIEWS IN AFRICA HOUSE, KINGSWAY. TREHEARNE AND NORMAN, ARCHITECTS.

Croydon (metal casements); British Reinforced Concrete Co. (reinforced concrete floors); Farmer and Brindley (marble work); W. B. Simpson and Sons, Ltd. (tiles); Leyland and Birmingham Rubber Co. (rubber floors); H. Pontifex and Sons, and Shanks & Co. (sanitary fittings); Strode & Co., Ltd. (electrical work, iron doors, side entrances, and fire-hydrant main); J. W. Singer & Co. (iron entrance gates and doors); Benham and Sons, Ltd. (heating); Empire Stone Co. (staircases); Lion Foundry Co., Ltd. (escape staircases); Stone & Co., of Deptford (fire hydrant fittings); Acme Flooring and Paving Co., Ltd. (wood block-floors); Siemens Bros. & Co., Ltd. (telephones); E. Shipton & Co. (call bells); Pyrene Co., Ltd. (fire extinguishers); F. B. Francis (carving); G. Jackson and Sons (fibrous plaster); James Gibbons, Ltd. (locks and furniture); Milner's Safe Co., Ltd. (strong rooms); Thos. Faldo & Co., Ltd. (asphalte); and Collyer and Son (shop fitting).

The whole of the internal solid plastering was carried out by The Grano-Metallic Paving and Plastering Co., Ltd., the ceilings being executed in ordinary plastering and the walls in Keene's Cement. The "Malcrete" flooring of the Grano-Paving and Plastering Co., Ltd., was put down in the basement. Mr. F. T. Wood acted as clerk of works.

A detail drawing of the centre bays of the principal elevation is reproduced on page 766.

The R.I.B.A. War Memorial

TRENWITH WILLS, A.R.I.B.A., Architect

An impressive ceremony took place at the R.I.B.A. on November 20, when the Earl of Crawford and Balcarres, late First Commissioner of Works, unveiled a war memorial tablet containing the names of 232 members and students of the Royal Institute who laid down their lives during the Great War. The memorial contains the name of Field-Marshal Lord Kitchener, who was an Honorary Fellow of the Royal Institute.

Lord Crawford was received by the President, and by the Past-President, Mr. John W. Simpson, who was the assessor in the competition for the war memorial, and presented to his lordship Mr. Trenwith Wills, A.R.I.B.A., the designer of the memorial.

Addressing those present, Lord Crawford said: We commemorate our brother architects whose paths had seemed to be in peace, whose work was destined to be wrought in harmony, until they heard that great rending cry:—

"Quiet, untroubled soul, awake, awake!
Arm, fight and conquer for fair England's
sake!"

Hearing they answered, and answering
they gave their lives.

Two hundred and thirty Fellows, Associates, and Students of the R.I.B.A. were killed. Here is the list—their honoured names—no mere census sheet, but a roll of honour which records achievement; the same act of sacrifice accomplished by every one of them, but each in its different way, and each with the grandeur of personality in its suffering and abnegation.

On these occasions we are, perhaps, too liable to assess that equilibrium of sorrow; too ready to dwell upon the pathos of young life abruptly cut short. What secrets lie unrevealed in these tragic columns; what hopes and aspirations unfulfilled, alas! what poignant grief in the circles of family and home. Gone they are; dead we must reckon them to be, but though dead we must not look upon them as absent, since they still speak to those who survive, and will ever recall that without their agency all that we value as individuals, all that is most precious to our citizenship, all, indeed, which gives us the freedom of ourselves and of our country, would have been overwhelmed in disaster.

So let us take comfort, since glory is never without its measure of happiness. And who shall say that they missed their chosen career? They were indeed, great architects who built up the stalwart bulwarks of our Empire's defence with the very body of their death. Their creative genius has realized a fuller expression in that their earthly ideals have been translated into terms of spiritual reality, whose souls and sacrifices form even now a part of the great Temple not made with hands.

Nevertheless, our mourning should not be concealed. We shall never know the real extent of our loss, but if, as we hope, there are to-day the stirrings of a Renaissance in the noblest of the arts; if with that coming generation we are to witness the fruits of long and patient enterprise, of growing and more discerning appreciation of that improved organization and equipment on which such earnest effort is being expended, we must weep for much young talent that has been dispersed, lamenting that so many who were born to observe order and comeliness should have saved them for us at the cost of their lives.

Let us be thankful that so many of their comrades were spared. One thousand civilians issued from the peaceable calling of the architectural world, ready to die like the rest of them as soldiers; these are with us to-day. Their names do not appear on the altar stone of the Royal Institute. Upon them must fall the burden of carrying on the traditions of British art; of maintaining the high standard of public spirit, of duty—above all they will hand on to their successors the names of those whose hard lot they were ready to share. They will honour those who died, those for whom the thirst for truth and beauty (the artist's ceaseless quest), must at length have found its satisfaction at the very source of Beauty and Truth, where Eternity affirms the conception of an hour!

Four long years have now passed since upon the high and perilous peaks of victory our brothers laid the foundations of peace. We have still to erect that vast structure through toil and tempest, and through time. With undiminished faithfulness, with hearts which no tribulation can wear down, and which no discouragement shall turn aside, let us go forward and build.

To their victorious memory I have the honour, with deep reverence, to unveil this memorial.

Lord Crawford then unveiled the bronze tablet, and the Rector of St. George's, Hanover Square (The Rev. Prebendary F. N. Thicknesse), performed the dedication ceremony.

Proposing a vote of thanks to Lord Crawford, Mr. Waterhouse expressed his gratitude to Canon Thicknesse for regarding the R.I.B.A. as a corporate parishioner and for dedicating the memorial, and to Mr. Trenwith Wills for the work he had performed in connection with it.

He then said:—The claim that the poets have upon mankind is twofold, represents a double debt. First that they seize, and render into words, thoughts that would otherwise go unexpressed, and further, that they crystallize as thoughts vague aspirations and unformed regrets, or shapeless unsubstantial wonderings, thus—by creative contact with ourselves—making a mental treasure house of what unhelped by them, were chaos of the mind.

Lord Crawford, in his words to us to-day, has been *our* poet. He has framed in speech—beautiful speech—many unspoken thoughts which, even if spoken by us, certainly could not have reached his level of utterance.

Nay more. As a true poet he has left thoughts rising in our hearts, uplifting thoughts, which, if they are our own, are none the less born of the inspiration of his words.

In thanking him for this we thank him also in that this bronze (itself a message bearer) will, to the eyes and memories of those who have been here with us this afternoon, speak, when they look on it from day to day, not merely with the voice of reverent and ever-affectionate homage to the dead, but also with an echo of the words spoken so helpfully by him to-day.

Lord Crawford, in the name of architects who mourn the loss of comrades, brothers, sons, and in the name of parents and of those, whoever they may be, who, standing here, see on this bronze the name of one of those who

"Added love to love by severing
In love's own name some dearest tie
of love"

I thank you; and the thanks spring from the heart.

Mr. Keen seconded the vote of thanks, and said that Lord Crawford had identified himself with the Institute, and was always ready to help members, besides sharing in their loss and sorrow.

An illustration of the war memorial tablet is given on page 745.

Africa House is the most striking of the many buildings erected in Kingsway from the designs of Messrs. Trehearne and Norman. The detail illustrated above is of the centre bays on the principal elevation. Stone and brickwork have been used for the construction of the outer walls, and blue bricks where it is necessary to carry weight. There is no steelwork in the outer walls. A full description of the building is given in the article which begins on page 758.

Illuminating Engineering in Relation to Architecture

By LAWRENCE M. TYE

MR. LAWRENCE M. TYE read before the R.I.B.A. last week a paper on "Illuminating Engineering in Relation to Architecture." The President, Mr. Paul Waterhouse, occupied the chair, and among those present as guests were: Sir John H. Parsons (President of the Illuminating Engineering Society); Mr. W. R. Rawlings (Past President of the Electrical Contractors' Association); Captain E. Stroud (Chief Technical Engineer, Holophane, Ltd.); Mr. L. Gaster (Hon. Secretary, Illuminating Engineering Society); Mr. J. S. Dow (Asst. Hon. Secretary, Illuminating Engineering Society). Mr. Tye said: The success of gas and electricity as illuminants, particularly with subsequent progress in their efficiency, has led to the enormous application of artificial lighting, and installations have been made indiscriminately, in many cases without any regard being paid to physiological requirements or its application to get the best effects.

In the first place this advancement in the efficiency of illuminants has brought with it such high values of intrinsic brilliancy or surface brightness that it becomes positively dangerous, apart from discomfort from the point of view of vision, to employ modern light sources without due precaution being taken to suppress glare, quite apart from matters of light distribution.

As an example, with our early oil lamps the intrinsic brilliancy of the source was in the order of 3-8 candles per sq. in. In the case of the modern gas-filled electric lamp this figure has reached as high a value as 2,000 candles per sq. in. This in contrast to the brightness of average white sky, which is given as in the order of 2.5 candles per sq. in.

This consideration brings us to the fact that there is a correct standard or intensity of illumination for any given class of service: thus by under or over lighting a given area you produce an unnatural condition upon the eye with the result that eye strain and consequent fatigue sets in.

These standards have been carefully collated by illuminating engineers, operators, and specialists on eyesight, and a table is generally to be found in the technical data issued by firms who specialize in illuminating engineering.

To study a light source intelligently it is necessary to have before us a light distribution or photometric curve in order to show the exact manner in which the light rays are distributed. This is so important that I should like to urge that no lighting unit be seriously considered unless this data is made available.

One method of obtaining these photometric curves is by taking measurements at the various angles through the vertical axis of a light source.

With direct lighting the only useful light is that given between 0–60 degrees other than by reflection from walls and ceiling. Therefore, using a bare lamp with dark surroundings only 25 per cent. of the total light would be usefully employed.

It will therefore be seen what a great field there is for efficient lighting by the use of correctly designed reflectors.

There are in the main three methods applied to the lighting of interiors, i.e., direct, semi-direct, and indirect.

Direct lighting will first be considered, as it is unquestionably the most efficient, and results can be pre-determined with extreme accuracy. This method is at least dependent upon favourable surroundings, i.e., those having a high co-efficient of reflection.

By direct lighting with prismatic reflectors it is possible to redirect 75 per cent. of the total light immediately to your working plane, whilst transmitting in addition 20 per cent. for the illumination of walls and ceiling.

In general practice with direct lighting it is found that at least three distinct and definite types of light distribution are necessary. These, for distinction, are usually termed extensive, intensive, and focussing.

The extensive type reflectors are required for the lighting of low buildings, or where the distance between the points is rather great. The correct spacing ratio, i.e., distance apart to height, for this type reflector, is two to one for the attainment of uniform lighting. Thus for points spaced, say, 18 ft. apart, the correct height would be 9 ft. above the plane you are illuminating, which is usually 2 ft. 6 in. above the floor level.

The intensive type reflectors are required for the illumination of buildings with average ceiling heights and spacings. The correct ratio in this case for uniform lighting is one-and-a-half to one,—thus, for the example cited above, i.e., 18 ft. spacing, the correct height would be 12 ft.

The focussing type reflectors are required for the lighting of buildings having high ceilings. In addition, they are employed for the efficient lighting of buildings with galleries, where the low mounting of light units would bring them into the direct range of vision. In other cases the focussing type is used where concealed lighting effects are aimed at.

Particularly are focussing type units necessary in the case of factory lighting with overhead travelling cranes. In practice it is generally desirable to adopt as high a mounting height as possible, consistent, of course, with reasonable accessibility. By doing this you reduce the liability of glare, and it is particularly noticeable the extent to which shadows are reduced in consequence. This latter point is emphasized particularly in school lighting where you get a rising floor level.

For exceptional purposes, such as highly localized lighting shop windows which are narrow in relation to their height, even more concentrating reflectors than those coming under the heading of focussing are required.

Now in adopting these greater mounting heights it does not follow that the lighting efficiency of an installation suffers in consequence.

On reference to Fig. 1 it will be seen that, in order to cover 12 ft. at a height of 6 ft., the light rays need to be collected into a zone of 45 degrees. Again, to cover the same distance at a height of 8 ft. the light rays need to be collected into a zone approximately 30 degrees. Again, to cover the same distance at a height of 12 ft., the light rays are concentrated into as small a zone as 20 degrees, but in each case with a corresponding increase in the end-on candle-power.

This is the reason why the illumination intensities are the same in either of the three cases cited above.*

It is now as well to consider the various media available for the control of light, and to see how far they may be expected to comply with the requirements as set out above.

From the point of view of efficiency and flexibility of control, also for complete conformity with the fundamental laws of optics, we will first consider prismatic glass reflectors. These reflectors are designed on the principle of total reflection, and by modification in the contour it is possible to obtain any type of light distribution from extensive to extremely concentrated.

The definite character in which these results are achieved will be seen on reference to Fig. 2.

Opalescent glassware, whilst giving good diffusion, has not such complete control of the light. Incident rays on reaching the opal surface are mostly broken up and scattered more or less equally in all directions. Thus whilst the contour of an opalescent reflector may be varied as much as is desired, it does not appreciably affect its final light distribution curve, which remains of a general character.

Semi-Indirect Lighting.

Semi-indirect lighting units comprise a translucent dish made of opalescent glass, prismatic glass, or alabaster. They send most of the light to the ceiling, from which it is reflected downwards, but a certain percentage passes through the unit itself, depending upon the density of the medium.

This method of lighting must of necessity be more wasteful than direct lighting, considered from the point of view of energy, seeing that the ceiling has to be converted into a secondary source. The reflection co-efficient for a good white ceiling is 82 per cent., which immediately creates an absorption independent of that of the unit itself.

---

* For a detailed explanation of light distribution and zone factors refer to "The Lighting of Modern Commercial Buildings—Underlying Principles," by Capt. E. Stroud, ARCHITECTS' JOURNAL, 4 January 1922.

n semi-indirect lighting, therefore, it is essary for its successful application t the ceilings are made as light in ur as possible, also that they are plain aces, as free from obstruction as sible.

he system should not, of course, be lied to situations with roof lights, etc., erwise a very heavy loss will result. n important point, also, is the relation eight of a building to the spacing of its with semi-indirect lighting.

n investigation it will be found that e numbers of semi-indirect lighting allations are being replaced by more ient means, and in my opinion the tion rests in a return to units of a ct character, but offering a higher ree of diffusion.

t is in such matters that illuminating ineers would welcome a closer co- ration with the architectural profes- . We find, in so many cases, where ory would indicate a satisfactory pro- ure, it is made impossible by æsthetic siderations. An example to my mind the moment is in church lighting. re has been considerable activity of in raising the standard of lighting in h buildings.

or the efficient treatment of such in- ors illuminating engineers find im- nse advantage in placing their light ts in the centre of arches, adopting in suspension from the apices. By ng this the lighting of the nave and aisles is practically shadowless. this procedure, from the architect's nt of view, there seems to be two s of thought. In some cases we left to our judgment, in others we ourselves in a hornets' nest. I feel, refore, that we should greatly benefit the views of architects on such points.

would just like to mention that the sent is an age of specialization. It is ossible for an architect to be fully versant with all the latest applications ighting, nor is it necessary, seeing that any firms engaged in illuminating engineering would be only too happy to place before architects their experience, and assist in the drawing up of their lighting schemes, in most cases without obligation. It places no restrictions upon the architect—actually it might relieve him of considerable anxiety and trouble, in addition to which he has the certainty of results.

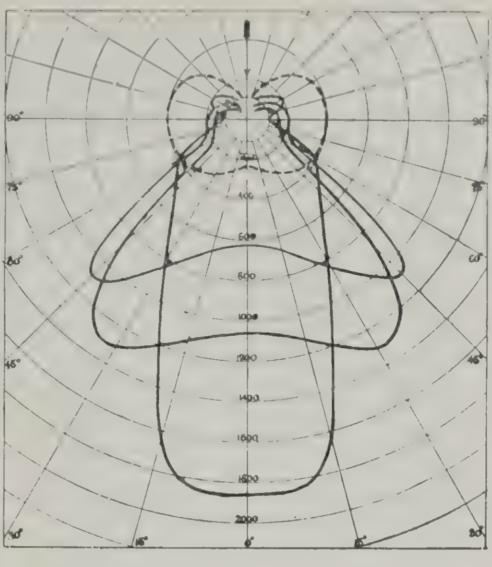

Fig. 2.

Discussion.

Sir John Parsons (President of the Illuminating Engineering Society) moved a vote of thanks to Mr. Tye for his "very illuminating paper." He (the speaker) was an ophthalmic surgeon, and—speaking out of the fullness of his ignorance of both illuminating engineering and architecture—so far as he knew our architecture was derived from the East, where, owing to an excess of light, buildings were designed to keep light out, which idea had been faithfully followed in the domestic architecture of this country. With regard to artificial lighting, he thought there should be more co-operation between illuminating engineers and architects, to their mutual advantage. The illuminating engineer might be led to do away with the atrocious fittings which disfigured so many interiors, and the architect would score enormously if he would make lighting part of his scheme. General illumination seemed to him to affect the architect's design very specially.

Mr. W. R. Rawlings, past President of the Electrical Contractors' Association, seconded the vote, and said that he felt with Sir John Parsons that there was still closer association wanted between the architect and the electric light fittings manufacturer. The architect put up a most beautiful building, and he left it for anyone to come along whose only consideration was as to how to light it. Ugly fittings were put in—such as they had there that evening (referring to the light fittings in the meeting-room of the R.I.B.A.). It was true that they had in London people who made a special study of beautiful fittings, but though they were very beautiful, they gave no light.

Mr. Hurst Seager said that he feared the lecturer had not lived up to his title. He was sure that the sort of co-operation that was wanted was for the architect to employ the illuminating engineer to get beautiful effects. He suggested that the dome of St. Paul's, the Victoria Tower, the tower of the Port of London Building, might be illuminated, as also the interior of Westminster Abbey.

Mr. L. Gaster said that only by the exchange of views could progress in good lighting be made. Referring to concealed lighting, he pointed out that what had popularized it in this country was the war.

Mr. Tye briefly responded and the meeting closed.

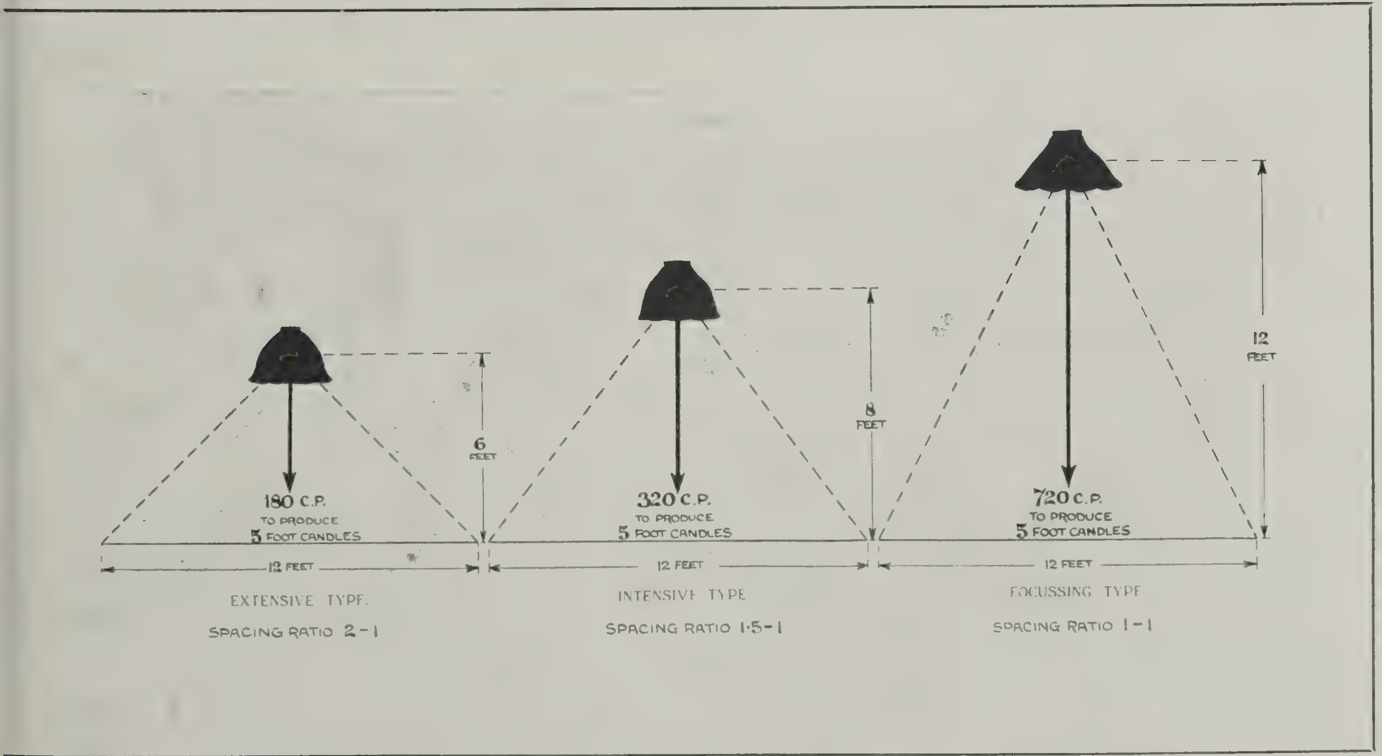

Fig. 1

Magazines of the Month*

A Literary and Pictorial Digest

THE current issue of THE ARCHITECTURAL REVIEW contains a finely illustrated article on War Memorial Windows by Mr. Maurice Drake, in which we are glad to observe a note of optimism.

"Nothing strikes a glass-painter so forcibly" says Mr. Drake, "as the enormously increased interest taken in his handicraft since the war. To that newly manifested interest English glass-painters have reacted in an extraordinary manner, and many of the windows erected during the past three years might have been painted in another country and another century from the work executed by the same painters no longer than eight years ago. It is not too much to say that glass-painting has again been new-born. The public for the most part is, of course, still ignorant of what constitutes a good window, and a great deal of inferior work has been perpetrated, and more will be perpetrated, until it comes to be understood that glass-painting is a very highly skilled handicraft, and not a thing to be taken up as a side line by tinkers and tailors and department stores. But if the public buy rubbish, they have only themselves to thank for it. The sixty or seventy bona-fide glass-painters in England are doing better work to-day than they have ever done before, and some of them are painting very fine windows indeed."

An Italian architect's conception of a National War Memorial for Italy (a monument upon a mountain) forms the subject of a remarkable illustrated article by Mr. Crossley Davies. He says: If Signor Eugenio Baroni's scheme is carried out—and a national committee has approved it—Italy will have the finest, and the biggest, memorial ever planned by an

heroic people to those whose sacred bones have paved the path to peace. It is an arresting conception, bold, imaginative, majestic. Its scope is truly national. Its sentiment is, as it should be, Latin. And its pedestal! Here is a stroke of genius, a poetic inspiration. What would not a sculptor or an architect give to have a mountain for his base? The main idea is simple, as indeed it should be. A gigantic cross tops the mountain, symbol of sacrifice at the scene of the greatest sacrifice made by the Italian army. The central part of the cross is a sort of sacred crypt containing the bones of the slain and an altar where prayers for the dead may be said. Here will be Italy's greatest shrine, a place for prayer and pilgrimage. The steps that lead up to the Ossarium, making approach slow, give ample time for meditation. There is here no Vanity Fair to distract and to demean. For here, amid the eternal hills, far from busy town and scrambling mart, sleep the nation's heroes. With a cross as the main outline of the memorial, the sculptor has designed statuary groups at commanding points, and it seems a natural development that these should have become rather like Stations of the Cross on a fine processional pilgrim way.

THE ARCHITECTURAL FORUM contains the first part of an article on "Mexican Renaissance" by Walter H. Kilham, who points out that it is not remarkable that the true story of architecture in Mexico remains generally unknown when one examines some of the statements rampant in even modern geographies.

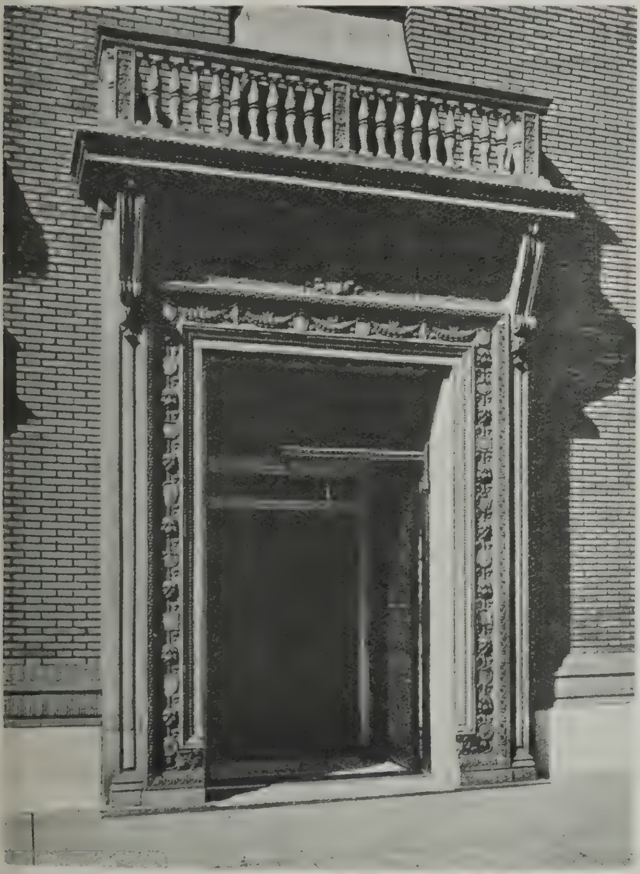
As a matter of fact, up to about 1820, the date of Mexican independence, Mexico was the only country on the American continent which practised architecture at all in the real sense of the word, for prior to that time the buildings of the English colonies and the United States were comparatively small in size and slight in construction, with thin walls and wooden roofs, devoid of sculpture or mural decoration, and of a degree of artistic development which entitles them to consideration more for sentimental reasons than for any great merit, while those of the other Spanish settlements are generally of less artistic importance than those of Mexico, though ordinarily of solid and scientific masonry construction.

GARDEN TO A RESIDENCE IN OHIO. HOWARD SHAW, ARCHITECT.
(*From "The Architectural Record."*)

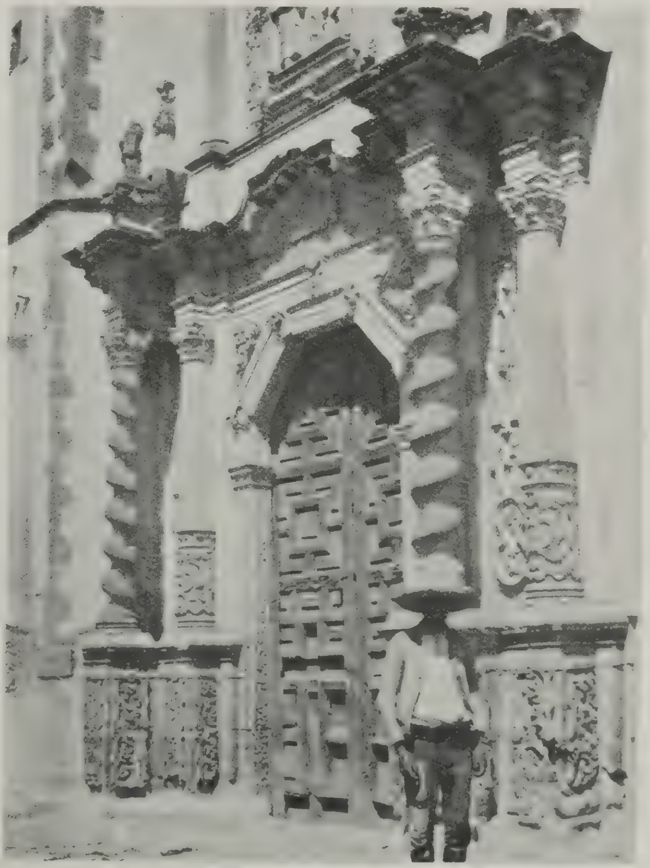
Of course a highly developed technique was not attainable at the beginning, and the early buildings, rude rather than elegant, sought to satisfy the most urgent needs rather than good taste. Nevertheless, such buildings as the palace of Cortez at Cuernavaca or the Casa Alvarado at Coyoacan, both built within a very few years of the conquest (1521), even though the walls are of rather undue thickness and the arches low and squat, are of a far greater degree of sophistication, from a constructional standpoint, than anything produced in the American colonies before the revolution.

The house of Mrs. William Hayward, Fifth Avenue, New York, of which we reproduce an exterior and interior view, with a plan, is illustrated by several plates. This residence is one of the most important individual dwellings erected in New York during recent years. Designed by Guy Lowell in the style of the Italian renaissance, the house is built entirely of pink Tennessee marble, while a balustrade of bronze is placed above the cornice.

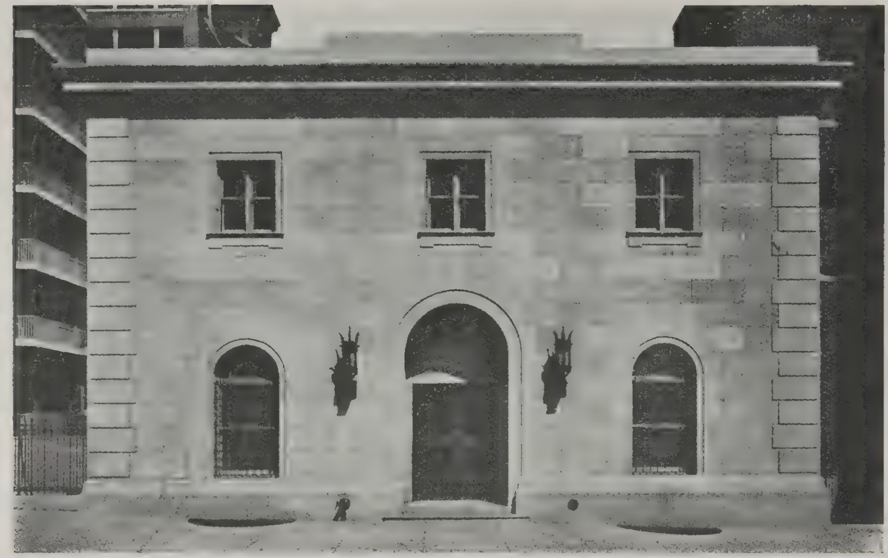
The plan of the interior provides rooms of unusual size and height. From the vestibule one enters the lower hall from which the dining-room opens at the right, while at the left and facing Fifth Avenue are two reception-rooms, and just ahead is the stair hall of elliptical form in which the balanced stairway leads to the main floor. Upon this floor the entire avenue side of the house is taken up by the drawing-room which is connected by a long gallery facing Eighty-Sixth Street with the library, while still beyond is a billiard-room. The ceilings of the first floor are 15 ft., and those of the second or main floor 18 ft. 6 in. in height.



ENTRANCE TO AN APARTMENT HOUSE IN NEW YORK. D. EVERETT WAID AND J. E. R. CARPENTER, ARCHITECTS.
(*From "The American Architect."*)



DOORWAY OF CHURCH NEAR S. JUAN, TEOTIHUACAN, MEXICO
(*From "The Architectural Forum."*)



MOUNT SINAI HOSPITAL, NEW YORK. ARNOLD W. BRUNNER, ARCHITECT.
(From "The American Architect.")

The interior of the house fulfils the promise made by its rich and dignified exterior. Several of the rooms are fitted with antique panelling and other woodwork taken from old buildings in France and England, and the furnishings of the house are largely antiques, with many treasures of paintings, tapestries, and Oriental porcelain.

"Current Tendencies in Country House Design in the East," "Country House Architecture in the Middle West," and "Some Country House Architecture in the Far West," all profusely illustrated by many beautiful examples, are the titles of three articles which take up well-nigh the whole of THE ARCHITECTURAL RECORD.

The last issue of THE AMERICAN ARC
TECT includes among its examples
current work views and plans of Mou
Sinai Hospital (Arnold W. Brunn
architect), and an apartment hou

iate for our amplification into ARCHI-
CTURE. On all sides there are signs of a
vival, firstly, of the building industry—
e which bids fair to release the purse-
und activities of the immediate post-
r years—secondly, of public interest in
hitecture. Of the latter we shall have
re to say; the first has been long
aited by architects and builders, whose
ced inactivity during the past few
ars has been one of the most deplorable
mptoms of the economical embarrass-
nt into which the war has led us."

Mr. Robert Atkinson contributes a
per read as an address to the com-
titors in the Society's Victory Scholar-
p Competition in October, with the
le "The Olympic Stadium," and by the
urtesy of the editor we are able to
roduce the bird's-eye view and section
the South Park Stadium, Chicago;
which structure the writer says: "It
probably a great improvement on the
lier ones, has the long side divided
such a way as to bunch the bulk
the seating accommodation near
semi-circular end, the rest of the
gth of the sides being simply filled in
th temporary seating which can be
noved. In such a scheme the stadium
be modified to accommodate 50,000 or 100,000 people with very little difficulty, and the semi-circular end used as an open-air theatre. Here they get the greatest number of people within view of the wrestling and the more intimate games. Of course, the tail end of the longer running races finishes just in front of the semi-circular end."

Mr. A. R. Powys devotes his monthly article on architecture in THE LONDON MERCURY to recent architecture in Cambridge, reviewing Downing College (designed by Wilkins and built in 1807), Mr. F. W. Troup's Low Temperature Laboratory, the School of Parasitology, by Mr. Harry Redfern, the new Bio-Chemistry School, by Mr. Edwin Cooper (now under construction), the work of Mr. Leonard Stokes at Emanuel College, and Mr. T. H. Lyon's recent building, the Chapel of Sidney Sussex College.

Members of the London Society have paid a visit to the New London County Hall, and a record of their journeyings appears in the current issue of the Society's Journal. The recorder expresses the belief that now that this great improvement to the right bank of the river has been opened, the day is not so very far distant when the whole length of the river shore, at least between Westminster and Southwark, will have been reclaimed, and Londoners will have the opportunity of appreciating afresh the magnificent sweep of the Embankment upon the other side.

THE CONNOISSEUR publishes some views on the exterior and interior of the "Red Lodge," Bristol, together with a brief account of its history and its present days. The engravings of George Cuitt also form the subject of an illustrated article.

HET HUIS, OUD & NIEUW is entirely occupied with designs for the replanning of certain districts of the Hague. Many excellent perspective views are included, and Mr. Ed. Cuypers supplies descriptive letterpress.

The R.I.B.A. Overseas Examinations

The Examinations have been held in the following centres overseas: Cape Town, Melbourne, and Sydney.

Cape Town.

Of the five candidates who were admitted to the Special War Examination, four passed and one was relegated. The successful candidates are as follows: Hart, Edward G., Cape Town; Milligan, Thomas W., Cape Town; Stocks, Clifford W., East London, South Africa; Tait, Alfred A., Grahamstown.

The following candidate passed the Special Overseas Examination: Wilson, John G., Pretoria.

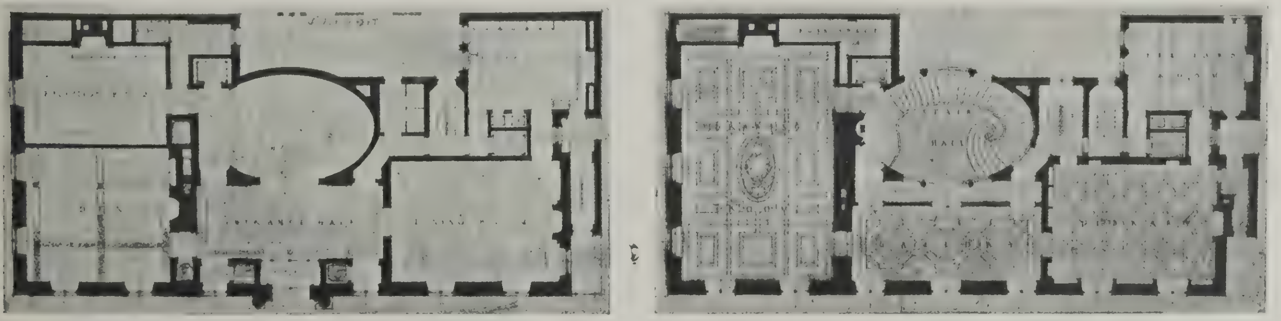
Melbourne.

Of the nine candidates who were admitted to the Special War Examination, five passed and four were relegated. The successful candidates are as follows: Eales, William H., St. Kilda; Finlayson, M., Heidelburg, Victoria; Henderson, William A., Melbourne; Martin, Marcus W., Melbourne; Williams, Percy S., Melbourne.

Sydney.

Of the eleven candidates who were admitted to the Special War Examination three passed and eight were relegated. The successful candidates are as follows: Mills, John C., Sydney; Phillips, Herbert E., Hastings, Hawkes Bay; Phillips, Lionel, Burwood.

One candidate sat for, and was relegated in, the Special Overseas Examination. The following candidate passed the Intermediate Examination: Hodgson, Frank L., North Sydney, N.S.W.



HOUSE IN NEW YORK: GROUND AND FIRST-FLOOR PLANS. GUY LOWELL, ARCHITECT.

Law Reports

Driving of Piles. Action against Builders

Hoare & Co., Ltd., v. *Sir Robt. McAlpine and Sons.*

Nov. 21. Chancery Division.
Before Mr. Justice Astbury.

This was an action by Messrs. Hoare & Co., Ltd., brewers, and the licensees of the Steam Packet Hotel, Lower Thames Street, E.C., and Mr. F. T. Jarvis, their tenant, against Sir Robt. McAlpine and Sons, contractors, for an injunction to restrain them from carrying out works on the site of a proposed new building to be called Adelaide House, so as to cause damage by subsidence, or vibration, or loss of support to the plaintiffs' premises. Plaintiffs also claimed for damages, which they alleged were caused by the driving of piles for the construction of the new buildings.

Mr. Tomlin, K.C., and Mr. J. F. Carr appeared for the plaintiffs, and Mr. Upjohn, K.C., Mr. C. W. Farwell, and Mr. T. Mathew represented the defendants.

The facts of the case were as follows: The Steam Packet Hotel is about 20 ft. below the level of King William Street and Adelaide Place. The defendants are constructing a large building on the south side of Lower Thames Street, on an area formerly occupied partly by the Pearl Insurance Company and partly by the wharf from which the Belle steamers formerly started. It was in the excavation of this site that the arch of Old London Bridge was discovered, about which there has lately been much discussion. It is intended that the new buildings shall attain the height of 120 ft., the highest buildings in the City except St. Paul's, and they will be 100 ft. above the level of Adelaide Place, where they will face Fishmongers' Hall. The site is on the London clay, over which there is a depth of about 16 ft. of made ground. In order that the building may be safe, it is necessary to drive a large number of piles through the made ground into the London clay, and the building will then be constructed on what is called a "raft" of concrete on the top of the piles. These piles are more than a foot square, and vary in length from 24 ft. to 38 ft. It was stated that 671 piles have already been driven, and a very large further number have yet to be driven. They are driven either by what is called a "monkey," which drops a weight of about two and a half tons from a height of more than 5 ft. four times a minute, or by a steam hammer delivering 140 blows a minute.

It was stated that the London clay has a resistance like rubber, so that a pile, when driven, recoils somewhat from the depth to which it is originally driven, and in the later stages is only driven in one-fifth of an inch by each blow. It was also stated that when a certain depth is reached the clay acts like a fluid in transmitting vibration.

The plaintiffs' hotel is situate about 40 ft. from the nearest pile, and formerly consisted of four stories above the ground floor. The defendants began work about the middle of November, 1920, and the plaintiffs allege that the driving of piles, by vibration or otherwise, produced such an effect on the building that on June 30, 1921, the City Corporation served on the owner or occupier of the building a notice that the building was in a dangerous state, and requiring it to be made secure. The plaintiffs caused the building to be shored up, but on January 16, 1922, a notice was served that the house should be pulled down to the first floor, and on January 25 a summons was issued by the Corporation, upon which an order was duly made on January 31 for this to be done. The house has since been pulled down except the ground floor, which the plaintiffs have been allowed to retain for the sale of beer and other liquors. It was stated that the house was about a hundred years old, but the plaintiffs alleged that it had recently been thoroughly repaired and was in a stable and good condition. The plaintiffs' lease has about ten years to run, the ground landlords being the Fishmongers' Company, who require the plaintiffs to take any necessary action, relying upon the covenants in their lease.

The plaintiffs began their action on November 23, 1921, before the order for the demolition of the house was made. It was stated that the houses on each side of the plaintiffs' building had already been set back to widen Lower Thames Street, and that, as more than half the cubic contents of the building had gone, any building erected hereafter on the site would be a "new building," and must be set back accordingly, so that there would only be an area about 8 ft. or 9 ft. deep available for the building.

His lordship in the course of a reserved judgment said that he had to consider a question of fact and a question of law. The question of fact was whether the damage to the house was caused by vibration arising from the driving of piles by the defendants, and the question of law was whether, assuming this fact was proved, the condition of the house was such that the defendants were not responsible for the damage so caused. On the evidence given on behalf of the plaintiffs the question of fact seemed to be proved in their favour. It appeared that in 1919 certain repairs were done to the house to the satisfaction of the district surveyor, who gave evidence that the house was then in a stable condition. It was proved that the defects in the house did not appear until after the pile driving had begun. The general evidence on behalf of the defendants did not upset that evidence. He was of opinion that the vibration from the pile driving had caused the damage, in consequence of which the order for demolition was made.

The question of law remained to be considered. The defendants contended that their action was lawful and that the damage arose in consequence of the weak and unstable condition of the house. The plaintiffs contended that they had a right of action. Here the house in 1920 was not a delicate instrument which would be easily damaged by a justifiable action, as suggested by the defendants. It was old and built in an old fashion, but on proper lines, and had been repaired in 1919 to the satisfaction of the district surveyor. There was no justification for its being shaken down in its declining ag by an adventurous and powerful neigh bour.

It was an alarming proposition that o should have to consider such a questio as: When did an old building lose i right to protection? There was no pla now for an injunction, but the plaintif were entitled to a declaration that the were entitled to damages, and the amou of those damages would be referred to t Senior Official Referee, but the inqui would be deferred for four weeks whi the defendants considered the question an appeal. He ordered defendants t pay the plaintiffs' costs of the action.

Breach of Covenant Action against a Valuer

Clifford v. *German.*

Nov. 15. Chancery Division.
Before Mr. Justice Romer.

This was an action by Mr. R. S. Cliffor of Loughborough, against Mr. F. W. Germa a valuer of Leicester, claiming damage for alleged breaches of covenants con tained in an indenture of October 2 1920, under which plaintiff purchased residence, cottage, and ten acres of lan at Charnwood, in the parish of Nanpanto Leicestershire.

Mr. J. G. Hurst, K.C., for the plainti said his claim was in respect of a failu to give vacant possession of the cotta and failure to maintain and repair t property. In 1909 the defendant b came tenant of the property, which w on the borders of the Charnwood Fores at a rent of £87 a year. It formed pa of the Curzon-Herrick estate, and 1920 the trustees put it up for sale public auction. The defendant purchas it for £1,750 and two days later sold it persons named Mounteney and Shephe for £3,000—a clear profit of £1,25 Mounteney and Shepherd sold a part the property to the plaintiff for £3,000 the residence, cottage, and the bulk the land—under the same covenan as to vacant possession and repair as the had from the defendant. The importa question was the cottage, which w absolutely essential to the enjoyment the property. The plaintiff was Alderman of the Loughborough To Council and a member of the Leicest shire County Council, and had frequent to attend meetings late at night. T property was about two miles from railway station and it was necessa to have a man residing in the cotta to cultivate the gardens. After t plaintiff purchased he found that t cottage was let to a man not in t defendant's employ.

Mr. Clifford, giving evidence, said t property was useless to him witho possession of the cottage. He ha endeavoured to sell it, but nobody wou buy because they could not get occup tion of the cottage.

Mr. German, who appeared in perso said that Mounteney and Shepherd kne the cottage was inhabited by a ma not employed by him. He had tried, get rid of him, but there was no alte native accommodation in the distri or even at Loughborough.

is lordship gave judgment for plain- Defendant had unwisely agreed to vacant possession, regardless of the that he was not in a position to so. He ordered an inquiry as to ages, and also with reference to the ch of covenant to maintain and ir.

Correspondence

n Praise of Terra-Cotta"

To the Editors of THE ARCHITECTS' JOURNAL.

RS,—I read the article in your issue ovember 22, having the above title, ng to find a little critical information . The chorus of praise lifted to this erial in English and American periols—a kind of strophe and anti-strophe ss the Atlantic—requires also some ation of facts if it is to carry weight. In lon, for instance, few would deny that eign of terra-cotta can best be studied ussell Square. And the writer of the le says that the material in question ore durable than stonework. May I then for some information as to why e beginning of this year parts of the le of the Russell Hotel had to be wed? The building is not unduly sed, nor is it of antique date.

HOPE BAGENAL.

e Future of Architecture

To the Editors of THE ARCHITECTS' JOURNAL.

RS,—I heartily endorse the suggestion ained in your last issue, by Mr. ur Welford, on "Architects and sing." In it is wrapped up the larger of the future of English architecture neral. The book by Abraham Swan, , served its purpose in the way of aganda; the architect benefited (to t extent we do not know), but more rtant still the public learned what pect and look for in good building. this aspect which is so vital at the nt day. We should realize more and the necessity for a sound English tion for the education of the future itect—a tradition true to type, freed the trammels of extraneous con- ion properly systematized, all the n facts gathered together, expressing thoughts in the right vernacular and ge we live in. Settle once for all the e of styles, and taboo outside in- ces.

ny of us are groping in the dark; we a lead. Inigo Jones and Sir Chris- er Wren founded what we might well national school. What better lead we have than their example, and e man who left the greatest name ny English architect, what better orial could we raise. to one whose ntenary we are about to celebrate the carrying on of the Wren tra- n?

e Englishman's privilege is to possess om of speech; perhaps this accounts e freedom of our work at the present We express ourselves in all lan- s, hence discord; far be it from us to originality and the spirit of adven- but let it be the right sort and n limits carefully laid down. Per- the greatest power in education is onment; with beautiful things always before us we should naturally be led to beautiful thoughts. By example your journal has done yeoman service in the past; it is up to all the professional journals, lay press, the R.I.B.A., and the allied provincial societies to inculcate this knowledge by ever bringing before us the essence of those works which posterity has handed down, and which collectively go to make English architecture a living force.

JAMES A. SWAN.

P.S.—The name of Abraham Swan is of particular interest. I may, perhaps, claim a relationship—my grandfather, Aaron Swan, born 1794, was articled to the City of London architect (? name). A case of name and tradition being handed down.

The Whitgift Hospital

(*Communicated*)

Among the buildings of historic and artistic interest possessed by Croydon one of the most notable is the Whitgift Hospital, which occupies a prominent position in North End—the main street of the town. Queen Elizabeth, during her reign, appears to have paid several visits to Archbishop Whitgift, whose palace was situated in Croydon; and what is now known as Whitgift Hospital was built by that ecclesiastic towards the end of his life for the benefit of poor and aged people of Lambeth and the town. The date of its construction is 1599. The buildings are two stories high, and occupy the four sides of a quadrangle. They include quarters for fifty people, a chapel, great hall, and other interesting features. While it has been somewhat tampered with in restorations that have taken place from time to time, it remains a generally complete example of an Elizabethan building, very expressive of its purpose and of considerable charm. The value to Croydon of having a building of such interest and beauty as this is—situated in a prominent position in the town and drawing the attention of countless people to the historic importance of Croydon and its part in the life of the Elizabethan period—is very considerable, and there can be no question that such a building has a distinctive value extending far beyond the limits of the town in which it is situated.

It appears that for a long time a section of townsmen (as represented by certain of its borough councillors) has desired the sweeping away or at least the partial demolition of Whitgift Hospital. Presumably some financial or other material advantage is expected to result from such a change. So strong, anyway, has been the desire that there has been a deliberate setting back of relatively new buildings in George Street, adjacent to the Hospital, in order to make it appear that the old building was an obstruction projecting beyond the general line of the road. A similar position has been deliberately created in recent years on the return front in North End, where, instead of the line of Whitgift Hospital being adopted as the new improvement line for frontages of the adjacent reconstructed premises, their main wall has been set back several feet, with the obvious desire to bring about a similar situation in North End to that which now obtains in George Street. There does not seem the slightest excuse for the action so taken, except as a means of creating a situation that might assist the desire of those who wish the Hospital to be destroyed, for it is clear that the sweeping away of Whitgift Hospital is not in any way necessary to effect the road improvements that the circumstances require.

During the last twenty or twenty-five years there has fortunately existed in Croydon a very active and enlightened Whitgift Preservation Committee who have vigorously opposed interference with the old buildings, and who between the years 1909 and 1912, successfully set aside the Croydon Council's destruction scheme and, with the valuable assistance of the Local Government Board, which showed very splendid public spirit in the matter—induced the Council to adopt the Defence Committee's scheme, i.e., for the setting back of the "bulge" in the line of road that occurs on the western side of North End, opposite the Hospital, together with other frontage improvements calculated to effectively assist traffic difficulties, and which, apart from its obvious merits as a road improvement scheme, avoided interference with the Whitgift building. On the basis of this scheme, formally adopted by the Croydon Council in 1912, and approved by the then Local Government Board, grants of money have been made, and it would naturally be assumed that the Council were in honour bound to carry it into execution as opportunities presented themselves. Recently, however, there have been indications of a deliberate attempt to set the approved scheme aside and to revert to the old purpose of lopping off the Hospital in order to spare modern buildings, devoid of any interest at all, that exist west of it on the opposite side of the road. It is known, in fact, that the Croydon Council is promoting a Bill in Parliament to obtain powers for sweeping away the Whitgift building. Anything more short-sighted in the interests of what really matters in the town of Croydon, can hardly be imagined, and the action contemplated seems to be without a shadow of excuse. An inspection of the conditions on the site or of a plan of the road, makes it obvious to anyone competent to judge the situation that the scheme proposed by the Preservation Committee, and eventually adopted by the Croydon Council and approved by the Local Government Board in 1912, as already mentioned, represents from every point of view the obvious way of dealing with the traffic conditions in the part of the main road in question, and, moreover, assists the problem that arises from the restricted condition of Crown Hill—the branch road that enters the highway at this point.

On hearing of the course now proposed to be taken by the Croydon Council the Royal Institute of British Architects took immediate action, and on its initiative a conference has taken place on the question at which the whole situation was carefully reviewed by representatives of the Royal Institute, the Whitgift Hospital Preservation Committee, the Society for the Protection of Ancient Buildings, the Town-Planning Institute, the London Society, the Town-Planning Committee of the R.I.B.A., the National Trust, the London Survey Committee, and the Surrey Archæological Society. As a result all these bodies are not only agreed as to the local and national importance of preserving Whitgift Hospital as a valuable relic of Elizabethan architecture, but have decided to support the 1912 scheme as providing a practical and effective road improvement which meets traffic requirements without the necessity for any interference with the Hospital. They have resolved, moreover, to take further steps to emphasize the importance of this view in quarters where it may receive due weight, and hope that the very valuable principle of avoiding wherever possible interference with historic and beautiful buildings may be increasingly supported by public opinion.

The Wren Bicentenary Programme

A meeting of the Grand Committee for the Wren Bicentenary Celebrations met at the R.I.B.A. last Wednesday, the president, Mr. Paul Waterhouse, being in the chair.

Representatives of the following bodies have been elected to serve on the committee :—

Canon S. A. Alexander, M.A.	The Dean and Chapter of St. Paul's Cathedral.
Mr. Edgar Armitage ..	The Junior Art Workers' Guild.
Mr. Frederick Cavendish Bentinck.	The Trustees of the British Museum.
Major-General Wilkinson Dent Bird, C.B., C.M.G., D.S.O.	The Royal Hospital, Chelsea.
Mr. F. G. Dawtrey Drewitt, M.D., F.R.C.P.	The Royal College of Physicians.
Sir Lionel Earle, K.C.B., K.C.V.O., C.M.G., J.P.	H.M. Office of Works.
Sir Banister Fletcher, F.S.I.	The Carpenters' Company.
Mr. H. Denston Funnell ..	The Architects' and Surveyors' Assistants' Professional Union.
Mr. John Good, D.L., J.P., F.I.O.B.	The National Federation of Building Trade Employers of Gt. Britain and Ireland.
Mr. Arthur Gray, M.A., Master of Jesus College.	The University of Cambridge.
Mr. Josiah Gunton (Chief Commoner).	The Corporation of London.
Sir William Hale-White, K.C.B., M.D.	The Royal Society of Medicine.
Mr. Stanley Hamp ..	The Architectural Association.
Professor Selwyn Image ..	The Church Crafts League.
Sir Thomas Graham Jackson, R.A.	Wadham College, Oxford.
Mr. H. V. Lanchester ..	The Town Planning Institute.
Professor W. R. Lethaby	The Society for the Protection of Ancient Buildings.
Mr. J. Mewburn Levien ..	The Royal Philharmonic Society.
Dr. Ellis H. Minns ..	Pembroke College, Cambridge.
Mr. John Murrey	The National Federation of Building Trades Operatives (London District Council).
Mr. E. J. Partridge, F.S.I.	The Society of Architects.
Dr. F. W. Pember, Warden, All Souls College.	The University of Oxford.
Mr. J. Wells, Warden, Wadham College.	The University of Oxford.
Sir Hercules Read ..	The Society of Antiquaries.
Maj. Richard Rigg, O.B.E., T.D., J.P.	The London and Middlesex Archæological Society.
Mr. W. E. Riley, R.B.A. ..	The Official Architects' Association.
Professor Sir Arthur Schuster, Ph.D., LL.D., D.Sc., Sc.D., F.R.S.	The University of London
Sir Cecil Harcourt Smith, C.V.O., Director, Victoria and Albert Museum.	The British Institute of Industrial Art.
Mr. J. C. Squire	The Architecture Club.
Mr. Lawrence E. Tanner	Westminster School.
Mr. Andrew T. Taylor, J.P. F.S.A.	The London County Council.
Mr. Carmichael Thomas ..	The London Society.
Dr. H. H. Turner, Savilian Professor of Astronomy, University of Oxford.	The Royal Society.
Mr. Lawrence A. Turner ..	The Art Workers' Guild.
Mr. F. J. Walton	The London Master Builders and Allied Industries Association.
Mr. Edward P. Warren, F.S.A.	The Civic Arts Association.
Sir Aston Webb, K.C.V.O., C.B., P.R.A.	The Royal Academy of Arts.
Mr. S. M. Young, F.S.I. ..	The Worshipful Company of Masons.

The following have also consented to serve on the Grand Committee :—

Professor Arthur R. Hinks, O.B.E., M.A., F.R.S.
Mr. Ernest Law, C.B.

The Executive Committee is as follows :

Walter Cave.
Sir Banister Fletcher.
H. M. Fletcher.
Walter H. Godfrey.
F. R. Hiorns.
Arthur Keen.
Mervyn Macartney.
S. C. Ramsey.
Arthur Stratton, F.S.A.
Walter Tapper.
W. H. Ward, F.S.A.
Paul Waterhouse, F.S.A.
Maurice E. Webb, D.S.O., M.C.

The Executive Committee submitted the following draft programme for the consideration of the Grand Committee, and this was, in the main, adopted :—

2 p.m.—Procession from the Mansion House to St. Paul's Cathedral, in which the Lord Mayor and Masters of City Companies will take part.

2.30 p.m.—Memorial Service in the Cathedral, visit to the crypt and the placing of a wreath on the tomb of Wren by the president R.I.B.A.

4 p.m.—Tea at the Guildhall.

6.45 p.m.—R.I.B.A. Council Dinner to which the members of the Grand Committee would be invited.

8.30 p.m.—General meeting of the R.I.B.A., with short papers by the president R.I.B.A., Sir Reginald Blomfield, R.A., and Mr. A. Clutton Brock on the subject of Sir Christopher Wren and his work.

Honorary corresponding members of the R.I.B.A. in foreign countries to be invited to this meeting, and the allied societies to be requested to hold similar commemoration functions at their own centres.

It was decided to combine the proposed Council Dinner with the Annual Dinner of the R.I.B.A., and to include Mr. Mervyn Macartney among the after-dinner speakers.

Various other proposals in connection with the bicentenary celebrations were discussed, among them an exhibition of Wren photographs, drawings, and models, visits to Wren's buildings, and a Wren fancy dress ball.

Messrs. Clay and Sons have offered to take the financial responsibility of publishing a commemorative volume in aid of St. Paul's Cathedral Fund, and the Architecture Club will assist the lay Press in the supply of articles and general information.

Mr. William Haywood on Paris

Mr. William Haywood, F.R.I.B.A., in another of his University Town Planning Lectures, said that during the eighteenth century Paris surpassed Rome in town planning progress, but the singularly complete plan to which she had now attained was largely the result of a wonderful series of unpremeditated sectional developments, adroitly linked together by Haussmann in the nineteenth century. Thus on the north bank of the Seine during the reign of Louis XIV the spacious bastions of the city walls were replaced by a great sweep of tree-lined avenues, afterwards known as the "Grandes Boulevards." The Tariff walls built in 1784, with their extra-mural avenues, became the "Boulevards Exterieurs"; the Champs Elysées, an exclusively royal parkway from the Tuileries to St. Germain, was converted to public use by Napoleon I; and the destruction of the Tuileries led to the opening up of a unique approach to the Louvre, upon which, with the Place de la Concord as pivot, the Madeleine and the new façade of the old Palais Bourbon (now
Chambres des Députés) gave a balan
architectural composition.

The task of linking up these and ot
disconnected units of the city plan
given by Napoleon III to Haussma
who displayed consummate ability
dealing with the many legal, techni
and financial problems involved.
continued the Rue de Rivoli from
Louvre to the Bastille, re-establish
the great cross-road from east to w
and by innumerable cuttings, juncti
and linking-up devices, brought the r
system of the city into coherence.

The inspiration for the new sense
unity in town planning, now appar
in the plan of Paris, was to be fo
primarily in the formal and ord
thought of the Renaissance, and this
factor in design was first exercised
freedom, in the landscape architect
of the period. It was in the acade
completeness of such gardens as thos
Versailles, Marly, and Hampton Co
that the corporate possibilities of t
planning was most easily seen,
although it could not be said that
lesson was fully applied within the pe
of the Renaissance, it was there that t
would find the origin of comprehen
town planning for great modern citie

Exhibition of Water Colours at Bethnal Gree

In 1885 Mr. Joshua Dixon, a succes
cotton merchant and a judicious colle
of pictures, bequeathed to the Beth
Green Museum the whole of the painti
in his house, Winslade Park, near Exe
for the benefit of the public of
London, where he was born in 1810.
of this bequest consisted of very caref
chosen water-colours by artists of
British school. As a part of the pro
of reorganization which the Beth
Green Museum is at present undergo
these water-colours have now been
arranged and are suitably exhibited
the Central Hall, where they are g
a prominence they thoroughly dese
They comprise notable works by som
the most eminent among the founder
the school, including fine examples
John Varley, John Glover, George Ba
jun., William Hunt, Turner, of Oxf
Peter de Wint, David Cox, and Co
Fielding. The middle period of the sc
is represented by such men as Bla
friend Samuel Palmer, F. O. Finch, L
Haghe, W. L. Leitch, and Birket Fos
while the collection is also rich in wa
colours by artists who were work
during the period at which Mr. D
was collecting. Among these we
instance the work of George W
Henry Brittan Willis, Robert Th
Waite, Alfred Powell, and Charles Da
son, who are represented by excel
drawings.

The public of East London has ne
been given a better opportunity of re
ing what a wealth of beauty has
produced by the water-colour artist
the British school. All who are intere
in art should visit the museum and
these drawings. It is to be noted
inducements to study have been
sidered in the new arrangements,
seats have been placed convenie
at intervals about the gallery so that
visitor can sit and enjoy the exhi

the same comfort one expects to e when reading a book.

he museum is open free from 10 a.m. p.m. on weekdays, and from 2.30 p.m. on Sundays.

Woman A.R.A. at last !

t the general assembly of Academi- s and Associates Sir Bertram Mac- nal, A.R.A., K.C.V.O., sculptor, was ted a Royal Academician, and Mr. rge Lambert, painter, and Mrs. Annie Swynnerton, painter, were elected ciates of the Royal Academy.

r Bertram Mackennal, who was ted K.C.V.O. after the unveiling of tatue of King Edward last year, is an ralian by birth—the first Australian ecome an A.R.A. and the first to have works purchased by the Chantrey uest. He designed the present coin- and the medal on which the King's rait on postage stamps was based. larger works include the War Me- al at Islington, statues of Queen Vic- for India, Australia, and Blackburn, National Memorial for Gainsborough, Memorial Tomb of King Edward VII t. George's Chapel, Windsor, memo- to his late Majesty in London, utta, Melbourne, and Adelaide, and Parliamentary war memorial un- d on Wednesday by the Prince of es. He was elected an A.R.A. in .

r Bertram Mackennal's promotion to honours was in the ordinary course of ts in view of his equestrian statue of Edward—for which he is not alto- er to be blamed, as he was not respon- for displaying Edward the Peace- er as a swaggering warrior, and a who did as little riding as he could, seated on a prancing horse—and the large part he has played in official statuary.

Mr. George W. Lambert is an Australian citizen, born in Petrograd, his father being an American and his mother an Englishwoman. He studied under Julian Rossi Ashton at Sydney, N.S.W., and, having won a travelling scholarship, worked for two years in Paris. During the war he acted as official artist to the Australian Forces in Egypt and Palestine.

The new woman Associate was born in Hulme, Manchester, in 1844, one of seven daughters of Mr. Robinson, a Manchester solicitor. When the family fell into adverse circumstances she and two sisters began to paint small water-colours for a livelihood. After a short term at the Manchester School of Art she went to Rome to study, and there met Mr. Joseph Swynnerton, the sculptor, whom she married in 1883. Until his death in 1910 they lived for the most part in Rome.

Recognition was long in coming to Mrs. Swynnerton, but for the last twenty years her work has been keenly sought by purchasers of insight. Mr. John Sargent recently bought and gave one of her most famous pictures, "The Oreads," to the nation. Her work "Mater Triumphalis" was presented by Rodin to the Luxembourg Gallery, and she is also represented in the Metropolitan Museum of New York. Her portraits include that of Henry James, presented to him by a group of admirers. Manchester, Oldham, and Liverpool all possess pictures by her.

Other of her pictures in public galleries are: "Dream of Italy" in the Metropolitan Museum, New York; "St. Martin's Summer," at Ottawa; "Sense of Sight," at Liverpool; "Portrait of Mr. Gaskell," at Manchester: "Cupid and Psyche," at Oldham; and "The Oreads," at the Tate, London.

SIR BERTRAM MACKENNAL, K.C.V.O., R.A.

Educating the Public— New Style

The education of the public has of late been a favourite topic in the architectural world. An exhibition of trade films given at the West End Cinema last week tempted one to covet an equally effective publicity for the profession.

If cinema audiences all over the country could be compelled to watch the intricate and entrancing processes of building construction, more, if they could see drawings taking shape beneath the draughtsman's fingers, could have ocular demonstration of the manifold, but little known activities of the architect, could have brought home to them in similar fashion the disastrous effects of dispensing with his services—but one trembles to think of the film possibilities of architecture!

The Cinema Publicity Service, Ltd., who were responsible for the exhibition, had got together an excellent collection of short "interest" films in which the powder of advertisement was cunningly concealed in the jam of the silent drama. A few of them, indeed, relied solely on the fascination of machinery for the necessary thrill, and in this respect the Anglo-American Oil film stood supreme. In the various boring processes illustrated, suspense is followed by the glow of achievement, later come the mechanical marvels by which the processes of refining, packing, and dispatch are carried out.

Fiat and Morris motors have also a tale to tell, and one would like every contractor and every workman to see the excellent "Safety First" parable which concluded the entertainment.

Coming Events

Thursday, November 30.

Birmingham Town Planning Lecture.—"Modern Town Growth; Vital Conditions; the Garden City." By William Haywood, F.R.I.B.A. 5.30 p.m.

Friday, December 1.

R.I.B.A.—Opening and Private View of the Exhibition of Contemporary British Architecture. 2.30. p.m.

Royal Technical College Architectural Craftsmen's Society, Glasgow.—"The Value of Geometry to the Architectural Craftsman." By T. Brown, F.S.A. (Scot.).

Institution of Mechanical Engineers.—Thomas Hawksley Lecture: "Some Recent Researches on Lubrication." By Dr. T. E. Stanton, C.B.E., F.R.S.

The Art Workers Guild.—"Timepieces and Clocks."

Tuesday, December 5.

Conversazione. Architectural Association. 8 p.m.

Liverpool Architectural Society.—Paper by S. E. Mahon (Winner of the Hanan Scholarship).

Institute of Heating and Ventilating Engineers, Birmingham.—"Ozone in Ventilation." By Chas. G. Huntley.

"St. Paul's and its Builder." Lecture by Canon Alexander at St. Dunstans'-in-the-Fields. 1.10 p.m.

The Week's News

Proposed Tenements for Paisley.

Paisley Housing Committee are applying to the Scottish Board of Health for authority to erect tenements.

A Discovery of Terra-cotta Clay.

Banks of first quality terra-cotta clay covering 200 acres and nearly 100 ft. deep, have been found in the Benderloch district of Argyll.

Change of Address.

Mr. George W. Martin, M.I.Mech.E., M.I.H.V.E., M.J.I.E., consulting engineer, has moved to Sentinel House, Southampton Row, London, W.C.1.

The Royal Sanitary Institute.

The next Congress of the Royal Sanitary Institute will be held at Hull from July 30 to August 4, 1923, by invitation of the Mayor and Town Council.

Alterations to Taymouth Castle.

Mr. Andrew Balfour, F.R.I.B.A., of Glasgow, is the architect for the extensive alterations at Taymouth Castle, Perthshire, which was bought to transform into a modern hydropathic.

Bournemouth War Memorial.

Bournemouth's War Memorial has been unveiled by the Lord Lieutenant of Hampshire. Mr. A. E. Shervey, L.R.I.B.A., the deputy borough architect, acted as honorary architect.

Housing at Oswestry.

The Ministry of Health have refused to approve tenders for twenty-five houses at Oswestry at £405 each. Instead they suggested smaller houses. Oswestry Town Council have refused to reduce the size of the houses.

Orphans' Homes for Brighouse.

The Managers of the Smith Orphan Homes at Boothroyd, Brighouse, have adopted a scheme for the erection of additional homes. The plans have been prepared by Mr. R. F. Rogerson, of Brighouse, Yorkshire, architect.

Proposed Cinema for Bentley.

It is proposed to form a private company at Bentley, near Doncaster, to build a cinema in Askern Road. The cinema would accommodate approximately 800 people, and have several shops at the front.

Housing at Mexborough.

The Urban District Council propose to erect further houses on their housing site at Mexborough. Plans have been prepared by Mr. D. W. Harrop, of Genoa Street, Mexborough, architect, for a further thirty-two houses.

A "Skyscraper" Cathedral.

The corner-stone has just been laid in Chicago of the First Methodist Episcopal Church—the world's first skyscraper cathedral. The building, which is situated in the heart of the busy "Loop," will be more than twenty-one stories high, when completed early next year.

Return of Sir Edwin Lutyens, R.A.

Sir Edwin Lutyens, who since September has been busy at Delhi, for the rebuilding of which he has made many notable designs, will be back in England early in the New Year. He hopes to sail from Bombay on December 30.

Housing near Doncaster.

Messrs. Barber, Walker & Co., the proprietors of the new colliery at Harworth, near Bawtry, Yorks, have prepared plans for a new village containing 1,300 houses. It is also proposed to erect a club and institute and a church, and to provide a recreation ground.

Wakefield Building Developments.

A residential building estate is being developed in Secker Lane, near the small farming village of Woolley, which lies between Barnsley and Wakefield. Mr. J. R. Wilkinson, of Regent Street, Barnsley, architect, is preparing plans for the first residence, with garage, etc., complete.

Hastings Electricity Works Extension.

The Mayor of Hastings recently opened the extension to the Corporation Electricity Works. The whole of the constructional steelwork and fire-resisting flooring on the "Mon'lithcrete" system was supplied and fixed by the Fawcett Construction Co., Ltd., of Westminster.

New Buildings for Glasgow.

Plans passed for new buildings in Glasgow include a factory for the Distiller's Company at Pinkston, garages and workshops, church additions, a hall, and cottages. One of the garages for the Scottish Co-operative Wholesale Society will accommodate 180 three-ton lorries, and 25 light motor-cars.

Hospital Extensions at Mexborough.

The General Committee of the Montagu Hospital at Mexborough, near Rotherham, are considering an extension scheme. The scheme is estimated to cost £18,000, and provides for increasing the number of beds from 40 to 96, two more private wards, and for extensions to the administrative block.

R.I.B.A. Member's Decease.

Among the deceases of members announced at the meeting of the R.I.B.A. last week was His Highness the Maharajah of Jaipur, elected Hon. Fellow 1891. The Maharajah was the donor to the Institute library of the "Jeypore Portfolio of Architectural Details," consisting of six folio volumes prepared by the late Colonel Sir S. S. Jacob, C.I.E., under the Maharajah's patronage.

Interesting Durham Discovery.

Workmen engaged by the Ecclesiastical Commissioners to repair some dilapidations in the west wall of the chapel found the floriated capital of an arch deeply embedded in plaster. When the whole of the plaster had been removed a perfect specimen of some arcading of the twelfth century was revealed. Several arches which have been exposed to view are to be left uncovered.

Architects' Fees for State-aided Housing Schemes.

The Ministry of Health and the tribunal appointed by the R.I.B.A. are anxious to obtain a settlement of all claims for architects' fees in connection with State-aided Housing Schemes without further delay. Architects who still desire the assistance of the tribunal are therefore requested to apply to the secretary of the R.I.B.A. on or before December 31, 1922. The tribunal cannot undertake to deal with cases submitted to them after this date.

Wooden Buildings Vetoed in Southp

Referring to the recommendation fr
the Ministry of Health that the Corpo
tion should amend its by-laws in or
to make provision for the erection
wooden buildings in Southport, it
stated that the Committee did not w
to have wooden buildings in Southpo
"They were not sightly and were not w
they should be, and were certainly
in keeping with the beauty of the to
which they desired to maintain." Anot
objection was the danger of fire.

Housing in Scotland.

The Scottish Board of Health ha
refused to sanction the erection of t
apartment houses. The Board's re
to Dumbarton County Council Hous
Committee was that they could
allow any houses to be built with St
assistance under three apartments.
houses suggested were two apartmen
with scullery, bathroom, and w.c.
similar reply was sent by the Board t
Committee of Ayrshire County Coun
The districts in which it was propo
to erect the houses are Kilbirnie, a
Dreghorn, Ayrshire.

L.C.C. Hall Acoustics.

Professor A. M. Low, the authority
sound, has made experiments to asc
tain the cause of the bad acous
of the council chamber of the new Lond
County Council Hall, Westminster Bri
(built at a cost of £4,000,000), where
audience do not hear speakers distinct
The remedy he has suggested is that hea
curtains should be hung round the dom
roof of the hall, which will prevent rev
beration. Professor Low points out t
the architect, Mr. Ralph Knott,
arranged for curtains to be hung, but
L.C.C. objected to these.

Heywood Housing Scheme Dropped

Owing to disagreement as to the typ
house to be built between the Heyw
Housing Committee and the Ministry
Health, it has been decided to wind
the housing scheme. Some thousands
pounds have been spent on the site
Darley Hall, in forming the streets, ar
tects' fees, &c., and the liability for
payment of this money is to be a mat
of arrangement between the Commit
and the Ministry. Not a single house
been built under the Government sche
at Heywood. The house which
Ministry recommended was estimated
cost £360, and the local Committee wo
not accept it.

Ideal Stores.

At a meeting of directors and oth
interested in the provision of higher
more beautiful store buildings for Lond
considerable attention was given to
aspect of safety in case of fire. The me
ing was called by the Incorporated As
ciation of Retail Distributors, which
in its membership all the large Lon
and provincial departmental stores.
was unanimously decided to appoint
Ralph Millbourn, managing director
Messrs. John Barker & Co. (Ltd.), K
sington, as chairman of a special c
mittee which will meet each week to
cuss store building and fire insura
matters.

The Greek Point of View

HE second of a series of lectures on Architecture, arranged by the Oxfordshire Society of Architects, been given in the Ashmolean Museum, ord. Mr. R. P. Jones, M.A., the lec- er, took for his subject "The Greek nt of View." Professor Percy Gardner sided.

Ir. Jones, in the course of his lecture, that Greek architecture comprises most perfect that has ever been luced. There are two qualities which e to be considered in studying its elopment. Firstly, that its ornament ssential to its construction; secondly, pture as applied to the architectural ns, is complete and distinct from n.

here are not more than about a en Greek temples existing in anything a fragmentary state. There is one d which fitly describes Greek work, that is "lucidity." It is simple and ct, and, obviously, has a timbered otype. The form and position of triglyphs are sufficient evidence, indicate this beyond doubt. Greek ples always exist in a brilliant atmo- ere. The matter of lighting, although bject for a great deal of conjecture, ne which was probably considered of ll importance by the Greeks. The ing of their temples lessened as one oached the inner sanctuary. (In y to a question, Mr. Jones explained the roof was usually covered with tiles of thin marble laid interlocking, through which a certain amount of light filtered.)

The method of building was from the outside inwards. This was entirely reversed in later ages. The basis of their design was the column with its entablature. Size made no difference, for smaller proportions were used in all buildings whatever their actual dimensions. There was a purpose in the flutes to the columns. The strong sunlight on plain columns gave a very definite line between the light and shady portions of the column, and this might have been thought to have detracted from the æsthetic value. Now, the flutes transferred a quantity of light to the shadow and a quantity of shade to the light surfaces. The point was clearly illustrated by lantern slides.

Greek architecture was trabeated. There were no arches giving thrusts, and it was in fact exemplary of the policy of our present Government in its "tranquillity, quietness and sedateness." That being so, there was no need for cementing material, and the various stones and features were built one upon the other with dry joints. After the burning of Athens by the Persians, it fell to the lot of Pericles to produce the great works which formed so important a standard in the chronology of architecture. Photographs of the Acropolis with its Parthenon, Erectheum, Propylea, Temple of Nikeapteros, etc., were shown, from which it was clear that the exterior of a Greek building did not express the arrangement of its interior.

Carefully taken photographs showed the slope of the columns, the horizontal curvature, etc., as examples of mathematical refinement. Excellent photographs of the Theseum, the Temple at Paestum, the Choragic Monument of Lysicrates, the Temple of the Winds, the Temple of Concord, etc., concluded a very interesting and informative lecture.

In his remarks Professor Gardner thanked Mr. Jones for his lecture, and informed the audience that the building in which they were was designed by Cockerell on the model of architecture shown in these Grecian temples, excepting the fact that the back portions had been neglected architecturally.

The Secretary of the Society, Mr. Thomas Rayson, in proposing a vote of thanks to the chairman and lecturer, was struck by the emphasis placed on a point made by Mr. Warren in his inaugural lecture: the fundamental importance of construction in fine architecture. Referring to Penrose as a mathematical archæologist, the audience were recommended to examine the steps at the west end of Saint Paul's Cathedral, London, for their horizontal curvature. He would have liked to have seen photographs of the Bassae Temple, on the study of which Cockerell based his design of the Ashmolean.

The Art of the Garden

By WILLIAM PAGE

is widely recognized to-day in England that the architect who de- igns the house should also lay out garden, or at any rate it should be out by someone in close co-operation sympathy with the architect. Un- nately it is difficult to convince ners that their gardens are not all ought to be and might be. The or science of gardening is very y practised; thousands have an sive knowledge of it, and are in ssion of multitudinous facts as to to produce fine blooms and large nens of all the various vegetables. have seized with avidity the details, emain in ignorance of the general iples.

untrained eye is seldom capable of that there are serious principles ved, and we are faced with the same em which so often confronts us we are designing a house, viz., to e our client to relinquish some hed details for the design as a .

will readily be conceded that every n must be specially designed for the which it encloses, according to its nd character, and that it should be ed to the nature of the site. Many rities place as the very first require- of the garden design—the strict of the house and garden, in all s. All the divisions of the garden ts special features must be con- l along with the plan of the house itself. The arrangement should be direct and simple. The garden, unless it be a very tiny plot, should not all be seen at a glance. Its beauties should be revealed by degrees, but the effort to do so should not be forced or apparent. The garden should hold surprises. Each part of the garden should have its own special purpose and meaning, and be so treated and adorned as to make it as interesting and useful as possible. All natural features should be taken advantage of to their fullest extent in the design; all its peculiar qualities and those of its surroundings should be turned to account. The levels, water, and trees all studied and made to invest the garden with its own particular charm and individuality.

The garden and its various divisions should be enclosed by good boundaries of stone or brick walls, hedges, or, at the least, well-designed trellis fences covered with growing things. By no other means can you achieve *the* most desirable and necessary qualities in a garden, viz., the feeling of mystery, seclusion, and shelter. It is interesting to note that the original meaning of the word "garden" in almost every language means "guarded, retired, secluded, a still removed place, separate, shut off, hidden from the day's garish eye, sacred to tranquillity, retirement and repose."

"The garden is a sort of sanctuary, a chamber roofed by Heaven," says an old author. "Wherever intrusion is possible and any movement from the outside world is heard, we have no garden in the fullest, sweetest sense of the word."

The stretches of lawn, pleasure gardens, the terraces, and green walks should, as far as possible, be rectilinear in plan; the paths should be straight. The planting should be in simple masses. Single trees and shrubs to be retained should be incorporated in the plan and connected up to the boundaries so as to appear intentional in the general scheme.

In designing the boundaries and enclosures and in the planting, any unlovely prospect will be shut out, all desirable views framed and focused and so enhanced.

Anything in the nature of display should be avoided in the garden. It may be said that the making of a garden in several divisions robs it of one very desirable quality, viz., the effect of distance. But a large open tract of garden does not necessarily give that effect. It is purely a matter of planning, and a long vista may be achieved in even a small garden. A large tract of formal garden seems barren and wearisome unless nature has been lavish in her gifts. Plants and flowers are seen to greater advantage if they are set in a comparatively small enclosure or placed in a border running the length of a wall or hedge. The growth and beauty will be more luxuriant when the flowers are concentrated, framed, and given a proper background.

The entrance should as far as possible be screened and shut off from the gardens.

and should be given its own individual treatment with good lines and, perhaps a few well-placed trees, rather than attempt to combine it with the gardens themselves.

The relationship of the house and garden have to be looked at from two points of view: first, the garden as seen from the house; and second, the house as approached from the garden. The house should be an effective background and, as viewed from the garden, considered as an integral part of the design, the whole being in unity, scale, and harmony.

The terrace should be made of such a length as will correspond with the width of the lawn or garden, and the house should be extended on either side by means of garden architecture. Pavilions or garden houses may be built at each end and connected to the house by walls, a series of piers, or a pergola. So the house is made to spread itself across the ground and perform its proper function in regard to the garden upon which it looks, and it is rid of any feeling of the isolation which divides it from its surroundings.

Easy and pleasant means of access to the garden from the house must be provided, and the windows of the principal rooms each provided with a view of a pleasant arrangement of garden design.

It has been said that if a man wants to know what a fool he is, let him go and lay out a garden, and certainly a successful garden cannot be conceived in vanity. The task must be approached with all humility, and the materials which nature has provided must be handled and fashioned in a spirit from which all vanity has been utterly banished. He is not greatest who presumptuously tries to shatter tradition, but he who humbly takes what other men have done and makes it more perfect.

The lawn should not be broken up with flower beds. These disturb the restfulness of the lawn, and add needlessly to the labour of the garden.

The flowers should be confined to long borders against a hedge or wall and to the enclosures specially designed for them.

The lawn, too, should be enclosed or, if it is desired to preserve a view from it, then the boundaries should be defined, otherwise much of its beauty is lost and the whole effect is depreciated. Grass banks should be avoided if at all possible. They effect a saving on first cost, but are difficult to maintain in good order, and very apt to become parched and bare in summer. Where there is a change of level it is much better to build a retaining wall, and, indeed, in all structural work the materials and method of building must be suitable and sympathetically treated. A nice choice between undue formality and decorativeness on the one hand, and untidy rusticity—so often mistaken for Art—on the other, will be made by the cultured designer. The work should not be so immaculate and devoid of texture interest as to repel the kindly touch of nature, nor so rough and unkept as to suggest that it is not part of a deliberate, orderly piece of design.

It is impossible to touch on all the features of a garden in this article. Almost any one aspect of garden design and garden feature might be made the subject of an article. The vegetable garden, for instance, may be made the most delightful place imaginable.

The foregoing extracts are from a paper read before the New Zealand Institute of Architects.

The Economy of Smoke Abatement

Ex-Bailie William B. Smith, of Glasgow, a member of the Departmental Committee on Smoke Abatement, in reading a paper before the Royal Society of Arts on the above subject, said that at various times many citizens had agitated for the removal of the smoke nuisance, but it was only within quite recent times that some serious effort had been made to improve matters. Formerly, those who caused the emission of smoke, whether manufacturers or householders, either maintained that it was impossible to prevent smoke or that, though it might be possible in theory, in practice it was so costly that it was not practicable to stop it. Manufacturers said that if they were interfered with by any regulations to prevent smoke they would have to close their works, or go to some place where the regulations were not enforced.

Until quite recently, the great difficulty was to suggest some alternative to the smoke producing methods. Now they had methods that were not only practicable, but that actually were more economical and might be adopted on that ground alone.

He recommended for the consideration of all those who had to do with the erection of new houses, where gas was available at reasonable cost, that in each house there should be installed one of the new type boilers burning coke, capable of being used as a closed up or open fire at will, to warm the living room and to supply the hot water required for all purposes.

A wash boiler should be fitted in the scullery, set just through the wall and back to back with the coke boiler, supplied with hot water from this boiler, and with a gas burner under it to raise the hot water up to boiling point when required; the flue from it going up into the flue from the boiler. In the scullery also there should be a gas cooker, provided with a canopy and pipe into the boiler flue to carry off all products of combustion both from the oven and boiling rings.

In each bedroom there should be a gas fire, with a flue of long narrow section in the special bricks forming part of the wall. These bricks might also contain a second ventilating flue. This would save money in construction. The lighting would be done by gas.

Where it had been decided to instal electricity for lighting, and a reasonable price could be charged for current, the house should be equipped with the coke fired boiler in the living room and wash boiler in scullery, as in the gas house, but the cooker would be electric, and in each bedroom would be an electric radiator. It would probably be cheaper to do cooking and the heating of the bedrooms by electricity, where heat is usually only required occasionally, and for short periods, than to instal a coal cooking range and grates, with the extra building in, and chimneys. Some electricity undertakings made this practicable.

Referring to industrial smoke he said :—When the Committee were in Sheffield, they were told that there were some processes that could not be carried on without excessive smoke. Admitting that that is so, should that smoke, after it has done its work, be allowed to escape into the atmosphere? I am of opinion that, as a matter affecting public heal
it should not be permitted, and in t
report I am a minority of one in reco
mending :—

> "That the Government should stin
> late and, if necessary, subsidise
> search, with a view to discovering
> efficient method of catching or cons
> ming the smoke before it passes in
> the atmosphere. When such a meth
> is found, its adoption by manufactur
> should be made compulsory, and Lo
> Authorities should be empowered
> make a contribution, if they desir
> towards the cost of installation a
> its maintenance."

Cost of the production should be pa
to them out of the public health ra
The City of Glasgow spent a capital su
of about 2¾ millions and are payi
annually about £300,000 in the treatme
of sewage that they may keep the Ri
Clyde clean, as a dirty river injured t
amenity of the city and district, althou
it did little harm to health. Should a
city not contribute a little, if necessa
for the amenity of the atmosphere a
the improvement of public health?

R.I.B.A.

The following notes are from
minutes of the last council meeting
the R.I.B.A., November 6, 1922 :—

Registration.—The Registration Co
mittee submitted a draft Bill for
Registration of Architects which was
proved in principle by the Council, w
directed that it should be sent to
Allied Societies for their comments.

Provincial Conference, 1923.—The
vitation from the Incorporation of Arc
tects in Scotland to hold the next P
vincial Conference in Edinburgh
June, 1923, was cordially accepted.

The Bristol Society of Architects
The Union of the Bristol Society of Arc
tects and the Gloucestershire Archit
tural Association was approved.

Statutory Examination.—A Certific
of Competency to act as District Surve
was granted to Mr. Clifford Cyril Know

The Whitgift Hospital, Croydon
The Croydon Borough Council were
vited to meet representatives of
Royal Institute to discuss alterna
measures which would have the ob
of preserving the hospital intact.

London Squares.—The President, P
fessor F. M. Simpson, and Professor S
Adshead were appointed to serve o
Committee of the London Society to c
sider measures for the protection
London Squares.

The Art Standing Committee of
R.I.B.A. have arranged a visit to
works of Messrs. Farmer and Brind
Ltd., marble-masons, of 63 Westmin
Bridge Road, S.E.1, on Saturday, Dec
ber 9, at 10.30 a.m. The visit is arran
for the morning, in order that actual w
in progress may be inspected, and
hoped that architectural students
join in the visit. Members of the R.I.
and their friends and students of the ar
tectural schools who wish to take par
this visit should apply to the Secret
R.I.B.A., by whom tickets will be
plied.

Arrangements have been made
holding the Exhibition of Archit
Working Drawings each year in
Galleries of the R.I.B.A. Work re
sentative of all classes of architecture
be exhibited.

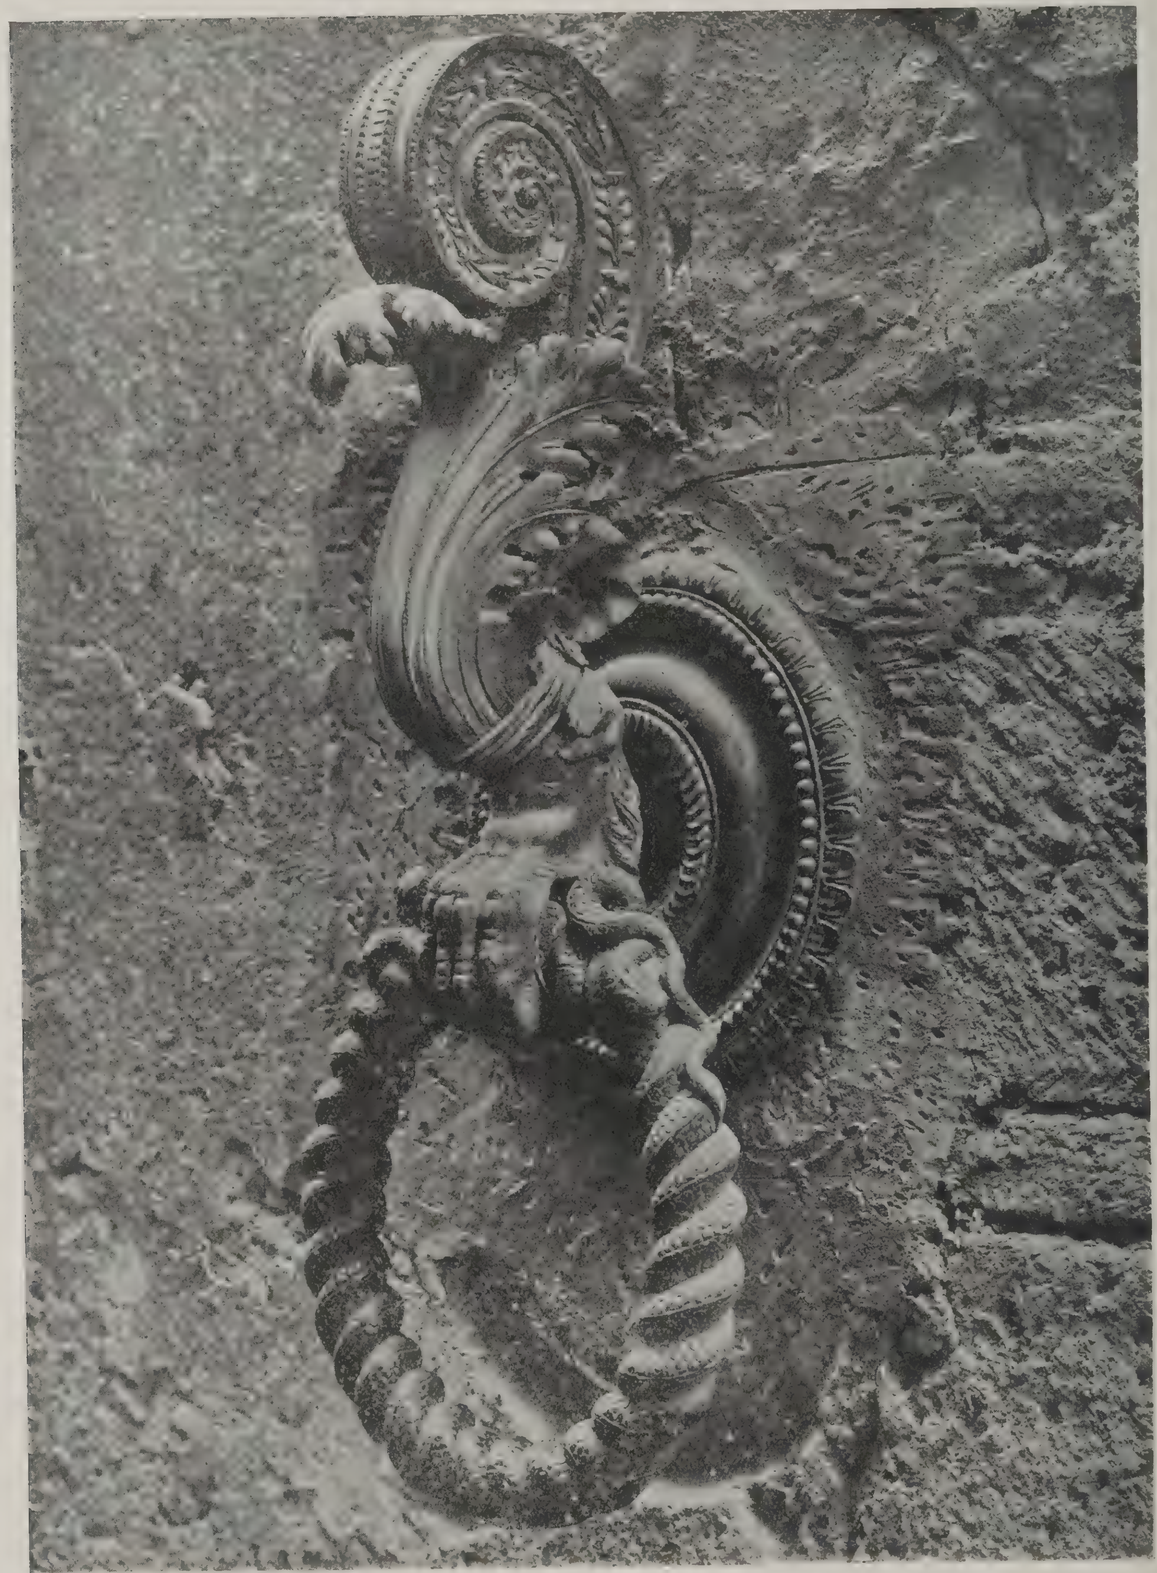
27-29 Tothill Street, Westminster, S.W.1.

Architectural Details. 38.—Bronze-Ring Bell Pull at the Magnifico Palace, Sie

Giacomo Cozzarelli, Architect



This magnificent detail was designed by Giacomo Cozzarelli, the architect and sculptor, and executed in 1508. Cozzarelli was a pupil of Francesco di Giorgio Martini, who was much interested in wrought iron work. He was born in 1453 and died in 1515.

THE

ARCHITECTS' JOURNAL

27-29 Tothill Street, Westminster, S.W.1.

lnesday, December 6, 1922 Volume LVI. No. 1457

Individualism or Coherence?

THE architectural tendencies of the day are perhaps nowhere more completely synthesized than in Regent Street. Here, house by house, the old order is giving way and yielding to the
erative demands of commerce. What, broadly, is the
lominating characteristic of the change? Is it not
coherence is being replaced by individualism?

he Regent Street of the early-nineteenth century
ned part—the principal part—of one of the most com-
e town-planning schemes of the period. But that fact
self constitutes no adequate reason for its preservation
s present form. In the first place, the original form has
ady undergone considerable modifications, and in the
nd, a city which is the centre of a growing, living and
plex organization cannot afford to preserve whole
ts or districts the buildings of which have ceased to
l the needs of the community.

dealing with cities a *via media* has always to be
d between harsh iconoclasm and inept sentimentality,
the growth of a town is largely a process of discarding—
oping—worn-out tissues and assuming new ones. The
ge which is coming over Regent Street is as inevitable
as the displacement of the hansom cab by the taxi-
r; a displacement which aroused contemporary oppo-
n in many quarters, on relatively the same grounds as
which are enunciated in favour of the preservation
hat remains of) Nash's Regent Street.

accept a general principle, however, does not neces-
y imply acceptance of its particular application, and it
ainst the form that the new Regent Street is assuming
protest is legitimate, and as this form seems to
mize the tendencies of the day, it may be worth while
ve the matter some consideration.

a generalization it might with some truth be said that
nost essential quality for the formation of a beautiful
is coherence. Picturesqueness—largely a trick of
—and natural beauty of situation, neither purely
tectural qualities, may contribute enormously to a
ral impression of beauty, but the intellect demands,
omplete satisfaction, evidence of deliberate thought,
crifice, and an expression of the civic consciousness.
this is best manifested where individual aspirations
been subordinated to those of the community. Ex-
ion of the collective will may have come about through
fforts of one man—a powerful monarch, a dictator,
mperor, or a despot, or through the efforts of an
d assembly; the important thing is that the town
its the civic consciousness and not a jostling of isolated
sts. The old Regent Street exhibited this consciousness,
he new Regent Street does not—nor, for the most part,
y of the present-day architectural activities of London.
craving for personal liberty has always been a pro-
ced national characteristic, and no Western nation
ts State or municipal interference with such intensity
e Englishman. The adage that "an Englishman's
is his castle" has even greater significance to-day if
" is substituted for "home" (are we not still a nation of shopkeepers ?), for the communal spirit is entering into our housing, while it has completely passed away from those parts of our towns which are devoted to business and commercial buildings. The old shibboleth that interference with the form of a commercial building is interference with trade, and is, therefore, against the most sacred interests of the country, is reiterated with wearying monotony. The prominence to which trade is entitled in the hierarchy of national activities and interests is scarcely, perhaps, within our province, but what is within our province is this fact, that a beautiful street is a far greater incentive to national well-being, including healthy, vigorous trade, than an ugly one, and a beautiful street is one that has been considered as a whole and not one that is composed of a blatant cacophony of self-advertising.

So complex are the systems of tenure that the chances of the emergence of a coherent scheme vary from district to district. Where, however, the street or district is under a single control, and where the leases fall in simultaneously, surely the chances are at their most favourable, except, perhaps, in a new street where new leases are being granted. Yet in both Kingsway and Regent Street the opportunity was, and is being, neglected. It is impossible to attribute the blame for these lost opportunities to any particular person or set of persons. It may be said that a nation gets "the architecture it deserves." Architecture is certainly not an isolated phenomenon, but is rather the result of constant action and interaction between various forces. Some of the blame, however, can certainly be laid at the door of architects themselves. The penalty for our subjugation of the material world is the growth of self-consciousness. Limitations of time and space tend to disappear, and the world, both three dimensionally and four dimensionally, lies before us for our immediate inspection, and we are able to study, not only the work of the whole world, but also the work of all ages. This tends to have a very deleterious effect, and is responsible for that deliberate process of selection which has led to the pernicious practice of consciously designing in a particular period, and to the everlasting discussion, in architectural circles, about styles which hinders all spontaneous creation. Another result is that it seems to stimulate the desire—paradoxically enough—for individual expression. Everyone must do something different—add to the discord by striking his particular note, even where a key has already been set. An example of this has been recently afforded in an important thoroughfare, where the second building of a block of two between two side streets has just been completed, but instead of continuing the design of the first building erected some fourteen years ago, and so making a complete architectural unity bounded by two streets, the new building utterly disregards its neighbour in material, in horizontal alignment, and in character, and so perpetuates the architectural chaos.

There would seem to be a kind of inability at co-operation, and even where corporate bodies make the attempt, as witness the L.C.C. in Kingsway, they end by abandoning their objective before the attacks of the individualists.

There are signs, just now, of a reviving interest on the part of the general public in architecture. This will result in a generally keener observance of street architecture, and in a growth of respect for the opinions of architects. The public, in fact, is becoming more receptive to whatever ideals the architect may have to propound. Surely, therefore, this is the precise moment to inculcate the indisputable doctrine that the beautiful town can only emerge by a combined effort; by relinquishing any insistence upon, at all costs, striking a personal, an individual, a different note; by realizing that a building in a town is but a unit in a street, which in itself is but a unit in the city. Only in this way can we hope that coherence will take precedence over individualism, and that somewhere, before long, we may be provided with another street, nobly planned and nobly conceived, that shall fulfil all contemporary requirements, and compensate us for the loss of our fast-disappearing Regent Street.

The St. Paul's Bridge Question

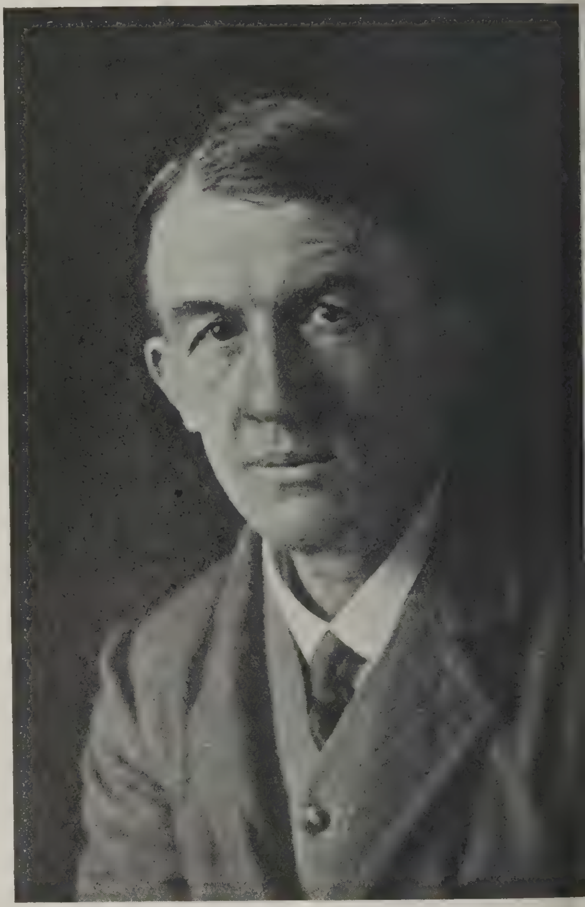
Apparently we are not to have the pleasure of seeing Mr. Washington Browne's design for a St. Paul's Bridge materialize. From the numerous and on the whole rather bewildering utterances about it in the council chamber and in the Press, it would appear that the City Corporation can afford neither to complete the project nor to abandon it. Construction would cost about a million and three-quarters, and abandonment, it is alleged, would or might involve reselling at a loss property that was acquired on the supposition that the Corporation had made up their beautiful mind to proceed. Shell-shock from the war has left them suffering severely from cold feet, and the shivering fits that are the well-marked symptoms of the onset of the disease that may be distinguished as economania—a disease that mimics economy, but is essentially very different from it. At any rate, the project for a St. Paul's Bridge seems to have fallen through, lending point to Professor Beresford Pite's letter to "The Times" of November 28 advocating a broader view of bridge-building for London, and asking the City Corporation to take a hand in supplying a bridge where one is really wanted—namely, at Charing Cross, where it might stand as a monument of a more memorable victory than that of Waterloo.

The Building Guild Section

It is seldom or never pleasant to chronicle failure. We are glad, therefore, to read in "The Observer" that the National Building Guilds are in a fair way to overcome the financial difficulties that for a moment seemed to threaten the movement with extinction. Agreeing with our contemporary that "it ought clearly to be explained that the difficulties in which the National Building Guilds recently found themselves were difficulties entirely of finance and in no case difficulties of principle," with pleasure we hasten to give currency to that explanation. The Guilds, our contemporary recalls, were started in 1920 mainly to increase and cheapen the production of houses for the working and middle classes. "The ideal was first to build good, substantial dwellings, devoid of shoddy materials and work, upon a non-profit-making basis. The actual cost of the building was to be charged, plus 40 per cent.; this surplus sum to be devoted (1) to the payment of full maintenance wages to Guild members when, owing to seasons of bad weather—rain, frost, and snow—work was impossible; and (2) to investigation and research and the acquirement of experience." Although the "full maintenance wages" clause has about it some faint odour of New Lanark, it must be remembered that, after all, the present industrial system is not so inveterate that it can be reasonably supposed to have reached finality—to be "the only way" of relating capital and labour; and all experiments like that of the building guilds will be carefully watched to see whether they are competent to provide a sound solution to a problem of baffling and perplexing difficulty.

A New A.R.A.

The profession is honoured by the bestowal of an A
ciateship of the Royal Academy on Mr. Herbert Ba
F.R.I.B.A., who is "the architects' architect." It wa
South Africa, whither he emigrated in 1892, that he
the foundations of his great reputation as an archit
Cecil Rhodes, "the Architect of Empires," having seen
admired Baker's work, saw in the young architect
idealist after his own heart, formed a close friendship
him, and commissioned him to build Groote Schuu
building that is of world-wide reputation for its excee
beauty and dignity, and is now the stately official resid



MR. HERBERT BAKER, A.R.A., F.R.I.B.A.

of the Prime Ministers of the Union of South Africa.
it is the fine Rhodes Memorial, a work of unquestio
genius. Mr. Baker designed also the powerful Siege M
rial in Kimberley. It has been declared, with no very
degree of exaggeration, that "he has filled South A
with beautiful buildings, which include no fewer than
cathedrals—those respectively at Cape Town, Pretoria
Salisbury (Rhodesia)." Of the Union Buildings at Mei
Kop, Pretoria, which are the administrative offices o
South African Government, it is freely said that the
among the most imaginatively conceived of public
ings; and his domestic work, in the Rand, reproducin
spirit of the fine old Dutch farmhouses at the Cape,
admiration of all who have seen either the actual
itself or illustrations of it. Edwin Lutyens and He
Baker having been fellow students, it is peculiarly f
that they should collaborate in the creation of the
Delhi. His suggestions (in collaboration with Mr. F
Troup) for reconstructing the Bank of England are a
memory. Thanks to his friendship with Cecil Rh
Baker studied intensively all along the shores of the
terranean, and in Greece, Italy, and Egypt. Profou
impressed by the advantages of such studies, he foun
scholarship tenable at Rome—a fact from which his
ness, active and practical interest in architectural
tion will be rightly inferred.

The Musée Rodin

By E. BERESFORD CHANCELLOR

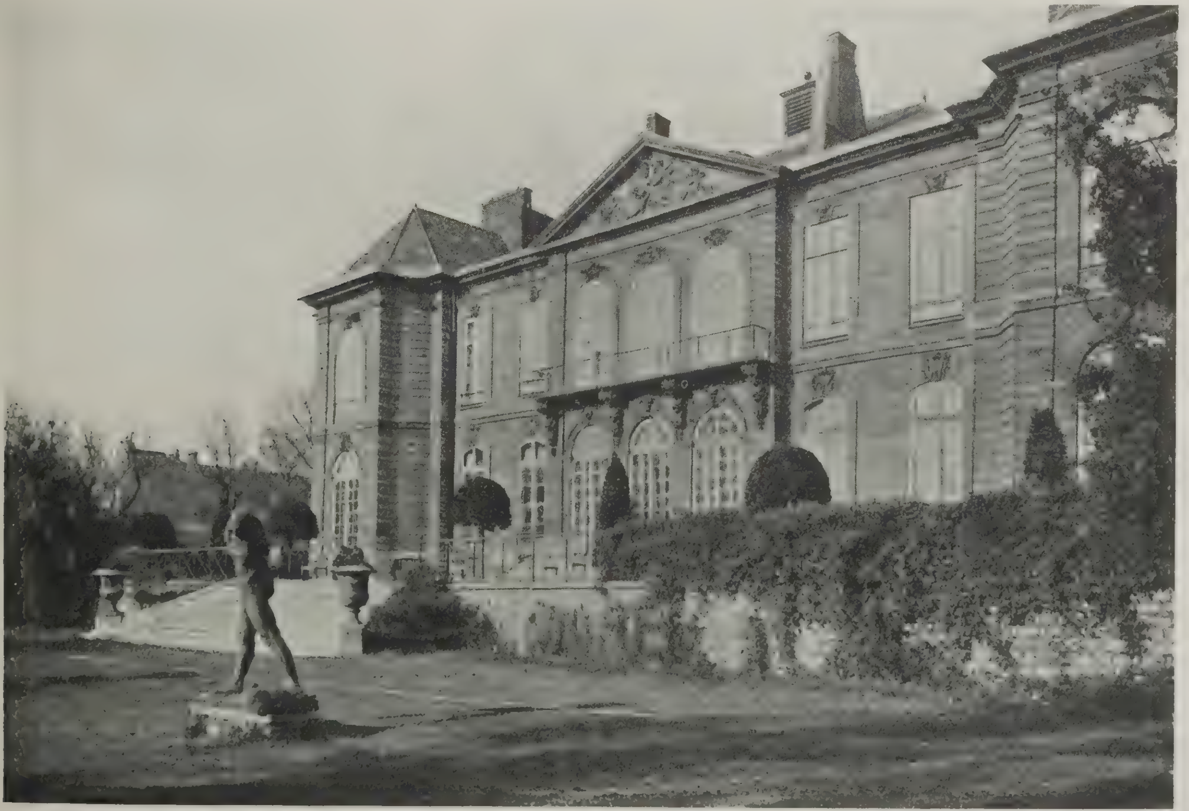
RODIN is one of the few great French sculptors whose names are known to the British public. Those to whom Rude, Carpeaux, Barye, Cain, and Prémiet are dead letters, are not only ac- nted with the name, but also with the work of the :or of "Le Grand Penseur" and "Les Bourgeoisie de is." This fact is due to several causes. In the first place, ate W. E. Henley and the French painter Legros may be to have introduced the knowledge of the man and his :s into our country, and this they did with such en- iasm and such insistence, that there gradually began to 1 interest and a curiosity taken in the sculptor who was to reveal in his achievements something of the creative deur of Michel Angelo. Then George Wyndham, a d of Henley's, had his handsome face sculpted by the :er, as did Henley himself, and Mr. Bernard Shaw, Howard de Walden, Lady Warwick, and Lady Sack- West. There followed Rodin exhibitions in England, the setting up of a version of "Les Bourgeoisie de Calais" e gardens attached to the House of Lords, and finally, recognition of England's aid to Belgium, Rodin gave no r than eighteen of his works to the Victoria and Albert eum, where they are now on permanent exhibition. ed to this something of the excitement produced in s by the refusal of the famous Balzac statue by the été des Gens de Lettres, which had commissioned it, wafted across the Channel, and caused many who have *r* for a scandal if not for art, to talk about the man who produced that wonderful but much misunderstood erpiece.

l this is now old history, and the name of Rodin, even ng us, has come to be recognized as that of one of the , his out-and-out admirers say the most, remarkable ptors of our age. It is not, therefore, strange that the ishman in Paris should visit the Musée Rodin as one e outstanding "sights" of the city.

e home of the collection is in itself a place of great est. It is, indeed, one of those splendid abodes in which the French *noblesse* of the eighteenth century passed their unregarded hours before the tocsin of revolution awoke them from their Armida dreams of luxury and *insouciance*.

The Hôtel Biron, in the Rue de Varenne, is a fine example of the architectural style of that period. It was designed by that great architect Gabriel for Peyranc de Moras, a rich financier who owed his wealth to the system of law which did as much as anything to ruin the country, and it was in course of construction from 1728 to 1731. However, its owner did not enjoy it long, dying in 1732, and his widow sold it to the Duchesse de Maine, a famous political lady. After some twenty years she died, and in 1753 the place became again the property of the de Moras family who, however, sold it almost immediately to the Duc de Gontaut-Biron. On the death of the latter it passed to the Duc de Lauzun, one of those who perished by the guillotine in the fatal year 1793. The gardens, always notable for their extent and beauty, having thus become public property, were thrown open to the people, and all sorts of public fêtes were given in them. At a later date the Duc de Béthune-Charost became the owner of the hotel and its grounds. It is not clear whether he ever actually occupied the house, but it is known to have been let in 1800 to the Papal Nuncio, who was there for eight years, and from 1811 to 1820 to the Russian Ambassador. In the latter year it was purchased by the Dames de Sacré-Cœur, who remained in possession until the "law of separation," as it was called, was passed.

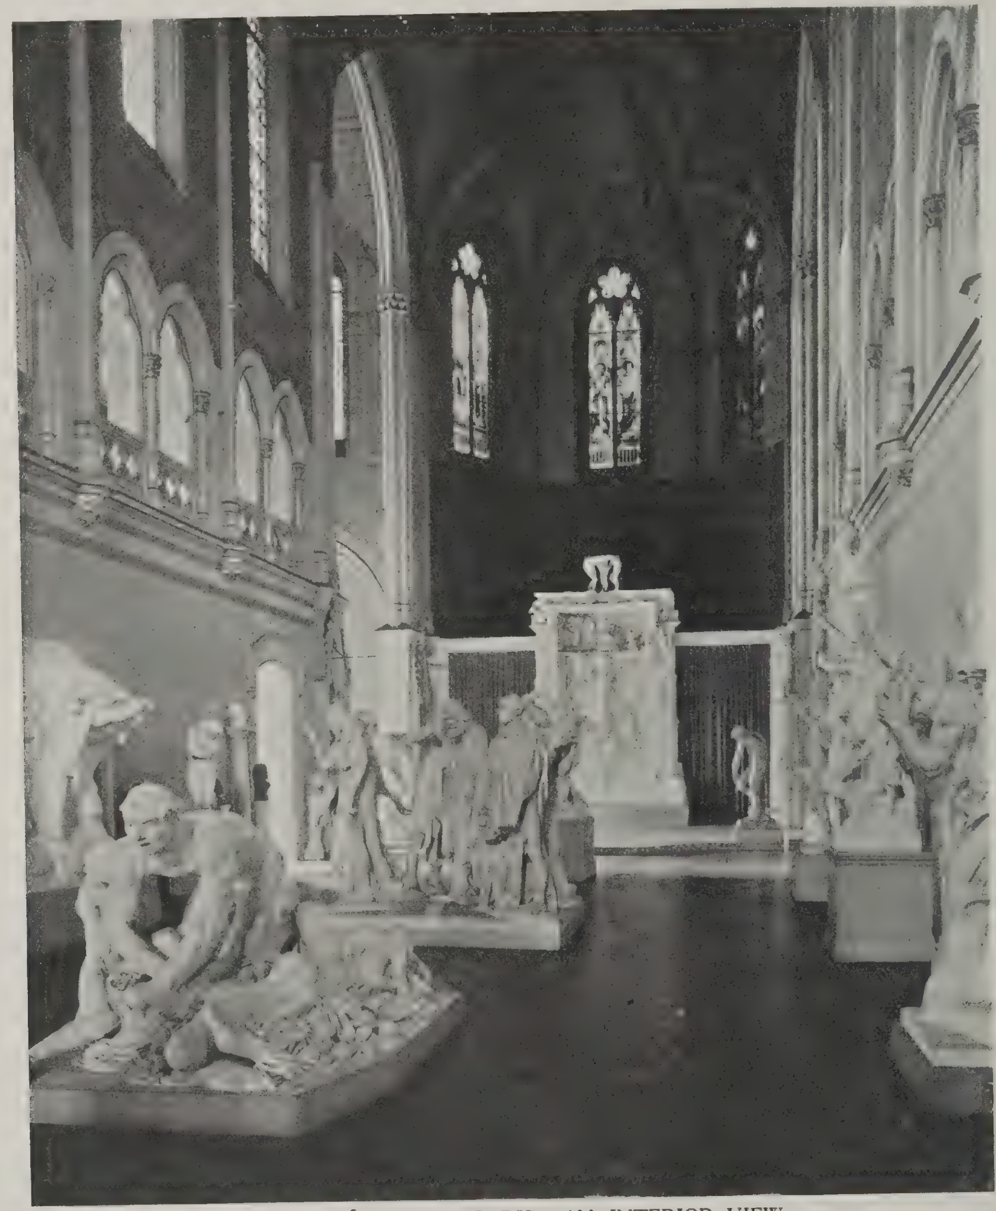
In 1907 Rodin, who also had a country house at Mendon, installed himself in a part of the great building which, being now the property of the State, has been made a national monument as the home of the examples, in stone, bronze, marble, and plaster, of all the master's works. Attached to the property is a chapel, which, having been deconsecrated, forms a kind of annexe to the museum, and now contains casts, etc., of the sculpture the bulk of which is too vast for even the rooms of the Hôtel Biron itself, large and splendid as they are. Here may be seen repetitions or casts



THE GARDEN FRONT

of such famous works as "L'Age d'Arain," "Saint Jean-Baptiste," the "Victor Hugo," the original of which is in the gardens of the Palais Royal, the extraordinary "Poste de l'Enfer," and the much-criticized "Balzac."

Those interested in architecture alone will go to the Hôtel Biron to examine this fine example of Gabriel's domestic style; those to whom sculpture makes a greater appeal will visit it to browse amid the life-work of one of the outstanding masters of plastic form; those who love both arts will find here a glorious legacy housed in a no less glorious setting.



THE MUSÉE RODIN, PARIS: AN INTERIOR VIEW

[The Hôtel Biron, Paris, is situated at the angle of the Rue de Varenne and the Boulevard des Invalides, the dome of the latter being visible through the trees in the garden behind the house. It lies, therefore, in the very heart of the once famous Faubourg Saint-Germain, almost facing the Pont Alexandre III.

The estate in all covers about 12½ acres, and comprises four buildings in addition to the gardens. Three of these buildings may be dismissed in a few sentences. One is a large and most unsightly chapel, next to the entrance on the right, which at once spoils the beauty and symmetry of the forecourt. Its presence there is due to the wholesale vandalism committed by the Dames of the Sacré Cœur and their priests, who seem to have made a point of destroying as much as they could of the beauty and architectural charm of the place during the long period of their residence there. Then there is a sma chapel erected in 1823, and at the bottom of the gar is the large private residence of the Lady Superior, erec by the first Mother, Mme. Madeleine Sophie Louise Ba in 1858, which in its turn spoils the appearance of end of the garden.

Like most of the noble houses of its period, the n building is approached by a spacious forecourt, or *d'honneur*, leading direct from the entrance to a fligh steps in the central pavilion of the house. To the r and left of the entrance there were originally a numbe inner, or *basse*, courts; those on the right provided sta for thirty-three horses and eight coach-houses, an to the great kitchens of the establishment. These purposely separated from the main building so as n offend the olfactory nerves of the aristocrats who frequent guests at the mansion. The *basse-cours* o other side of the entrance were added by the Duch Maine, and provided accommodation for the office her household. Her Grace, who was the widow of Ar Louis, Duc du Maine, one of the Bourbon princes, the house for life from the widow of de Moras. Duchess made other alterations inside the house, bu not destroy the beautiful proportions of the grand s

For information as to the original disposition interior one can turn to Blondel's "L'Histoi l'Architecture Française"(1752-6).]

Home Truths at the A.A.

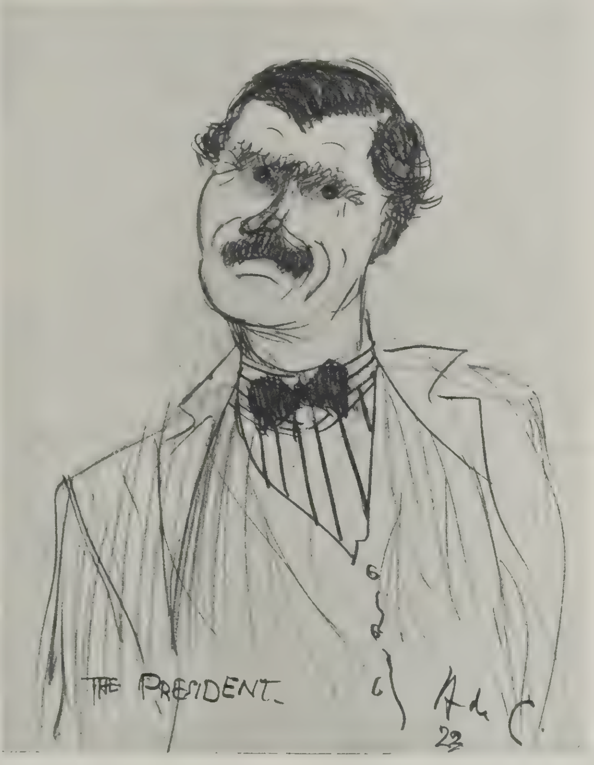
MUTUAL frankness was the order of the evening when Miss Edith Place revealed to the A.A. the secrets of a woman's heart, in other words, her view of domestic architecture.

he speaker expressed a delightful diffidence at addressing h an audience on such a subject, but courage evidently ced as she proceeded, for it was with no uncertain voice t she expressed the average woman's opinion of the rage house.

liss Place evidently has little love for the dwelling of lay, and still less for its contents. Carpets and curtains e her cold; "things" are her abomination; even much he regulation furniture should, in her opinion, make way built-in cupboards, dressing-tables, and bookcases.

heoretically she is, of course, perfectly right. We spend too much time doing work of own making, but a clinging ction for household gods and ded comfort is, it must be fessed, deeply rooted in the tish temperament.

lore possible of realization Miss Place's plea for more roughness in construction. urged the importance of l-fitting doors and windows, rds which do not allow the t of the space between to r up, wainscots which meet floor firmly, and preferably h a curve.



n the speaker's experience boards appealed to men just nuch as to her own sex, and invited the attention of her ience to various grievances nected with their construc- . They were never deep ugh for the proper storage of hes, and should go right to top of the room instead of ing a space at the top, which too small to hold anything ully, and only succeeded in ecting dust. Too often they e badly lit, and where there no window space an inside fitting for light should ays be provided.

he eternal kitchen problems also provoked Miss Place loquence. It should never be underground, always be lighted, and built on the north side, even if it were in t of the house.

he cooker should not be in a draught, and should have l table space near it. A glazed dresser is advisable, and drawers should be more numerous and shallower. If itects ever looked into the usual deep dresser-drawer would see what horrible untidiness it entailed. The e or shelf near the cooker might have arrangements for nary necessities. A saucepan shelf should always be ssible, and have doors panelled with perforated zinc. the store cupboard might, with advantage, be elled in the same way.

ith some delicacy Miss Place approached the question novable furniture. We have, she considers, far too h of this in our houses, especially in our bedrooms. If had more fittings in the shape of cupboards, some for ging, some with drawers, and had lavatory basins, we ld be able to do away with wardrobes, chests, and nstands, confining ourselves to bed, chairs, and a table. tting-rooms could, in Miss Place's opinion, be better just as pretty with cupboard fittings, shelves with glass lids, a bureau for writing below, a recess cabinet with glass doors for ornaments, the cupboard below divided to hold coal on the one side, music on the other. Cupboards are, in effect, the apparent solution of every household difficulty.

In California, where there are no servants, and the mistress of the house usually had to cook, clean, and wash, the average home was built of wood, beautifully floored, and very carefully planned. There was generally a roofed porch, and what is called a sleeping porch which has a roof, but the walls are of metal gauze. The cooker was usually gas, well raised, the light electric, and all the cupboards are closed with glass or wood doors. As a rule there were no "upstairs," or only one floor at the most. The public buildings, such as banks, stores, etc., are very handsome, with much plain marble, lofty ceilings, excellent lifts, and fine sanitary arrangements. Central heating saved much trouble, and the lavish use of electricity was another marked feature.

London was full of houses which are too big for the families of to-day; the best way was to make them into maisonettes, which were really more "homey" than flats, and had loftier rooms. Blocks of flats were dismal things, and it ought to be possible to break any ground leases or other drawbacks which prevent the large houses from being converted. We were rather restricted by our slowness; we must have "dining-rooms" and "drawing-rooms," even if each is little more than 6 ft. square; a roomy "parlour" would not suit us.

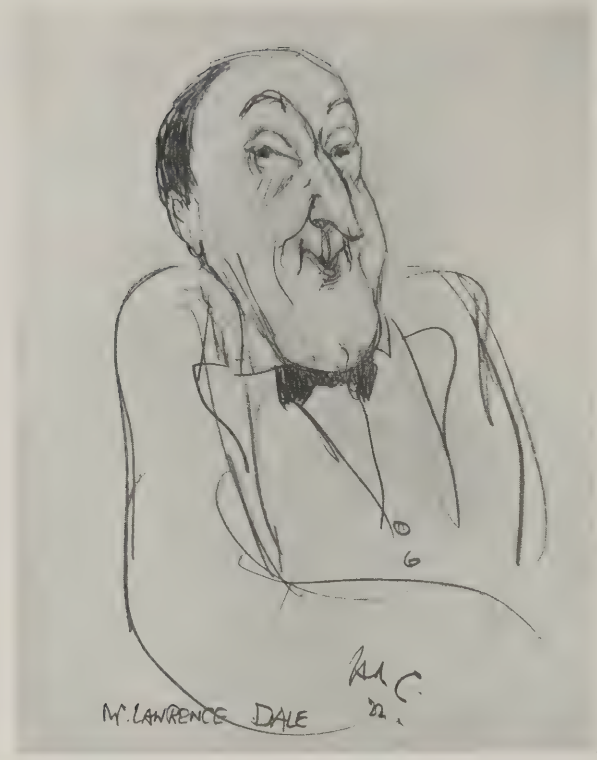
Stairs were generally too steep and narrow, thus causing undue fatigue. Why could they not be pitched as they were in old houses? Front doors might easily be recessed to save standing in the rain. This would not interfere with the front line, but only take about 2½ ft. from the passage or hall, and a small eave over the door would be attractive.

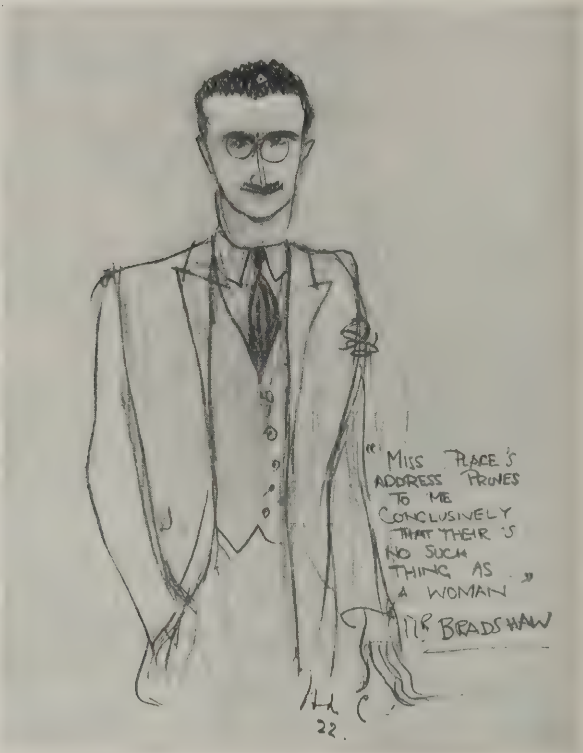
Proposing a vote of thanks, Mrs. Charles Peel remarked that every man kept a servant, either a wife or a housekeeper. If he did not we should long ago have done away with the brick and mortar monsters that eat up the lives of women. No matter what devices were introduced, there would never be a labour-saving house unless it were properly planned from the first. It must be made of the proper material, and have the rooms properly grouped. She told of one municipal house where the larder was by the front door, the stove in the sitting-room, the table in the kitchen, and the sink in the scullery, so that every time the wife prepared a meal she had to make a tour of the house.

The question of labour-saving houses deserves your most serious attention, she told the young architects. The best way for architects to understand the problems would be by their adding to their course of training a six months' apprenticeship to a charwoman.

A lively discussion followed, during which the lady speakers learnt something of the average architect's opinion of his feminine clients.

Adam, remarked Mr. Lawrence Dale, pathetically, did





"Miss Place's address proves to me conclusively that their's no such thing as a woman"
Mr. BRADSHAW
22.

not worry about a house; when Eve came along she demanded bedrooms. We were all living in out-of-date houses, and the modern generation of architects ought not to be blamed. The fitted furniture of America was to some extent due to the difficulty of obtaining labour for furniture removals; in England pieces of furniture were often heirlooms. Miss Place was clearly the ideal client, but it would be difficult to persuade people to pay the first cost of the improvements she suggested. He hoped Miss Place would repeat her lecture before an audience of clients.

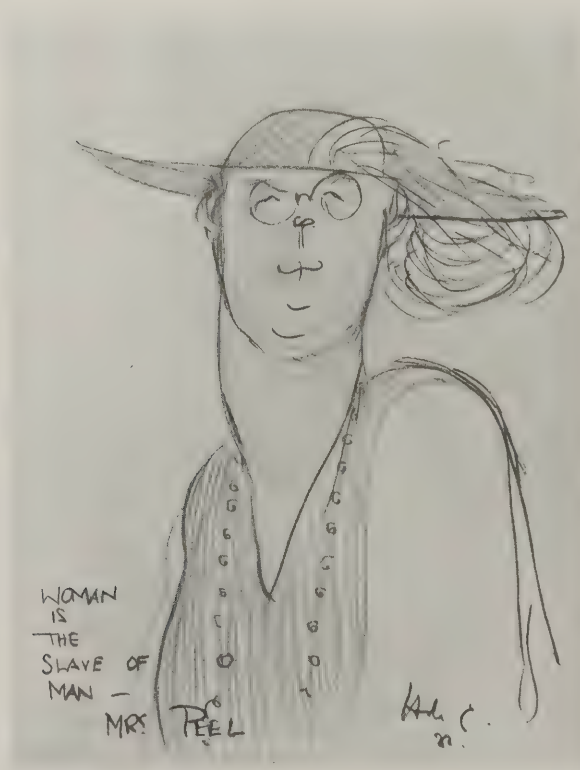
Mr. Bulkeley Creswell joined with ardour in the great cupboard controversy, and drew a graphic and grisly picture of the probable contents of the cupboards which every woman longed to possess. He was inclined to pour scorn on labour-saving arrangements, which were frequently misused by the servants whom they were intended to benefit.

Mr. Tait and Mr. Sullivan also spoke, the la taking great exception to the idea of a plug in the kit sink.

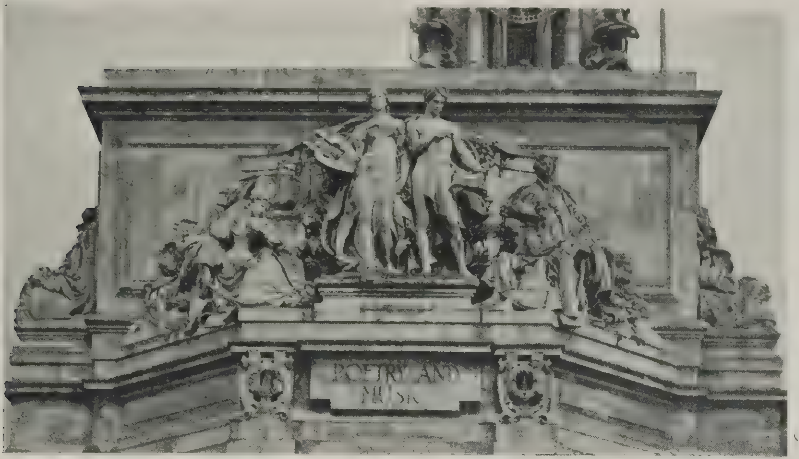
Mr. Jenkins took the trouble to work out the prob cost of the improvements indicated by Miss Place, calculated that it would amount to something like £2 on a £3,000 house. The wide staircase took up more s than could be usually spared.

Mr. Hamp thought that Miss Place was right, but client would never be persuaded to pay. Speaking t did not appeal to him, but he thought old houses ough be made use of.

Replying, Miss Place suggested the foundation of a tureship for clients, and Mrs. Peel said that it would to build properly planned labour-saving houses. A dom efficiency engineer should be attached to every fir architects.



WOMAN IS THE SLAVE OF MAN —
MRS PEEL



"POETRY AND MUSIC": A GROUP ON THE CARDIFF CITY HALL.

Paul Raphael Montford, Sculptor

By GEOFFREY GIDDINGS

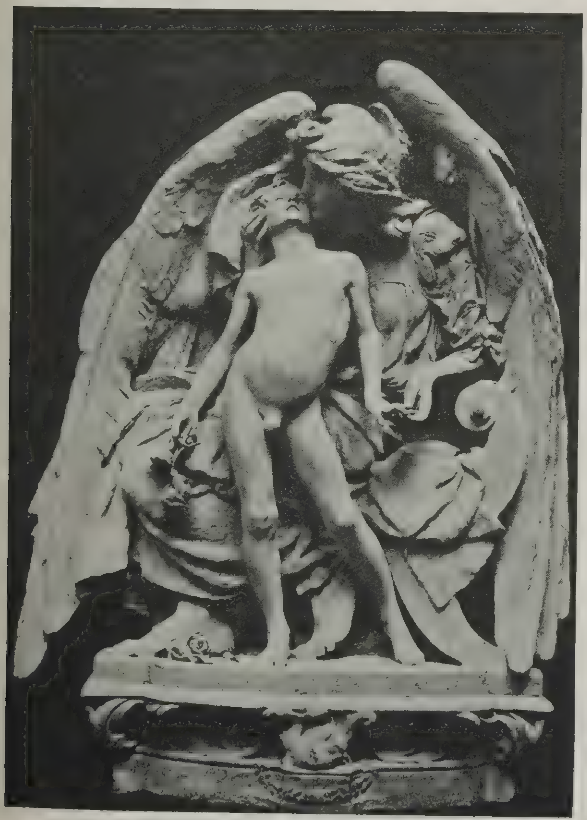
PAUL RAPHAEL MONTFORD first saw the light of day in the year 1868. If his birth was not attended by mystic auguries of luck, he at least entered this world with circumstance propitious to uture. His father, the late Horace Montford, who held equently, for many years, the Curatorship of the Royal lemy Schools of Sculpture, was at that time engaged e work which won him the Academy Gold Medal and elling Studentship.

om him his son, who entered the schools in his nine- h year, acquired a mastery of technique and ideals of manship, and inherited the desire to progress along idual lines, rather than emulate the work of the ers of a bygone day.

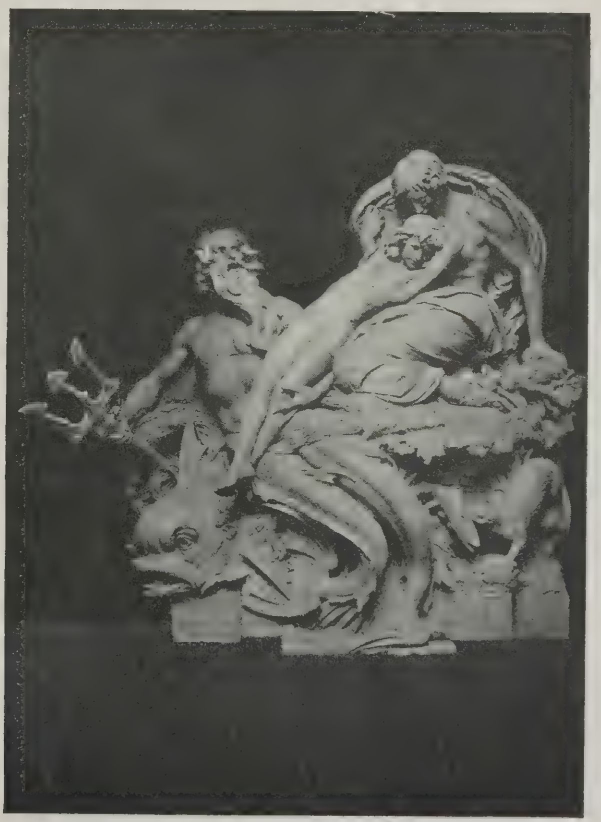
e beauty of the living human figure had supplanted classical ideal as the essential of education. The emy Schools gave, perhaps, the best training to be in those days, but in considering an artistic appreciation of the human figure alone as a sufficient endowment it provided its students with the rudiments of their art without indicating whither their abilities might be directed.

In 1893 Paul Montford, in his turn, gained the Royal Academy Gold Medal and Travelling Studentship. The European tour which followed this success—though he created little during his wanderings—broadened his horizon, brought him in touch with new possibilities, and went far in deciding those tendencies which have controlled his subsequent achievement.

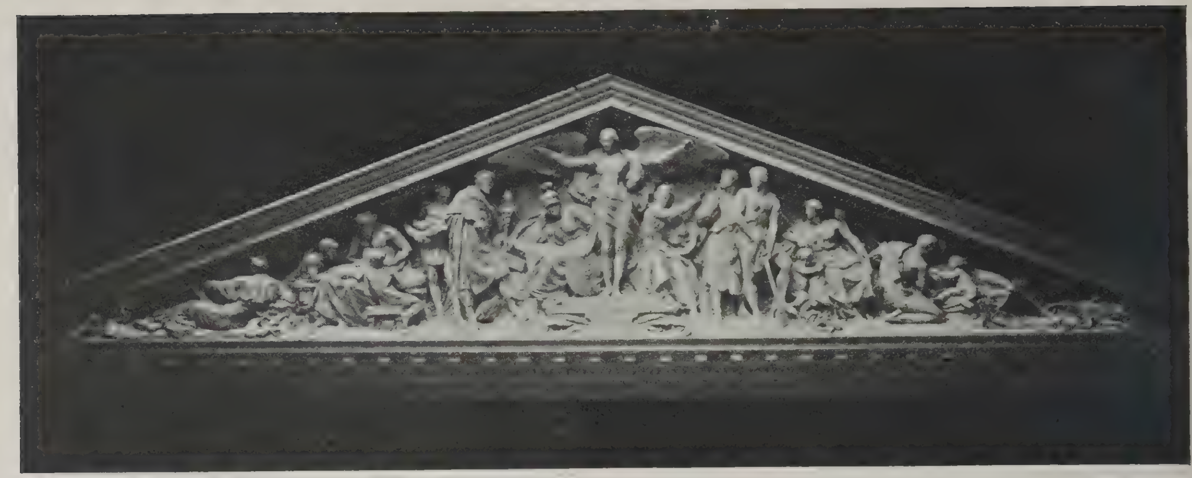
Although in Italy he came under the spell of the Florentine School, it was the works of the great French sculptors of the day—of Peuche, Carpeaux, Diderot, Mercier, and their contemporaries—which made the strongest appeal to his imagination and temperament. From them he gained that richness—a sumptuousness almost—which is characteristic of his art and which gives it much of its charm and its distinction.



"WHOM THE GODS LOVE . ."



"THE RIVER SEVERN."



DESIGN FOR A PEDIMENT FOR GOVERNMENT OFFICES IN WHITEHALL BY PAUL RAPHAEL MONTFORD.

Since those early days of studentship he has given his energies mainly to figures and groups with an architectural setting, to designs with a part to play in a larger scheme of decoration. Such works must of necessity be seen in the positions they were intended to fill to be properly appreciated—their height from the ground, the scale and character of the buildings has been influential in determining their form. It is typical of the thoroughness of his work that the parts seen and the parts unseen have been modelled and carved with the same carefulness and thought.

Working with the late E. A. Rickards—that most sculpturesque of architects—he began, in 1903, a series of designs for groups and panels for the Cardiff City Hall and Law Courts. His "Commerce and Industry" and "Poetry and Music" are groups too well known to call for detailed description. Of the two the former is the more consistently successful; in the latter the difficulty of making two upright figures the centre of the composition is not completely solved—as a recent writer has it, "the duality is not resolved." But the best of his Cardiff work, at once monumental and ideal, is his group at the base of the dome, "The River Severn."

The compulsory inclusion of the busts of Beit and Werner in the mascarons which flank the entrance to the School Engineering at South Kensington—their generous gift the nation—presented difficulties in which no sculpto would delight, but his method of overcoming them leave no idea of incongruity in scale or subject. His work her shows well his idea of the relation of sculpture to arch tecture—the broadness of treatment has been obtained b an elimination of all untelling details, by an insistence o the essential facts alone, and the simplicity is obtaine without a suggestion of mere barren emptiness.

In Montford's four groups for the Kelvin Bridge, Glas gow, we see the highest level of his achievement. In eac are two figures, composed about a massive lamp-standar and representing in turn, "Peace and War," "Commerc and Industry," "Shipbuilding and Navigation," an "Philosophy and Inspiration."

Realistic and natural as these figures are, and modern i their treatment, they are not the mere representation people, of things seen, but of sentiments realized rathe symbolizing in a summary of their attributes the who intention of their meaning.

For example, the magnificent figure of "War," stron wild, and loot-laden, despite its mediævalism, belongs t no definite place or period, but in it are manifest the wa

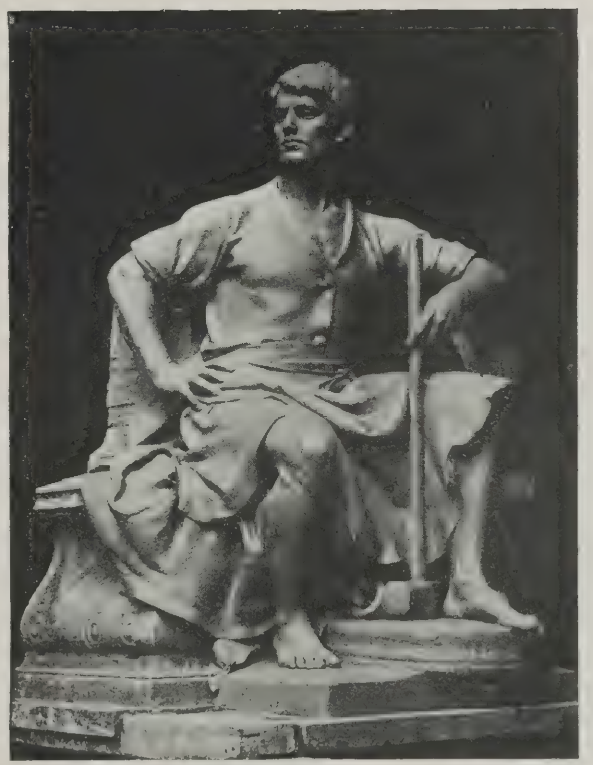
"COMMERCE."



"INDUSTRY."

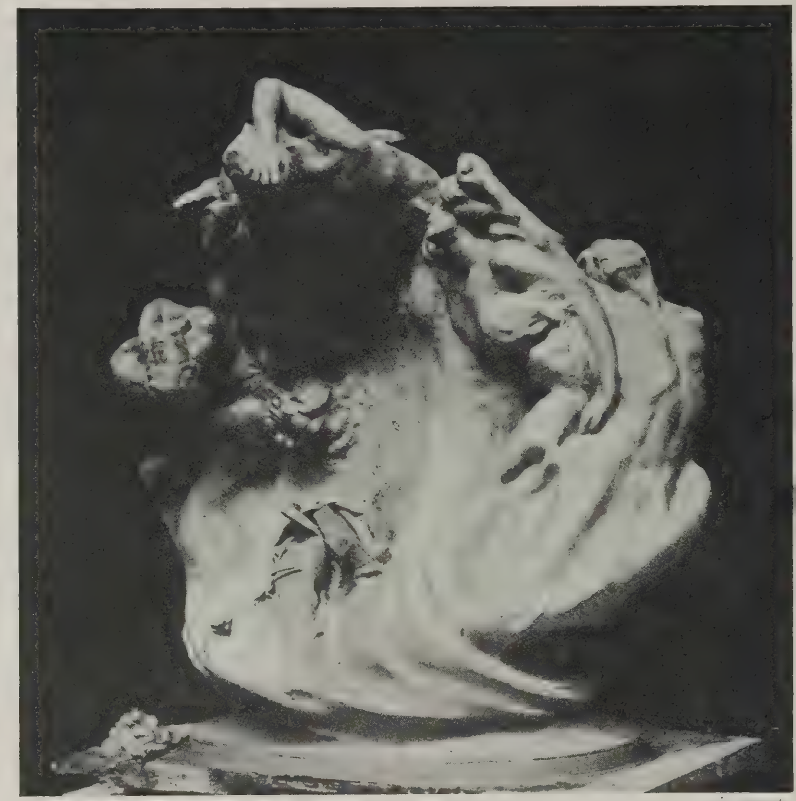
BRONZE STATUARY BY PAUL RAPHAEL MONTFORD ON THE KELVIN BRIDGE, GLASGOW.

spirit of all ages, the untamed force, the vigour, the lust of conquest and of gain, the primitive instincts of man.

In striking contrast is the gentle "Peace." By means so simple that we wonder wherein the secret lies this beautiful figure calls up all the associations of its subject, the arts and industries, untrammelled by strife, the security of the home and the sweetness of the life there, in a time of plenty, far from "War's shrill alarums."

It is noteworthy that the symbolism of Montford's recent work is never pedantic, never gathered without imagination from out the lumber of antiquity. He draws his ideas from his subject, and they need no ancient lore for interpretation.

In the figure of "Commerce"—and few sculptors would have ventured to typify Commerce by a woman—we have an instance of the aptness of his symbolism. How telling is the suggestion of the office ledgers, the purse, and the money-bag held out so temptingly; the very richness of the dress—rare brocade—the laced coif, the stringed shoes, speak of trafficking in precious goods. By what subtle alchemy does this single figure call up pictures of the desert caravan, the busy ports, the aged merchants signing their long bills, and the sailors singing in their ships along the bay. But to suggest more than is apparent is surely the mission, the magic, of art.

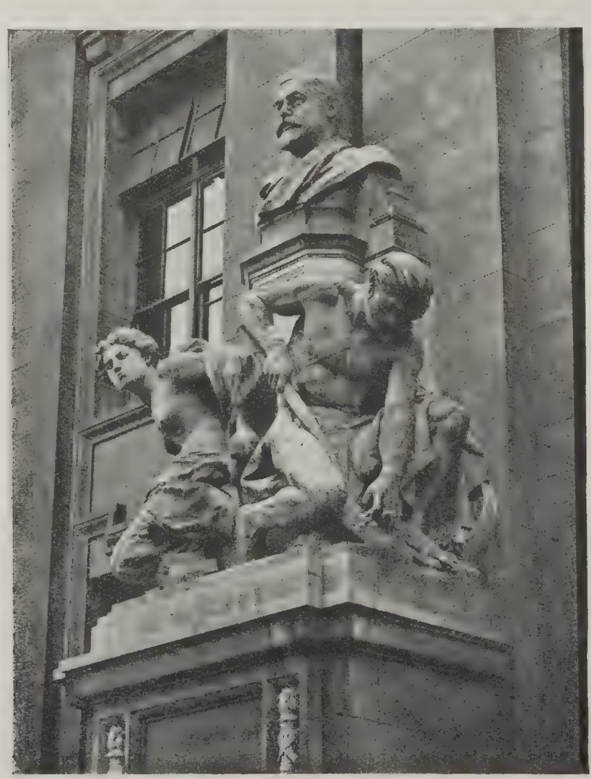


"THE STORM WAVE." PAUL RAPHAEL MONTFORD, SCULPTOR.

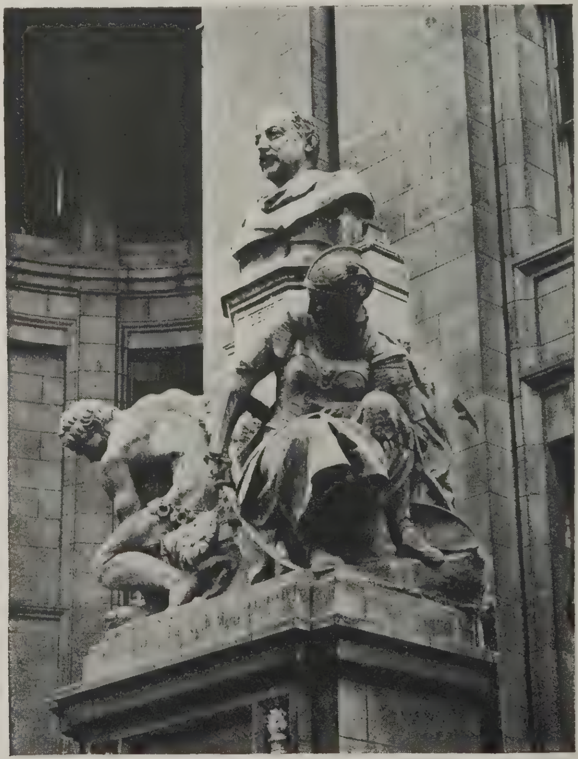
The more remarkable for its uniqueness, "Industry alone amongst these eight figures shows a self-consciousne of pose and expression. There is here apparent a certa self-satisfaction, a presumption of independence, of suf ciency in his own strength and power to bear alone t burden of the worl True, there is t pride in labouring, b also an ignorance the truth that m cannot live by bre alone.

Circumstances rath than inclination m have induced in Mon ford this preoccup tion with work of monumental characte for in that is not t limit of his interest abilities. He has son fifty busts to h credit. From time time he has creat works of a pure ideal character, e bodiments of so abstract thought sentiment. Such work is his "Fish man and Mermaid and such is his fa tasy "The Sto Wave." An ea group, unhappily d stroyed by an ac dent whilst castin was that entitl "Whom the Gods Love . . . . ." In spite of its imm turity and faults, as in the over-elaboration of t drapery, there is here a grace, a sweetness, a hauntin melancholy which arrest and charm; a fair promise greater things to come.

And this promise has not been unfulfilled.



"SMELTING AND MINING."



"STONE AND METAL."

TWO GROUPS ON THE SCHOOL OF ENGINEERING, SOUTH KENSINGTON PAUL RAPHAEL MONTFORD, SCULPTOR.

"Rushymead," Coleshill

A. DUNBAR SMITH and the late CECIL C. BREWER, Architects

RUSHYMEAD" stands on a fine site above Amersham, Buckinghamshire, on a ridge of the Chilterns. It commands not only the beech tree country at its feet, but also the Thames ley and the oaks of Windsor, and beyond that again in ar weather the Hog's Back in Surrey, and on rare asions beyond even that, the faint line of the Downs. . Thomas Forbes, the owner, and Mr. Brewer had fre- ently discussed the possibilities of altering or disguising old house, of building a new house, of designing a garden. length it was decided to pull down the old house and ld a new one on its foundations. The new "Rushy- ad" was the last design made by Mr. Brewer before his th. It was finally carried out under difficulties due to r conditions by Mr. Dunbar Smith.

he major rooms are planned *en suite*, with a large num- of communicating doors. It is possible on the ground r to go from the loggia at one end to the loggia at the er, through the length of the house, without traversing assage. The servants' quarters on all the floors are com- te in themselves and have their own stairs, lift, bath- ms, and corridor. An elliptical staircase-hall two floors eight, entered directly from the porch, is the key of the n. This hall, on the ground floor, leads between columns, two steps, into the second of a range of four reception ms opening into each other and looking south. The rs were originally designed for black marble, but they e been carried out quite successfully in teak. They end in the arc of a circle and consist of a series of equal ders with a corkscrew balustrading. A doorway to servants' quarters is placed on the axis of the ellipse comes centrally under the stairs. It has a circular d and is decoratively joined to the stair-ends. There is absence of heavy mouldings. The design of the hall sists of a series of shapes and surfaces lit at two levels pposite directions.

he four large reception rooms occupying the south are all different in shape. The drawing-room next main loggia is an oblong with a semi-circle added at h end. Next the drawing room is the square sitting-hall the short axis of the house. Next that is an octagonal ing-room, opening in turn into a large T-shaped billiard m. This diversity is not forced, but comes quite natur- . There is no through vista; the rooms must be crossed gonally, yet each is linked in design with the next.

he detail is simple, but the lighting, on the other hand, omplex and varied. The joinery is used cleverly; the ly proportioned doors in these rooms are of flush ogany and stand like dark mirrors in the ivory walls. drawing-room gives through three large French win- s upon the loggia, but is mainly lit by its end windows. difficult task of detailing the sitting-hall and the stair- -hall has been carried out successfully by Mr. Dunbar th. He has used as a motive for decoration *four bees* llusion to his client's name. Four bees are also to be d outside on the rain-water pipes and on the key-stones. the octagonal dining-room the ceiling is constructed brous plaster panels, the joints of which form a natural ern.

n the first floor the rooms looking south are smaller those on the ground floor by the width of a main idor, the partition wall of which is carried on a joist ing nearly the length of the house. The main bedrooms into this corridor and have a small bedroom between with connecting doors to form a dressing-room when ired. At each end a suite is formed by a bedroom and ng-room opening on to a loggia roof. These suites have their own bathrooms. The house contains five bathrooms, and in each case there is access to the plumbing through a special door, either in the bathroom itself or in the adjoining room.

The main corridor is lighted at the far end by a projecting bay-window led up to by wooden steps. The stair then leads up somewhat narrowly through an opening and round again into the corridor above, which is lit by the same window and fenced by a balustrade. Another series of rooms, including a nursery suite, are here situated in the roof, and through any window you can distinguish on a clear day the towers of Windsor Castle.

The details for the order in the entrance porch and in the loggias were among the few left by Mr. Brewer. The order has the following characteristics: The column is octagonal on plan and has sinkings upon the shaft; caps and bases are also octagonal; a plain lintel is surmounted by a freely designed cornice. The lead work protecting the top of the cornice has been ornamented and gives the effect of a narrow blocking course. The full effect of the inter-columniations can be seen best in the loggias, where the blocking course is of stone and is designed to form a seat on the roof above. The invention is confined to detail. The drawing was made to inch scale in a few hours, and the general proportions have not been departed from. It is an interesting example of direct design. The variations that were rendered necessary by practical issues as they arose in course of construction were as few as possible and made by Mr. Dunbar Smith as nearly as he could in his partner's manner.

Externally, "Rushymead" presents a soft brick suit of many colours in which are two rows of oblong sash windows flanked by green shutters. There is no cornice above, only a string and a tall parapet, behind which rises the roof. The projecting bays at each end are terminated above by gable-ends having stone copings.

The walls are hollow, and consist of a 9 in. inner wall to carry weight, a 4½ in. air space and a 4½ in. outer wall. The two are tied by large galvanized iron ties. The small bricks of the outer wall are less than 2 in. in height. They have a ½ in. mortar joint, and were specially made by Messrs. Rust and Radcliffe, of Chesham, to line at foot intervals with the courses of the ordinary bricks of the inner wall. The joints were pointed with a curved impress. The headers were cut so as not to project inwards into the enclosed space. The stone cills, keys, and copings are all of Portland stone.

The garden is partly laid out according to the plans of Mr. Dunbar Smith and partly according to the design of Mr. Wood, garden architect. Mr. Forbes did the honours of his garden no less pleasantly than of his house, and with an equal taste and interest.

We are indebted to the "Architectural Association Journal" for the foregoing particulars and for the loan of the illustration.

The general contractors were Messrs. J. K. Cooper and Sons, Ltd., of Maidenhead, and the sub-contractors as follows: F. Edwards and Son (heating and hot water supply); F. Geere Howard (electrical work); Joseph Armitage and G. and A. Brown, Ltd. (fibrous plaster work, etc.); Fenning & Co., Ltd. (marble work); Bassant Bros., Ltd. (parquet flooring); J. P. White and Sons, Ltd. (teak staircase and joinery to reception rooms); United Water Softeners, Ltd. ("Permutit" water softening plant); the Septic Tank Co., Ltd. (septic tank installation); James Ritchie and Sons (hand-power lift); Bratt, Colbran & Co., Ltd., Candy & Co., Ltd., F. Edwards and Son, and Thomas Elsley, Ltd. (fire grates); Charles Smith, Sons & Co., Ltd., Birmingham (ironmongery); A. Emanuel and Sons, Ltd. (sanitary fittings).

G. ALAN FORTESCUE, A.R.I.B.A., Architect

THE greatest objection that is urged against the bungalow is that the sleeping apartments usually obtrude themselves upon the domestic offices and living rooms. In the one illustrated—designed by Mr. G. Alan Fortescue, A.R.I.B.A.—this has been avoided by planning the house with two wings—the bedrooms and bathroom being self-contained in one wing, and the dining-room, kitchen, and maids' bedroom in the other. The connecting block is taken up with the lounge and sitting-room.

Such a plan lends itself to a greater lightness of design than when all the rooms are grouped together, and a paved court between the two wings can form a distinctive feature.

In designing the elevations the architect has availed himself of all the advantages of the plan. The space between the two blocks is paved as a court, with a pergola in front. At the back of the bungalow the slight recess between the two wings forms a loggia. The columns to the pergola are 10 in. octagonal, and were cast in concrete on the job. The bearers and cross-sparring are oak.

The bungalow is brick built, finished with Portland cement, the last coat finished with "wood float" and twice distempered white with "Duresco." The brick plinths are twice tarred.

The roof is constructed with 4 in. by 2 in. rafters, with $\frac{3}{4}$ in. close boarding, and 3 in. by 2 in. rafters spaced 8 in. apart to receive Italian tiling. The tiling is by Messrs. Ames and Quinis, London. Three-quarter inch beaded boarded eaves project 6 in. from the face of the wall.

The interior is particularly well lighted, the plan allov ing windows to be inserted in two sides of the room

The fire-place in the lounge (of which an illustration given) is plain brick with a dog-grate and fireback distinctive pattern. The overmantel is dark oak.

The windows are steel in wood frames. These we supplied by Messrs. W. Games & Co., Willesden. Th external window sills and thresholds are formed by har red brick-on-edge, while the internal sills and threshol are formed of 6 in. by 6 in. quarry tiles twice beeswaxed.

For the floors to the kitchen, corridors, bathroom, et 9 in. by 9 in. quarries were used.

The doors are two-panel, square both sides, the pane being filled in with $\frac{5}{8}$ in. birch Venesta and painted whit with 6 in. by 1 in. square skirting painted black. The fing plates and other door furniture, and the electric light swit plates, etc., are black ebony.

The coal fire to lounge and built-in gas fires to bedroon are constructed of concrete flue-blocks. An Eco anthraci range is provided in the kitchen.

As in the architect's other house, "Dormers," at Tham Ditton (illustrated in our issue for November 1, 1922), the is a service hatch from the kitchen to the dining-room, ar on the kitchen side the top part of the hatch forms a rece tacle, with a glazed door, in which china may be store Beneath the serving portion are drawers to pull in and o either side for knives, and underneath these and above t skirting a cupboard for glasses and decanters, etc.

Built-in cupboards are installed in all the bedrooms.

Llandudno War Memorial

S. COLWYN FOULKES, A.R.I.B.A., Architect

ORIGINALLY the Llandudno War Memorial was the subject of an open competition in which the design of Mr. S. Colwyn Foulkes, A.R.I.B.A., secured first place, and when it was decided to change the site Mr. Colwyn Foulkes was entrusted with the design of the present memorial. The type of the memorial has been determined primarily by its site. The fine width and length of Gloddaeth Street, terminating in the horizontal line of the promenade against the sky, called for some high form in contrast to this. It was felt that any memorial of a pronounced warlike or realistic character should be avoided, and that some form should be sought which, while satisfying the above considerations, would remain of permanent significance.

In reviewing the memorials of the past, it was felt that the obelisk was the type most fitting the conditions. It is a type which has been used as a commemorative monument by succeeding generations for nearly 4,000 years. In most of the principal European cities it survives to-day, where it usually marks the "place" or point of greates importance.

Unlike most of the classic examples, which are surrounde by buildings, this monument has the advantage of a complete silhouette against the sky. The lay-out on eithe side is designed to connect up the curves of the promenad and by its low character to lead up to and emphasize th memorial.

The monument is built of Cornish granite, and the co of the shaft is of reinforced concrete, the reinforcemen being carried down and connected with a reinforced concrete base 18 ft. square. The height of the memorial 50 ft. from the pavement to the top of the bronz grenade.

The work has been carried out under the supervision the architect by the following firms :—

J. and H. Patteson, of Manchester (obelisk); J. Whit and Sons, Birmingham (lay-out); and The Bromsgrov Guild, Bromsgrove (four lamps).

R.I.B.A. Street Architecture Medal

FOLLOWING are the conditions, subject to which the R.I.B.A. will award the medal for the street frontage of a building erected or completed within a radius of four miles from Charing Cross during the year ending December 31, 1922:—

1. With a view to encouraging excellence of design in street architecture, it has been decided to examine annually the buildings erected or completed during the year ending December 31, within a radius of four miles from Charing Cross, and to award a premium for the most meritorious external design.

2. Premiums.—The architect of the premiated building will receive a bronze medal, presented by the Royal Institute, together with a diploma signed by the Jury of Assessors.

3. Conditions:—

(*a*) The building must front to a street, road, square or court, to which the public has access within the four-mile radius. The award is intended for a street façade as opposed to churches or public buildings.

(*b*) The architect is the person from whose design the building has been executed.

(*c*) Any member or Licentiate of the Royal Institute shall be at liberty to nominate any building (not excluding his own work) for consideration by the jury. Forms of nomination will be issued with the first two numbers of the Journal in each session. These forms, which must be accompanied by an elevation to scale and a photograph of the exterior of the completed building for the information of the jury, must be in the hands of the Secretary R.I.B.A. by the end of February, 1923. These documents will be returned (carriage paid) to the sender after the award has been made. The jury do not
bind themselves to confine t
selection to the buildings no
nated.

4. Jury.—The award will be made
a jury of five appointed by the Counc
the Royal Institute. The jury for
award for the present year consists of

The Earl of Crawford and Balca
(Hon. F.), Chairman; Sir Aston W
(F.), P.R.A., Past President R.I.B.
Mr. Paul Waterhouse, P.R.I.B.A.;
Reginald Blomfield, R.A., Past Pr
dent R.I.B.A.; Mr. E. Guy Daw
F.R.I.B.A.

Before making their award the j
will personally inspect such of the bu
ings as they deem worthy. The aw
will be final and binding on the Cou
of the Royal Institute and the archit
concerned.

5. Presentation.—The presentation
the premium to the architect will be m
annually at a meeting of the Royal
stitute, of which the date will be announ
in the Press.

Correspondence

The Architect's Niche

To the Editors of THE ARCHITECTS' JOURNAL.

SIRS,—In his presidential address to the Architectural Association Mr. Hamp states that his visit to Holland proves to him that the general public in this country do not fully appreciate the architect and his work, and it seems to me that the fault lies very much with the architect himself.

What do they know of the architect? And what media has the general public for learning what are the functions of an architect? Rarely indeed do we see in the ordinary Press any reference to the architect's work. A public function takes place, such as the unveiling of some monument—the distinguished person invited to perform the ceremony is mentioned; any well-known visitor also, and nearly always the Mayor or other official, and often the Mayor's wife and his secretary, but never, or very rarely, the name of the creator of the monument.

The architectural publications proper are too costly to reach the hands of the many. Unless the architect's work is therefore displayed in the periodicals which the public habitually read, how can they be familiarized with or appreciate the work which the architect performs?

Mr. Hamp then goes on to refer to matters other than advertising or publicity, and suggests that the architect should originate and design all internal decoration, but in later paragraphs remarks that it is the task of specialists to experiment in materials, and with this I fully agree. The actual workers in the materials are the ones who know most about it, and they are as much experts as Mr. Hamp acknowledges the steel engineers to be.

I take it that Mr. Hamp means in effect that the draughtsmen designers who are employed by firms of craftsmen are there to develop the original ideas designed by the architect, and, being men who have made it their life's special study, should be given opportunities of finding an expression for their art. Mr. Hamp does not definitely state, but evidently means to suggest that every body of "enthusiastic" and "conscientious" craftsmen, whether designated by the name of firm or working as individuals, is one of the "groups of various experts whom architects can consult, and whose knowledge and experience are so necessary to all architects."

In more than one architect's office it is looked upon as little less than a crime that firms of craftsmen keep a staff of designers whose life-work it is to study the subject of design as more particularly applied to their own branch of usefulness. Surely the most capable interpreters of an architect's own ideas are the men or body of workers who are able themselves to originate and design.

The man who is unable to speak the language is not the man to understand the intention even if it is carefully written, and no drawing, however carefully prepared, will make a second-rate craftsman produce a first-class article.

Life is too short for an architect to pass through a practical course in every branch of activity which goes to the making of architecture; on the other hand, the specialist in any one branch cannot acquire the general knowledge which must control the assembly in one complete and harmonious whole.

One of the most important subjects dealt with by Mr. Hamp is the urgent necessity of finding some means of expression which will enable the general public to know more about architects and what they do.

The public know what a builder is. Why should the architect not be equally known? Surely there is some way of "letting their light so shine, etc.," which will not be undignified.

If the job is good we, the public, want to know who is the responsible man—
architect; if it is a bad job we, the pub
ought to know who did it so that he n
not perpetrate another like it.

Mr. Maurice Webb mentioned
question of payment of the extra spec
ists employed, and this point will
doubt be carefully considered by
proper authorities.

Mr. Austen Hall's desire that buildi
by "A.A." men could be recognizable
their fineness is stimulating, but we w
not only the founders and friends
have made the "A.A." what it is to-d
but the general public to know also,
the latter have no means of acquiring
necessary knowledge, no handbook,
regularly appearing article in any p
lication which they read. Can this
remedied? The practical suggestion
difficult to find, but can the architectu
profession not have an expert who
"write architecture" for the daily P
so that the discussion of architectu
subjects may be entered into, as spor
entered into, because people have
interest in it? H. W. CASHMOR

Acoustical Research

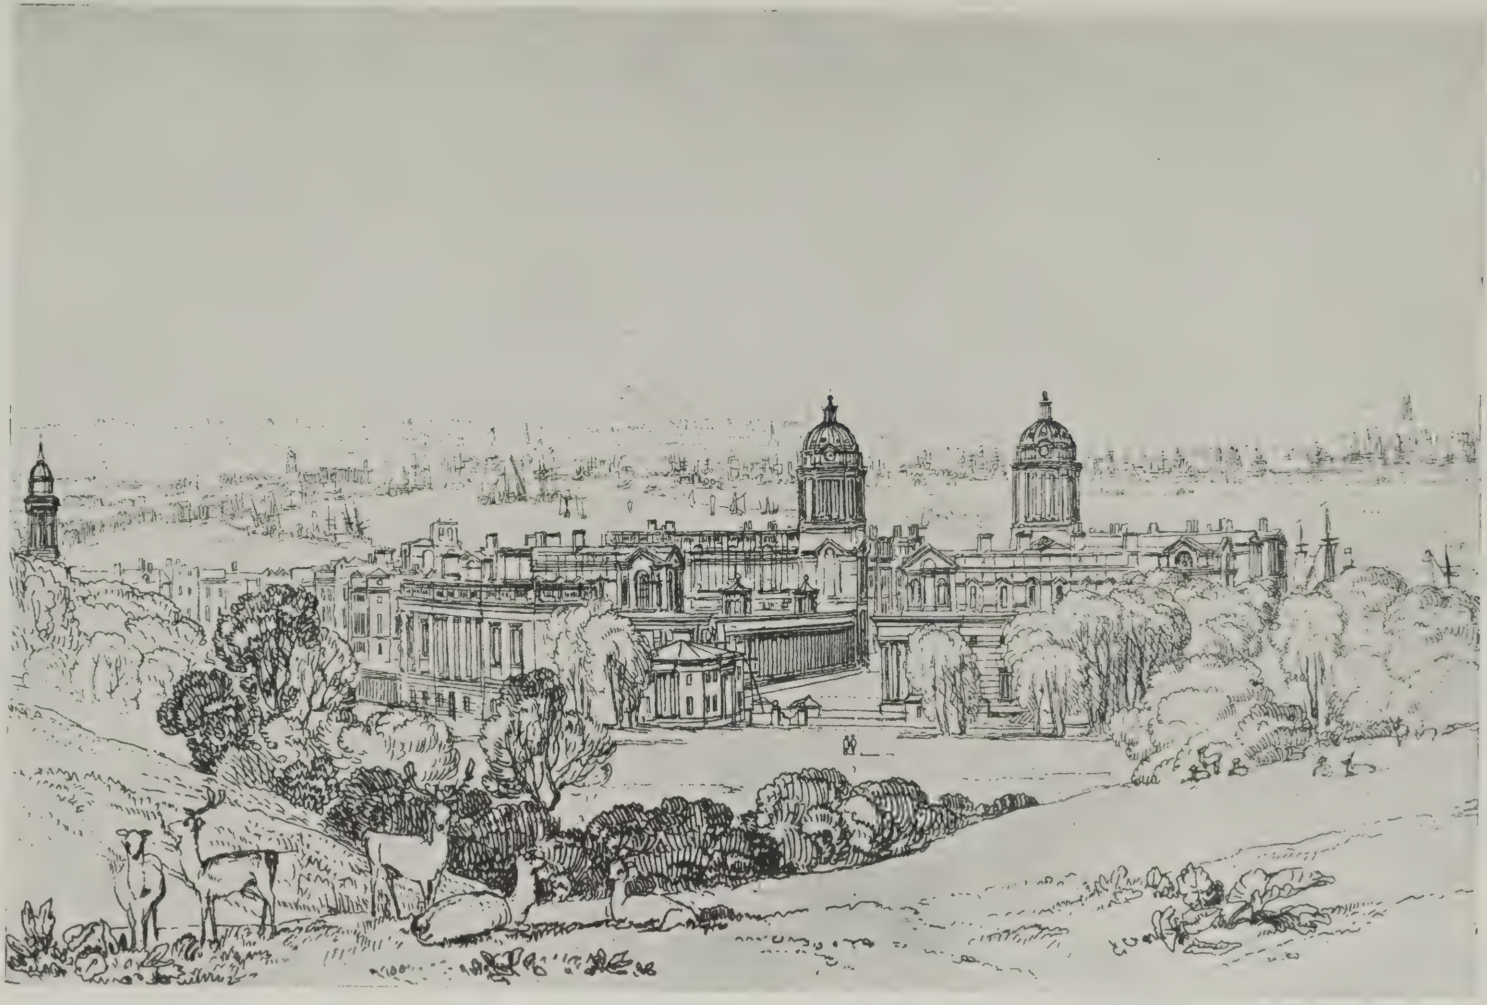
SIRS,—I was greatly interested in y
inspiring leading article in last we
issue, and hope that the elected lea
of the architectural profession will
quick to act upon the suggestion you
forward.

It is quite certain that given a pro
lead from headquarters, there are ma
capable architects who would be wil
to co-operate with scientists in ma
taining the prestige of this nation in
advancement of knowledge.

I, personally, know of a fair numbe
architects and scientists who are speci
interested in the study of architectu
acoustics, and if they can only be brou
together and their efforts co-ordina
the practical value of their services to
profession and the nation will be
hanced tenfold. JAMES CHAPMAN

London from Greenwich

From an Etching by J. M. W. Turner, R.A.



The above illustration of one of the etchings exhibited recently at the Cotswold Gallery gives us a glimpse of the profound imagination of Turner. His lines infer a thousand sounds, scents, vistas which they do not limb. He leaves a blank in a landscape, and instantly the fields, forests, rivers, hills, which he has not delineated, come crowding upon the mind in all their variations of colour and form.

Architecture and the Public

MR. ERIC MORLEY, F.R.I.B.A., F.S.I., in the course of his presidential address to the Leeds and West Yorkshire Architectural Society, said that the Department of Architecture had founded a Diploma course, on the successful completion of which students would be awarded the diploma of the School of Architecture. It was hoped before long to bring this course to the standard required by the Board of Architectural Education for exemption from the Associateship Examination of the R.I.B.A.

As to the future, the Committee for increasing benefits in the Society had now submitted their report, and had secured the consent of the Council to several of their suggested improvements. For one thing it had been decided to establish a travelling studentship of the value of £10. The method of selecting the student to whom this would be awarded, and other details regarding it, were still under consideration. Furthermore, it had been decided to inaugurate a series of junior members' meetings or debates. These were to be held on Friday evenings at a local café, and, it was hoped, they would at any rate partially supply the very urgent need for a permanent meeting-room for the Society. The date fixed for the annual dinner was January 24, and it was expected that the President of the R.I.B.A. would be present.

He thought that one of the most notable events in the records of the Society this year was the course of lectures which Mr. Addison had been giving at the School of Art on "How to appreciate Architecture," and the fact that these lectures were primarily intended for the public was unquestionably indicative of a step in the right direction.

He was quite sure the public were anxious to be instructed in the many vital things which constituted good architecture, and there were now a good many indications that the profession as a whole was at last beginning to take some action in helping them.

The medal and diploma for street architecture, which the R.I.B.A. had decided to award each year for the most meritorious external design amongst buildings erected in London, would inevitably attract considerable attention, not only within the profession itself, but through the Press from a wider public altogether. The very considerable publicity which would be given to the premiated building could not fail to create a new interest and cause the public to appreciate other buildings in relation to it, and to formulate for themselves definite opinions on buildings in general.

Indeed, in London and elsewhere the public were already evincing a growing interest. The recently opened County Hall had aroused a spirit of criticism far beyond expectation, and he was informed that discussions on the subject could be heard at almost any dinner-table in London. Decided opinions had been formed as to the success or otherwise of the design of the building; discussions had taken place as to its suitability for the site, and although for some time its cost was considered excessive, it was gradually being approved as a sound financial proposition.

Again, the recent decision to reconstruct and to erect additional stories over the Bank of England had created abnormal interest in the City, and rich financiers and stockbrokers appeared to be seriously perturbed.

Whether those building schemes were generally approved or not, however, was of less importance to the profession than the growing evidence that the indifference of the public towards art was being gradually dissipated, and was being replaced by a keen definite opinion.

In short, they might confidently hope that people were now beginning to realize the value of sound work, and to appreciate what banks, insurance companies, and some of the multiple shops had known for some time, that a building of distinction, to its owner, was a definite business asset, because of the attention it aroused amongst the buying public.

But the man who received from his architect a building of character, besides creating this interest and enlarging his own business connections, conferred benefits on his fellows more than he knew, for no man could be content with a dull and uninteresting building for his own when its near neighbour was one of beauty and distinction, and it was inevitable, in the end, that further good building would result.

To the profession this evidence of a wider interest in architecture on the part of those not actually engaged in the practice of it should be a great help and encouragement. One could not surely afford to neglect it, but should rather stir oneself to increased and effective effort and see that this same newly-discovered interest was stimulated and extended.

A society like their own had many opportunities, and by seeking the co-operation of the press they could help the public considerably, and once they got them to appreciate architecture it should of necessity follow they would begin to appreciate architects themselves.

The late Professor Aitchison, R.A., in one of his presidential addresses at the Institute, said: "The poetry, the eloquence, and the music of the past become the cherished possessions of all civilized nations. The statues, the bas-reliefs, the engraved gems, the coins, the plate, and the jewellery are spread over the civilized world. The architectural monuments alone point out the places where the great life of the nation once throbbed, and enable us to penetrate the thoughts that created them and to see the skilled handiwork of the people. . . . It is only by the people cultivating a knowledge of architecture, and so appreciating its beauties and emotional qualities, that a love for its masterpieces can be engendered and the architect rewarded, for the architect's principal reward is the enthusiasm and gratitude his works excite."

It was true that, at the present time, there was a noticeable lack of this enthusiasm, and, indeed, there were f opportunities for it, but if they equipp themselves to meet the new conditio which the commercial spirit of the a demanded, then the architect's right position would surely be maintained.

Although architects were most of the men of peace, he felt they must adop more aggressive policy, and by anticipati the inevitable developments in constru tion and design, they must convince t public that they had a real place in th lives, and that it was to the general we being for them to be consulted.

"There is," he said, "a challenge each one of us, by avoiding profession ism on the one hand, and a benevole neutrality on the other, to interest t public in our work; to convince them th we are here to assist progress and n simply to enjoy ourselves by designi enrichments and embellishments whi the builder or structural engineer mig find beyond his powers."

A tactful caution was essential, ho ever, in approaching the public, for th had one or two deeply rooted opinic regarding the architect.

At present no one knew, except t members of their own profession, what tremendous amount of work was oft required to solve what appeared to the simplest of problems, for, as a ru the better the solution appeared the le work would seem to have been requir to attain it.

It should, he thought, be more genera recognized that probably nearly all t nation's most successful buildings we evolved only after a host of differe attempts, and that the simple resu finally achieved was due to the successi efforts which preceded it.

For, in his opinion, it was the wo done, as it were, behind the scenes whi mainly went to differentiate the go architect from the bad, the man w really possesses skill from him who handicapped by not having adequa gifts.

In conclusion, he said: Let us be arch tects first, at all costs, and as we acknow ledge with Emerson that "Nothing gre was ever achieved without enthusiasm so let us be enthusiasts as well. F nothing so surely tells in the long ru and nothing so clearly points the mast architect, as the reflection of this san untiring enthusiasm in buildings whi in every way fulfil the demands and r quirements of a modern civilization.

The presidential address was followe by the distribution of the Society prizes, the successful competitors, wh are all past or present students of th Architectural Department, Leeds Scho of Art, being as follows :—

Measured Drawings (Society's Silv Medal): Frank Chippendale.

Essay Prize: R. G. Easdale.

Architectural History Prize: C. R. Hi

Design Prize: 1st, H. Conolly; 2n G. W. Alderson.

The Nicholson Prize: T. R. Shaw.

Measured by W. C. Stephenson and Alec G. Jenson. Drawn by Alec G. Jenson

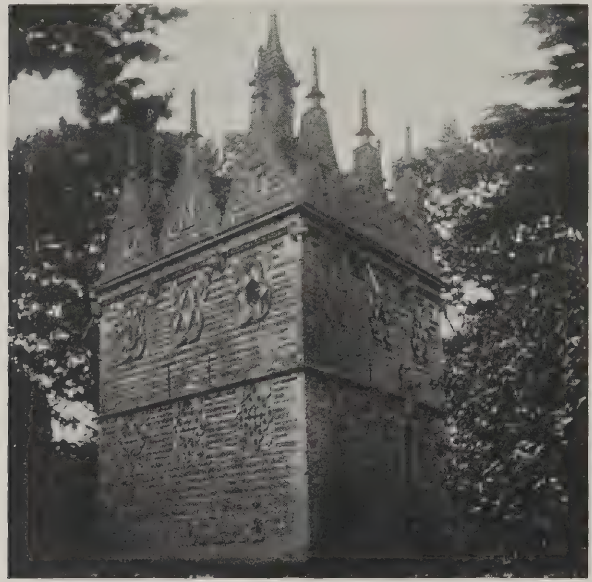
The residence here shown has been demolished to make way for a picture palace. It was an eighteenth-century building in the Adam style—though without the refinements of the genuine Adam work—Portland stone-fronted and red roofed.

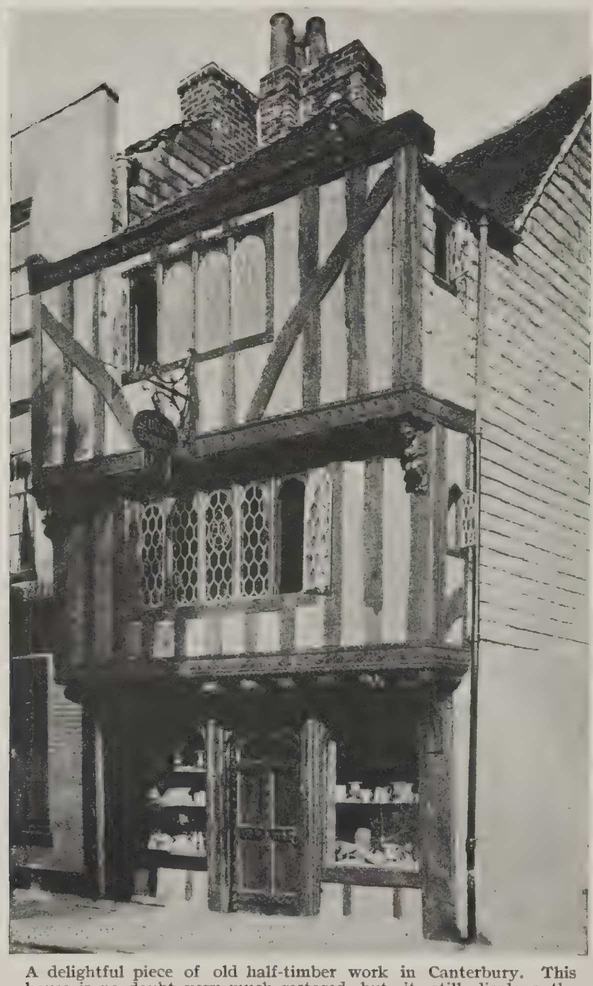
A Pictorial Review

Illustrations of Topical, Practical, or Curious Interest

Readers are invited to send in sketches and photographs for publication in these pages. A fee of 2s. 6d. will be paid for each illustration accepted. Contributions should be accompanied by short explanatory notes.

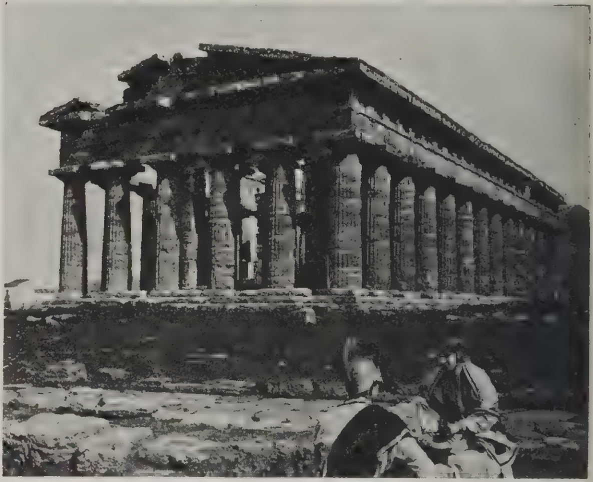


The Triangular Lodge in Rushton Park, Northants, was built by Sir Thomas Tresham about 1593. The ground plan is an equilateral triangle, and each side measures 33 ft. 3 in. There are three floors, three windows in each story on each of the three sides, and each window has three divisions. The roof has three gables on either side, and each of the Latin inscriptions is made up of thirty-three letters. The building is supposed to be emblematic of the Holy Trinity.—J.B.T.

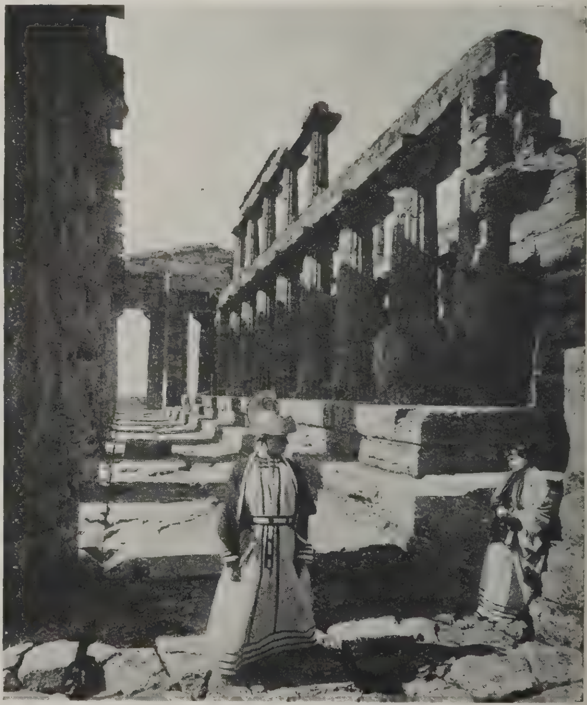


A delightful piece of old half-timber work in Canterbury. This house is no doubt very much restored, but it still displays the humorous and delicate fancy of the craftsman who built it. The gargoyles acting as consols are full of life and the sills have quite a subtle pattern.—H. H.

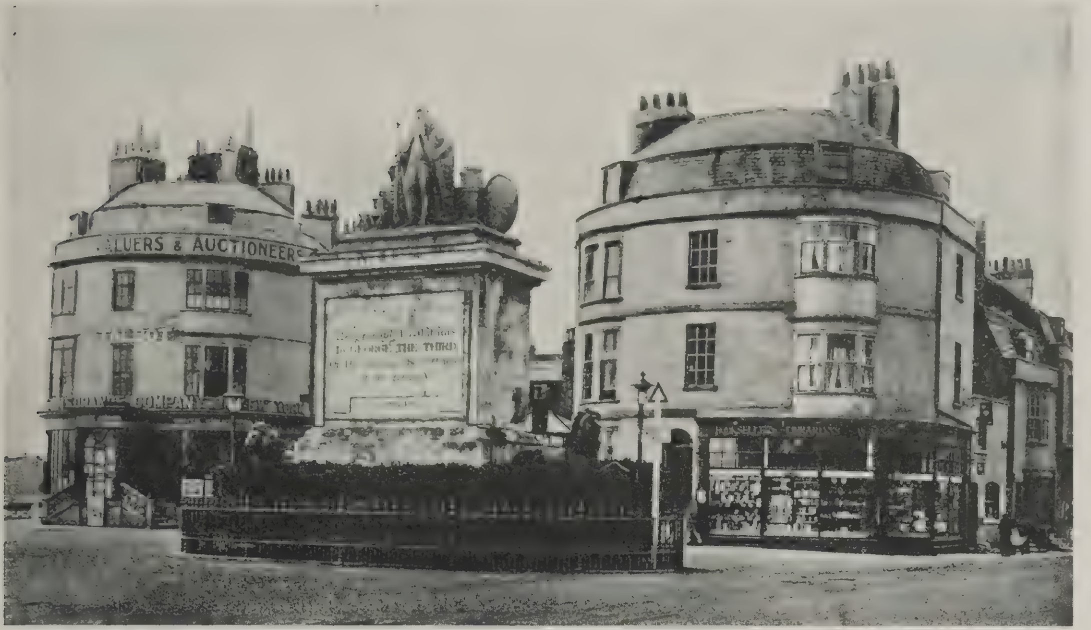
Until about seventy years ago this picturesque old building was the workhouse at Uckfield, Sussex. Divided into tenements it now houses several working-class families.—J. B. T.



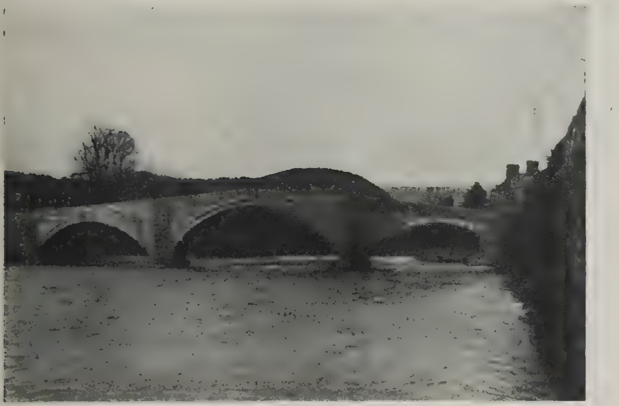
A view from the south-west of the Temple of Neptune, which is the grandest and most beautiful of the three at Pæstum. This temple is a fine example of Greek architecture of 2,400 years ago.—REALISTIC TRAVELS.



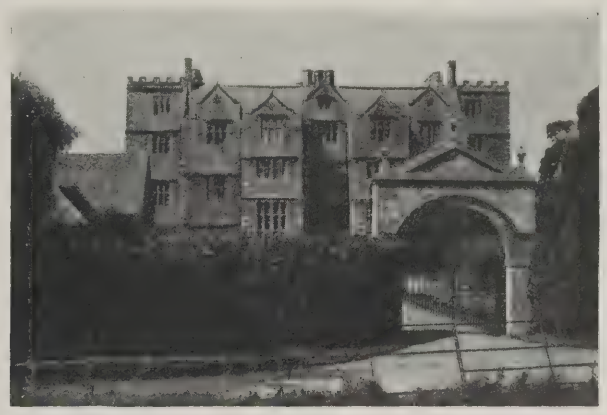
The south side alley along the Cella of the interior of the Temple of Neptune. There are two series of seven columns, each about 7 ft. in diameter, with a second row of small columns above which support the roof. The stone is a kind of travertine to which age has imparted a mellow tone. It contains fossil reeds and aquatic plants.
—REALISTIC TRAVELS.



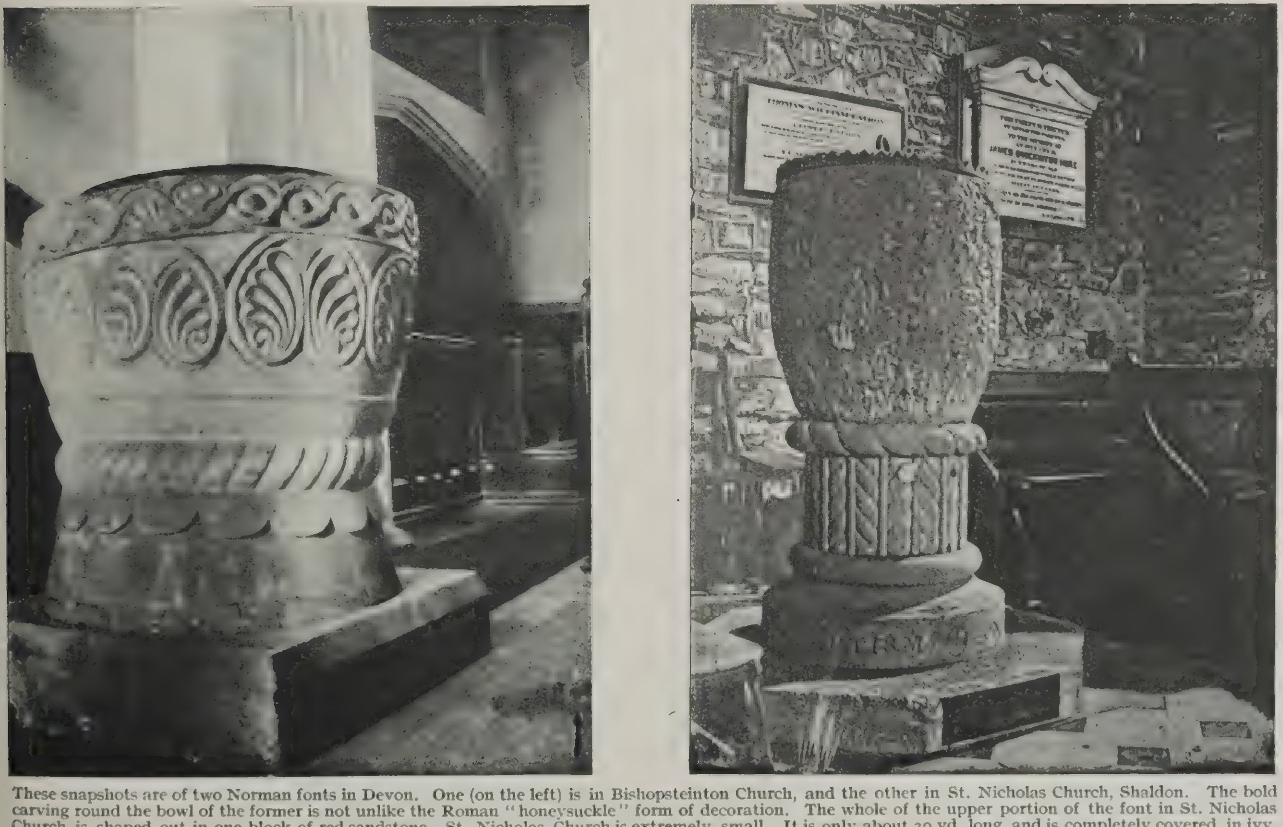
This statue of King George the Third at Weymouth is particularly interesting in view of the notes in your JOURNAL on the signing of architectural and other works of art. It will be noticed that in this case the unusual practice has been adopted of giving the name of the architect in lettering almost as large as the inscription itself.—C. S.



This bridge, which crosses the Conway at Llanrwst in North Wales, was designed by Inigo Jones and built in 1634. Its remarkable point is the shape of the arches, which instead of being semi-circular, as in the case of contemporary bridges, is semi-elliptical. The Llanrwst bridge set the fashion to future bridge-builders, and it is consequently of the greatest interest.—J. B. T.



Chastleton Manor House stands a little to the south of the main road between Chipping Norton and Moreton-in-the-Marsh. It was built by Walter Jones at the beginning of the seventeenth century on land bought from Catesby, the Gunpowder Plotter, who used the purchase money to further the affair of 1605. It abounds with masked doors and secret hiding places.—J. B. T.



These snapshots are of two Norman fonts in Devon. One (on the left) is in Bishopsteinton Church, and the other in St. Nicholas Church, Shaldon. The bold carving round the bowl of the former is not unlike the Roman "honeysuckle" form of decoration. The whole of the upper portion of the font in St. Nicholas Church is shaped out in one block of red sandstone. St. Nicholas Church is extremely small. It is only about 30 yd. long, and is completely covered in ivy.
—H. A. J. L.

Mr. G. W. S. Jarrett, M.P.

THE new M.P. for Dartford, Mr. G. W. S. Jarrett, whose portrait appears on this page, was at one time a member of the architectural profession, but since the war has devoted himself to journalism and politics.

In 1900, at the age of eighteen, he was assistant manager, and for the last six months manager, of the contract for the Frimley and Farnborough Waterworks. He then gravitated into architecture and learnt the profession with Messrs. Keith D. Young and Henry Hall, FF.R.I.B.A., with whom he stayed five years. From 1907 to 1909 he was assistant architect to the Devon Education Committee.

Mr. Jarrett passed the Intermediate Examination of the Royal Institute of British Architects, and sat for the final after unfortunately having lost his right arm, but failed in design. Owing to a breakdown in health, which necessitated his going abroad, he was unable to sit for this examination again.

After his restoration to health Mr. Jarrett became secretary and surveyor to the Lancing College, a position he held for two years.

During the war he served as staff officer, No. 7 District, and was not allowed to go abroad owing to the loss of his arm.

In 1918 he contested Mansfield (Notts), and from 1919 to 1921 edited "The British Citizen."

Mr. Jarrett won his seat at Dartford from a labour member.

MR. G. W. S. JARRETT, M.P

St. Paul's Bridge

THE decision of the London City Council to postpone the scheme to build the new bridge over the Thames in a line with St. Paul's is undoubtedly a wise one. The original scheme was ill-conceived, as the proposed bridge would be close to Southwark Bridge and not far from Blackfriars and there is never congestion on wide Blackfriars and very little traffic at all on Southwark.

The real problem is, of course, west of Waterloo Bridge, which is itself narrow and always congested, and about half a mile from Westminster Bridge. A bridge at St. Paul's would be superfluous, and London would still have to build a new bridge at Charing Cross.

The St. Paul's scheme was given Parliamentary powers in 1909. Since then Southwark Bridge has been rebuilt, and the Council have found that it is hardly used, while motor traffic has increased the congestion at Waterloo.

A bridge at Charing Cross would mean the destruction of the present bridge and the removal of the railway station to the south of the Thames. Here, too, time has worked for the Charing Cross scheme. The Charing Cross traffic has not increased in proportion to that of the other termini and Victoria has largely taken its place. The railway amalgamations also have removed many vested considerations. Another helpful factor since 1909 is the Bakerloo Tube crossing the river and linking up with the whole tube network.

Following is a report of the debate which took place at the meeting of the Corporation of London at Guildhall, last week, on a report of the Bridge House Estates Committee recommending that the work of constructing St. Paul's Bridge should be proceeded with. An amendment was moved by Colonel Vickers Dunfee urging that before the Court arrived at a final decision the committee be directed to confer:—

With the local authorities concerned with the approaches to the bridge outside the confines of the City, to see what street improvements are necessary to conform with the stipulations of the Ministry of Transport.

With the Improvements and Finance Committee as to the widening necessary to streets within the precincts of the City, and the necessary cost of same.

With the London County Council as to their contribution towards the improvement of the thoroughfare at the east end of St. Paul's Churchyard and Aldersgate Street.

With the Ministry of Transport with regard to financial assistance in improving this great highway.

The London Society had petitioned the members asking them to give the fullest consideration to alternative schemes.

Mr. A. Stanley-Stone, chairman of the committee, said that for thirteen years th Corporation had followed a consisten policy in regard to the bridge, and ha incurred an expenditure of £50,000 i preliminary work.

Colonel Vickers Dunfee, moving hi amendment, asked which authority wa going to pay for the great improvemen that would have to be made at the junc tion of Guildford Street and Marshalse Road, Southwark. An enormous are of insanitary property was being cleare in that borough in connection with th committee's operations there, and whethe the bridge was built or not that improve ment, which would provide an enormou amount of work for the unemploye would be proceeded with. The fou viaducts which were part of the bridg scheme would be detrimental to propert and one of them would cross the faires and finest thoroughfare in the City— Queen Victoria Street — while littl Knightrider Street would be simply tunnel. The Corporation wanted t know in black and white exactly wha other authorities were prepared to do i the direction of financial help.

Sir Banister Fletcher seconded.

Sir William Treloar said the Corpora tion should admit that it had made mistake. The proposed viaducts woul ruin the City.

On a division, Colonel Vickers Dunfee' amendment was carried by ninety-fiv votes to sixty-two.

Reinforced Concrete Calculations for Beginners. IV

By Professor HENRY ADAMS, M.Inst.C.E.

(Continued from November 22, page 734.)

SUMMARY of the effects of altering the proportions of a reinforced concrete beam will be found very ful in designing so that the maximum economy can be obtained. They are follows :—

a) Increasing reinforcement and leav- concrete unaltered reduces the stress the steel and slightly reduces that in concrete.

b) Reducing reinforcement and leaving crete unaltered increases the stress in steel and slightly increases that in concrete.

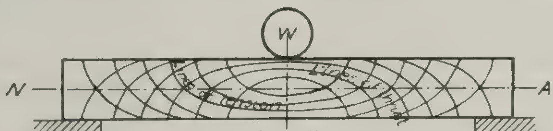


FIG. 5

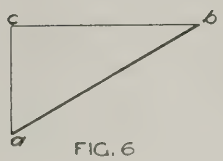

FIG. 6

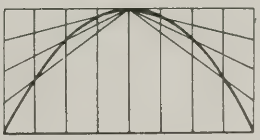

FIG. 7

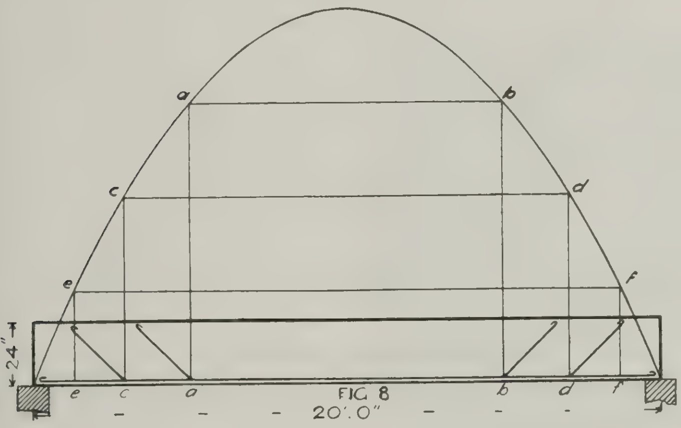

FIG 8

c) Increasing the depth of concrete leaving reinforcement unaltered htly reduces the stress in the steel considerably reduces that in the crete.

d) Reducing depth of concrete and ving reinforcement unaltered increases stress on both materials.

e) Reducing reinforcement and in- asing depth of concrete increases the ss on the steel and reduces that on the crete.

f) Increasing reinforcement and re- ing depth of concrete slightly reduces stress on the steel and considerably reases that on the concrete.

f we could see the lines of stress in a ded beam we should find them some- g like Fig. 5, and taking a piece of any of these lines as indicating the direc- of the stress at that part we can nsform the diagonal stress into longi- inal and vertical stresses by the iangle of forces." For example, in Fig. 6 let *a b* be a piece of a thrust line, draw horizontal and vertical lines to meet at *c*, then if *a b* represents the amount of diagonal thrust, *c b* will represent to the same scale the effect in longitudinal thrust or compression, and *a c* the effect in vertical shear. It would be too intricate to attempt to work directly from these curves in designing a beam, and all are agreed to take their horizontal and vertical equivalents. The horizontal forces are measured by the bending moments and the vertical by the shear forces. Every variation of loading produces a different bending moment diagram, and it is usual to draw this out to scale. The bending moment diagram for a uniformly distributed load on a beam supported at the ends is a parabola, with a base equal to the distance from centre to centre of the supports to any given scale. The method of drawing a parabola is shown in Fig. 7.

The relationship between a bending moment diagram and the tensile and compressive stress may be explained simply as follows: Take a flanged beam under distributed load and supported at the ends, the bending moment will be $\frac{WL}{8}$; divide this by the mean depth centre to centre of flanges, and it will give the total stress in either flange; divide again by the area of one flange and it will give the tension or compression per square inch; or $f=\frac{WL}{8ad}$. In the tables of strength of rolled joists we have the section-modulus given as Mx, sometimes known by the letter Z. This Mx is merely the *a d* in above formula. For reinforced concrete beams it is convenient to draw the height of the parabola equal to the full size combined diameters of the steel rods. Thus, for the beam we have been calculating, Fig. 8 shows the elevation with a parabola $4\times\frac{3}{4}=3$ in. high. Projecting downwards from points *abcdef* where the lines representing the rods cut the parabola, we find that between *a* and *b* on the base line we require all four rods to satisfy the bending moment, but at these points we can do with one less, so that one of the bars may be turned up at each end as shown. Then a second bar may be turned up at *c* and *d*. At *e* and *f* a third bar might be turned up, but it is hardly worth while, and the two outer bars would then be left to run through to the ends of the beam. The turned up ends will help to provide against the shearing forces. In the next chapter we will consider these shearing forces more in detail.

(*To be continued.*)

Exhibition of Contemporary British Architecture

The Annual Exhibition of Architecture in the R.I.B.A. Galleries at 9 Conduit Street, W.1, was opened by the President, Mr. Paul Waterhouse, on Friday, December 1.

Among those present at the Private View were :—

Lord and Lady Aberconway; Lord Carmichael, Lady Carmichael, and Miss Carmichael; the Earl of Crawford and Balcarres; Lord Hemphill; General Lord Horne; Lord and Lady Morris; Lord Muir Mackenzie; Lord and Lady Eustace Percy; Lord Shandon; Lord and Lady Strathspey; Lord and Lady Stuart.

Sir Herbert Austin; Sir John Burnet, R.A., and Lady Burnet; Sir Edward and Lady Busk; Sir Anthony A. Bowlby, President of the Royal College of Surgeons; Sir James and Lady Crichton-Browne; Sir Theodore and Lady Cook; Lady Eve; Sir Park Goff; Sir Charles Holme; Sir Arthur L. Lever, M.P.; Sir Malcolm and Lady Macnaughten; Sir William and Lady Plender; Sir Edmund Phipps; Sir Charles and Lady Ruthen; Sir Alfred Temple; Sir Charles and Lady Walston; Lord St. John of Bletso; Sir Charles Hobhouse; Sir Alfred Mond, M.P.; Sir Edgar Bonham Carter and Miss J. F. Bonham Carter; Sir Isidore and Lady Spielmann; Mr. Wm. C. Noxon (Agent-General for Ontario); Bishop Gore; General Swinton; General Spears and Mrs. Spears; Mr. Ramsay Macdonald, M.P.; Mr. John P. Hay, M.P.; Mr. G. W. S. Jarrett, M.P., and Mrs. Jarrett; Mr. W. Reynolds Stevens; Mr. Gilbert Bayes.

Commander Carlyon Bellairs, M.P., and Mrs. Bellairs; Dr. W. A. Chapple, M.P., and Mrs. Chapple; Major F. H. Fawkes, M.P.; Mr. H. D. Lorimer, M.P., and Mrs.

Lorimer; Mr. Maxwell Thornton, M.P.; Major R. D. T. Yerburgh, M.P.; Mr. H. Hughes-Stanton, A.R.A., and Mrs. Hughes-Stanton; Mr. Nigel Playfair; Miss Irene Vanbrugh and Mr. Dion Boucicault; Mr. H. Gordon Selfridge; Mr. Arnold Bennett; Mr. L. Cope Cornford; Mrs. Harcourt Smith; Mr. and Mrs. Baillie Scott; Canon Alexander; the Dean of Windsor and Mrs. Baillie; Mr. and Mrs. John Galsworthy; Mr. Thomas Marlowe; Miss Marie Lohr; Mr. Charles Marriott; the Hon. Peter C. Larkin (High Commissioner for Canada); Mr. A. H. Ashbolt (Agent-General for Tasmania); Mr. and Mrs. Greville Montgomery; Mr. and Mrs. Ouless; Mr. J. E. K. Studd and Lady Kathleen Studd; Mr. Eric Barnard; Mr., Mrs., and Miss Evans; Lt.-Col. C. P. Crane and Mrs. Crane; Mr. E. K. Chambers and Mrs. Chambers; Mr. and Mrs. H. V. Lanchester; The Rev. Dr. and Mrs. Haynes; Miss Haynes; Mr. G. Rowland Hill; Mr. J. Allen Howe; Mr. Roland B. Chessum; Mr. and Mrs. Starkie Gardner; The President, the Institution of Electrical Engineers; the President, Royal Meteorological Society; the President, Law Society; the Master, Society of Apothecaries; the Master, Armourers and Brasiers' Company; the Master, the Painters' Company; the Master, the Clothworkers' Company; the Master, the Wheelwrights' Company; the Master, the Vintners' Company; the Master, the Tallow Chandlers' Company; the Master, the Poulterers' Company; the Master, the Fruiterers' Company; the Master, the Fishmongers' Company; Mr. Charles L. Hartwell, A.R.A., and Mrs. Hartwell; the Headmaster of Bradfield College.

The Mayors of Paddington, Lambeth, Kensington, Marylebone, Hampstead, Holborn, Woolwich, Poplar, Deptford, Westminster.

Competition News

Edinburgh Housing Scheme.

In the open competition in connection with the Edinburgh Corporation's housing scheme in the Grassmarket, architects had to submit designs for block dwellings. Mr. T. P. Marwick, architect, was the assessor, and the awards are: First, Messrs. Begg and Lorne Campbell, Edinburgh; second, Mr. T. Aikman Swann, Edinburgh; third, Messrs. Reid and Forbes, Edinburgh. The Corporation are building these houses and others to provide dwellings for people dispossessed by slum clearance operations.

The Henry Saxon Snell Prize.

The subject given for essays in competition for The Henry Saxon Snell Prize of the Royal Sanitary Institute was "Improvements in the Sanitary Appliances and Fittings for New Housing Schemes, having regard to Efficiency and Economy." Eight essays were received, and they have been brought under the consideration of the Council. The adjudicators appointed for the competition were:—Louis C. Parkes, M.D., D.P.H.; Mr. A. Saxon Snell, F.R.I.B.A.; Sir Henry Tanner, C.B., I.S.O., F.R.I.B.A.; and Professor E. R. Matthews, F.G.S., A.M.Inst.C.E., nominated by H.M. Office of Works.

Acting on the advice of the adjudicators the Council do not see their way to award the prize to any one of the competitors. They have decided, however, in view of the considerable amount of work and preparation involved in regard to the following five essays, that the amount offered for the prize shall be divided equally between the writers:—"Finis Coronat Opus"; "Reliable"; "Dum Spiro Spero"; "Tubalcain"; "Efandec."

The Late Mr. H. H. Thomson, F.R.I.B.A.

We regret to announce the death of Mr. Howard Henry Thomson, F.R.I.B.A., of Leicester, at a nursing home in London after undergoing an operation. Mr. Thomson, who was 57 years of age, was a Devonian, and was born and educated at Exeter, and articled to Mr. J. Crocker of that city. He went to Leicester about thirty-six years ago and became assistant to Mr. A. Wakerley. Afterwards he went into practice with Mr. J. Blackwall, of Kettering, and conducted the Leicester office.

Mr. Thomson had been in practice for himself since 1904, first at Halford Street Chambers, and later took over the practice of Messrs. Goddard and Catlow, at Market Street, Leicester. He became a member of the R.I.B.A. in 1889, and was elected a Fellow in 1906. From 1906 to 1908 he was president of the Leicester and Leicestershire Society of Architects, and was an acting member of the Council up to the time of his death.

A very considerable part of his work was won in competition, and included the Leicester Isolation Hospital, the Masonic Hall, Leicester, the Usher Hall, Edinburgh (of which he was joint architect with Messrs. S. Harrison and Sons), the Wyggeston Boys' School, and, since his death, his design secured first place in the competition for Southend Schools.

THE LATE MR. H. H. THOMSON, F.R.I.B.A.

Amongst his other works were Messrs. Greenlees' warehouse, Leicester, the Liberty Shoe Factory, Leicester, St. Alban's Church, Leicester, and many striking examples of domestic architecture.

Mr. Thomson was a prominent Freemason, and was a past-master of the Knight of Malta Lodge, Hinckley, and a past senior warden for the province of Leicestershire and Rutland.

List of Competitions Ope

Date of Delivery.	Competition.

A Small Exhibition

On Thursday and Friday of this wee a small exhibition of work by two youn lady artists—Miss Phyllis Blundell an Miss Carey Morgan—is being held No. 9 Woodstock Street, Oxford Stree W. The display includes a variety excellent things, both of ornament an utility, such as small portrait bust statuettes, reliefs, etchings, calendar etc., as well as a collection of painte trays, bowls, electric light stands an hand-painted bowls for indirect electr light fittings. Miss Blundell's miniatu portrait busts and statuettes are perfe works of art. She has a real gift for portraiture, which is particularly well show in some delightful little studies of children. The exhibition is well worth visit.

An Important Amalgamatio

An amalgamation of importance to th building trade has been arranged whereb the "Poilite" factory and Asbestos Cement business of Bell's United Asbesto Co., Ltd., and the "Everite" factory an Asbestos-cement business of the Britis Everite and Asbestilite Works, Ltd., wi be carried on at the present addresses o the two companies in Southwark Street London, and 29 Peter Street, Manchester under the same management as before but under the name of Bell's Poilite an Everite Co., Ltd., which has been registered with a capital of £500,000.

The new company will thus posses two extensive and well-equipped factories, one at Harefield (Middlesex), an the other at Widnes (Lancashire), in th centre of a great industrial area. It i expected that by standardizing thei manufactures the new company will b able to effect deliveries from the factor nearest to customers, thereby savin transport charges and giving prompt an efficient service. The amalgamation take effect as from December 1.

The Week's News

The number of building trade operatives unemployed on October 23, 1922, was 118,739. It is estimated that for the four weeks in October those persons received about £260,000 in unemployment benefit.

Restoration of Belper Church.

The old church of St. John at Belper has been re-opened by the Bishop of Derby, after the thorough restoration which has been carried out by Colonel Hunter, F.S.A., with the approval of the Society for the Preservation of Ancient Buildings. The church dates from the latter half of the thirteenth century.

State-aided Housing.

Major Boyd-Carpenter states in Parliamentary papers that it is estimated that the commitments under the assisted housing schemes, including slum clearances, will amount to £9,900,000 a year, of which £9,100,000 will be borne by the Exchequer.

Sale of Valuable Books.

Messrs. Puttick and Simpson, auctioneers, 47 Leicester Square, London, W.C., announce a sale of valuable books and manuscripts, including the architectural library of the late Arthur H. Newman, F.R.I.B.A. The sale will be on two days, December 13 and 14, and view can be had on the two previous days.

Salford's Dilapidated Houses.

In the annual report of the Salford Medical Officer of Health it is stated that a very great deal has been done in getting repairs to property carried out, but general dilapidations are still far too common, and property owners still show strong disinclination to look after their property in the efficient manner in which it was looked after before the war.

Proposed New Hall for Glasgow.

The erection of a hall to meet the requirements of the Woodside, Ruchill, and North Kelvin districts of the city has been recommended. It is proposed to build the hall on vacant ground in Granville Street and Clarendon Street. The cost is estimated at £18,000. The plans show a large hall, which will accommodate 870 persons, and two lesser halls.

Architects' Fees for State-aided Housing Schemes.

The Ministry of Health and the tribunal appointed by the R.I.B.A. are anxious to obtain a settlement of all claims for architects' fees in connection with State-aided Housing Schemes without further delay. Architects who still desire the assistance of the tribunal are therefore requested to apply to the secretary of the R.I.B.A. on or before December 31, 1922. The tribunal cannot undertake to deal with cases submitted to them after this date.

The Tontine Steeple.

With regard to the proposal to retain the Tontine Steeple on its original site at Glasgow Cross, a highly satisfactory meeting has taken place between Sir Frank Baines and Messrs. Keppie and Henderson, the architects, and Mr. Nisbet, master of works. Sir Frank will report to his department on the matter in due course. Meantime, two piers are to be sunk with a view to ascertaining the nature of the subsoil in the vicinity of the ancient structure.

An Exhibition of Ironmongery.

An exhibition of ironmongery is now being held at the Architectural Association and will remain open until Thursday, December 21. The following are exhibitors: The Brockley Forges, H. F. Ramsay (London), Ltd., J. Starkie Gardner, Thomas Elsley, Ltd., the Bromsgrove Guild, Comyn Ching & Co., Ltd., C. B. Davis & Co., Burt, Escare and Denelle, Ltd., Birmingham Guild, Ltd., Josiah Parkes and Sons, the South Kensington Museum, and Mr. Robert Atkinson.

We shall notice the exhibition more fully next week.

An Architectural Revue.

An architectural revue, arranged by the Architectural Association Lyric Club, will be given this month at 34-35 Bedford Square. All the proceeds will be devoted to the Architects' Benevolent Fund. The revue will be given on Monday, Tuesday, Wednesday, Thursday, and Friday, December 11, 12, 13, 14, and 15, at 8.0 p.m.; and on Tuesday 12, Thursday 14, and Friday 15, at 2.30 p.m. Tickets 5s. and 2s. 6d. may be obtained from the Secretary Lyric Club, M. L. Anderson, 34-35 Bedford Square, W.C.1.

Relic of Bermondsey Abbey.

During recent excavations at Bermondsey on the site where a new building is to be erected for the Anglo-American Oil Company, a stone bearing the consecration mark of Bermondsey Abbey was found in the ruins. This stone is stated to be the only one in existence, the others having been destroyed by Henry VIII. Bermondsey Square marks the spot where a once famous abbey stood. A monastery was founded there in 1082 by Alwyn Childe, a London citizen, in what was then the Meads of Bermondsey. Later the monastery was raised to the dignity of an abbey, which in due course received a grant of the manor from William Rufus.

A.A. New Members.

The following new members were elected at the last ordinary general meeting of the Architectural Association:—Messrs. Leslie C. Powell, Hubert C. Morton, H. Greville Montgomery, F. W. Walford, R. Randal Phillips, Miss K. M. Wallis, Messrs. S. E. Lester, J. P. Nisbet, J. J. Reynolds, W. R. Brinton, H. E. G. Browning, E. B. Cumine, Naozo Shiga, E. S. North, C. R. Crickmay, J. M. Tandy, Miss N. A. Nickalls, Messrs. L. L. Brown, G. R. Barnsley, J. H. S. Woddington, K. D. Sanders, E. H. Beale, L. P. Williams, S. A. Elijah, B. C. Sherren, B. H. R. Murray, J. R. D'Oyly, Christopher Green, Miss J. Wall, Mr. S. N. Bertram, Miss L. M. Sharpley, Messrs. Ian Forbes, F. E. Parr, Miss M. L. Bennett, Messrs. H. W. Kelham, Evelyn Freeth, R. H. W. Richardson, J. V. Hamilton, L. C. Varcoe, Miss M. F. Rigg, Miss M. L. Wilkinson, and Messrs. L. N. Holt, A. Vetchinsky, and W. V. Trubshawe.

Rates of Wages in the Building Trades*

The following table, which is published in the first issue of THE JOURNAL for each month, shows the rates of wages of craftsmen (bricklayers, masons, carpenters an joiners, woodcutting machinists, slaters, plumbers,* plasterers, painters †) and labourers in the building industry. Architectural Details. 39.—Doorway in the Arcivescovile Palace, Lucca.

This doorway, in the Chancery of the Arcivescovile Palace, Lucca, is Italian Renaissance in style, and displays the enormous amount of work that the Italians expended on every detail. Each rosette in the door panelling differs and, rich as it all is, never a moulding is repeated either on architrave or door.

The Passing of Rural Street Architecture

THOSE who have travelled through the country by road—and who have not in these days of increased motor transport facilities?—must have become aware of an insidious change that is coming er our villages and small towns. In many places the uses that have been built during the last two years are stinctly superior to their predecessors, yet something is cking, and a certain monotony pervades these newly mpleted groups. The thing that is lacking is the village reet.

It is easy to understand that with the violent swing of e pendulum against the endless rows of narrow-fronted, rniciously ornamented houses which composed the tter half-century's contribution towards "housing," a action should take place in favour of the semi-detached use. But one monotony—albeit a superior one—must t be allowed to replace another, and this surely is the esent danger. This, let it be understood, is no charge ainst town planning, or against garden cities or garden burbs; we are sufficiently aware of the enormously creased amenities which have accrued owing to the aseless propagation of high ideals and standards by bodies nnected with these movements to make such a mistake; is, however, a plea to avoid too much insistence upon a rticular solution to a complex problem. It is a mistake, o, to imagine that to-day everyone demands the seclusion hich is yielded by the forecourt and the gravelled path proach. There are many to whom the beat of the village vement, the light, the warmth, the gregariousness, the ry gossip which it yields, are more than compensation r the loss of a few square feet of front garden, the hedge paling, and the swinging gate. And, architecturally, ho can deny the ineffable charm of the village streets up d down the country? Those placid-fronted houses, in ick or stone, or half-timber, with bay windows, their w-fronted shops, their cornices or eaves, their little sements or lengthy white-lined sashes, the odd juxtasitions, the discrete units making a concrete whole, a ole of indescribable charm. Are we, of this age, to make such contribution for the delectation of our own and bsequent generations?

This should not be interpreted as an exhortation to solve e problems of the present by an imitation of the past. one particular, at least, the present-day conditions call a somewhat different treatment. The enormously creased road transport has brought acute discomfort to e inhabitant of many a village street. Nevertheless, this insufficient reason for the complete abandonment of a race treatment of houses whose entrance should be ectly from the pavement. It may be that the main ffic road will be given over completely to shops, banks, mmercial and public buildings, with a village square ening off this road. Into this square will be drawn ivate houses, the village lawyer, and the doctor, and ers who desire to be "on the spot" and yet sheltered m the worst noise and dust which are the unavoidable comitants of the increased road traffic.

It is the passing away of any conglomerate masses of ildings that is to be deplored; the endless repetition of pairs of houses, whether of similar or of diverse design, with here and there a carefully placed close or cul-de-sac, will not compensate for that slowly matured blossom of rural architecture, the high street of our small county towns and of our large country villages. Is there any reason why contemporary development should not sometimes take the form of a harmonious prolongation of the main street? A block of half-a-dozen houses, or a group of shops in the same pleasant brick or plasterwork, with the same dignified sashes, or lowlier casements, would surely be a welcome addition to the existing architectural effect, yet what actually happens is that the approach to almost every small town is notified by a succession of semi-detached houses each snugly—and smugly—ensconced behind its front garden; then with a violent transition we pass into the old street rich in humble architectural achievements. There would seem to be no attempt at co-ordination, and the legacy of the past is altogether ignored. In some of the more populated rural districts, villages of the utmost charm, rich in architectural deposits, are linked up by attenuated series of semi-detached houses with a complete disregard of the existing state of affairs—no attempt, in fact, is made to achieve any unified architectural scheme; it is just this which constitutes the difference between a road lined with houses and a street considered as an architectural composition, and it is for the latter that we plead.

To-day the opportunities are immense. All over the country schemes are in active preparation, and by them will prosperity, in the fullness of time, judge us and our labours. If the garden city or garden suburb method is ruthlessly to be applied, whether or no that application be the most suitable for the particular circumstance, there will assuredly pass away, at least for the present, a development which, if hitherto on less scientific lines, has, at least, yielded results the beauty of which none can deny. Although town-planning may be regarded as a science, architecture yet remains an art, and as such it cannot thrive if overburdened and hampered by an excess of theories. For this reason a certain amount of laxity, of flexibility must remain. Zoning and the segregation of buildings of different classes and purposes is desirable enough, yet if pressed to its utmost limits it inevitably leads to dullness. Who, for instance, would desire to lose the rare old bow-fronted shop window set surprisingly between sedate dwellings to beguile the unwary purchaser, because it is not placed among its fellows in the "shopping centre"?

Architecture, and especially town-planning, is so eminently a human art that those who practise it must bring to bear the same sympathy and forbearance with which they would handle human problems. For, however much we may theorize about humanity, when we actually come to deal with individuals we recognize their right to depart from type and to be judged and handled according to idiosyncrasies and circumstances. This is the treatment required for towns and villages, and if this were done the village street would more often become a nucleus for a further development on similarly gracious lines instead of an isolated gem compressed in an uncongenial and ill-harmonizing setting.

The remedy, of course, is to entrust this work, upon which so much depends, to men of wide knowledge and sympathy, with whom there will be no chance of the ruthless application of some newly-acquired theory—suitable enough in particular circumstances—to every situation.

Theories in the hands of the unskilful are dangerous weapons, and to-day, with our quick dissemination of knowledge and information, we are beset not only by theories but by fashions, crazes, and other ephemeral dangers. The real town-planner must have a vision that transcends such things, for if he has not then, indeed, the rural street is doomed, and the countryside and the nation will be left (unless, indeed, as we can hardly think, it has ceased to have an eye or a care for such matters) to mourn its loss.

A Philip Webb House in Danger

Sir Aston Webb, Mr. W. R. Lethaby, Mr. Halsey Ricardo, and Mr. Edward Warren, are prominent among the signatories to a letter protesting against the destruction of the house known as No. 1 Palace Green, Kensington, of which, they have been informed, it is in imminent danger. The Earl of Crawford and Balcarres, Mr. G. K. Chesterton, Mr. John Drinkwater, Mr. J. W. Mackail, and Mr. J. C. Squire, eminent men of letters all, who also sign the protest, believe the house to be worthy of preservation because it was designed by Philip Webb, and set up a new and beautiful tradition in domestic work. "This house," the letter states, "a work of the late Philip Webb, the lifelong friend of William Morris, was practically the first essay in the modern type of thoughtful and individual town-house building, and is altogether a remarkable work of art." The site is believed to be leased from the Woods and Forests Commissioners, to whom this appeal should not be made in vain.

Regional Surveys

In the current issue of "The Geographical Journal," Mr. C. C. Fagg, president of the Croydon Natural History and Scientific Society, demonstrates some of the virtues of the regional-survey idea. Since 1912, the members of his society have been engaged in making a regional survey of the district in which they live, "exploring, and setting down on large-scale maps accounts as complete as they can be made of the physical and biological features of their district." This excellent idea may have first taken really popular form in school nature-study rambles. Elementary-education authorities have always greatly stimulated and encouraged it, although at first they did little more than cause the points of the compass to be marked on floor or ceiling. From this definite indication of locality the children were taught to look beyond the parish, and to explore a little, actually or in imagination, the regions round about. They made descriptive inventories of what they saw, and with some, when they grew up, the habit of accurate topographical observation was cultivated and developed until the notion of regional surveys took form in collective effort, first local and sporadic, then regional and systematic, its finest results being those achieved by the architects and surveyors banded together to parcel out parts of Britain into regional-survey districts during the war. The fruits of those regional surveys should not be allowed to wither. They are of the greatest importance to architects and town-planners, and ought to be digested and co-ordinated at the expense of the State and for the special benefit of the building community as well as for the benefit of the business community in general. Such useful materials as those collected in the course of the surveys should not be allowed to moulder in museums or be buried in archæological archives. Nor should the London County Council's fine collection of photographic records of notable buildings be stored away, as they are, where nobody thinks of looking for them. Architecturally, as well as historically, they are very valuable from many points of view, and should be made more easily accessible.

Wanted, a Building Code

For some few years past Scotland has enjoyed—
otherwise, but there is no evidence of serious objection
a building code that, at all events, has the advantage
showing the architect and the builder definitely what th
may and may not do. England has not yet adopted
general building code. Building by-laws vary with t
district; so that if one side of a street happens to be
the A district, while the other side is under the control
the local authority of B, in A the builder may do wi
impunity that which B might penalize: or *vice vers*
That may be an exceptional case, but at any rate t
divergencies of local by-laws have been so great th
it was always rash to make plans for any given distri
without first conning its by-laws, which, as often as n
were only to be seen at the local authority's offices, i
volving, too often, a long and an expensive journey f
the architect. While, however, it is certain that a nation
building code would offer many substantial advantages,
is equally certain that it would meet with tremendo
opposition, especially where vested interests and privileg
are involved, as they often are—in the matter of wat
fittings, for example. The R.I.B.A., which appointed
joint-committee last January to discuss the question, a
understood to have considered the advisability of esta
lishing a new building code of general application throug
out England and Wales, but to have come to the conclusi
that Parliament would not pass a code overriding t
sacred principle of local autonomy. Vested interests a
the rooted Anglo-Saxon tradition of local self-governme
would, we fear, certainly be strong obstacles. Yet t
case for by-law reform is not altogether hopeless. A dra
Bill which may possibly be adopted by the Governme
introduces many improvements, and in particular do
much to encourage greater uniformity. Two of its pr
posals are that all by-laws shall be revised every t
years, and that local authorities shall give reasons wh
disapproving plans. In an era of rapidly moving even
the revision should be quinquennial rather than decennia
and it would almost seem that all that the authoriti
object to in a building code is its name.

The Late Sir Norman Moore and St. Bartholomew's

Sir Norman Moore, whose death was announced a fe
days ago, had established a strong claim to the gratitu
of Londoners, and, indeed, to that of all lovers of ancie
buildings. At a period in his career when he was at h
busiest as a distinguished physician he contrived to fi
time for the strenuously active advocacy of the restoratio
to dignity and decorum of London's oldest and, therefor
most interesting church. While fulfilling important an
onerous duties at St. Bartholomew's Hospital, first a
physician and afterwards as lecturer on various depart
ments of medical science, Moore nevertheless found tim
to make himself thoroughly acquainted with every stic
and stone of the ancient church of St. Bartholomew-th
Great, West Smithfield. As one result of his carefu
investigations, he wrote a masterly monograph on th
subject. What is more, he so incessantly and so powerfully
in the press and in other directions, awakened publi
interest in the grand old church, that ultimately funds wer
provided for its restoration, and for its rescue from th
encroachments, well-nigh sacrilegious in character, o
blacksmiths, whitesmiths, furriers, curriers, and what-no
whose workshops adjoined and jostled the church. I
was largely owing to the exertions of Sir Norman Moor
that these unseemly excrescences were swept away, an
Sir Aston Webb was given scope to perform his notabl
work of sympathetic restoration. Sir Norman's scant
leisure was always spent vigorously and beneficently
Asked to name his recreations, he wrote in "Who's Who
"*Labor ipse voluptas.*"

Contemporary British Architecture at the R.I.B.A.

WHEN the Continental exhibition of modern American architecture halted in the hospitable galleries of the Institute on its way back to America we all of us said, "Now *is* is what the English architects ought to do." Well, e R.I.B.A. very sensibly took the hint, and the exhibition of Contemporary British Architecture, now ing held in Conduit Street, is the most interesting sult.

Any architectural exhibition that included contributions om such men as Sir Edwin Lutyens, Sir Robert Lorimer, r. Herbert Baker, Mr. Gilbert Scott, Mr. Edwin Cooper, d Mr. Ralph Knott, with a good body of the less-renowned d a tail of the obscure but promising, will certainly, and t altogether unjustly, be called "Representative." Yet e could name half a dozen good men straight off whose rk would have surely strengthened the show, but who, r some reason, are not represented at all. However, ken as a whole, the exhibition is an extremely interesting e, and makes a distinct step forward in a very important atter—the architectural education of the public.

Those who have been in the habit of seeing THE ARCHI-CTS' JOURNAL and "Country Life" will greet most of the hibits as old friends, and will, perhaps, be surprised at e relatively small proportion of really significant work at has escaped illustration and honourable mention in eir pages. The popular belief that the diligent searching garrets would result in a haul of genius still flourishes in ite of phenomenally little support from actual experice, and some of us may have hoped that this welllvertised exhibition might have discovered some new ar to be acclaimed and added gratefully to the accepted ghts of the architectural constellation. When, however, e remark any of the compositions that are new to us as particularly distinguished or engaging and then turn to our catalogue for the author, we usually find that he is known to us already, and instead of adding another name to our list of "The hundred best architects" we merely add another laurel leaf to the crown of the celebrated Mr. Jones, or the scarcely less distinguished Mr. Robinson. This forces one to the reluctant conclusion that there are in actual fact a quite definitely limited number of really first-class architects in active practice, and that the reserves of talent obscurely languishing in the provinces that one might have hoped to tap are largely non-existent, or, perhaps, not yet discovered even by a building client. The malicious might suggest that the Hanging Committee has hung the best "names" instead of the best available architecture, but reference to the catalogue will sufficiently refute such cynicism, for the merely "eminent" are conspicuously absent, whilst merit outside the fold of the Institute has been generously recognized. "Reference to the catalogue," by the way, is always a tiresome proceeding, and it would surely be an improvement if some neat standard label could be gummed in the corner of each picture giving the subject and the name of the architect, so that the languid (and who does not ultimately grow languid at the most festive exhibition?) may praise the righteous without the tedium of hunting up names in a long list.

We are probably all now agreed that next to an exhibition of actual buildings, a thing unfortunately impossible, architectural achievement is best displayed by a show of photographs. In this matter the Americans are ahead of us, as certainly as they are our superiors in monumental and grand-scale designing. If we recall the American exhibition held earlier this year in the same galleries we

cannot but remember the great imperial-size photographs proper to the heroic scale of their subjects. No doubt the American architect has larger opportunities than his English brother, but at the present moment he would also seem better to deserve them. Such easy comparisons are, however, apt to be misleading and unfair, as would be too great praise of the American photographs at the expense of our own.

We note the wonderful definition, clear-cut detail, and sharp, informing shadows of the former, forgetting, perhaps, the strength and brilliance of their sunlight; we praise the dramatic value of their photographic nocturnes when we should more properly acknowledge their pre-eminence in the new art of "flood lighting." There are but two photographs by such lighting in the present exhibition, one being Sir John Burnet's "Selfridges," and the other Mr. Curtis Green's Wolseley building in Piccadilly, the last showing a particularly effective result (No. 210). Pending the time when "Adelaide House" shall be ready for the photographer, we are glad that Sir John again exhibits his exhilarating sketch for it, as there is little in the show on the grand scale in the American sense.

Of Mr. Herbert Baker's work we have seen too little, and as most of it is overseas, the photographs here representing him are particularly welcome. Incidentally, they reveal the author of the most attractive memorial gateway to Lord's Cricket Ground that has recently made the St. John's Wood Road architecturally important and wherein W. G. Grace is commemorated in the most ingenious and architecturally satisfying trophies of cricketing gear. That Mr. Baker is equally at home on a big scale is proved by his great Pretoria Buildings (No. 198), whilst the Villa Arcadia (No. 199) shows that tenderness for texture and atmosphere which first brought him into honourable notice.

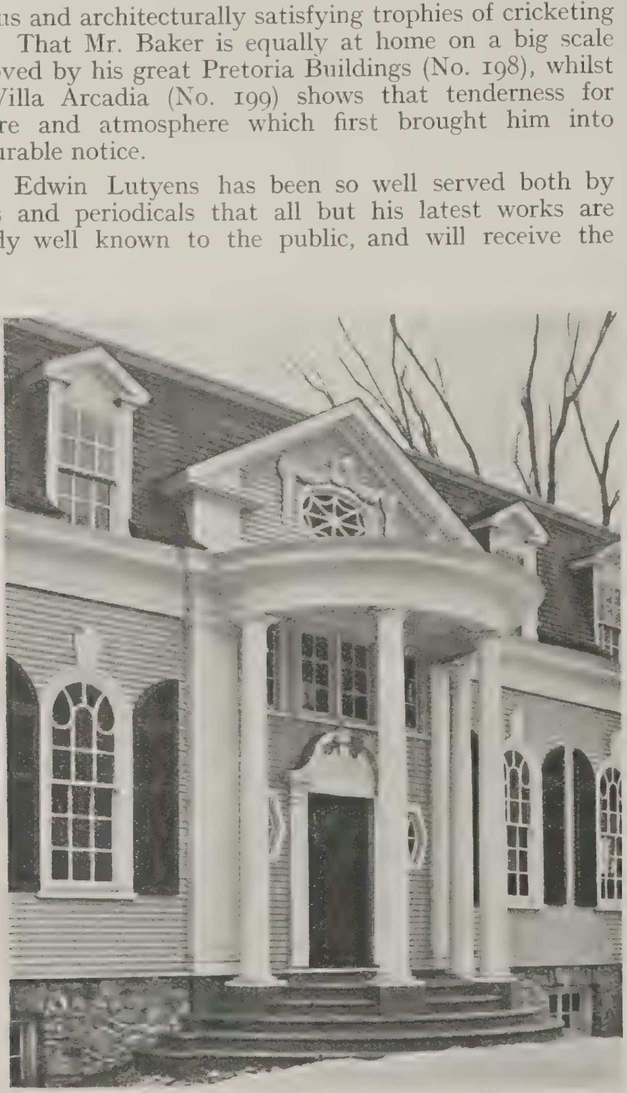
Sir Edwin Lutyens has been so well served both by books and periodicals that all but his latest works are already well known to the public, and will receive the admiration that is their due without special commendation here. As a classic example of English brickwork his Hampstead Garden Suburb Institute (No. 45) still remains pre-eminent.

The "Moderate" house is not so well represented as might have been expected, "Sprowston Court," by Messrs. Milne and Phipps (24), being amongst the best. Mill Hill School is happy in a Gate of Honour, by Mr. Hamp, that the photograph shows to be a composition of considerable dignity (48).

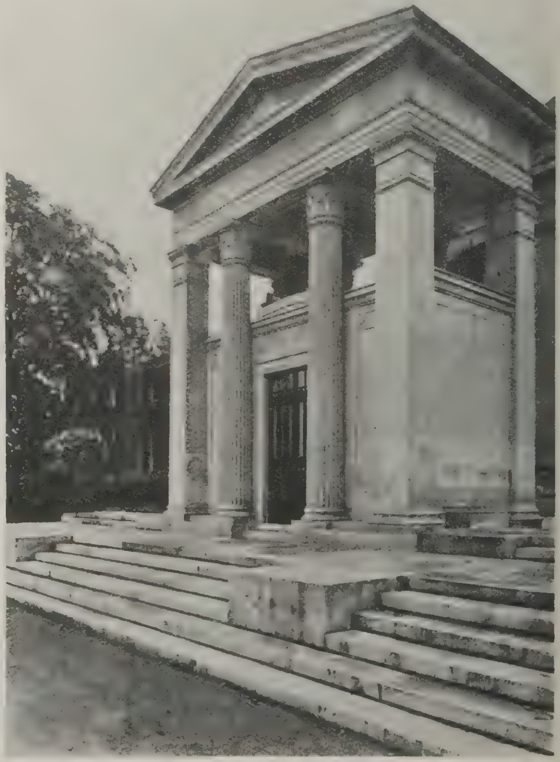
"Housing" houses are commonly only interesting in mass, and do not show to much architectural advantage when studied individually and in detail. The little dwellings erected by Messrs. Hennell and James at Welwyn Garden City are notable exceptions, and have a refinement and charm reminiscent of Professor Adshead's engaging work in the same field.

Thomas Worthington and Sons are well represented by the severely beautiful "Faculty of Arts" building at the University of Manchester, whilst Messrs. Willink and Thicknesse are much honoured by the imposing *palazzo*, called "The Cunard Building," that now distinguishes the Liverpool river front.

The work of Messrs. Lanchester and Rickards is well and amply illustrated, and is interesting as typifying a distinct phase in modern English architecture that is not, one feels, in the main stream of its evolution for all its vigorous ingenuity. Their drinking fountain at Newmarket is not a characteristic work, but individually pleasing. Thanks to the awakening of the daily Press to the importance of architecture as "copy," we are all of us pretty familiar both with the new County Hall and the Port of London building, but Mr. Yerbury's photographs of the former are in themselves a pleasure to look at as compositions in light and shade. Mr. Knott and the light of Heaven have, of course, between them given Mr. Yerbury his opportunities, but he has certainly made good use of them (No. 132).



ENTRANCE PORTICO, HOUSE AT DORVAL.
SEPTIMUS WARWICK, F.R.I.B.A., ARCHITECT.



GATE OF HONOUR, MILL HILL SCHOOL.
STANLEY HAMP, A.R.I.B.A., ARCHITECT.

(*The Exhibition of Contemporary British Architecture.*)

Photography has not quite done justice to Mr. Gilbert Scott's great work at Liverpool Cathedral, and a pale vater-colour of his proposed chapel at Huyton gives a etter taste of his quality.

Mr. Brierley shows what he has done at Sledmere Hall n the eighteenth-century tradition; Mr. Robert Atkinson, is exceedingly festive Regent Theatre at Brighton. As a etting for an "evening out" of light-hearted gaiety the nterior of the Regent is a triumph, combining, as it does, gay sensuousness with real architectural feeling.

In the photographs we of course miss the colour chords hat are so important a part of the whole effect in fact. he street front does not appear to be quite successful, but e are willing to believe that actuality may have been nkindly treated by the camera. To the more æsthetically inded Mr. Maclaren Ross's "The Order of Silence" hould be commended for its broad simplicity, whilst Ir. Warwick shows an engaging little piece of detail in his Portico at Dorval" (No. 258).

But one might continue such not very profitable comment through the whole series of 322 exhibits, dealing out raise or blame as seemed just from one's own individual et arbitrary point of view. In point of fact I have here one little more than indicate a few of the photographs at gave me pleasure without attempting to justify prerences that must, after all, be largely personal and may ven seem capricious.

CLOUGH WILLIAMS-ELLIS.

The President's Message

The following is Mr. Paul Waterhouse's introduction the catalogue of the exhibition:

What did Wren say, the great Sir Christopher, to hom next year we shall offer the honours of bi-centenary membrance? Here are his words: "Architecture has s political use, public buildings being the ornament of a untry. It establishes a nation, draws people and mmerce, makes the people love their native country; hich passion is the original in all great actions of a mmonwealth."

Whether these words were a necessary reproof to the tizens of the seventeenth century, or whether they were it an echo of the popular appraisement of the architect, is happily a fact that in England of to-day there is much ss need to remind people of the importance of architecre than there was fifty, forty, or even thirty years ago. en of commerce, men of trade, are nowadays aware that ere is "something in it"; and it is rare to find the prooter of a big building—however utilitarian his views—10 does not appreciate the necessity of getting skilled lp towards shaping his structure in accordance with cognized rules of propriety. There are several reasons ich will account for this—and perhaps the chief is one which we owe a vote of thanks to prominent individuals the modern world of trade. These men, wise enough to ow that good taste was an asset, and clever enough to ow where and how the good taste could be engaged, have en setting a standard from which their rivals and imitas dare not, for their very lives, fall back. Nor must we erlook the no less commendable, though less unexpected, elity of our modern banks, insurance offices, municilities and public companies to the claims of architecture— fitting mistress and handmaid of their constructional ievements. I shudder to think what would be the sent aspect of London if certain vast enterprises of the t twenty-five years had come to birth in the third quarter the past century. Those were the days when the flames Gothic enthusiasm had died down, only to leave among tain architects an impression that, inappropriate as thic traditions were to the needs of modern commerce, Gothic school had at least broken down all obligations vards the starched correctness (not *my* definition) of the ssic rule. There followed, as an ignoble sequel, a period ich it would be a mere compliment to call an age of nse. It had not even the immodest charms of licentiousness. The unhallowed result of the sense that traditional correctness did not matter introduced a theory, pleasant enough for the ignorant, that any whim which could find its way into the brain of any architect, however untutored, might appropriately find its way out of that brain on to his drawing-board and thence on to his unhappy creations.

It is to this train of reasonless reasoning that we owe most of the faults which make a large part of the City of London, and a larger proportion of Southwark, nightmares of jaded and mongrel effort.

"Originality," its producers would have called it, or possibly "design." But every drawing is a design and every building is original in the sense that it has an origin. It is only by the strangest freak of language that we confine this term to those things whose origin is as far as possible undiscoverable. Some would define as original those things "whose origin is in themselves," which are, in fact, contrary to all laws of Nature. Let it be said at once that spontaneous generation is no fit method of birth for architecture. It is not only indecent but happily impossible, for the product of such birth, whatever name it may take, cannot have the architectural nature.

I am quite deliberately certain that British architecture to-day is healthier, stronger, and nearer to the unattainable level of pure art than it has been for a hundred and fifty years. If this were not a public document, I would go further, and for this reason—that great and beautiful as were the achievements of the eighteenth century, miraculous as was Wren, magic as is the charm of his predecessor, Inigo Jones, and his great successor Gibbs, there was not in the days of those heroes, as there is to-day, so vast a company of contemporary architects among whom safe choice might be made.

To-day, it is true, there are men in the first flight to whom others are secondary; but the number of the secondary is legion, and by calling them secondary I am not calling them second best. Many of them are only on the second step because of certain conditions of standing room, and every year our systems of well-devised rivalry bring fresh men into prominence from the deserving ranks of the juniors or of the less known. Recent inquiries have led me to believe that architectural competitions, which are to many the ladder to fame, are nowhere in Europe conducted with such spotless fairness as characterizes our British methods in this respect. Certainly there can be no land which surpasses the British Isles in the success and universality of its present systems of architectural education—a success and universality which are, I believe, daily increasing. I only allude to this educational subject in order to point out that no person or corporation desirous of erecting a truly architectural building on lines of authentic and scholarly architecture can have any excuse in Britain for failing to find an architect. I am not forgetting the supremacy of France in scholastic architectural training, nor am I overlooking the present laudable efforts of Paris to weld into that training a sounder knowledge of construction; but I do say, armed with some personal acquaintance with modern educational conditions and free from personal doubts, that the employers or would-be employers of architects in this country have before them for their open choice an abundant army of highly trained men in whom taste, knowledge, and energy have been nurtured by the friendliest of rivalry and the most enthusiastic zeal.

In setting up this Exhibition it is not pretended that all the exhibits are of equal merit, still less that the very best work of our time is fully represented. Various circumstances have hindered the inclusion of certain works which the Selection Committee would have desired to see included, and which the visitors to the Exhibition will very probably expect to find. It will be easily understood that suitable photographs or drawings are not always available.

At least, it may be said that the Committee have done their best to make the collection illustrative of a fairly wide area of architectural enterprise and to exclude unworthy examples.

Architects and Housing

By MANNING ROBERTSON, A.R.I.B.A. (Late Deputy Chief Architect to the Ministry of Health, Housing Department)

THE President of the Architectural Association has done valuable service in introducing this important subject into his opening address, and his action has elicited some interesting opinions on the direction in which architects can most effectively give their services to the community. It is unlikely that anyone who has seriously considered the subject will quarrel with the "four points," introduced on the same subject in Mr. Hamp's article in THE JOURNAL for November 29, to the effect that architects are the right persons to design houses, builders to build them, and that the public should understand this and collaborate in the employment of both, each within his legitimate sphere. But Mr. Hamp's further assertion that "the need for houses would by now have been much more successfully met if the architects and builders had been allowed (sic) to work together without any form of Government interference" is open to question.

When the writer first joined the Local Government Board, in January, 1919, local authorities were sending in plans of housing schemes with which it was intended to proceed, and he can assure Mr. Hamp that the schemes then submitted were, without one single exception, such as showed no signs of architectural collaboration. These were the houses that would have been erected if the Government had not interfered. The possibility of architectural co-operation had not entered the heads of the local authorities concerned, and it was solely owing to the powers of veto exercised by the Local Government Board that any new standard of housing was arrived at.

What reason have we to suppose that the house-builder would have been approached by the architectural profession early in 1919 when at the end of 1922 we still find that nothing has been done?

The Local Government Board, in its "Manual on State-aided Housing Schemes," recommended the employment of architects, this being the first real step towards getting any general employment for architects in this class of work, a recognition that could not have been obtained without the power of the Government behind it, in the form of a veto upon houses that did not come up to the standard laid down in the manual, which was itself based on the Tudor Walters report. The credit for this recommendation on the part of the Government belongs principally to the then Chief Architect for Housing, Mr. S. B. Russell, who was untiring in his efforts to give architects the chance to "make good." But for the "official architect," a higher standard of planning and design would never have been attempted, and the tax-payers' money would have been spent upon subsidizing houses of the type that was being erected in pre-war days in our suburbs. If proof is required, what of the houses built under Dr. Addison's subsidiary scheme—the Grant to Private Persons? These houses were erected in 1920-21 entirely by private enterprise, within the most sketchy limitations laid down by the Government, no adequate standard being demanded. What was the result? Is it not notorious that the houses built under this Grant were of a miserably low type? The erector hardly ever went near an architect, and, taken as a whole, the houses both in design and construction were well below pre-war standard. Large numbers of old army huts and similar contrivances were pushed up by persons who were neither architects nor builders. Mr. Hamp tells us that if capital had been provided at a low rate of interest for private enterprise there is every reason to believe that full advantage would have been taken of such action. Experience under the Grant to Private Persons does not support this view. The employment of architects in housing work was a direct result of "Government interference," and without such interference architects would not have been consulted.

The housing standard originally laid down has for t past twelve months been gradually vanishing, and standard worth speaking about is likely to be insisted through the initiative of the present Government, even it subsidizes building. One can only hope that t Government schemes erected under the local authoriti and public utility societies may act as an educatio sufficient to demonstrate the value of the arch tect's contribution. Housing has been in splints lo enough, and architects and builders ought now to capable of carrying on at the higher level that has bee established.

It appears to be generally assumed that wholesa muddling sent up the price of Government houses unheard-of heights, whereas the heavy cost was really d to the Government's efforts to appease the clamour public and Press for houses in impossible numbers to erected with impossible speed. Such an over-demand o labour and materials could have had no other result, an the mistake lay in trying to oblige the electors instead telling them frankly that their demand could only be fu filled by slow degrees (an unsavoury truth that woul have elicited storms of abuse).

To pass now to Mr. Maurice Webb's suggestion. appears to contain one vital defect. It does not provid for the lay-out of the houses. To give a house-builder book of plans and tell him to select which he likes is no nearly sufficient. The lay-out of the site is even mor important than the plans of the houses, and the groupin of plans is a further development depending upon th configuration and aspect of the site in question. Individua attention and advice are surely essential, and a builde should be given both by any qualified architect he ma choose to consult, with sufficient particulars as regard lay-out, type plans, and skeleton specifications to enabl him to produce a job creditable to the architect and himself. The fee must be low enough to be "economic, one that makes it worth a builder's while, from the standpoint of increased amenity and rent, to consult an architect. In this way we would obtain more individualit and local charm than could be achieved by any number o books of type plans. Such a book, prepared by competen architects to suit varying localities and aspects, is alread in existence, having been published by the Ministry o Health, and all the objections that were urged by architects against this book when it first appeared must appl with equal force to any new books that might be produced. The question outstanding at the moment is tha of the "economic fee," and how much an architect will b expected to do under such a fee.

Architects should realize that they can look for further encouragement from the Government. They mus in future not only stand on their own feet (if they are stand at all), but they must push the Government instea of letting the Government push them. It is for th architects, the house-builders, and, one hopes, the doctor to see that the standard of housing is maintained.

The advantages that would accrue from personal co-operation between architects and house-builders would b immeasurable. Together they could attack the by-law and insist on the necessary reforms by forcing the hand of supine local authorities, and, where necessary, of th Government itself. They could resist unjustifiable speculation in land values, and make their united voices hear in the preparation of town-planning schemes. The might even make the public take an interest in its own welfare, a departure that would be almost unique in this country

Le Théâtre des Champs-Élysées

A Democratic Building

By H. BARTLE COX, A.R.I.B.A. (Membre corr. S.A.D.G.)

FIVE million francs for three play-houses with a total
accommodation for 3,000 spectators. A quiet
edifice decorated by eminent sculptors and
painters. Two years' construction in reinforced
crete over a waterlogged site. Such in few words are
striking data of the most complete and cheapest
odern" temple to music in the world.

fter the famous Opera House, the Théâtre des Champs-
sées is the most beautiful operatic and dramatic
ice in Paris. Scientifically it is far finer. Æsthetically
strikes a progressive note in architecture. It was
shed in 1913 at a period, in France, of comparative
riety while the former was begun in 1861, when France
gorged with gold! The
pera" took seventeen years
build, only seats a little
r 2,000 spectators, and
35,000,000 francs of the
ch!

he second empire and the
d republic are forcibly con-
ted by these two theatres,
one a fashionable ren-
vous for bal-masqué and
ballets, with "Escalier
nneur," spectacular
yer," "Loges Intimes,"
acoustic properties, and
xtravagant display of glit-
g ornament; the other a
tific disposition for the
g of drama and the hear-
f classical music. At the
era" the spectacle is as
h in the auditorium as on
stage, but since the time
agner the art of the stage
more moment than the
lity of the auditorium.

od concerts are given
he Théâtre des Champs-
ées, and crowded houses
witnessed "Le Ballet
e" and the first repre-
tion of Stravinsky's "Le
du Printemps." The taste of the twentieth century
rtainly less vulgar than was that of the nineteenth.
les Garnier's world-famous "Académie Nationale de
que" was paid for out of "La Cassette de l'Em-
r," and is monarchical in character, whereas the
re in question is the outcome of private enterprise, and
nocratic in principle. The architectural "programme"
entirely different one, yet since the dazzling splendour
e former Parisians are prone to judge all other lyrical
comedy play-houses from the standpoint of the
ra." A plain, logical, and economical edifice for a
re seems to some monstrous. In spite of good
tectural proportions, comfortable seating, perfect
tic properties, the latest mechanical devices for all
of musical drama, excellent lighting, heating, and
lation, the Parisians were scandalized in 1913 by this
g outrage on their prejudices, even the organizers
to blame their technical advisers, saying that they
ruined, but its serious import rapidly winning favour
dministrators now claim to have shown foresight in
ying the right men.

BUST OF M. AUGUSTE PERRET, BY BOURDELLE (MAÎTRE DE L'ŒUVRE OF THE THÉÂTRE DES CHAMPS-ÉLYSÉES).

The building is severe and the decoration restrained. The architectural style needs no name; it is the rational outcome of the principle adopted. The importance of this building lies in the fact that it is the only competent French effort at an adaptation to all "Modern" conditions.

The first performance given was "Benvenuto Cellini," by Berlioz, on the occasion of the inauguration on April 2, 1913, by Monsieur le Ministre de l'Instruction Publique et des Beaux Arts.

The "Programme" and the "Parti."

No just estimate of the æsthetic value of any building can be formed without knowing the "Programme" which dictated the solution or "Parti." In all periods of æsthetic building the architecture was the reasoned outcome of the "Programme." In most Renaissance work the programme was the illogical outcome of some preconceived architectural prejudice.

The Théâtre des Champs-Élysées would not be so much praised and blamed if modern artistic tendencies were less confused. Our epoch has no style, no unity of religion, no common social ideal. The majority of architects are without faith and their work without character. Archæological mimicry is less traditional than rational work that adjusts itself to the progress of industry.

The governing note of the project under consideration was the creation of a "Temple de la Musique," of a theatre specially devoted to the meditative hearing and to the perfect performance of the great lyrical masterpieces. To be an artistic enterprise as a financial undertaking. The slogan launched forth was "English comfort, German technique, French taste."

The commercial idea is due to its founder and Director, Monsieur Gabriel Astruc, a French Israelite theatrical manager renowned in all the capitals of Europe. The "Président du Conseil d'administration," Monsieur Gabriel Thomas, was responsible for most of the organizing. For some time, many personalities felt that the great intellectual "Capital" should be adorned with a sanctuary to choreographic and lyric musical art. The "Opera," it was estimated, was better suited for carnivals, *fêtes de joies et de luxe*, than for the more pure art of music.

It was hoped to build this theatre on the site of the old "Cirque d'été" in the gardens of the Champs-Élysées, hence its name. The Swiss architect Fivaz was entrusted with some preliminary studies, then, for diplomatic reasons, M. Roger Bouvard, son of the "architecte de la Ville de Paris," but the public Press was against a private theatre and the authorization to what was called a sacrifice, of a

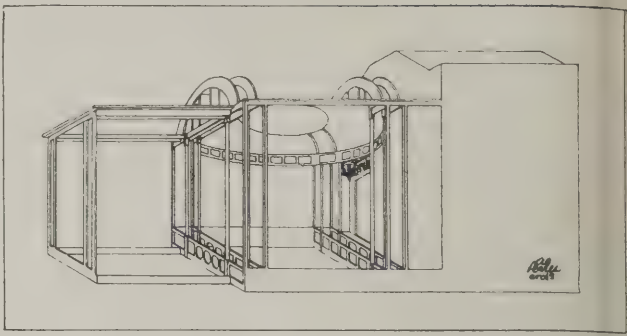
part of one of the finest public promenades was, in spite of the move, not accorded. Finally a site was found, almost a rectangle, about 325 ft. long by 114 ft. wide, at 13 and 15 Avenue Montaigne, near the Place de l'Alma. The details of the programme were then fixed with some precision. The projected monument to comprise a large theatre with an auditorium as spacious as possible and a stage fitted up with all the latest resources of mechanism. The "ensemble" to be conceived in a manner lending itself as well to lyrical drama, and even tragedies, as to ballets or to symphonic concerts. Not forgetting social custom, it was important to emphasize that such a place was destined for artistic manifestations before all. It was to be a sanctuary to phonetic art and not a rendezvous for fashion ! *

M. Thomas surrounded himself with a host of collaborators, and the principal play-houses of Europe were studied, including the Opera at Paris, the Scala at Milan, the theatres at Cologne, Munich, Cassel, Stuttgart, Dresden, Moscow, and, for machinery, Bayreuth. Monsieur Van de Velde, Belgian architect, was at one time engaged for decorative purposes, but nothing of his work now remains. Monsieur Milon was the engineer chosen for the important electrical and mechanical installations.

After mature consideration it was decided, for economical reasons, to build in reinforced concrete, and by an honest use of the material gain 20 per cent. of space. From this moment the design and construction of the edifice fell to the lot of the firm Messieurs Perret frères, architects and builders. Claude is the contractor, and Auguste and Gustave, reinforced concrete experts, the architects, both of whom were brilliant students at the Ecole des Beaux Arts. They studied in the atelier of M. Julien Guadet, the illustrious Professor of the Ecole, and architect for the reconstruction of the famous "Théâtre Français." Monsieur Auguste Perret is the senior partner, and this firm finally completely remodelled the whole scheme and realized the work both



THE DISPOSITIONS AND SHAPES OF THE THREE MAIN BLOCKS OF THE THÉÂTRE DES CHAMPS-ÉLYSÉES.

from the point of view of the general architectural "part and from the constructional and decorative standpoint.

Juxtaposed to the large theatre, arrangements were be made for a smaller one to be worked independently f the representation of comedy; finally a picture gallery (no undergoing transformation and to be opened next seas as a small trial theatre to seat an audience of 250 peo and to be let out for private purposes) was to comple this grandiose and complex problem, new also by t sobriety which the character of the monument imposed !

So much for the "programme." Messieurs Perre *parti* is a disquieting revelation to many "Ecol students who miss their much-cherished *points de poc* (dark spots), indicating strong vaults and souple arrang ments on the old method of arches built in stone. The are no massive walls, consequently an economy of spac The whole is a unified skeleton, with very thin holl wall fillings (130 ft. high, 1 ft. 4 in. thick, including cavit covered with marble on the main façade.

eratic and dramatic arts in Paris. Juxtaposed to the large theatre is a smaller one to be studied in conjunction with the plans illustrated on page 833, and the latitudinal section on to adapt a theatre to all "modern" conditions.

the edifice: 1, Entrance and peristyle; 2, auditorium; 3, stage, etc.

An examination of the plans will show how simply the problem has been solved. The emphatic points of support are the four pylons, making a square supporting the circular auditorium. These pylons are noticeable on the plan of each floor, and the motive logically traverses the building in both directions and is rationally accentuated on both façades.

A plaster model of the entire building was made $\frac{1}{10}$th full size at a cost of 50,000 frs.

Construction and Decoration.

The site, close to the Seine, covers an area of 3,000 square metres, and cost two million francs. The building is adjoined by houses on the left of the façade to the Avenue Montaigne. On the right is a narrow passage leading to the artists' loges.

The waterlogged soil is of clay. The foundations go down, under the stage, some 25 ft. below the level of the road. Great care had to be taken to ward against the rise of the Seine, especially in January, and to be prepared for floods, as in 1910. The basements are naturally waterproof, and the building floats like a flat-bottomed boat. The foundations are composed of a series of inverted arches carrying a certain number of piers on a raft, distributing the weight of the superstructure.

The handling of the façade is, of course, largely influenced by the exigencies of the plan. The regulations of "La Ville de Paris" request 80 cm. (2 ft. 7½ in.) width of door opening to every hundred persons contained in the theatre.

From the road we enter the vestibule, thence direct into the peristyle with the principal staircases. There is no foyer, the lateral galleries serving the purpose; the motive of this peristyle is largely inspired from the masterly composition of Victor Louis at the "Comédie de Bordeaux." The width of the corridors is four metres (13 ft.), as at the "Opera."

The auditorium, the very heart of this complex organism, is the scientific and artistic masterpiece of the theatre. Circular in plan, with three balconies supported on the cantilever principle by the four pylons before mentioned, not a single column interrupts the view of any spectator. It holds 1,974 people, and there are no stage boxes. The seating is extremely comfortable. The orchestra stalls are placed on a gentle double curve, that is, from side to side of the hall and from the proscenium to the back of the hall. Each person has a separate elbow, the width from centre to centre being 2 ft. 1 in., and from back to back 3 ft. 0½ in. At the "Opera" they are only 1 ft. 10½ in. and 2 ft. 6½ in. respectively. Access to the seats is again regulated by the Paris by-laws, viz., 80 cm. (2 ft. 7½ in.) width for every 100 persons. In the rows of seats one can pass without disturbing seated people, which is rare in France. For ingress and egress to the seats one does not have to pass more than eight persons. It is estimated that the theatre could be completely evacuated (except in case of panic) in less than ten minutes.

The size of the auditorium, roughly one-third of the entire structure, is in singular contrast to the ostentatious "Opera" (the largest theatre building in the world), of which the same relationship is popularly demonstrated by placing the thumb-nail in the centre of the hand with the fingers extended.

Acoustics.

There have been no complaints with reference to the acoustic properties of the Théâtre des Champs-Élysées, which are considered as perfect as possible for a hall exceeding 56 ft. in depth. Monsieur Perret claims that the secret of this science is in: 1, the proportions of the auditorium; 2, dry materials; 3, perforations. The width and depth of the hall are about 88 ft., and the height about 65 ft. (the "Opera" roughly 128 ft., 91 ft., and 65 ft. respectively, not so good acoustically speaking, especially the depth from the proscenium). An auditorium that is too large is not good for sound—for that reason a comedy theatre for the representation of intimate plays should be small, as the subsidiary playhouse of the building in question.

Leaving for a moment the scientific proportions, it is worth noting that the artistic handling of the auditorium was greatly appreciated in 1912 when a group of engineering students from the "Ecole Centrale" were conducted over the theatre during the course of its erection. The carcass of the hall was finished, but it was empty and devoid of any decoration, yet the harmony of the proportions was unanimously acclaimed. The nudity of the construction enabled the students to understand the sublime significance of the word "Architecture."

The heating and ventilation throughout are generally recognized as beyond reproach, and the material of the structure being of reinforced concrete the building is perfectly dry. The doors of each "loge" are perforated, and so also are the fronts of the topmost loges in the gallery, which have an artistically designed grating.

This lyric hall is considered a great scientific success for the hearing of sound and its reposeful decoration conducive to the meditation of music.

The width of the proscenium, which is movable, is 62 ft., that at the "Opera" only 52 ft.

The orchestra is hidden at a lower level than the stalls, and is half under the stage, as at Bayreuth. The balustrade separating the musicians from the audience is not solid, but is made of a delicate gilded bronze trellis, so that the hearing in the first rows of the stalls is direct, and not by reflection.

For big concerts the space occupied by the orchestra can be covered. On these occasions the stage receives a platform with scenery background (see the accompanying plans), continuing the architecture of the proscenium. The platform is for the chorus singers, whose voices instead of being lost on the immense stage, are entirely directed towards the hall.

The auditorium being circular (the best shape for avoiding nodical points), it is naturally covered by a cupola, whose form, however, is not a concave spherical surface, but has a convex central motif avoiding vertical echoes. Behind this glazed central shield are strong electric lights which illuminate the hall and show off to advantage the paintings of M. Maurice Denis in the cavetto of the cupola.

* * * * * *

The stage, the central part of which is a big empty box, is fitted up with all the latest mechanical devices for any form of modern performance. Under it are three basements containing machinery of the latest pattern from Germany. The scenery can be lifted without being folded. At the end of the site are the buildings for the artists with the *foyer de la dance*, etc., and an electric station. The back wall of the stage is 130 ft. high and only 16 in. thick—such are the capabilities of reinforced concrete—but as this wall has no auxiliary support (floors, etc.) it is reinforced by two triangular ribs somewhat as engineers strengthen their connecting rods.

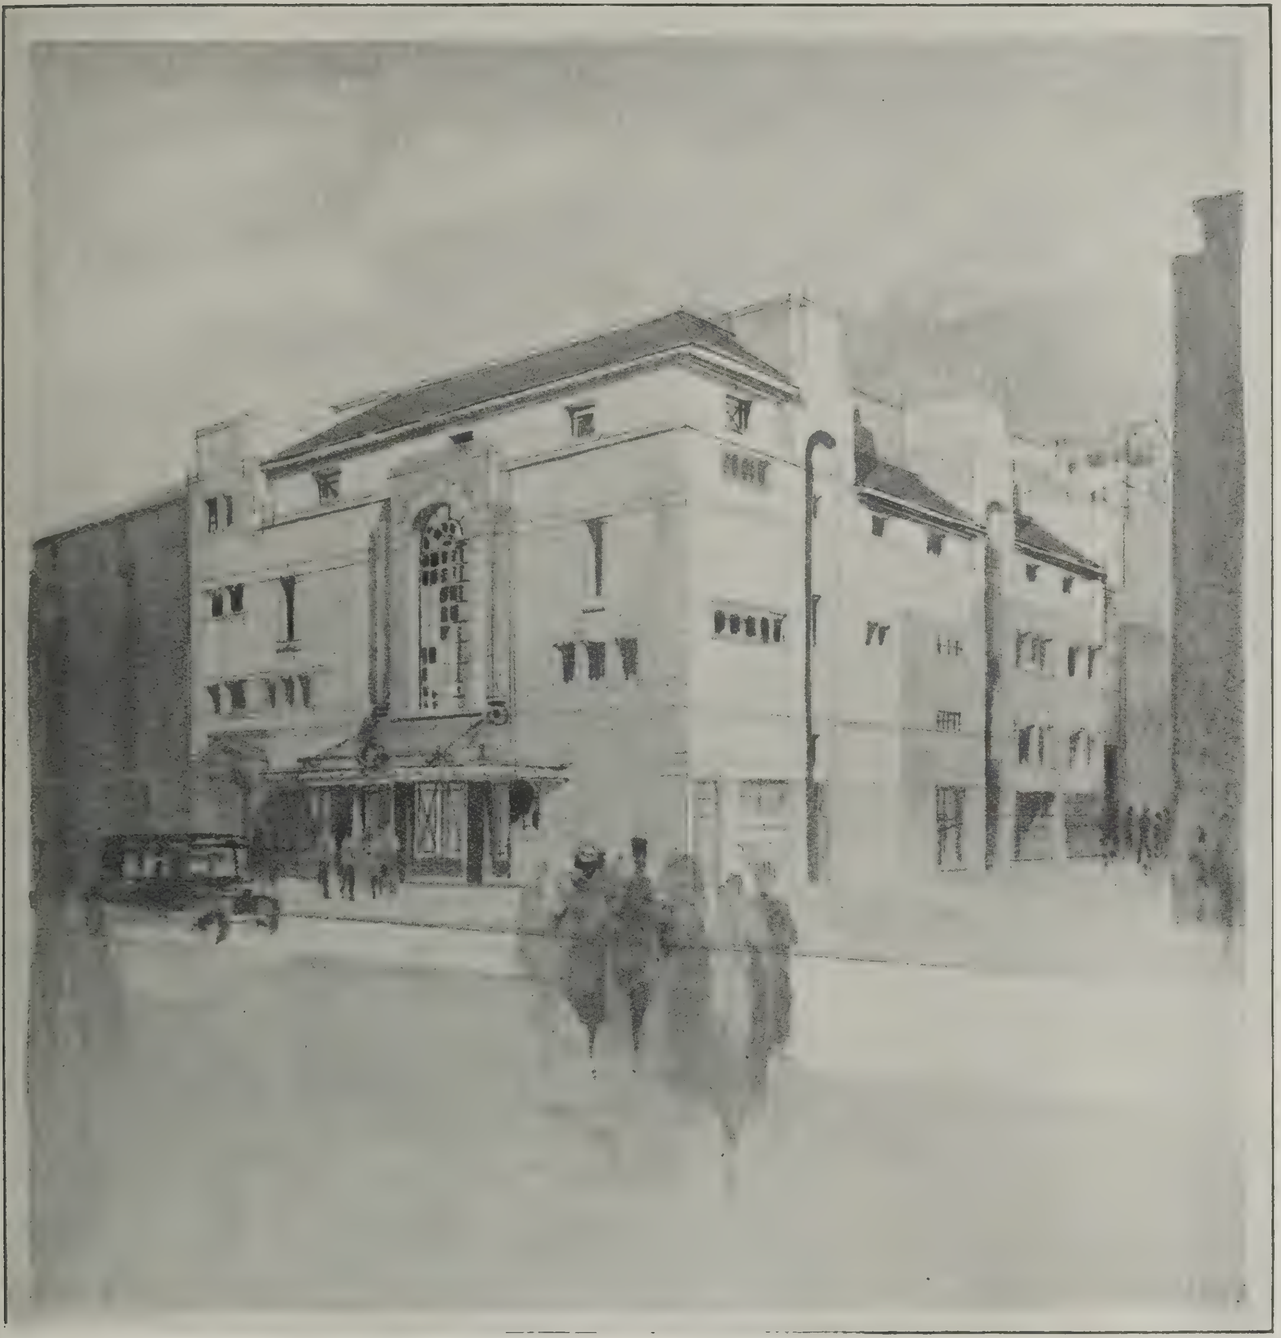
* * * * * *

The stage, 128 ft. long, 56 ft. deep, is furnished with every conceivable safety precaution, fireproof curtain, automatically working danger signals, isolated incombustible staircases, etc. The question of fire prevention has been effectively studied, and excellent terms have been accorded by an association of insurance companies who, by virtue of the building being in reinforced concrete and of the installation of Grinnell sprinklers, have reduced the policies by a half. In two of the pylons, above mentioned, staircases have been worked running from the lowest basement to the top of the roof. In these, apertures have been formed in such a way as to enable firemen to play water either on the stage or on the auditorium.

(*To be continued.*)

The Proposed New Crown Theatre, Drury Lane, London

E. Schaufelberg, Architect



This theatre is shortly to be erected on a site in Drury Lane. Mr. Laurence Cowen is associated with the enterprise.

Woodwork: Its Application to Modern Buildings

MR. T. P. BENNETT, F.R.I.B.A., in the course of a paper read before the Incorporated Institute of British Decorators, on "Woodwork and its Application to Modern Buildings," said :—

Externally the half-timber building has a tremendous fascination, principally, no doubt, for the reason that this combination of materials is so full of life and interest because of the contrast in colour values and its truthful construction. Suitably applied half-timber work is still a possibility in country districts. It is however subject to two restrictions: (1) if used as solid timber, backed with the necessary thickness of brickwork to make it fire-resisting, it is expensive; and, alternatively (2), if used as surface decoration it is open to the criticism of not fulfilling its true function in the building.

However, one occasionally finds a client who is really interested in the appearance of the building and in half-timber construction, and its use then becomes a possibility. In other cases we may be allowed to call half-timber work a method of surface decoration, much as the Romans decorated their buildings with marble sheeting and constructed them of concrete. The great point of the matter is that half-timber work can only be successful if it is developed from the study of old examples, examples in which design actually grew from the necessities of construction.

The half-timber work of the jerry-builder is anathema, and the reason for the strong objection of the man of taste to such work is its over-elaboration and senseless application. Its correct use is another instance of power and rectitude arising from knowledge. Even the most elaborate examples of the fifteenth and sixteenth centuries create a sense of simplicity by their composition and massing.

To my mind, Bexton Manor, with its straight eaves and simple posts, is a delightful example of work of this style.

The variety and interest of half-timber work is in further evidence at the Lion and Swan Inn at Congleton, where the architect appears to have indulged his fancy in many ways. There is more than a suggestion of restoration in the appearance of this example.

Singleton Manor in Kent indicates the application of half-timber work as it is frequently found in this county and the adjacent county of Surrey, namely, contrasted with simple wall surfaces and big masses of roof.

Half-timber work is however only one phase of woodwork, and there are many other instances of extremely happy combinations in English domestic architecture.

How delightful are the posts and beams, the weather-boards and brackets of the Butter Walk at Dartmouth, or the simplicity and value of the window frames and the over-hanging first floor in a cottage at Orpington, the detail showing a solid frame, solidly constructed panelled doorway, and a certain amount of carving which is quite interesting.

In the classic building wood is still in many cases in evidence. Groombridge Place, Kent, would lose a great deal of its interest if its porch were removed and its sash-bars taken out.

To show how woodwork, if unsympathetically handled, may be unnoticed, or if seen may be uninteresting or detrimental, we have the Pallazo Bevilacqua at Verona. The Italians, however, are capable of obtaining great effect by the sparing application of wood, which we see in the Cloisters of San Lorenzo at Florence.

Wren was fully alive to the value of material, and in such a building as the Orangery in Kensington Gardens the excellent effect produced is due quite as much, if not more, to the texture of the sash-bar, frame and its brick surround as it is to the fine composition and proportion.

Coming to individual features the doorway offers the greatest field, and is susceptible to the greatest variety. The Georgian architects above all others realized the value of wood in this connection. The scope in this direction is unlimited, the precedent inexhaustible. We have the hood with all its numberless variatio and possibilities. There is the beautif canopy from 17 De la Haye Street, Wes minster, now in the Victoria and Albe Museum, and another I am able to illu trate from Laurence Pountney Hill. detail equally interesting from Burwa in Sussex, with which you are probab familiar. The canopy represents o phase only of the doorway. There a many others. South Kensington co tains a pilaster and pediment treatme from Abingdon Street, and there are course many similar examples in Bedfo Row and Bloomsbury.

The architrave in combination wi brackets is seen to advantage in the doo way from Rye House, and as the centuri advance we get what one might descri as an Adamesque treatment such as th shown upon the screen of which I cann trace the origin.

It is interesting here to study the co trast produced between wood and plast by such a subject as the entrance to t Chapel at Morden College, because th and other similar treatments often bas upon Italian precedent have been used American domestic architecture in rece years with such conspicuous success.

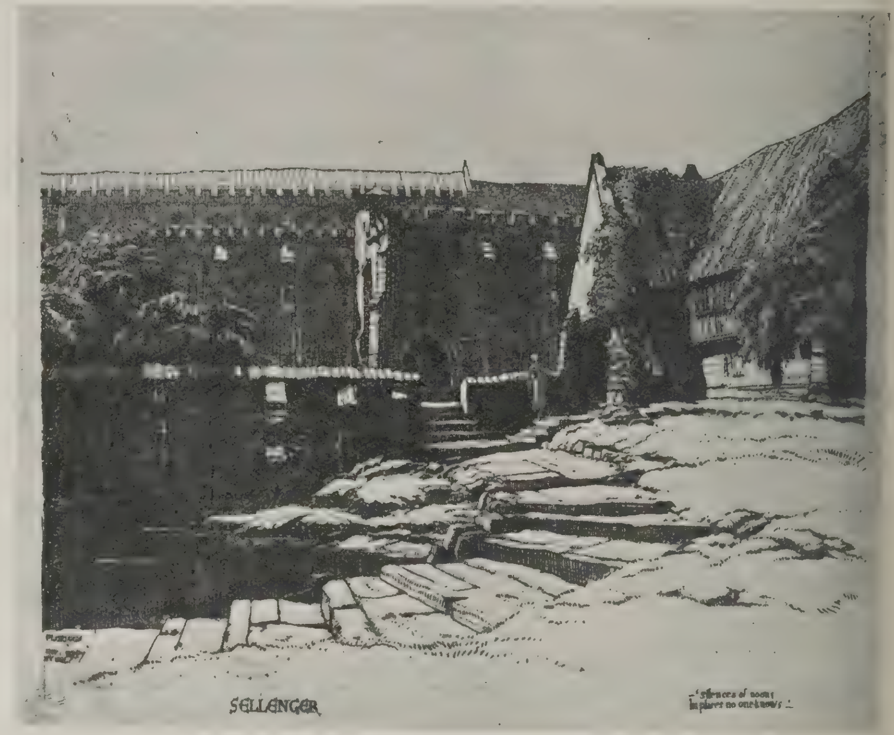
The Etchings of F. L. Griggs, A.R.A., R.E.



SELLENGER
–'silences of noon; in places no one knows'–

SELLENGER. FROM AN ETCHING BY F. L. GRIGGS, A.R.A., R.E.

FOR some reason, difficult to fathom, the Press has been, on a whole, rather perfunctory in its notices of the etchings of F. L. Griggs, A.R.A., now in their last week at the XXI Gallery, Adelphi. Is it a genuine indifference, or has the dynamic attraction of the younger movement in art spoilt the taste of our critics for the less tortuous or sensational? Whichever the explanation, it is seemly that something more than a few fugitive lines of praise should, at this juncture, be recorded.

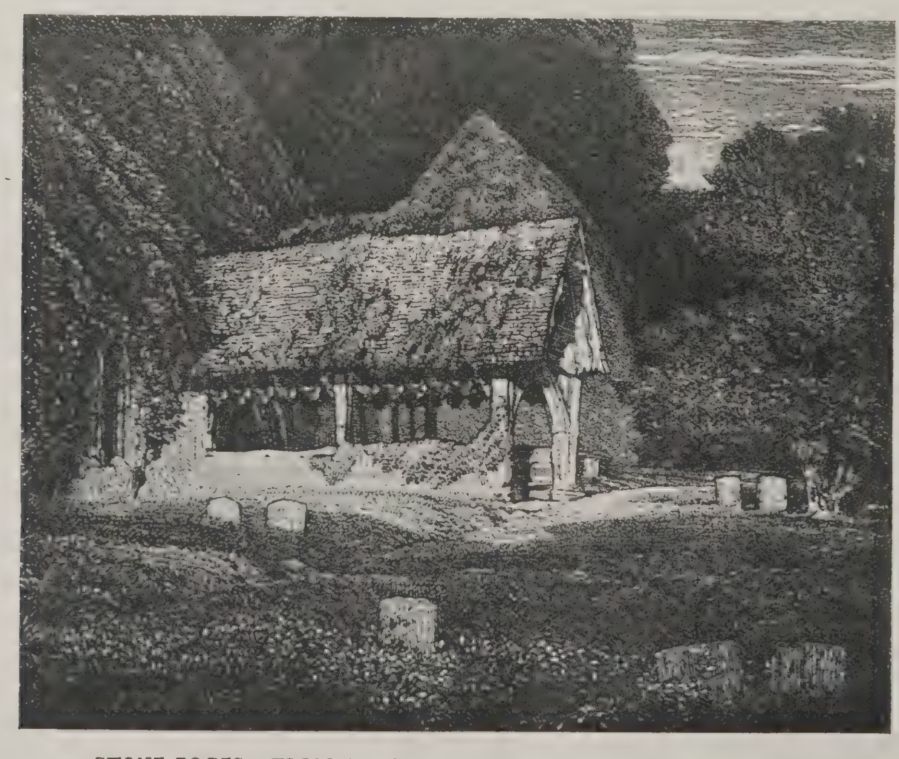
Looked upon as a whole, they are a significant stage in the development of those etchings that concern themselves strictly with architectural subjects. And they are so for two reasons; first of all, on account of their resourceful technique, but chiefly because of the peculiar and rare qualities which they convey, and of which they are the outcome; for the history of these etchings is a *te deum laudamus* to that rural, polished, and robust England which is in no guise more felicitously expressed than in those grand and solid vestiges, the mediæval structures. Especially those simple but noble ones set amid superb landscapes which, together, have touched our sensitiveness of response ever since Walter Scott sang romantic pæans on their behalf.

Mr. Griggs has felt the lovely charm of these vestiges and their settings so deeply that his rich observation has wrought with no sense of effort or artifice, and wrought through an especially severe and difficult medium, but then it is evident that for the ordeals of stubborn struggles with so intractable a material, the artist has all the necessary fortitudes. It may be partly due to the fact that he only took up etching when he had mastered not only the difficulties of drawing in pencil and pen, but also the numerous allurements bound up with its practice. Therefore, not in his etchings shall we discern those natural juvenile ailments of forced composition or of mannerisms in presentation to which the frisky and brilliant talent of ardent youth is prone. No! his heart, schooled to the last reserve of expression, guides the hand surely, and if his etchings are done, at times, with an almost perilous completeness, they throughout impress our understanding with a ripe mastery of technique serving the securest of all imaginations.

Mr. Griggs's love for the Gothic architecture, which once gave to England so fair an aspect, lies behind all the etchings of architectural subjects which, so far, represent his etched work, whether of imaginary scenes or of actual places. The link between the two is architectural and historical truth, at one and the same time a source of strength and of weakness. A weakness in the sense that it betrays a certain limitation of creativeness. True enough he does create imaginary scenes, as in "The Pool" (30) or "The Ford" (31), or "Totterne Inn" (39), but these have been formulated within the more strict channels of idealized realism, so to speak. Of course, a man who should attempt to define this artist by his limitations might find many of them, a method by which only the very greatest, like Rembrandt, pass unscathed.

In the case of Mr. Griggs one perceives that his passions are rather pure and steady than violent; he is seldom insurgent and seldom purely lyrical. Never amusing, though he sometimes condenses ironically—by omission. He has no rude or exuberant enjoyment to communicate, nor any excessively intense moment of ecstasy, but, on the other hand, he does possess an austere and deep faith and love in the England of yore, and through a sombre sumptuousness does he express both. In regard to either actual places or imaginary scenes, the style chosen is a shapely enough vehicle. The reproductions given here show that clearly.

That of St. Wendred's Church gives practically nothing but a mere structure, but so relentless and withal so considered is the accumulation of its component parts that a feeling of clear-cut richness pervades the whole, and so delights us. But yet it is simplicity itself. In that of of Sellenger the style is every whit as shapely, but deeper are the emotions which it strives to express. The marvellous integrity of the technique is here suffused with an added boldness of presentation. How audacious and melancholy—how serene; how laden with strong



STOKE POGES. FROM AN ETCHING BY F. L. GRIGGS, A.R.A., R.E.

veliness! And how convincing it is to e side by side four different states of is same plate; this one with the light enly distributed; that other with its rious planes more wilfully receded; a ird with a freer foreground.

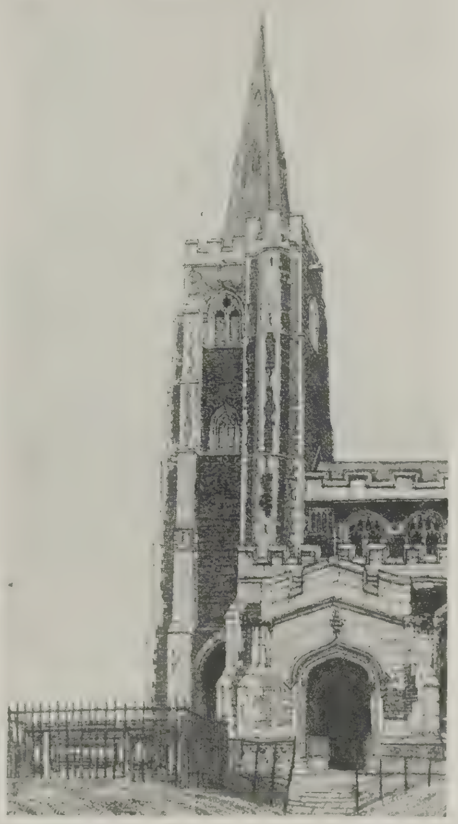
Whilst on the subject of technique it is teresting to observe that in this series Sellenger the recital of facts is an almost mplete reversal of those obtaining in her series, notably that of Stoke Poges e illustration), of which no fewer than six ates are shown. In the Sellenger series r. Griggs has worked from an original ching rich in contrasts of chiaroscuro to ater one more subdued and, to my mind, s effective. In that of "Maur's Farm," rhaps the ablest, the process is, as I ve said, reversed, and every change of tail meticulously checked. In No. 2 ge, the entire etching is kept light; straggling tree, in the left corner, over ne high-buttressed wall, grows bigger d bigger in Nos. 3 and 4, whilst the ching yields greater contrast in light d shade; the sky, at first cloudless, is w furrowed with streaks of cumuli, til in No. 5 the heightened lights and rker shadows invading all objects are de magnificent by the closing-in of the y which, at last, binds the whole thing th the pattern of its streaks. "All the of the summer day became silent after ndown; the earth was dark and very ll as with a great thought; the sky was a pale window through which men and gels looked at one another without a rd." . . . And this, Mr. Griggs has erringly conveyed. G. HOLT.

Contemporary Art

Fine Art Society.

MR. LAMORNA BIRCH, whose exhibition of oils and water-colours has just opened at the ve Society, New Bond Street, is an ellent example of the *born* painter. may have—indeed, he has—limita-s, of course, but taking it as a whole, output is very genuinely artistic. reover, this output is brought out a complete mastery over the medium l paint, as such, cannot be better lied to canvas. He knows all the ks of the trade, and it is felt that he nt it as he went on. Briefly, he lies his paint as Nicholson or Sir lliam Orpen apply theirs, unhesitat-ly, and with a gushing brio nice to ice. Mr. Birch is not, so one pre-es, given over to bothering about t other artists do. The "Côterie" ing is alien to him. He has too much lo, and the time thus saved is spent doors amid delightful scenery. Scot-l and especially Cornwall attract him t, and the vivid colours, of depth, med in by strong patterns of rocks, s, and vigorous horizons, are to him an ambrosial drink of infinite joy. the least of the charm of his work is spontaneous and sunny ability of ging to his public the very shocks himself felt at the time. Depth of er, glistening sunlight, fine, lovely s, immense skies, either rebellious or tly heavy with the tranquillity of k—these are his subjects and the very erial of his well-deserved triumphs.

ompared to him, Mr. C. B. Prescott mes a far more modest countenance. water-colours of Southern Italy and y, shown at the same galleries, are the fruits of a mind less gifted but not less enthusiastic. Let it be admitted at once: Mr. Prescott's water-colours are inclined to be over-laboured, and the thousand and one minutiæ which a painter should instinctively eliminate are, with him, included and made a fuss of, to the detriment of unity. A laboured water-colour of Italian gardens is bound to look finicky and a little meretricious, and Mr. Prescott would do well to be less conscious of his foreground and more concerned with an adequate composition, with light and the magnificent incidentals teeming in all Italian gardens. The "Temple of Concord at Girgenti" (4) is overvaried; greater simplicity would improve it. One of the best water-colours shows some "Almond Blossom in Girgenti" (23); here the artist has well caught the delicate colour of those delightful trees. "Wall Flowers" (26) is bolder than most, and it is in that direction that Mr. Prescott should turn. If proof be needed that the atmospheric effects and the intensity of colours to be found in shadows in that lovely land are studied by Mr. Prescott, it is supplied in "Fountain in Taormina" (40), where all the values are faithfully and pleasantly given. Its one weakness is the too violent pitch in which are plunged the shadows of his foreground.



ST. WENDRED'S CHURCH. FROM AN ETCHING BY F. L GRIGGS, A.R.A., R.E.

Grosvenor Galleries.

The winter exhibition at these spacious and well-lit galleries is now opened, and a fair galaxy of talents gives of its best and most characteristic. As usual, the standard is pretty high, only a mere handful of really poor paintings are to be observed straggling in corners. The very first exhibit promises well. "Paul" (1), by George Clausen, R.A., is, indeed, delightful. It shows the quizzical and smiling face of a fuzzy and fair-headed boy. It is both emollient and direct. R. Anning Bell, R.A., takes us back to the romance of the pre-Raphaelites. How odd to see his "Palace of the Sleeping Beauty" (4), so freshly conceived and painted! If, at times, one sees a certain tiredness in some of the portraits, that fault is not to be laid at the door of Mr. William Rothenstein, whose thoughtful and well-arranged "Young Bengalee in Meditation" (18) will appeal to many. The place of honour is taken by a portrait of H.R.H. Princess Mary Viscountess Lascelles, by Oswald Birley. It is competently done, but there is nothing transcendental about it by any means. Just competent. Far more successful and interesting is the portrait of Clough Williams-Ellis, M.C., architect (124), by the same artist, where the masculinity of the sitter is fittingly expressed by a spirited and sympathetic handling. As to Mr. Ambrose McEvoy, he seems to get more and more ethereal in his portraits; soon the sitter will be but a lambent shadow, an aura of splendid evanescence.

It is amazing the attraction which Dieppe Harbour has on painters. Since Cotman's days, at least twenty well-known interpretations of it have been given, and Mr. Charles Cundall's is as meritorious as its predecessors. Here is a smallish oil showing almost as much knowledge of atmosphere as Mr. Sickert's, only in a more solid form. Significant design (helped by the bird's-eye view), discreet and subtle colouring, a nicely effused technique—it's all there, and so is the result of permanency in values truly caught.

Sir John Lavery has several portraits; if not insufferably beautiful, they are at least very good portraits, but the artist comes down with his "Passing of Michael Collins: Pro-Cathedral, Dublin" (31), which betrays a hasty job and undoubted staleness. An excellent *peinture de genre* is Sir William Orpen's "Barrel Organ" (38), done in the manner of the French or our own eighteenth-century painters. Neither mawkish nor reheated, it bears testimony to the resiliency of its author's voluble temperament and love of versatility. The modern touch is provided by an excellent "Mostar, Herzegovina" (66), by Mr. Stanley Spencer, whose sense of composition is as bold as it is happy. The realistic school *a outrance* has two able exponents in Mr. Algernon Newton, whose "Regent's Canal" (103) is a faithful and reticent piece of work, and in Mr. Cecil Hay, whose "Green Pot" (78) exhibits a deadly accuracy and a sombre, impeccable presentation which is most impressive at first glance, but least convincing to the wayward mind that likes its food not quite so chewed beforehand. G. HOLT.

Art Exhibition in London.

An exhibition at Devonshire House of work by the art students of London, in aid of the Hospitals of London Combined Appeal, was opened yesterday at 3.30 p.m. by the president of the Royal Academy (Sir Aston Webb). It comprises oils, water-colours, black and white, decorative work, architectural drawings, craft and sculpture. It will be open to the public from ten o'clock to-day, December 13. The ordinary charge for admission to view Devonshire House will also admit to the exhibition. Sixty per cent. of the sale price of pictures will be allocated to the Combined Appeal.

Construction. 28.—New Offices for the Liverpool Victoria Friendly Society

THE COMPLETED RETAINING WALL ALONG BLOOMSBURY PLACE.

THE under-pavement vaults along Bloomsbury Square and the retaining wall along Bloomsbury Place—the construction of which was described in our issue for October 4—have now been completed, and the isolation of the site from water, also described in that issue, has been satisfactorily carried out. So far the super-cement ring surrounding the centre portion to be built under the present scheme appears to have successfully kept out the underground water, and it is hoped that no further difficulties will be encountered in this direction.

The accompanying illustrations showing the completed vaults along Southampton Row, the coal vaults in Bloomsbury Square, and also part of the retaining wall along Bloomsbury Place, give a good impression of the finished work. It will be noticed that no shoring up is being provided, even of a temporary nature, as the design of the vaults was carried out in such a way as to make them act as retaining walls as well. That the design has been successful in this respect is proved by the fact that up to the present no trace of any crack has been observed in the roadway on the three sides supported, although on the Southampton Row side especially, very heavy traffic is passing continuously. The absence of vibration within the vaults themselves is also quite noticeable.

The whole of this northern portion of the site has now been excavated down to the sub-basement level, and the foundations for the centre grillages are being proceeded with.

Under-pavement vaults will eventually extend along the whole of the Southampton Row front of the building, and partly along Vernon Place, and the necessary excavations for this work are nearing completion.

On the opposite page is a reproduction of a working drawing of the reinforced concrete retaining wall along Bloomsbury Place.

As in the case of the vaults, the wall was designed to transmit the whole of the thrust to the blue clay of the foundations, and is, therefore, rigidly attached to the main raft.

Two systems of bars are provided for this purpose: the main system, consisting of the horizontal $1\frac{1}{4}$ in. bars, which are carried through from the wall and take the bending moment at the vertical face of the main raft, and an auxiliary system of vertical bars, $\frac{3}{4}$ in. dia., which provides for the bending moment across a horizontal plane just under the part projecting from the raft. During construction, c
creting was carried up to practically t
level, and the vertical system acts as
tie between the upper and lower porti
of the main foundation block.

Originally, the back of the wall
designed with the usual batter, but it
afterwards decided, in order to facilit
construction, and from various ot
considerations, to alter this to a verti
surface; and the rapidity with which t

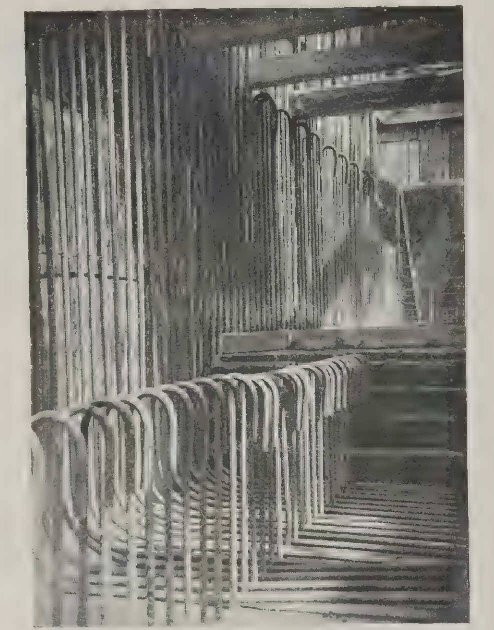
Plan of Retaining Wall
Sections of Connection of Walls to Grillage Raft

THE LIVERPOOL FRIENDLY SOCIETY BUILDING, SOUTHAMPTON ROW, LONDON. DETAILS OF RETAINING WALL IN BLOOMSBURY PLACE section of the wall was built fully justified this decision.

The illustration (on this page) of some of the reinforcement of this wall, shows clearly the two systems of bars referred to above, as well as the first reduction of the steel in the height of the wall; and the illustration on page 844 shows the finished retaining wall.

The present scheme for the building provides considerable shop accommodation along part of the Southampton Row front, at the Vernon Place end. By a rearrangement of the lower floor levels, the ground floor of these shops will be at pavement level, and will open on an arcade extending along their whole front. A mezzanine floor between the street level and the general first floor level of the building will considerably increase the accommodation available.

The next article will deal with the design of the first section of the underpinning wall for the existing buildings; and some of the main calculations and diagrams will be included.



THE LIVERPOOL VICTORIA FRIENDLY SOCIETY BUILDING: Reinforcement of the Retaining Wall along Bloomsbury Place.

R.I.B.A.

New Members.

At the last business meeting of the R.I.B.A. the following were elected members :—

Fellows.

Ansell, W. H., London.
Bothwell, E. F., Shanghai.
Callow, C. F., Hastings.
Carnell, J. L., King's Lynn.
Collins, H. R., Chester.
Ditchburn, D. H., Bombay.
Gotch, L. M., Kettering.
Marwick, T. P., Edinburgh.
Middleton, O., St. Albans.
Riley, W. H., Leicester.
Ryde, F. C., Weybridge.
Short, E. W. G., Salisbury.
Soutar, C. G., Dundee.
Stretton, C., Leicester.
Tanner, E. J., London.

Associates.

Alexander, W., Quetta.
Allen, C. W., Nottingham.
Angus, A. E., Windsor (Ont.).
Austin, L. M., Hammersmith.
Backway, G. H., Wandsworth.
Baillie, W., Glasgow.
Ball, W. F., Gloucester.
Ball, W. A. C., Croydon.
Bankart, H. C., Hampstead.
Barnard, C. D., Leyton.

Council Meeting.

At the last Council meeting of the R.I.B.A. the following business was transacted :—

Architects' Fees for Housing.—It was decided to recommend the general body to amend the scale of charges by omitting Clause 9 and adding a footnote calling attention to the General Housing Memoranda of the Ministry of Health now governing the fees payable to architects.

Architects and Speculative Housing Work.—The Practice Standing Committee have arranged to confer with representatives of the following bodies upon the question of deciding upon a scale of fees for architects: the National Federation of Building Trades Employers, the National Federation of House Builders, the London House Builders' Association.

The R.I.B.A. Certificate Book.—
the recommendation of the Prac
Standing Committee it was decided
restrict the sale of the R.I.B.A. Certifi
Book to members and Licentiates of
Royal Institute.

Architects and Limited Liability C
panies.—The Council are of opinion tha
is undesirable for members of the Ro
Institute to form themselves into lim
liability companies for the purpose
carrying on the profession of an archit

Annual Dinner.—It was decided
the R.I.B.A. annual dinner should be
on February 26, 1923, in connection
the celebration of the bi-centenary of
Christopher Wren.

Death of Sir Ernest Geor

Full of years and of honours, Sir Er
George, R.A., passed away last Fri
at the ripe age of eighty-three. By
the greater part of his work consiste
country mansions, most of them
from the foundations, but some of t
older houses remodelled. The list
even the chief of his country house
a long one, and the places in which
were built include a large number of
counties of southern and western Engl

In London, he built not only si
houses, but whole streets, whilst the
has his Royal Exchange Buildings, Mar
bone his Royal Academy of Music,
Golders Green his crematorium.

Born in London on June 13,
George received his education at Brigh
and Reading, after which he was arti
to S. Hewitt, and entered the R
Academy Schools. There he took the
medal for architecture in 1859. He be
practice two years later in partner
with Thomas Vaughan—also a p
winner, but of the Royal Institute
British Architects. On Vaughan's de
in 1871, he was joined by Harold
and on the latter's retirement, in
by A. B. Yates. The support of a par
left him more free for the purely art
aspect of his calling.

In 1896 he was the recipient of the
medal for architecture which the Sover
annually bestows, on the advice of
Royal Institute of British Archit
But it was not till 1910 that he bec
an Associate of the Royal Academy,
having been president of the R
Institute of British Architects in 19
In 1911 he was knighted, and in 191
his seventy-eighth year, he was elect
full member of the Royal Academy.

The public will remember his ass
tion with the new Southwark Brid
opened in June last year—the architect
treatment of which he was responsibl

Correspondence

The Organization of Acoustical Research

To the Editors of THE ARCHITECTS' JOURNAL.

SIRS,—I have read with interest your ader on the Organization of Acoustical esearch, and as I am particularly terested in the subject I regret to note at the Institute of Structural Engineers as not amongst the list of societies ked to co-operate.

Should developments occur, and I ncerely hope they will after your most luable lead, I hope that the above- entioned society will be invited to tend.

A. G. HUNTLEY, A.M.I.Struct.E.

To the Editors of THE ARCHITECTS' JOURNAL.

SIRS,—The editorial on the organiza- on of acoustical research in your issue r November 29, more particularly e final conclusion, is most interest- g.

In July last the Council of the R.I.B.A. lled the attention of the Science Stand- g Committee to this matter and re iested that it may be placed on the genda for the first meeting after the cess.

The Science Standing Committee have ked representatives of other societies assist them, as it is evident that fur- er research work must be undertaken, d we hope this will be carried out rough the Department of Scientific d Industrial Research.

Apart from the Council of the R.I.B.A., e President, Mr. Paul Waterhouse, .A., has taken a most active interest the matter as shown by his presidential ldress, and the profession can be assured at the Council of the R.I.B.A. are fully ive to the importance of this subject, d have already commenced to draft research programme.

J. ERNEST FRANCK.

Joint Hon. Secretary, Science Standing Committee.

The Building Guild

To the Editors of THE ARCHITECTS' JOURNAL.

SIRS,—Your editorial comments on the fficulties of the Building Guild appear me to be a little cryptic.

I would venture to suggest that the perience of the Guild has not been the scovery of virtues in the capitalist stem, but a discovery of the difficulties hich must face any organization to-day, unded on the principles of the Guild. o put quality in place of quantity, and e service of the community in place of ofits, is not exactly an ideal which com- ands commercial success. Neverthe- ss, the continuance of the Guild is to desired, and to be encouraged by chitects, not, as you suggest, with the ject of correcting "economic fallacies respect of capital and labour," but that may continue as it has begun, to build ll, and to make the time-honoured rase of the specification a reality— at "all materials and workmanship shall be the best of their respective kinds." The Building Guild is out to build well it has built well—and incidentally it has revived some very old virtues which long since have become somewhat moth-eaten. The most stalwart defender of the capitalist system does not sing anthems in praise of it in his early morning bath, does not commemorate the soundness of its economics in verse or the beauty of its towns in prose.

It is, indeed, publicly and secretly a "much despised" system.

G. LE MORRIS.

[Quality first, certainly, and principle before profit all the time. Mr. Morris will admit that we said nothing to the contrary; nor did we say that the Guild system should be encouraged by architects with the specific object of correcting economic fallacies in respect of capital and labour. Such fallacies exist, however, and if, incidentally, the Guild system corrects them it will make a considerable addition to the virtues that our correspondent claims for it.—EDS.]

Educating the Public—New Style

To the Editors of THE ARCHITECTS' JOURNAL.

SIRS,—It seems odd that a professional journal should applaud the "publicity agent concealing the powder of advertisement in the jam of cinema 'interest' films," as you do in your issue of November 29.

Long years of assault by commercial interests upon the self-respect and decorum which belongs to human nature have established advertisement as a thing tolerated because it cannot be got rid of, and what we now see is the apotheosis of the common braggart. The approaching reign of the publicity agent, for whose practices you express such enthusiasm, will mark the apotheosis of untruthfulness.

The daily papers are loaded with puffs and advertisements masquerading as news items.

This is done because someone has paid for it; it is effective only because the public believes in the *bona fide* good faith of the paper, and the man who thus betrays the public's confidence in the integrity of its newspapers is this fellow you applaud because, having noticed that the public believes in the good faith of cinema proprietors, he is laying himself out to betray that confidence too. I do not understand the grounds for your enthusiasm. Is it that you wish ill of the cinema? Or is it that the advertisement trying to pass itself off as an honest attempt to entertain gives you pleasure? If so, your experience is different from mine, and your estimation of your fellow victims of the publicity agent is different also. Where you expect applause I foretell a riot, and it is difficult to understand what good reason there is for you to invite your readers to rejoice in such devices.

H. B. CRESWELL.

[In fairness to the "publicity agent" we must point out that the exhibition of trade films, of which a notice was given in our issue of November 29, was no attempt to deceive or to get the public in to see trade films under the guise of an ordinary performance. It was plainly and straightforwardly advertised as "an exhibition of trade films," and what we meant when we spoke of "concealing the powder of advertisement in the jam of cinema 'interest' films," was merely to say that the advertiser was attempting to make his advertisements more attractive. In other words, the artist is now being allowed to enter—yes, even the office of the publicity agent.—EDS.]

The Exhibition of Contemporary British Architecture

To the Editors of THE ARCHITECTS' JOURNAL.

SIRS,—With a great flourish of trumpets an announcement has been made of an Exhibition of Contemporary British Architecture at the R.I.B.A. I have seen in the technical journals a list of the celebrities who were present at a private view. This is most interesting reading, and doubtless worthy members of our Council were present in force to bask in the sunshine.

Remembering how one was circularized by the present Council, when seeking election, and the "great stand" they made for the younger members, I was astonished to find on visiting the Institute about 6 o'clock on Wednesday evening, with a view to seeing the Exhibition, that the door was closed, I being informed by the commissionaire (still on duty) that the Exhibition closed at 5 o'clock.

Do the Council realize that younger members of the profession have to work during the day? Possibly the Exhibition is not for members of the profession, but, if not, why on earth is it advertised in the technical journals?

At the present time the Council are asking architects to bring before the members of their staff the advantages of working for the Institute examinations, and becoming members.

How "cheap" a chief would look, after having interested his staff, at the following:—

ASSISTANT: "Oh, sir, I went to the Institute last night to see the Exhibition."

CHIEF: "Yes—what did you think of it?"

ASSISTANT: "Well, sir, the Exhibition was closed. I understand that it closes daily at 5 o'clock."

CHIEF: "Oh, I am sorry to hear that, but never mind, Professor ——— is reading a paper next Wednesday evening on 'The Destruction of Timber by White Ants,' which I am sure will be most interesting and better than an exhibition of Contemporary British Architecture."

I am sure that others must feel strongly on this matter. Full reports are published in the technical papers of all papers read at meetings, but an exhibition of drawings can only be seen by a visit, and assistants should not be barred from this pleasure.

DISGUSTED ASSOCIATE.

Some Principles of Architectural Planning

By ARTHUR J. DAVIS, F.R.I.B.A.

IN delivering a lecture on "Some Principles of Architectural Planning," at University College, London, Mr. Arthur J. Davis, F.R.I.B.A., said : In this country planning as an art has been very little appreciated, either by the enlightened public or even by architects themselves, and for ten intelligent persons who understand good detail and fine proportion in an elevation there is hardly one who will realize the value of a well-conceived plan. We cannot be surprised at this when we see that our Royal Academy banishes from the walls of its yearly exhibition all plans and confines itself to the hanging of pretty pictures.

In planning it is variety and the unexpected which appeal, but these qualities must be bound together by an orderly arrangement on sound logical principles.

The requirements of large cities vary from year to year. The enormous and ever-increasing size of our modern towns, the daily ebb and flow of the countless multitudes which inhabit them, the introduction of mechanical transport, and the consequent difficulty of regulating the traffic in the busy hours of the day, have given rise to problems which are almost impossible of solution. Unfortunately we seem to be unable to profit by the experience of our past failures, and it is deplorable to have to record that cities which have expanded to twice their original size in a relatively short period are often controlled by municipalities whose breadth of vision is limited to their tenure of office.

In London it is regrettable to see so many missed opportunities to overcome the awkward conditions with which we now find it so difficult to cope. Do we not hear with unavailing regret that the short-sighted policy (the result of the vested interests of the day) caused the abandonment of Sir Christopher Wren's nobly conceived plan for reconstructing the City after the great fire? With this glaring example of lack of foresight, from which we are still suffering to-day, it might have been hoped that we had learned our lesson, and would not again repeat the errors of the past, and yet the confusion continues.

To give you one example of this lack of vision, do we not see that when our latest building, the London County Hall, is completed, the great opportunity of constructing on the south side of the Thames an embankment similar to that opposite has been missed and only a narrow footway for pedestrians provided?

Without unduly labouring the point I will refer to the recent illustrations in the Press showing the proposed reconstruction of the Bank of England and some of the neighbouring properties. In view of the alarming congestion which occurs daily in one of the most crowded centres in the world, it would seem obvious that the foremost consideration would be to take advantage of replanning schemes in order to widen the thoroughfares which converge to that spot. Yet we see that the controversy only touches on the best way of erecting a new bank with the retention of Sir John Soane's original elevations.

The totally revised planning of the whole neighbourhood has never apparently even been contemplated. The Bank of England being a low building, as are many of its neighbours, it follows that if these are replaced by higher structures housing a far greater population than at present, the already too congested streets will soon become absolutely impassable. Surely the first duty of the controlling authorities should be to say to the owners of these properties : "You shall not be allowed to increase the height of any of your buildings unless you give up to the public a proportionate area on plan."

Dealing with planning generally Mr. Davis said : In my opinion, all the public buildings of a city should be erected in prominent positions, and should be so designed as to clearly denote their purpose to the passer-by, whereas a private dwelling should be more remote in its situation and make no attempt to attract undue attention. This principle applies as much to the sites to be chosen as to their individual treatment.

A stranger walking through a city should be attracted by the harmonious grouping and setting of its public monuments. He should be able to discern at the glance which is the cathedral, the town hall, the museum, or the opera house. Each of these edifices should bear its special character, and leave the observer in no doubt as to its destination. On entering he should find the special department he proposes to visit without the slightest hesitation. Simplicity and directness of approach are essential, and these combined with a certain grandeur and architectural magnificence are the chief characteristics which should adorn every successful public building. These qualities are entirely independent of style and period.

To all the inhabitants of the city the part ownership of these fine monuments should be a source of pride and gratification. In their treatment there is no necessity for modesty or concealment, and both outwardly and internally they should bear the mark of the wealth and taste of the cities which they embellish.

The characteristics of the domestic dwelling are diametrically opposed to this point of view. The home of a private individual should be kept screened from the curiosity of the passer-by. The moment the owner passes the boundaries of his property he would naturally desire to avoid the obtrusion of inquiring neighbours and the inquisitive gaze of strangers. Thus we see in every country that in all fine periods of architecture the typical private house is surrounded by fences and protective walls. The important rooms overlook enclosed gardens or are planned around an atrium or inner court. Invariably the desire seems to be to avoid attracting undue attention. A fine doorway porch or entrance gate alone would suggest to the wayfarer the importance of the dwelling. We see this idea applied equally to the early Greek and Roman town houses as to the Moorish Kasbah or the Florentine palace of the Renaissance. Whether these living apartments surround an atrium, a patio, or a *cour d'honneur*, the principle is the same.

It is frequently asked : "Why are buildings so often laid out in formal and axial compositions regardless of their practical requirements?" There is no doubt that, having taken into consideration the situation, levels and approaches whenever a symmetrical treatment is possible a more regular and dignified result is obtained. I think that the human mind, from natural reasons, instinctively turns to an orderly and balanced composition.

The criterion of a good plan is the ease with which it can be deciphered without the necessity of its various parts being labelled or marked by titles or sub-titles It should clearly show the type of construction the author has chosen to adopt New portions should be distinguishable from the old, and each individual floor should bear its special characteristic.

The good architect will always design in three dimensions. When working out his plans he will consider the elevations and sections which complete them, and at the same time study the constructional and engineering questions which are inseparable from their conception. He will endeavour to design in space, and I assure you that the power of composing in this manner is much more difficult than it would at first appear.

Simplicity and directness are essentials of good planning. A sense of proportion, accompanied by some skill in the handling of the curved and straight lines, the contrast between thick walls and light partitions, the correct delineation of courts and areas, the indication of vaults, columns, and staircases, produce a result which has a charm and harmony of its own.

Architecture to be effective should be treated broadly and simply. The onlooker, whether in a city, a garden, or a building, should never be allowed to feel confused or bored.

Architecturally for every site, whatever may be the area and surrounding conditions, there is but one ideal planning solution; there may be sometimes an alternative, but there are seldom three equally good schemes to a given site. A thorough comprehension of the programme is half the battle. The most difficult thing in the process of planning is to become thoroughly acquainted with all the aspects of the problem with which we are confronted. Logic and sincerity are the two all-important qualities we must apply if we wish our plans to reflect our individual interpretation of what is fundamentally true in the aims and requirements of our age.

Prize Distribution at the R.A. Schools

HE annual distribution of prizes of the Royal Academy Schools took place on Saturday evening last. Aston Webb, P.R.A., presented the es in the presence of a distinhed gathering of members of the al Academy.

Aston Webb said that the outstandfeature of this year's award of prizes that the ladies had nearly swept the d. He congratulated them on this but warned the students that this of thing must not be carried too far. sense the Academy itself had set an example in electing a lady to its s, but they—the Academy—had no ntion of allowing the ladies to carry efore them. He said that those walls ed that they had done much work the last distribution of prizes, espe- when one realized that it was a tion only of what they had done, and some of the students had been end on decorative work for the London ty Council. He thought that it was general opinion of those who had nined the work that the studies from life were many of them good, but he d warn them against drawing frag-

The studies of drapery were also good, though these were not, perhaps, quite up to the level of last year. The drawings from the antique showed study and careful drawing. He went on: "The foundation of your art is, of course, drawing; and when you come to paint it is inevitable that while you are overcoming the difficulties of tone and colour, construction and form are to some extent disregarded, but be very careful that this is not due to discouragement or laziness. Keep alert and you will find that a constant care for proportion is an assistant to truth in colour and tone.

"In landscape painting and composition you have still much to learn. Composition is, perhaps, the study which requires the most extensive knowledge and skill, and it is not surprising, therefore, to find that here you have also much to learn in the arriving at the right scale, then proportion, form, and colour in which to depict your subject; but as this is the most difficult of all to learn, so it is also the most important, for without it other qualities, beautiful in themselves, would be entirely thrown away. There is a general opinion, I think, that though the sculpture is small in quantity it is high in quality. This is satisfactory, for sculpture is a monumental and permanent art which cannot be set aside or ignored when once it has been set up in our towns or villages, but remains as an adornment, or the reverse, for generations to come."

Sir Aston Webb referred to the loss of one of their most distinguished members, a distinguished architect, and a great friend—Sir Ernest George.

The architecture makes a good show when it is remembered that it is only an evening school and the students work there after a long day in the office.

The designs for a memorial chapel are good, though the author of one (the prize-winner) appears to have a difficulty in deciding whether he intended to crown his building with a dome or a tower.

There is only one measured drawing of old work which is good, but we should like to see more. There is almost yearly an opinion expressed that painters and sculptors would benefit by a time spent in the architectural school. I think there can be no doubt that this is so, and also that architects should spend some time with the sculptors.

R.I.B.A. Visit to Marble Works

NE might suppose that the architect should be very well acquainted with all the multifarious arts and rials he brings together to form a ing; that, in fact, he should know at deal of their technique, in the of arts and crafts, and a great deal e processes of manufacture in the f materials. And so he should; only, tunately, the architect does not long enough. If he was given, by divine dispensation, three times the al period of man on this earth (and stly deserves it), then he might to that state of encyclopædic know- to which he is ever striving.

ods are among the things of which rchitect would know more, and so is le, for marble is such an essential ing material. Yet there are a hundred ent varieties, each different in colour, re, and adaptability in working.

visit of the R.I.B.A. on Saturday o the marble works of Messrs. Farnd Brindley, Ltd., was particularly sting. There were a fair number of ers present, and the party was cond through the works by Mr. Brindley. was first of all impressed by the lerable size of the works, the large er of men employed, and the extent ariation of the work undertaken by m.

instance, we were shown a com- slab of pure crystal silica made up small pieces of crystal, each piece hing in the nature of a rarity gar- from the corners of the earth.

veneering of a surface in lapis is interesting. Lapis lazuli, it rs, is found in comparatively small which are cut up into thin slices; ices are placed side by side on a e, and then set in a matrix to form ogeneous whole.

The firm are busy on a good deal of the interior and decorative work of Liverpool Cathedral. Most of what we saw were delicately carved details in Hoptonwood stone, with bases and heavier detail in Derbyshire fossil.

It happens, as we learned afterwards, that the stone we thought Hoptonwood is not strictly so. It is the same as Hoptonwood in colour and texture, but apparently there are minor differences in that it does not come from the same quarry. We were shown a bewildering number of different kinds of marble and stones—one had no idea that there were so many in this world—from the different kinds of granite to the semi-precious stones like labradorite, and rare marbles like Spanish red.

The particular possessions of the firm are verte antique, a green marble, of which we saw a good deal in various stages of working, and cipollino. Both these marbles come from Greece, where the firm have done so much in re-discovering the ancient quarries and in working them again. We were shown an altar in alabaster, made to the designs of Mr. Paul Waterhouse, and an interesting font in Spanish red cunningly inlaid with verte antique, by the same designer, and both for a church at St. Andrews, Scotland.

There was a wall memorial framed in St. Ambrogio red verona — a beautiful marble of rich brown-red colour and of fine dappled patterning. There were many kinds of marble besides such materials as porphyry, which, by the way, appears to be native to Egypt; there being no real porphyry in this country.

The machinery in use was, perhaps, the most interesting part of the visit. There was a machine for cutting mouldings in marble by means of a carborundum grinding stone grinding on to the marble slab which moves slowly along on a moving table. These carborundum grindstones work at a very high velocity, and the frictional action on the stone sets up great heat, which is counteracted by a continuous squirt of water on the point of grinding. The carborundum stones are used in many sizes and degrees of fineness, so that all shapes of mouldings may be cut.

The cutting machines in use are weighted frames containing steel blades which work backwards and forwards horizontally on to the marble blocks, while water and sand are sprayed on to cuttings throughout the whole operation. We were told that a block of marble about 2 ft. thick takes many days to cut through. This is the general way of cutting marble. A quicker way for use when a certain piece of marble is required at short notice is by means of a carborundum cutting stone, which looks and acts just like a circular saw only that the slab of marble is fixed on a mechanical slow-moving table.

We also saw the large polishing machine at work. The unpolished marble is placed on a great steel table and a thing like an enormous flat hand with arm attached slides over the surface with an action not unlike that of a person wiping a marble table-top, but magnified considerably. The surface is first polished with sand, then emery powder, and finished with putty powder.

A visit to a museum of specimens and casts of memorials and statuary completed the visit.

Messrs. Farmer and Brindley are to be congratulated on the scope and conduct of their business, and to be thanked for their hospitality so extended to the profession.

F. E. T.

The Week's News

Thirsk New Church House.

£1,360 has been raised towards the building fund of the new church house.

Road Work at Hendon.

At a cost of £30,000 Station Road, Hendon, is to be reconstructed.

Concrete Roads.

Roads of concrete instead of macadam are suggested as a means for reviving the Kentish cement industry.

Housing at Slough.

Slough has 224 Council houses occupied under a scheme for 242. There are still cases of overcrowding in the town.

Chesterfield's Crooked Spire.

The famous crooked spire of Chesterfield parish church threatens to fall unless soon strengthened.

Bideford Bridge.

Bideford Bridge, Devon, built by monks in the fourteenth century, is in danger of collapse.

Housing at Hanwell.

Hanwell Council, who are building about fifty houses, are urging the Ministry to allow them to build 500 more under a subsidized scheme to meet the demand.

More Houses for Hampstead and Hendon.

In preparation for the extension of the Hampstead tube, hundreds of houses are being built at Golders Green, Hendon, and Mill Hill.

New Church for Harrogate.

A new church in the Renaissance style and faced with stone is to be built by the Harrogate First Church of Christ Scientists.

New Bridge for Boothferry.

It is proposed to build a bridge over the river Ouse at Boothferry. The Ministry of Transport are being approached for a grant towards the cost.

More Houses for Selby.

The Selby Urban District Council have accepted tenders for the erection of thirteen additional working-class houses at £363 10s. per house.

N.E.R. Cottage Homes.

Cottages are to be built at Hull, Shildon, Selby, Tyne Dock, Acomb, Knaresborough, Hexham, and Scarborough. The last three have not yet been submitted to tender.

Norton Electric Power Station.

Plans have been passed for a new electric power station to be erected by the Cleveland and South Durham Electric Supply Company, Limited, in a field on the south side of the river Derwent.

Stowe School.

Mr. Clough Williams-Ellis has been appointed architect to the Stowe School Governing Body, which includes Lord Gisborough (chairman), Field-Marshal Sir William Robertson, and Dr. David (late headmaster of Rugby), the Bishop of Ipswich. A committee of ladies that includes Mrs. C. S. Peel, the domestic economy expert, is co-operating with the architect in the equipment of the kitchen and offices.

£5,000 Gift for Housing Scheme.

At a meeting of the Liverpool City Council it was announced that an anonymous gift of £5,000 to be used in furthering the work of the Housing Committee had been received.

More Houses for Wortley.

The Wortley (Yorks) Rural District Council are to build thirty additional houses of the class A non-parlour type. Tenders that have been accepted show an average cost of house to be £330.

Broadstairs Pavilion.

In mentioning the proposed pavilion and dance hall at Broadstairs it was stated that the plans had been drawn by Mr. George Graham Tucker, whereas the architects for this building are Mr. Cecil Massey and Mr. Tucker.

Thames Embankment Extension.

The Improvements Committee of the L.C.C. recommend that the embankment which extends from Victoria Tower Gardens to Lambeth Bridge should be joined to the existing embankment in Grosvenor Road at an estimated cost of £160,000.

Widening the Strand.

An important Strand improvement scheme to be carried out by the L.C.C. has been approved by the Westminster City Council. It is intended to widen the stretch between Adam Street and Durham House Street, in connection with the new building which is being erected on the old Tivoli site.

£50,000 Wanted for St. Paul's.

Canon Alexander, treasurer of St. Paul's, announces that the St. Paul's restoration fund has not yet been completed. Rather more than £100,000 has been received since the work began in 1912; but less than half the present appeal for £100,000 has been subscribed.

Giant Dock "Dolphins."

Four gigantic "tables" of reinforced concrete, each with ninety-four legs, are to be constructed in Southampton Harbour for the mooring of the world's largest floating dock, now being built on Tyneside, for the London and South-Western Railway Company, at a cost of about £1,000,000.

£1,000,000 Masonic Temple.

A million pound Masonic peace memorial temple is to be founded on the site in Great Queen Street, which has been the home of the craft for more than a century and a half.

Architects' Fees for State-aided Housing Schemes.

The Ministry of Health and the tribunal appointed by the R.I.B.A. are anxious to obtain a settlement of all claims for architects' fees in connection with State-aided Housing Schemes without further delay. Architects who still desire the assistance of the tribunal are therefore requested to apply to the secretary of the R.I.B.A. on or before December 31, 1922. The tribunal cannot undertake to deal with cases submitted to them after this date.

A Brick from Nineveh.

A Babylonian brick from the ruins of Nineveh, bearing the stamp of Nebuchadnezzar, date 605 B.C., is one of the items to be included in the sale by Mes
Knight, Frank, and Rutley at "
Nash," near Worcester, which commen
yesterday. Before the war the Gern
excavations on the site of Baby
city itself led to the discovery t
every brick examined bore the name
the monarch in whose reign it had b
made.

The Architectural Association's Conversazione.

The annual conversazione of the Ar
tectural Association was held at t
headquarters in Bedford Square
Tuesday evening last week, the gu
being received by the president,
Stanley Hamp, F.R.I.B.A., and M
Hamp. An exhibition of the late C
Brewer's drawings, together with exh
tions of photographs and sketches m
by A.A. members on their recent exc
sion to Holland, and students' work, w
among the attractions of the even
A good musical programme was gi
by the Keith Prowse orchestra, and
dance, arranged by the Lyric Club,
held after supper.

Waygood-Otis Club

Nineteenth Annual Dinn

At the London Tavern, Fenchu
Street, the nineteenth annual dinner
the Waygood-Otis Club took pl
recently under the chairmanship
the president, Mr. H. C. Walker, man
ing director of the Waygood-Otis Co
pany. Among other directors pres
were Messrs. H. Harmsworth, C. H.
Day, R. H. Thorpe, and C. Clarke, w
the guests included Messrs. J. D. Gilb
M.P., Mortimer Lancaster, H. J. Mitch
and H. Cattanio.

At the conclusion of the repast
chairman proposed the toast of "
King," and then proceeded to give t
of the "Waygood-Otis Club and Officia
In the course of his remarks Mr. Wal
mentioned the gratifying fact that
club now consisted of 700 members,
referred to the devoted work of its
cials, who had, one and all, contribu
to its success by their self-sacrific
labours. It was, he went on to obse
the function of the sporting and so
fixtures of the club to bring all who
longed to it into closer comradeship
fellow workers for a common end.

The chairman, having presented
prizes won by members of the Cric
and Cycling sections, Messrs. J. E. Pl
ridge and W. E. Hopkins, responded
the toast, and reviewed in detail the cl
activities during the year.

Mr. C. Clarke (director) in the cou
of his reply to Mr. A. Nunn, who offe
the toast of "Waygood-Otis, Lt
alluded to the interest the company
always taken in the personal welfare
the employees, and expressed the v
that the spirit of loyalty to one's sid
so necessary in sporting contests—had
counterpart in the attitude of the
ployees to the firm. In each there
the same impulse on the individual's p
to strain every nerve to win success
his side, and this was team work at
very best.

The speeches were interspersed w
musical items and recitations, wh
received a full measure of apprecia
from those present.

The Annual Prize Distribution at Cardiff

THE annual prize distribution and exhibition of designs and measured drawings has been held in the Assem- Hall of the Technical College, Cardiff. out 100 Fellows, Associates, and Stu- its of the South Wales Institute of chitects, Central (Cardiff) Branch, and ir friends, were present. The chair was en by Mr. E. C. M. Willmott, R.I.B.A., chairman of the Cardiff anch, who was the first lecturer on chitectural Design in the Technical lege.

Principal Charles Coles spoke of the ly days of the Technical College, and ntioned that among its old students e the President of the South Wales titute, Mr. Percy Thomas, O.B.E., R.I.B.A., and his partner, Mr. Ivor ies, A.R.I.B.A., who designed the sent Technical College as a result of an n competition, and Mr. Turner, who lt the college.

Ir. Percy Thomas, who spoke with husiasm of the work of the Cardiff ool of Architecture, with which he ps in close touch, awarded the prizes the successful students, the prize- ners being as follows :—

telier.—First prize, Colin Jones; ond prize (equal), C. F. Bates, L. S. tchard.

Day School: Design.—First Prize, Monroe; second prize, B. Thomas.

Measured Drawings.—First Prize, L. Monroe; second prize, J. B. Wride.

Mr. W. S. Purchon, the Head of the Department of Architecture in the Technical College, explained that while the meeting was one of the South Wales Institute, the school and the Institute were so closely allied, and the students of the school having won all the prizes offered, it was difficult to differentiate it from a prize distribution for the school. He then gave a brief address on the work of the School of Architecture, pointing out that much of the credit for the work of the school was due to the ability and energy of his assistant, Mr. Winder, M.A., A.R.I.B.A., and that a modern school of architecture was far from being a one-man affair, the Cardiff School owing much to members of the staffs of the School of Art, and of the Engineering, Mathematics, and Chemistry Departments. The speaker announced that during the session the recognition of the school by the R.I.B.A. had been confirmed after an inspection by visitors from the Board of Architectural Education.

The R.I.B.A. Jarvis travelling student, Mr. Eric Page, who in the previous summer had done such excellent work with Mr. Biss in Italy, had spent part of the summer of 1922 with Mr. V. L. Nash, studying in the neighbourhood of Paris.

All the full-time ex-Service students who had recently left the school after their two and a half years' period of study had obtained suitable appointments. Several of the students had obtained the Associateship of the R.I.B.A.

Messrs. Colin Jones and C. F. Bates—members of the atelier—won the Newport (Mon.) War Memorial Competition.

In concluding his address Mr. Purchon pointed out that architectural education for the public was an important part of the work of a school of architecture, and expressed the willingness of the Cardiff School of Architecture to co-operate with the local secondary and high schools in an attempt to stimulate the interest taken by young students in this great art. He also drew attention to the important work done by modern schools of architecture in assisting architecture to settle down after the divided councils of the last century, and the value of these schools in forming real schools of architectural thought in which groups of enthusiasts were working together towards definite ideals.

A vote of thanks to Mr. Percy Thomas and to Mr. Purchon was proposed by Principal Coles and seconded by Mr. Turner, after which the meeting adjourned for refreshments and the inspection of the work of the students.

Parliamentary Notes

BY OUR SPECIAL REPRESENTATIVE.

The Cost of Housing.

ir Montague Barlow, the Minister of our, informed Mr. T. Thomson that whole question of housing policy was iving the careful attention of the ister of Health.

nswering a question from Mr. Thom- Sir M. Barlow said that according to eturn which had recently been fur- ied by local authorities who were ying out housing schemes, the average n expenditure on houses for which tracts had been made would work out approximately £1,090 a house. The l settlement of costs which had been le to date related only to small emes, covering only 11,000 houses. The rage cost of building in those cases, usive of land development, profes- al fees and expenses, worked out at 3 a house.

Slum Clearance.

ajor Boyd-Carpenter, Parliamentary retary to the Ministry of Labour, rmed Sir A. Holbrook that it was nated that the commitments under late Government's assisted housing emes, including slum clearances, would ount to £9,900,000 per annum, of ch £9,100,000 per annum would be ne by the Exchequer.

The Lake in St. James's Park.

r J. Baird, First Commissioner of ks, informed Sir H. Brittain that only remaining building in St. James's k had been handed over to the Dis- l Board, who were now obtaining ers for its demolition. The question of the refilling of the lake was under serious consideration, and he hoped that it would be filled by the early summer.

Housing Progress.

An important statement with regard to the Government's housing policy was made by Mr. Inskip, the Solicitor-General. After reviewing the late Government's scheme, the right hon. gentleman said that its result had been to provide, at enormous cost, just over 215,000 houses, which, with another 3,000 dwellings that had been provided by the conversion of huts and hostels, would make something like 220,000 dwellings. At present, 188,000 houses had actually been completed, or had been completed on November 1. Of the 176,000 houses to which the local authority and public utility schemes were limited, 11,000 had not yet been begun, and work was proceeding on 118,000, so that there were something over 30,000 houses on which work still remained to be done. As to the future, the Government could not adopt the Labour party's plan of the erection of national factories for the manufacture of material. The only statement which the Government could make at present was that houses could, in their opinion, be more advantageously provided by those whose business it was to build houses than by the State. The Government was most anxious that private enterprise, which, when all was said and done, had provided large numbers of houses in the past, should be encouraged to develop its great resources. The Government would consider whether any action on their part, including possibly the extension of existing provisions under which private builders could borrow money at reasonable rates, would assist in that direction.

There were already signs of a revival in private enterprise in building. Local authorities were showing a readiness to undertake building without State aid. Thirty-five local authorities had already undertaken to build houses without State assistance, and another sixty were considering proceeding on those lines. But the continuation of the present system, under which the liability of the local authorities was fixed at a penny rate while the Government contribution was unlimited, could not be contemplated. It had already involved the State in a charge of £9,000,000 a year, extending over a period of sixty years. Whether any scheme under which the Government was to provide financial assistance would offer better hope still remained for consideration. Present-day tenders had begun to approach an economic level.

With regard to slum areas, the desire of the present Government was to carry out and extend the policy of the late Minister of Health, which was to assist local authorities in providing the clearing houses into which to put the population. The Government had undertaken to provide a sum which at present was not to exceed £200,000 yearly towards the deficiencies of local authorities in slum areas. He hoped that, with the co-operation of all parties, life in our great cities might, in a short space of time, be lived under happier conditions.

At question time Major Boyd-Carpenter,

Parliamentary Secretary to the Ministry of Labour, informed Mr. Collison that local authorities had in several cases taken over land acquired under the Assisted Housing Scheme for building purposes at the present market value, and such land had also been disposed of on similar terms to private persons undertaking building.

Replying to Sir Walter de Frece, Major Boyd-Carpenter said that since August applications for housing subsidies had been received from some 170 local authorities. These applications had been reviewed in relation to the urgency of the need, special consideration being given to the populous urban centres where skilled labour was available, and to the number of houses already authorized or in hand; and in fifty-two cases local authorities had been authorized to proceed with further houses within the limits laid down for the assisted scheme. Some twenty other authorities had decided to build without subsidy.

In answer to Mr. D. Somerville, Major Boyd-Carpenter said that of the 176,000 houses to which the original housing scheme was limited, 175,400 had been definitely allocated, and 546 provisionally allocated. In addition, 39,145 houses had been provided with the aid of the private builders' subsidy. On November 1 last, 145,771 houses had been completed, and he was not aware at present of any general avoidable delay in the completion of houses for which contracts had been let. The lowest price for a house complete with drains, paths, fences, and g and hot water installations was £297 1 He had no reason to believe that the co of building would not continue to fall.

Major Boyd-Carpenter informed M T. Thomson that 145,771 houses had be completed by local authorities and pub utility societies on November 1, a 39,145 houses had been completed at th date by private builders under t Housing (Additional Powers) Act, 191 making a total of 184,916 houses co pleted. In addition, 3,056 dwellings h been provided by the conversion of hu and hostels. Some 30,229 houses mained to be completed and of the 18,847 were in course of construction November 1 by local authorities and pu lic utility societies.

Regional Planning

A MOST interesting lecture has been given by Professor P. Abercrombie to the Liverpool Architectural Society on the subject of regional planning. The term, he said, was intended to signify something more than the need that had always been felt, and had always been largely exercised in the past, for a single town to obtain control of developments which, though outside its jurisdiction, were manifestly merely offshoots of its own growth. The scheme was concerned with the development of a wide area in which there might be, and probably were, one or more dominating centres; at the same time the interests of the lesser authorities were concerned. Thus in Massachusetts there was the city of Boston, though no one would suggest that the rest of the State was a suburban development of Boston. In one respect the Boston and regional scheme did not carry out the exact programme which was meant to-day by regional development, for it would appear to have proceeded by means of individual aspects rather than by a treatment of the whole. That was, perhaps, inevitable in pioneer work, but what was of absorbing interest to us in this country was that in that district they had succeeded in carrying out one of those aspects, namely, the famous park system. It was natural in America, where so much attention was given to recreation, that that should be the first aspect to be dealt with, but apart from that one felt that in many ways recreation and open spaces were ideal subjects for proving the need of regional action. They had to take what was left unspoiled of Nature's gifts in the matter of open spaces.

And these do not always exactly coincide with the artificial boundaries or human developments which have led to the need for parks. It is quite possible, of course, and it is frequently done, for a local authority to purchase parks outside its area, but when this is done there is a certain feeling that the open space is going to be used by people who have not paid for it, and the only satisfactory solution is joint action and joint financial responsibility. Here, then, is the keynote of regional planning, and the whole business sooner or later will resolve itself into a question as to who is to pay for the objects aimed at, and as the park system of Boston gives us a system of assessment and joint usage and completely successful operation, I suggest that all those who are interested in carrying regional suggestions into execution should make a thorough study of this pioneer scheme by which parks to the extent of 15,000 acres, with 25 miles of parkway, are maintained by some thirty-eight local authorities.

Of a later date than their park system was the homestead commission, started in 1913, originally for housing purposes, but, as has happened with housing organizations elsewhere, it was soon found that town planning is necessary to precede housing, and accordingly the homestead commission has been merged into a co-ordinating body which is charged with the setting up of local planning boards throughout the metropolitan district, and apparently by means of actual conferences this central board intends to co-ordinate the work of the separate local boards. It will be interesting to watch the result of these annual conferences, and to see whether a regional plan will be evolved carrying the scope of the regional park system into all aspects of city development. In this country we have certainly been less advanced, and having pushed ahead with fair success the preparation of town-planning schemes there has been the danger, as has been pointed out by one or two thoughtful critics, of our perpetuating on a large scale some of the errors of the estate development of the nineteenth century, in which schemes, which may be good in themselves, have not been sufficiently wide in their outlook to meet neighbouring needs. It was Professor Geddes who by directing attention to careful study of a population map urged that in very large parts of this country it would be disastrous for any town to think it possible to look after its own affairs without considering the needs of its neighbours.

Not only are there these existing groups of towns and urban communities corresponding in each case, except the metropolitan one, with well-worked coalfields, but there are the new rising districts in which it is possible to attempt some avoidance of the drawbacks which are almost ineradicable in the older regions. If we have any faith in the future of our country we must at any rate see that these coming districts have prepared for themselves a definite plan of growth so that the most efficient use may be made of their natural possibiliti With the older districts we have walk more warily, and the first region be considered was perhaps the m difficult physically and administrative With the South Wales coalfield it w thought necessary to set up a commissi and take evidence from all sections of t community as to the necessity for gional action, for this at once brought the fore the boundary question. If t increase in population were to be hous under reasonable conditions it was nec sary to go outside the congested valle into the agricultural plain adjacent— half-hour's journey farther from work and in other local authorities' area The commission's report (mutilat though it was in publication) is, neve theless, the "case for regional planning as Mr. Aldridge's book is for town pla ning. Once for all, backed by all t evidence of mine-owners, workers, lo authorities, and others, is the need f joint action definitely demonstrated. T South Wales report was not really regional survey (though so-called), a much less a regional plan, but a p liminary study and proof of the need o regional planning, and it is well wor reading as a text-book as to what regio planning means and what a regional pl should contain.

Turning to regional survey proper was obvious that a different method approach was necessary in different d tricts—where less development had tak place greater freedom of action and su gestion was possible. Thus at Doncast with large tracts of land debarred fr housing, it was necessary to indica clearly-defined centres in which reside tial development could take place, a should be encouraged in order to provi workpeople for the factories whi would be located on the low-lying groun The collieries, at present situated at average of about three or four mil apart, themselves promoted the growth separate village communities. The resu instead of a single homogeneous town the size of Sheffield or Leeds, should a series of communities complete as their civic functions, but of a size limit in most cases to 20,000 inhabitan separated by farmland or park strips, b all communicating directly with Do caster as their natural metropolis f trade, culture, or recreation.

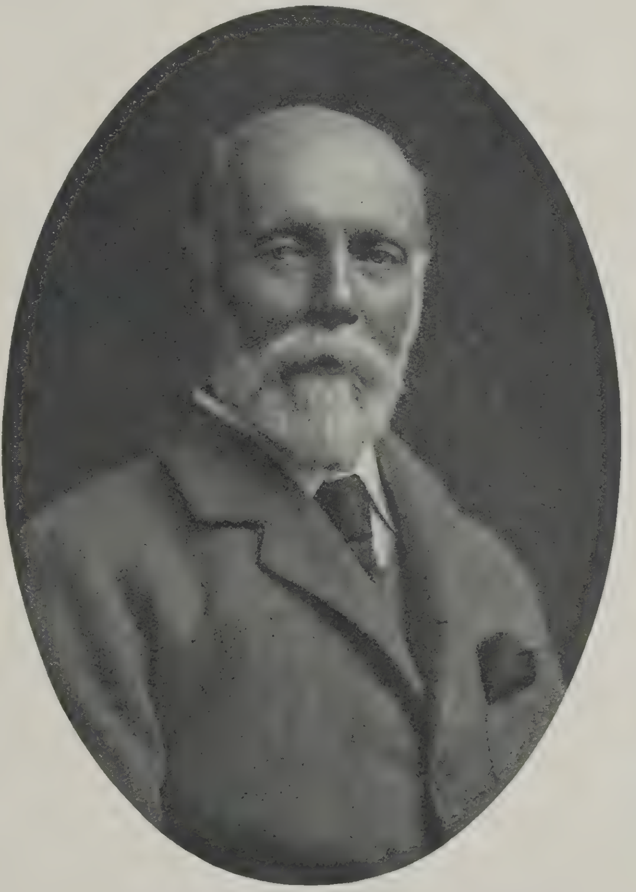
The Late Sir Ernest George: An Appreciation

MORE than thirty years, alas ! have elapsed since the writer of this notice came under the influence of Ernest George. The recollection is still vivid. An experience which brought one r some years into daily contact with a brilliant, kindly, id sympathetic artist must indeed be unforgettable. hat it has proved of lasting and inestimable benefit need ardly be stated.

To have worked in the atmosphere created by such a an was both stimulating id inspiring. Mundane conderations, which so often harss the conceptions, seemed most absent. A consistent ream of important and, in ct, imposing commissions ien flowed through the office, id the serenity which preiled was rarely disturbed by imptuary distractions. In genial and luxuriant an ivironment architecture was eshly realized and thoroughly ijoyed. Ernest George's conptions were delightful. Their mple directness made them isy to construct and kept iem free from the complitions which always are the ncomitant of an involved heme.

His designs were representive of the romantic outlook hich prevailed amongst the ading artists of his time—at is, they were identified ith the reaction which led the abandonment of either stale and threadbare classic of a blatant utilitarianism hich seemed the alternative. hen much of the energy the civilized world was conntrated upon mechanical ursuits, progress, to most inds, seemed wholly dependent upon such development. vidence of this blight still persists; witness the many ude railway embankments, bridges, viaducts, and the conries of dreadful houses which have disfigured our streets id destroyed the environment of so many great towns.

It was of great importance that even a limited number men maintained their sanity and a happier outlook; ithout them all respect for beauty would have been swept ray, and a vile torrent of materialism would have left the orld in a state of drab and banal ugliness.



THE LATE SIR ERNEST GEORGE, R.A., PP.R.I.B.A.

Though influenced by the mediæval revival, few of Ernest George's actual buildings are Gothic in character or design. The freshness of various phases of the earlier Renaissance appealed more strongly to a brilliant brain fertilized and stimulated by travel and the swift impressions thus received. A client's instructions seemed to electrify the wide knowledge he had acquired. The drawings which ensued literally poured from his ardent brain like an incandescent stream, and crystallized in the picturesque and harmonious compositions so familiar to all who are interested in his work. Little correction of his first sketches followed or was necessary. So highly developed a sense of beauty as was his made ugliness of form impossible, and it was this endowment that so distinguished his creations and impressed itself upon all he did.

Ernest George's powers of representation were exactly fitted to his active mind. He drew with astonishing rapidity. With him, pencil, pen, or brush were equally happy media for the expression of his ideas, and everyone at home or abroad who has ever seen him sketch continued to wonder at his facility. In writing and draughtsmanship his ideas were distinctive and individual. But although the aura is too subtle to be estimated in terms of recollection, its enduring effect is seen in much of the best of our contemporary architecture.

Edwin Lutyens, Herbert Baker, Guy Dawber, and the late Dan Gibson are but some of the well-known architects whose work is founded upon the training received and the mental knowledge imbibed whilst in his office. That so modest, so retiring, so sensitive a nature could exert such consummate influence is ample testimony to Ernest George's outstanding abilities, and proves that the standard he set and consistently maintained has been of very potent value to our times, as those who were fortunate enough to have served under him now more fully realize.

H. H. WIGGLESWORTH.

Notes and Comments

Waterways and Warehouses

Colonel Frank Rayner, D.S.O., engineer and general manager of the Trent Navigation Company, did well to call attention, in a paper read at Manchester before the North-Western Section of the Institute of Transport, to the national need to develop the waterway system of England. Hitherto the attempts at such development have been piecemeal and unconcerted—the waterways have not been town-planned, so to speak. For traction, Colonel Rayner suggested trains of non-selfpropelled boats, with tugs driven by internal-combustion engines. A fleet of tugs should run regularly to scheduled times, and should tow at fixed charges. A corollary of this sensible proposition is that depôts with wharfage, warehouse, and other station accommodation shall be provided at suitable points. Not only, therefore, will the systematized waterways afford greatly increased facilities for carrying—at cheaper rates, no doubt, than the railways charge—heavy building materials, for instance; but the design and construction of waterside warehouses and wharves will be considerably modified, and such buildings will, it must be supposed, not only alter in type but increase in numbers. We suggest that Colonel Rayner's admirable paper should be printed, and circulated as widely as possible among the general trading community, on whose interests it would certainly exercise a beneficial influence.

Whitgift Hospital: Testing the Taste of the New Parliament

Once again the R.I.B.A. has demonstrated its concern for the preservation of a venerable building. On clear realization that Croydon Borough Council really meant to petition Parliament for sanction to get rid of the Whitgift Hospital, the R.I.B.A. summoned a conference comprising representatives of the Whitgift Hospital Preservation Committee, the Society for the Protection of Ancient Buildings, the Town-Planning Institute, the London Society, the Town-Planning Committee of the R.I.B.A., the National Trust, the London Survey Committee, the Surrey Archæological Society, and, of course, the Institute itself. The conference considers that the demolition of the hospital is unnecessary for the street-widening which the Croydon Council demand so obstinately. The uncommonly ugly modern buildings on the opposite side of the road could well be spared, and their removal would provide all the space required. The irony of the situation is that these unlovely buildings actually originated the trouble. They are mushroom encroachments and excrescences on the area to which the beautiful old almshouses stand central, and the remedy now sought by the vandals is to remove, not the intruders, but the almshouses! Aided by the influential opinion of the R.I.B.A. conference, Parliament should have no difficulty about making up its mind instantly to throw out with every circumstance of ignominy the Bill which the Croydon Borough Council are so imprudently promoting. Croydon Council in passing, by forty-seven votes against six, on November 27 its degrading resolution to ask Parliament to sanction the removal of the only building in the town that has any claim to veneration, has excited the derision of the entire art-loving community. The Bill on which it is wasting the ratepayers' money will serve as an "acid test" of whether or not the new Parliament is sound on questions of amenity and good sense, and we sincerely hope and trust that his Majesty's Lords and Commons will emerge triumphant from the ordeal by taste. Many voices are heard in the Whitgift Hospital case. Those favouring the retenti of the hospital are for the moment in the ascendant. Alde man Howard Houlder, chairman of the Whitgift Found tion, maintains that the decision of the council to prese a Bill for the removal of the hospital "must by no means accepted as reflecting the views of the town as a whole A poll of the borough will almost certainly be held, ar Alderman Houlder confidently asserts that "there is a ver important mass of opinion which is strongly opposed the street-widening, which, if carried out in accordan with the statutory powers asked for in the resolution of th town council, would involve the demolition of the hospital. Alderman Houlder refers to a matter that certainly, as h says, should not be overlooked. If, he urges, the preserv tion of the venerable building is a matter of national co cern, the nation should certainly share any additional co that may be involved in adopting an alternative schem Mr. G. Lacy Hillier, who obviously speaks with hig authority on road lay-outs, maintains that as the new reli road from Thornton Heath to Purley will, when finishe divert from the Croydon High Street a very large propo tion of the through traffic, "this should alone provide sufficient reason for leaving Archbishop Whitgift's Hospit undisturbed." There are, of course, some who favour M Milnes Emerson's proposal, contributed to our pages a fe weeks ago, to shift the hospital bodily, and a firm of co sulting engineers write to say that they foresee no difficu ties whatever in carrying out this scheme. They estimat that the actual cost of moving the building some 40 ft. in north-easterly direction would not exceed £25,000, and the suppose that the cost of acquiring the property at the re of the hospital would be small compared with the cost acquiring its present site. All the same, we trust that th Croydon Bill will be thrown out. With respect to Alderma Houlder's anticipation of the satisfactory result of a town poll we are less sanguine than we are that the nation will or day awaken to a keener sense of its responsibilities for th preservation of buildings of national importance, and for th formation and maintenance of roads that, being use nationally, should not be allowed to constitute a heavy loc burden.

"The Housing and Town-Planning Record

The publication of a fortnightly record, issued b the National Housing and Town Planning Council, of whic body Mr. R. Aldridge is the well-known secretary, resumed after a suspension of a few months, the preser issue being devoted to a review of the progress made i the housing and town-planning movement during the pa five months. The "Record" also announces that th agenda for a series of conferences of local authorities to b held throughout Great Britain early in the coming year to be prepared.

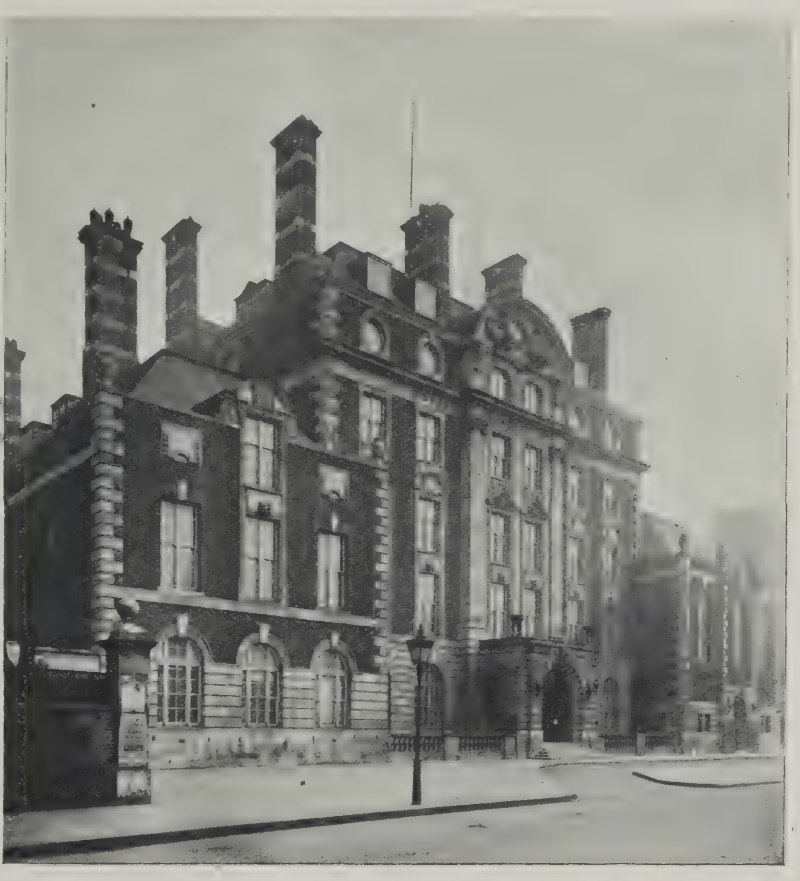
In view of the great public interest evinced in the pr posal that new houses should be exempted from municip rates for a series of years, the discussion of this matter wi be included in the agenda, as will also several of the vexe problems arising in regard to the administration of earli housing Acts concerning the clearance of unhealthy area These will include questions as to the type of house whic should be built, the desirability of re-housing on cleare sites, or the migration of the dispossessed to suburba areas, and the possibility of securing greater attention t the repair of houses not in all respects fit for huma habitation.

Full particulars of these conferences will be found o pages 881 and 882 of this issue.

he Work of the late Sir Ernest George, R.A.

N conversation with Mr. Alfred B. Yeates, who was in partnership with Sir Ernest George from 1893 up to the time of the latter's retirement from practice two years ago, some additional biographical particulars re given to a correspondent of THE JOURNAL, and he Times" gave a fairly representative list of the k carried out by the eased architect, from ich paper we give the owing :—

Rousdon, in Devon- re, built for Sir nry Peek, one of his lier and most success- works; Motcombe, Dorset; a charming all house at Fal- uth, in Cornwall; tsford, in Gloucester- re (in which county Berkeley Castle, re- red by him); Ruckley nge, Salop; Dunley l and Burbridge Park, Surrey; Sedgwick k and West Dean, Sussex; Eynsham l, in Oxfordshire, ere is also Shiplake rt, on the Thames, rlooking Berkshire; es and North Mimms, Hertfordshire; sug- tive of the pleasant ces where is to be nd his charmingly glish and restrained k, in harmony with surroundings. Far- north, his hand and e are to be seen Welbeck Abbey, which he improved and partly uilt after a severe fire, and at Crathorne Manor, in kshire, as well suited to the *genius loci* as his houses her south. A group of finely designed and commodious ses in Harrington Gardens, South Kensington, some nty houses in Collingham Gardens, the "Yellow House," swater, and houses in Berkeley Square and Mount eet exemplify his style, as do also mansions in Berkeley are and Cadogan Square.



THE ROYAL ACADEMY OF MUSIC, LONDON.

There are houses of his, too, in Cadogan Square. In Piccadilly is the shop, No. 36, originally built for Sotheran, the bookseller, while at the corner of Piccadilly and Albemarle Street is the large terra-cotta fronted building, reminiscent of his Continental journeyings, once known as the Albemarle Hotel. The City has his Royal Exchange Buildings, Marylebone his Royal Academy of Music, and Golders Green his Crematorium.

Sir Ernest George did not do much church work. St. Andrew's at Streatham (where his father lived), St. Pancras at Rousdon, Devonshire, with two English churches in the Engadine, are the sum of his efforts in this direction. Farther afield is a villa at Antibes, and the Shirpur Palace in India.

[On this and the following pages we illustrate examples of his work.]

A position in his office was much sought after by young architects and the number of leading men who were either articled to him or passed through his office shows the influence and education his work afforded. Among them were: Sir Edwin Lutyens, R.A.; Herbert Baker, A.R.A.; Arnold Mitchell, John Joass, Professor Adshead, Herbert Read, H. H. Wigglesworth, C. Farey, E. Guy Dawber, H. W. Wills, and the late David Kennedy.

He was an exceptionally rapid worker—visualizing his work and seldom redrawing or altering details. "His disposition," said Mr. Yeates, "was a singularly happy one, and he was worried only when he had no work to do."

Mr. Yeates was able to recall the time when Sir Ernest used to ride on horseback from his house at Streatham to his place of business every morning.

Le Théâtre des Champs-Élysées

A Democratic Building

By H. BARTLE COX, A.R.I.B.A. (Membre Corr. S.A.D.G.)

(Concluded from last issue.)

HEATING and ventilation have received much attention. Comfort, in fact, has been studied in all its forms, and draughts are eliminated. In a well-heated auditorium a cold blast is often ienced when the curtain rises, but at this theatre there rrangements for a barrier of warm air between the and the hall, which are said to work efficaciously. e exterior air is taken in at the roof of the build- nd brought through filters, the surfaces of which eated by steam. The temperature of the corri- is noticeably higher than that of the audi- n. The heating is effected by five boilers ("Idéal") ɔoo calories. Certain warm-air inlets are placed under alcony loges, and outlets for the vitiated atmosphere rovided for in the base of the cupola. The renewal e air is calculated at 30 cubic metres (1,060 cub. ft.) rson per hour.

* * * * * *

lighting of this theatre is a speciality and extremely ful to the eyes. Not a single lamp is directly visible. ghting is by reflection. The small comedy theatre fly lit by a crown of invisible lamps placed along the f the cupola. The large lyrical theatre receives most light through the big shield already mentioned, from emanates a soft and diffused light, whilst the backs of ges and balconies (often dark and purposely so, for the h theatre, hitherto, has been designed in the nature "salon") are themselves illuminated by lamps con- behind the ribs which support the corbelling of the bove.

The peristyle staircases and galleries are lit through large semi-translucent glass cups suspended from the ceiling. There is an intensity, but no crudity of light. It is well distributed and admirably diffused, adds to the grandeur of effect, avoids fatigue, and forms no small part in the restrained decorative treatment of this scientifically artistic edifice.

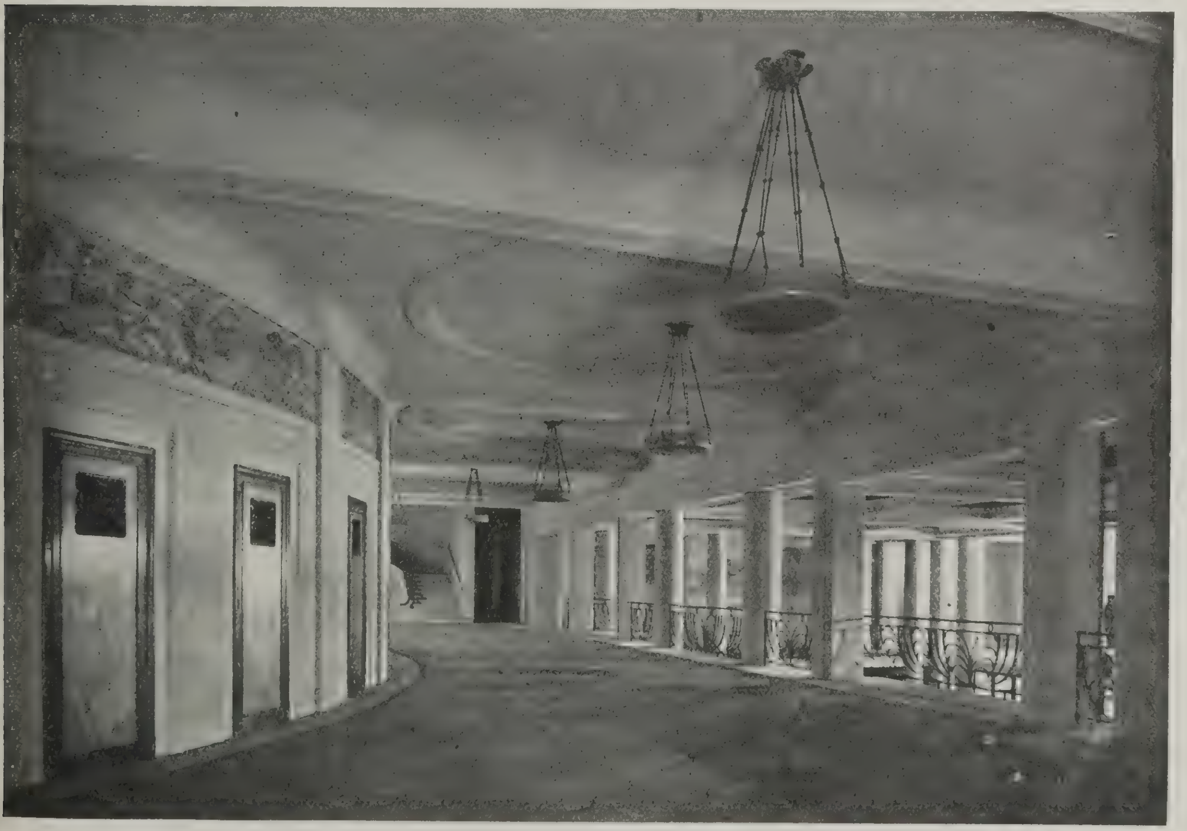
Decoration.

The distribution and installations of the building, in fact, everything touching comfort and the material exigencies of a modern "Salle de Spectacle," are unanimously acclaimed beyond criticism. However much opinions on art differ, these qualities, in themselves, speak highly in favour of its æsthetic value.

The decoration is consistent with the "programme," and no attempt at hiding a new form of construction has been made. For this reason it has been much misunderstood, for people are accustomed to false luxury.

Reinforced concrete lends itself to the realization of any shapes, but some are more expensive than others, and, therefore, less characteristic. The best form of shuttering is rectangular, consequently the straight line is the rational one. It is, perhaps, early to judge of these nascent forms. At present we are in the heroic period. In any case, Messieurs Perret have not played tricks with their material!

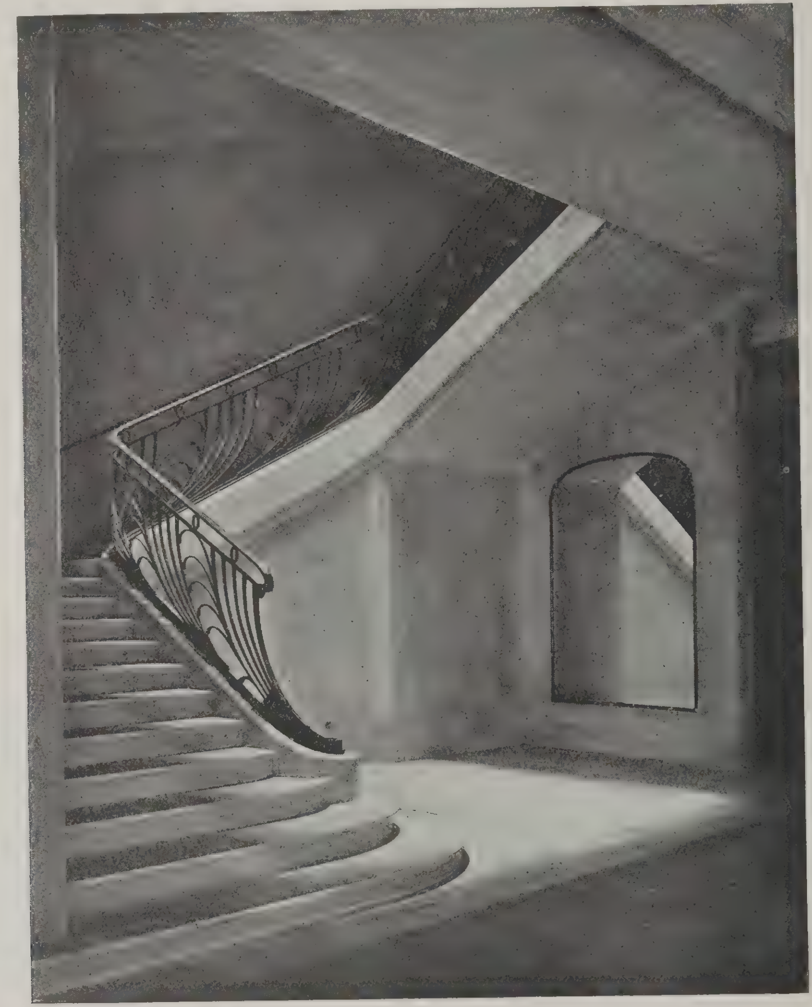
The interior of the building is much as one might expect from the exterior, that is to say, a temple of music with no warm frivolity. Severe cold beauty was new to the



ONE OF THE LOGES. A. AND G. PERRET, ARCHITECTS.

Parisians, and a deluge of invectives counterbalanced by a party Press campaign accompanied its inauguration. It is, however, a building with a strongly marked character representative of the times. Modern taste is getting tired of sham, and there is now a demand not only for economy, but for truth.

The colonnade of the peristyle has been criticized with sarcastic pomposity as belonging to the reinforced concrete order. Some people must always have "Orders," but MM. Perret have done their best to eliminate this prejudice. They have built in a new material upon entirely modern principles and treated them as such. These so-called columns are merely thin posts that go from the bottom to the top of the building, and to which the beams are affixed and not carried over them. The edifice is a monolith and not constructed on the old method of superposition or by layers. It is, therefore, illogical to expect base, shaft, capital, and entablature, and MM. Perret have had the courage to do away with them. They have merely placed little bronze bands under the ceiling to emphasize the points of junction. Round these cylindrical posts, to mark their continuity, there is a slight depression in the floor.



LE THÉÂTRE DES CHAMPS-ÉLYSÉES, PARIS: A SIDE STAIRCASE
A. AND G. PERRET, ARCHITECTS.

The beams apparent in the peristyle are covered with stone-coloured "stuc." They divide the ceiling into coffers which constitute the only ornament. The floor is paved with marble, framed with stone.

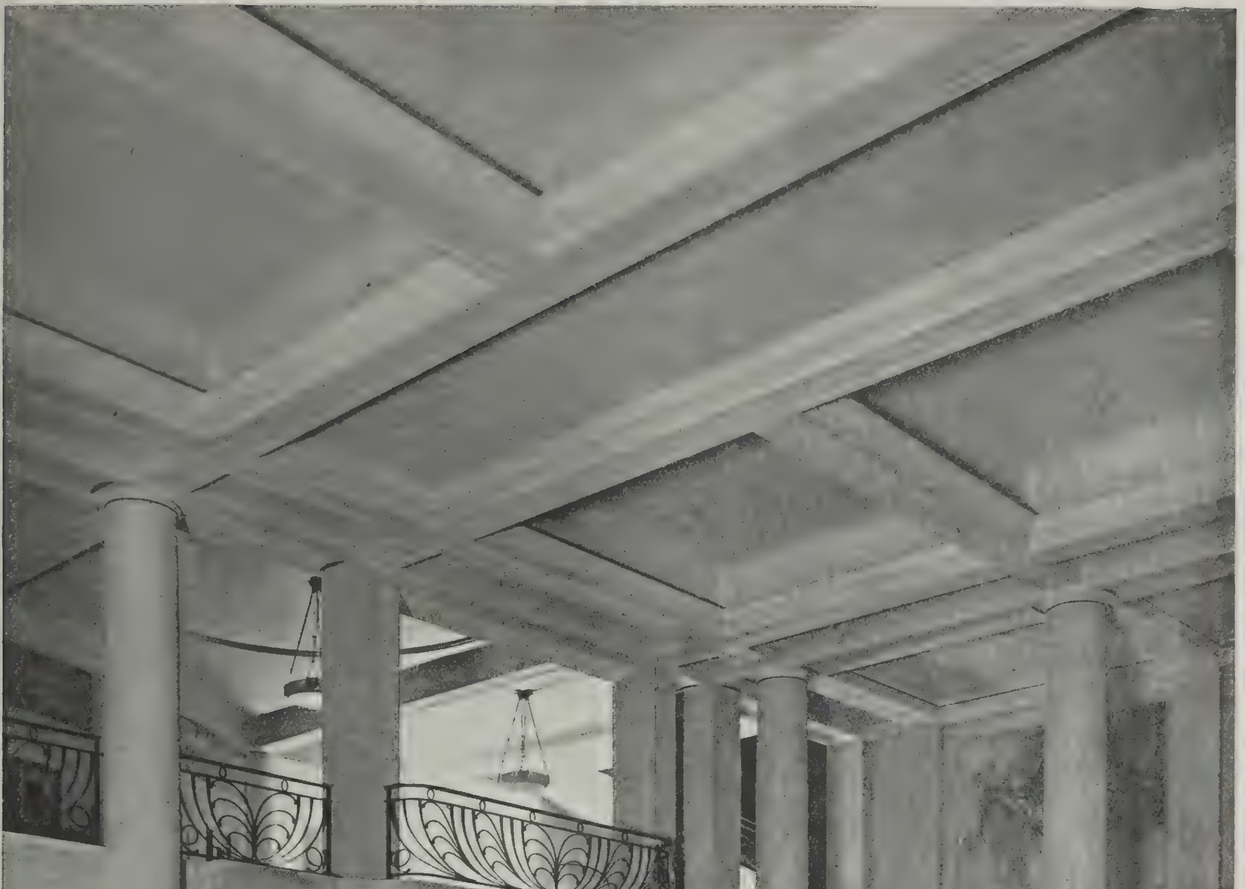
The elegant palm treatment of the wrought-iron balustrades is in harmony with the primitive character of this vestibule, a character which no sumptuous hangings, movable furniture, or fleshy oil-paintings disturb. Some panels were painted in fresco by Bourdelle direct on plaster without any attempt at polychromatic brillian

The auditorium is likened to a jewel-case. Yes ! bu must be full or it looks very empty. It is a new bea which makes one forget to praise its comfort. One longer looks at the auditorium, one only sees spectat It is admirably designed to show to advantage the bea of the fair sex. The "Opera" always looks full, but at Théâtre des Champs-Élysées there is no elaboration of g no stuffy drapery, no heavy cornices, no cupids balan themselves on thick bulging balconies. No prover cut-glass chandelier. The frame of the stage is somew richer than the rest, but the hall is noble in charac and free from the usual vulgar exuberance (cartouc caryatides, attributes), thus the spectacle on the st as well as the toilettes of the ladies in the audienc more enhanced than if an exaggerated sumptuou crushed it all out. The balconies have a gentle c edges very low, simply plated with marble, relieve copper bands. The seating is covered with amaran damask.

The cupola is decorated by the paintings of M. Ma Denis, representing in four large panels, separated by medallions "en grisaille," the history of music.

These paintings, it was hoped, would be the glory theatre, but if admired by the populace for their senti tality, their old academic composition mixed with m outlined drawing coloured in a sickly fashion leave with an insipid impression of music.

With none of the stronger qualities of the modern-a school they are falsely primitive and pseudo-mystic.



LE THÉÂTRE DES CHAMPS-ÉLYSÉES, PARIS: PERISTYLE STAIRCASE AND GALLERIES.
A. AND G. PERRET, ARCHITECTS

ideal striven after so fails to convince that they are bordering on the pornographic.

From an architectural point of view, it is unfortunate for the reputation of the co-operation in the "ensemble" that these paintings are not more in sympathy with the temper of the edifice.

The sculptures on the main façade and the frescoes round the outside of the "premières loges," by Bourdelle, are of a very different calibre. They have a strong personal conviction, so naturally have their bitter enemies and their staunch admirers.

With reference to the vigorous sculpture by Bourdelle on this theatre, the reader is referred to an article on the life and works of the master which appeared in THE ARCHITECTS' JOURNAL for March 29 and April 5 of this year. Those who dislike any transformation of the human figure, called by the naturalist distortion, and those who are enamoured with aristocratic elegance and with what is called distinction, will be shocked by these daring personal works of Bourdelle. The frescoes, however, are generally admitted to be harmonious in tone with the architecture, and the sculpture outside, whatever its taste, is in scale with the perspective.

Other artists were employed to decorate this complex organism, notably Madame Jacqueline Marval for the "foyer de la danse." Monsieur K. X. Roussel composed a *fête dionysiaque* for the curtain of the Théâtre de Comédie. In the foyer of this small theatre M. Vuillard has exercised his talent as colourist. M. Lebasque has decorated the "salon des dames," and the witty caricaturist, M. Sem, the "bar-fumoir." All these artists responded to the call of M. Thomas and collaborated under the discipline of the architects, Perret frères.

The decoration of the exterior is plain and simple. The long elevation to the narrow passage is left quite bare, only showing a rational treatment of the construction, cement posts and white brick fillings, the whole harmonious in tone, of good proportions, and composed.

The main façade to the Avenue Montaigne depends for its effect upon logical principles. It is a daring piece of work, where no artifice of decoration alters the complete expression of the construction. The richness necessary for such a monument is obtained by the materials themselves, the richest that the architect could procure, viz., marble and gold.

Nothing in this façade suggests an architecture of blocks of marble, no piling up on successive layers, but it is treated as what it is, a facing. It is easy to see that the jointing does not correspond horizontally as for a façade with courses. The architects did not wish to emphasize on the outside the use of cramps for fear of letting in water. It is interesting to note that the centre motive with the pylons of this elevation makes a perfect square. Bourdelle's sculptures are admirably in character with the subject, and make grey decorative focal spots in the right places. The rounded portion on the corner is the separate entrance to the small theatre.

The marble employed comes from Châtelperron (Allier) from a quarry once worked in the middle ages, notably for Notre Dame de Paris. The quarry, since abandoned, was specially reopened for the Théâtre des Champs-Élysées. This marble is of a light-grey tone tinted with yellow, and is not affected by frost, nor in any way deteriorated by contact with cement. Another important feature is the fixing of this lining, which is scientifically managed in such a way that any settling or movement could not cause it to separate from the wall. A serious omission in most cased buildings in the past.

Refined bands of gold discreetly indicate the assemblages and the luxurious aspect is completed by the gilding of the solid parts under the windows of the first floor.

* * * * *

The whole edifice was built in two years, and the complete cost of the entire structure (exclusive of site), including all the construction and all the decoration, was only five
million francs (£200,000). Like the theatre at Bordeau
by Louis, it was designed and built by the architect, carri
out on the principle of a contract for a ship—a lump su
for the whole job.

The Second Empire and the Third Republic.

Charles Garnier (1825-1898), author of the "Nouv
Opera" at Paris, Grand Prix de Rome, 1848, Membre
l'Institut, and Grand Croix de la Légion d'Honneur, w
probably the greatest architect of his age. His reputati
is immense, and justly so. His masterpiece, the "Opera
is a marvel of composition, one of the most admired, y
one of the least important of buildings. Designed
ancient principles, while materials of the epoch were use
it adds not one iota to the development of architecture.

It was monarchical in character, and served its purpo
admirably, but Garnier's genius, like the Second Empi
was destined to have its vogue and then to pass away as
interesting fashion. Not so with Egyptian and Goth
architecture, of which the construction and decoration w
honestly modern for its day, based on the same cand
principles now prevailing for steamships and for mot
cars.

The age makes the man, not the man the age, cons
quently the faults of fashion in Garnier's work, and t
qualities of research in Perret's, must be ascribed as mu
to the age as to the man. The "Opera" was undoubted
over-adulated in its day, but art critics are, perhaps, no
too severe on its demerits, neglecting, as they invariab
do, to study the "programme" which led to its "parti.

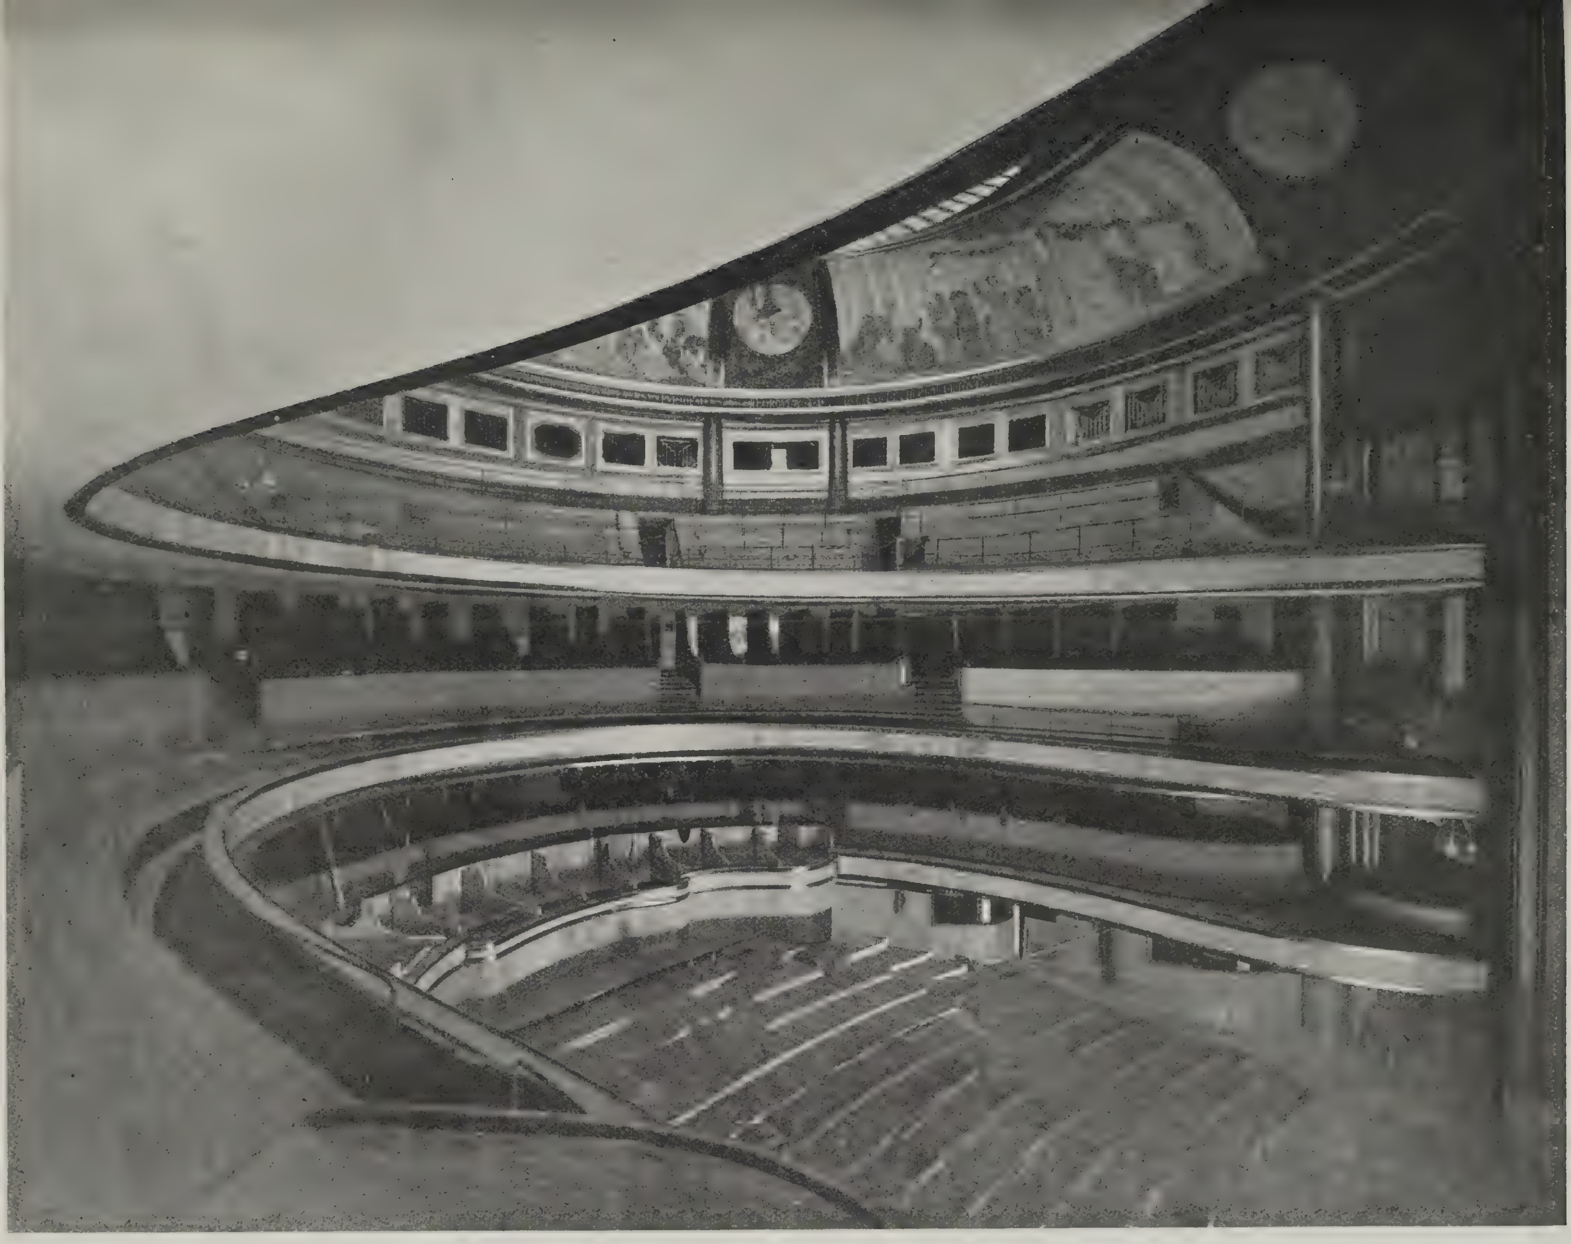
The "cassette" of the emperor was 40,000,000 frs.
year (of the epoch!). The President of the Repub
receives but 1,200,000. Political events have evolved, a
never will there be an opportunity for the realization
design such as that presented for the average Grand P
de Rome competition. However good these exercises m
be for study they are still based upon an antiquated a
pompous attitude. Great is the man, however, who, havi
profited by this training, can free himself from its tramme

Two of the greatest architects of the day, from a dem
cratic point of view, are Monsieur Tony Garnier, of Lyo
(Grand Prix, 1899), who scandalized the "Institut" by sen
ing as last "envoi de Rome" a design for "Une Cité Indu
trielle," and M. Auguste Perret, Maître de l'Œuv
of the Théâtre des Champs-Élysées. Both these men
learned and have a healthy dislike for a fastidious use
the orders. Both are practical and have a laudable co
tempt for the lazy archæological precepts of drawing-roo
architects. Both are successful because they do their b
to ennoble democratic work. Both take an interest in arc
tectural education, and admire the "École," but both prea
the necessity for a reformation of this official instituti
Their voices, together with many others, are being hea
and listenedt o; M. Tony Garnier is on the jury. In Engla
professors appear to be taking up the École methods
fifty years ago), at a time when France is striking out
modern lines.

* * * * *

M. Auguste Perret, born in 1874, was award
several medals at the École, and won the Prix des Amé
cains. At an early age he started on practical work, a
has collaborated with his brother on several factori
houses, and churches in reinforced concrete, besides t
Théâtre des Champs-Élysées, which is a landmark in t
evolution of architecture. He has travelled considerab
has a good library, but never uses books when maki
designs, nor are they sumptuously bound and ostentatiou
displayed to impress clients. He is fond of "Le Gra
Durand," which in his spare moments he studies, wi
compass in hand, in order to find out the secrets und
lying the proportions of the great architectural masterpiec
Another book he greatly admires is "Les plus excelle
bastiments de France," by Du Cerceau.

M. Perret is not a Gothicist but, though a pupil of Juli
Guadet, he appreciates the soundness of much of the tea
ing of Guadet's rival, Viollet-le-Duc, and believes with h



LE THÉATRE DES CHAMPS-ÉLYSÉES, PARIS: AN INTERIOR VIEW TAKEN DURING THE PLACING OF THE HANGINGS AND CARPETS AND BEFORE THE INTRODUCTION OF THE FURNITURE.

A. AND G. PERRET, ARCHITECTS.

that the architect (vague designation for modern work) is being rapidly replaced by the engineer. He admires the École, but only for training in composition; he feels that (like the Church) it should be separated from the State. M. Perret carries out work, not on mediæval principles, but in some respects similar to what prevailed in the Middle Ages. He is not, for that reason, a member of any of the big architectural societies. Both the Société Centrale and the Société des Diplômés request all their members to sign the "Code Guadet," which stipulates that: "Il (l'architecte) exerce une profession libéral et non commerciale. Cette profession est incompatible avec celle de l'entrepreneur, industriel ou fournisseur de matières ou objets employés dans la construction."

"L'Architecte qui se fait entrepreneur ou commis d'entrepreneur, métreur, vérificateur, perd la qualité d'architecte."

This "Code Guadet," which was conscientiously framed, is probably hindering the progress of the profession, and of late, especially since the war, is greatly attacked. Often the societies, in order to keep up their membership, are obliged to grant special dispensations. However, it is still in force and adhered to by the majority of the magnates who for the present run the profession for better or for worse. For this reason Messieurs Perret frères have many jealous enemies, and their architecture is often scathingly anathematized as the work of mere builders.

LE THÉÂTRÉ DES CHAMPS-ÉLYSÉES, PARIS: THE CENTRAL MOTIF (IN COLOUR) OVER THE PROSCENIUM.

The Théâtre des Champs-Élysées is, nevertheless, an unquestionable effort in the right direction. Much ink has been spilt in praising and condemning this building. In 1913 it was the public Press that first took the matter up, but as the articles were written by journalists the information was scanty and of doubtful origin. However, their noise was useful, for the professional papers could no longer keep silent.

A well-illustrated popular account of the decoration appeared in a special number of "Art et Décoration" (April 1913). "L'Architecture," the official organ of the Société Centrale, thought politic (May 17, 1913) to psalmodize against the exotic taste of the building in a polemical article trying to damn by faint praise. Such unpatriotic time-serving behaviour, under the cloak of sincerity, shows a lack of constructive vitality. It slowly lowers the prestige of all our old-established institutions. October of the same year "L'Architecte," a freer-lan devoted two numbers to a long, well-studied article M. Paul Guadet, who explained with much erudition æsthetic importance of this highly successful mod theatre; the article was accompanied by a large series very fine illustrations. Later "La Construction Modern in three consecutive numbers for November 1913, g a no less full account of the technical qualities and p lished numerous views. "Le Génie Civil" (April 5, 19 brought out a fully documented article by the engine M. L. Gellusseau, giving much useful information fron scientific point of view.

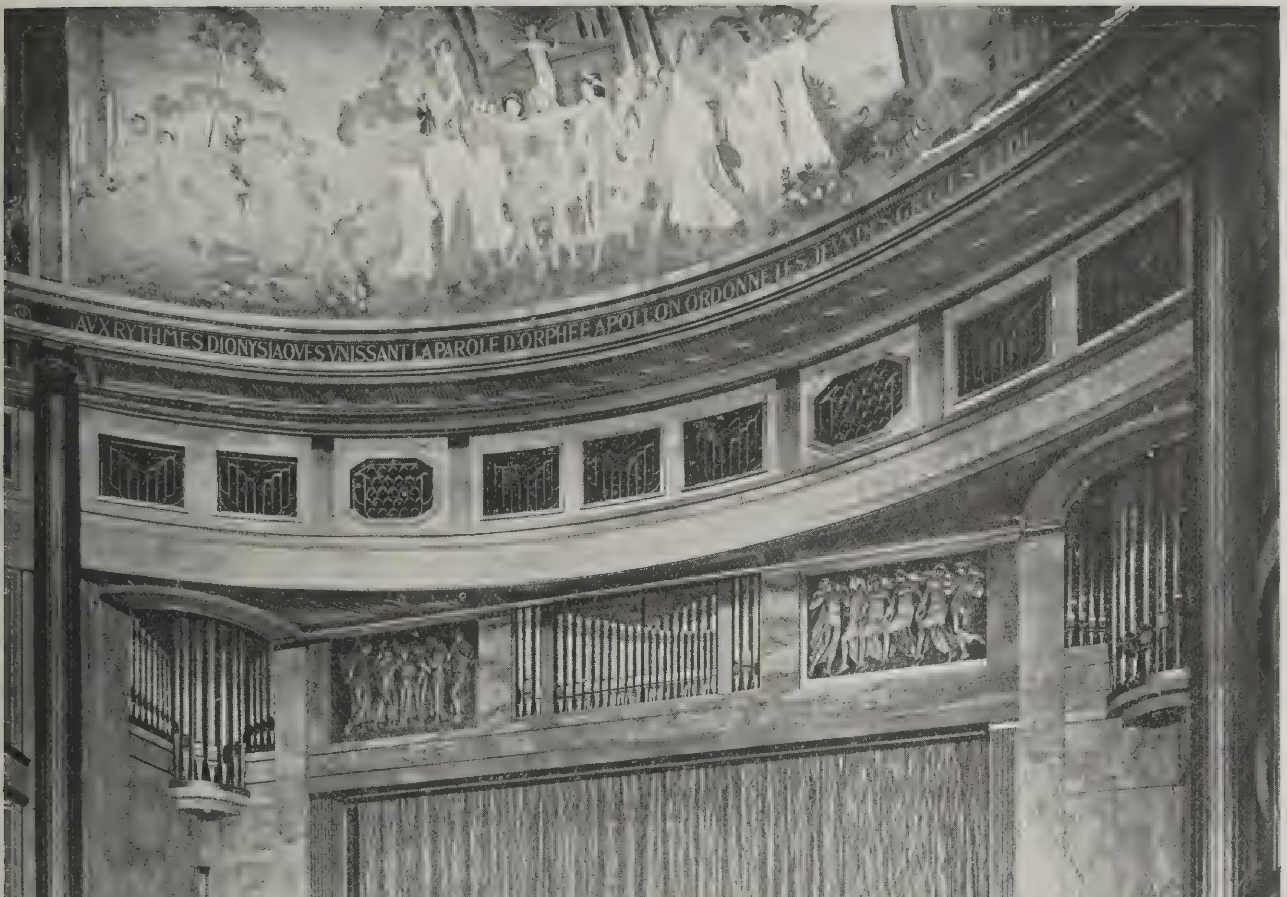
The great work on the æsthetic value of this theatre written by Monsieur Paul Jamot whom, either to uph or to refute, all the other writers quote. M. Jamot "conservateur adjoint du Musée du Louvre." His stu on this theatre is a special seventy-page illustrated pamph published by the "Gazette des Beaux-Arts," 1913. I a learned document written in a most inspired style.

Despite opinions, this building forces itself upon attention. Much credit is therefore due to the foresi of its founder, and to the faith of its administrator, Ast and Thomas.

"Le grand architecte, c'est l'état social" says Guad If such be true of Charles Garnier (the greatest expon of the "École" training) it equally applies to Augu Perret, for no other solution of the problem in quest would have rendered its erection possible. That is w the construction and decoration of this theatre passed i his hands. The buildings of the Third Republic cannot built, and therefore should not be judged, upon princip prevalent in the Second Empire.

* * * * * *

The building has been stigmatized as a poor civic deco tion, not having the aspect of a theatre, and not externa expressive of the internal arrangements. This is a kind armchair criticism characteristic of dotards and coxcom inexperienced with modern "programmes." Had State or the Ville de Paris offered a site and financed affair we certainly should have had another imitation



AVX RYTHMES DIONYSIAQVES VNISSANT LA PAROLE D'ORPHEE APOLLON ORDONNE LES JEUX

"LE MUSE ET PÉGASE": A FRESCO. BY ANTOINE BOURDELLE.

the "Opera." Such may be the method for École "projets," but in twentieth-century practice it is otherwise.

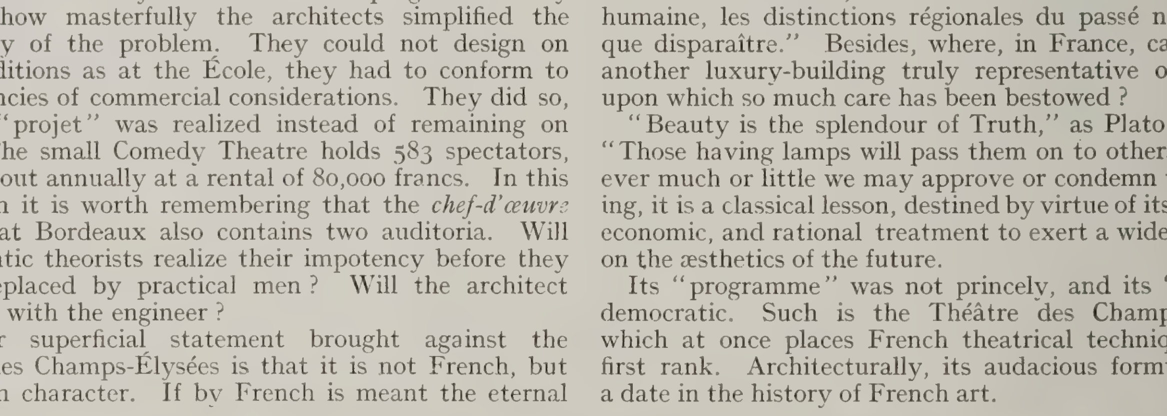
As to its aspect a modern theatre wants no great flight of steps, and (in France at least) it is unnecessary to have a pompous loggia from which a prince and his courtiers can offer themselves to the gaze of the populace. The life of a theatre is in its inside.

With reference to the external expression of internal arrangements a study of the site and programme fully explains how masterfully the architects simplified the complexity of the problem. They could not design on ideal conditions as at the École, they had to conform to the exigencies of commercial considerations. They did so, and the "projet" was realized instead of remaining on paper. The small Comedy Theatre holds 583 spectators, and is let out annually at a rental of 80,000 francs. In this connection it is worth remembering that the *chef-d'œuvre* of Louis at Bordeaux also contains two auditoria. Will our pedantic theorists realize their impotency before they are all replaced by practical men? Will the architect keep pace with the engineer?

Another superficial statement brought against the Théâtre des Champs-Élysées is that it is not French, but German in character. If by French is meant the eternal use of Louis XVI ornament, and by German a rat treatment of modern construction, then the stateme correct, but instead of being an indictment, as inter it is an unconscious compliment. M. Paul Guadet (s Julien Guadet) very aptly says in his masterly analys the building published by "L'Architecte," that "I évident aussi que, avec l'uniformisation actuelle des cédés de construction et des matériaux employés l'architecture comme, dans toutes les branches de l'act humaine, les distinctions régionales du passé ne peu que disparaître." Besides, where, in France, can we another luxury-building truly representative of the upon which so much care has been bestowed?

"Beauty is the splendour of Truth," as Plato says, "Those having lamps will pass them on to others." ever much or little we may approve or condemn this b ing, it is a classical lesson, destined by virtue of its scien economic, and rational treatment to exert a wide influ on the æsthetics of the future.

Its "programme" was not princely, and its "part democratic. Such is the Théâtre des Champs-Ély which at once places French theatrical technique in first rank. Architecturally, its audacious formula m a date in the history of French art.



LE THÉÂTRE DES CHAMPS-ÉLYSÉES, PARIS. A STUDY FOR APOLLO: THE CENTRAL MOTIF OF THE MAIN FACADE BY ANTOINE BOURDELLE, SCULPTOR.

Enquiries Answered

Foundation for Elevated Tank.

"Structural Engineer" writes: "Would Professor Adams kindly give the method of calculating the holding-down bolts and concrete foundation slab for the water-tank structure shown on the accompanying sketch. The total dead weight of the tank (full of water), including the structure, equals 70 tons, and with the tank empty equals 21 tons. The overturning moment due to wind-pressure is 424 ft.-tons, the total resultant pressure being 10·3 tons, acting with a leverage of 41 ft. above the top of the foundation. It has been suggested that four ⅞ in. diam. by 2 ft. 6 in. long anchor bolts to each post would be suitable, and the safe permissible pressure on the subsoil may be taken as 1½ tons per sup. ft. Please show calculations for four separate foundation piers, and also alternative if foundation is formed of a slab extended over the whole area. What would be the distribution of pressure on the soil in the latter case, and would steel reinforcement be necessary?"

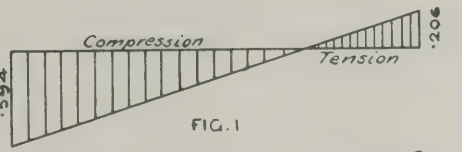


FIG. 1

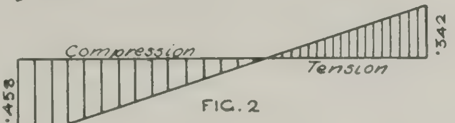

FIG. 2

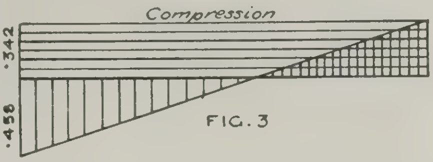

FIG. 3

—Assuming the tank full and a continuous base 20 ft. by 18 ft. the calculations will be

$$\frac{W}{A} \pm \frac{M}{Z} = \frac{70}{20 \times 18} \pm \frac{424}{\frac{1}{6} \times 20 \times 18^2}$$

=·194 ± ·4 = ·594 tons sq. ft. compression and ·206 tons sq. ft. tension as in Fig. 1. With the tank empty the calculations will be

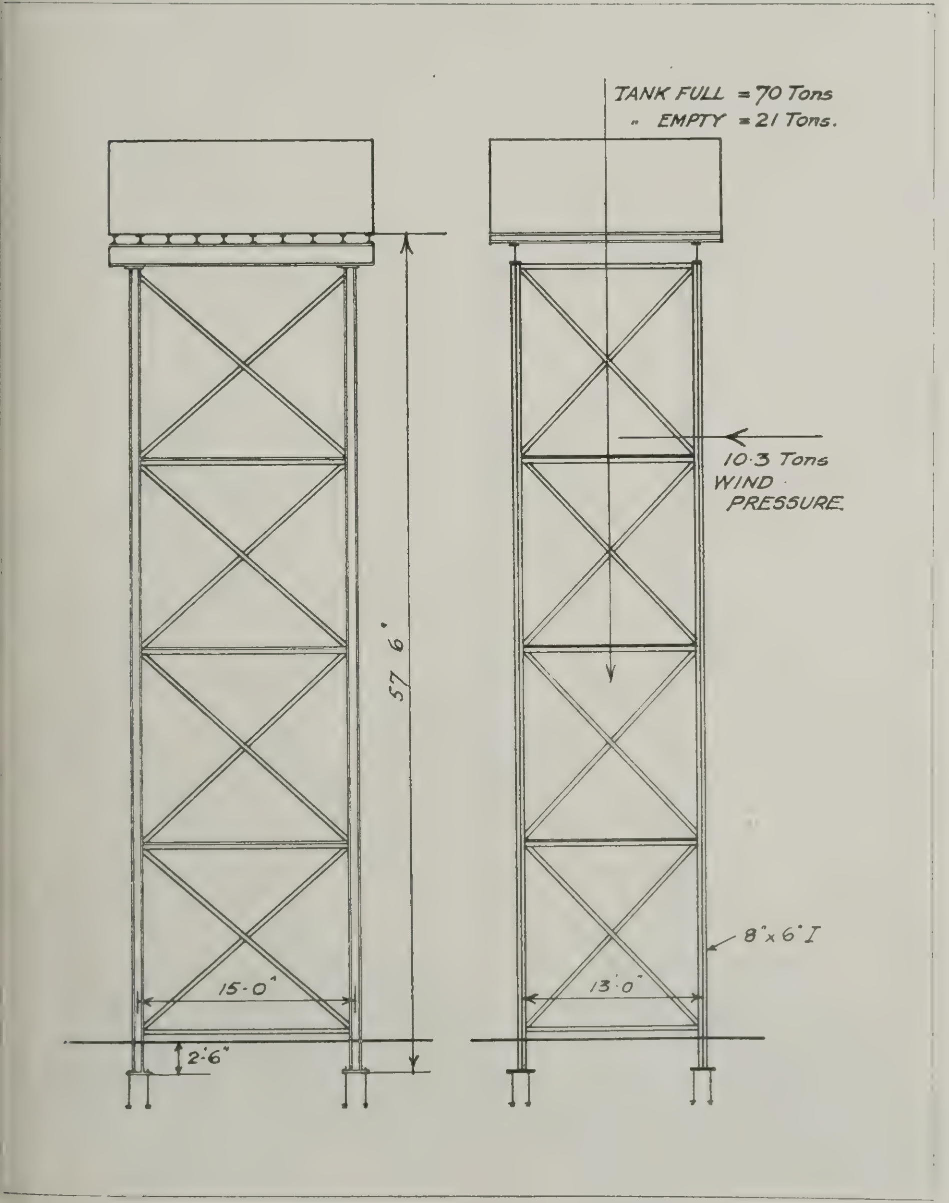
$$\frac{W}{A} \pm \frac{M}{Z} = \frac{21}{20 \times 18} \pm \frac{424}{\frac{1}{6} \times 20 \times 18^2}$$

=·058 ± ·4 = ·458 tons sq. ft. compression and ·342 tons sq. ft. tension as in Fig. 2. We must therefore add weight in the slab to extinguish the tension, as in Fig. 3, say, ·342 × 2,240 = 766 lb. per sq. ft., or a thickness of $\frac{766 \text{ lb. sq. ft.}}{130 \text{ lb. cub. ft.}} = 5{\cdot}9$, say 6 ft. With this thickness it will not need reinforcement, but the bolts should not be less than 4 ft. long with good washer-plates, say, 9 in. by 9 in. The pull on each bolt, there being four in each of the feet of the framework, will be $\frac{424}{13 \times 4 \times 2}$ = 4·07 tons. Allowing a safe working tension at bottom of thread of 4 tons sq. in. the area must not be less than $\frac{4{\cdot}07}{4} = 1{\cdot}02$ sq. in. A 1¼ in. bolt has an area at bottom of thread of ·894, which is not enough, so that 1½ in. bolts should be used.

If independent foundations be substituted for the slab the maximum upward pull on each will be $\frac{424}{13 \times 2} = 16{\cdot}3$ tons; their weight must therefore be at least equal to this, say $\frac{16{\cdot}3 \times 2{,}240}{130} = 280{\cdot}86$ cu. ft., or, say, a cube of 6 ft. 6 in. side. The maximum compression on the soil with independent foundations will be the same as the upward pull, plus the dead load, plus the weight of concrete

$$= \frac{70 \times \frac{1}{4}}{6{\cdot}5^2} + \frac{424 \times \frac{1}{2}}{13 \times 6{\cdot}5^2} + \frac{6{\cdot}5^3 \times 130}{6{\cdot}5^2 \times 2{,}240}$$

= ·414 + ·386 + ·377 = 1·177 tons sq. ft., which is well within the allowed limit of 1½ tons sq. ft. There will, therefore, be considerable saving by adopting the independent foundations. HENRY ADAMS.



FOUNDATIONS FOR ELEVATED TANK.
(*See Enquiry by "Structural Engineer."*)

The Size of Rolled Steel Joists.

Student writes: "Can you inform me the depth, etc., of a rolled steel joist, clear span 45 ft. at about 14 ft. centres, to carry only the steam pipes from three boilers. Cross joists to be at convenient centres? What is the most economic material, etc., for carrying a light load, say, two tons, over a 50 ft. span, when depth of beam has to be reduced as low as possible? Is there a rule which governs the depth of R.S.J.'s in such cases?"

—The information given is insufficient to permit of a full reply. A rolled steel joist 45 ft. span should not be less than 22½ in. deep however light the load may be, so that a 24 in. by 7½ in. by 100 lb. R.S.J. is indicated. The size and position of the steam pipes should have been given. The general rule for rolled joists is that the depth in inches must be not less than half the span in feet; every case must, however, be considered on its merits. A lattice girder is the most economical method of carrying a light load over a long span because of the increased depth that is possible. If the depth is to be reduced to the smallest limits a compound girder of rolled joists and plates is practically the only means available, but extra material is then required to overcome the deflection due to shallow depth.

HENRY ADAMS.

Proposed Improvements in Central London

By JOHN MURRAY, F.R.I.B.A., F.S.I.

IT is generally agreed that a large area north of the river in the Charing Cross district needs development in order to improve traffic conditions and to afford greater facilities for trade even if a new Charing Cross Bridge be not built. During recent years various independent schemes of improvement have been suggested; but owing to lack of co-operation among the various authorities concerned little has been carried out.

It may be thought that there is no great likelihood of any large development taking place immediately, but I venture to suggest, in order to prevent any further unnecessary interests accruing, that the problem should be considered without delay by the authorities concerned, including the London County Council, the Westminster City Council, the Holborn Borough Council, the Lambeth Borough Council, and the railway companies.

There is a great need for central offices for Colonial trade similar to those now being provided for America by the Bush Building in the Strand. These offices could all be erected in the proposed new thoroughfares shown on the accompanying plan, and the opening up of Central London in this way should result in the greatest improvement that has been attempted in the Metropolis since Regent Street and Regent's Park were laid out by the Crown about a century ago and presented to the public under the auspices of King George IV.

It is desirable that a decision be arrived at regarding the necessity for a Charing Cross Bridge, and in the event of its being deemed necessary the position should be agreed upon and further vested interests in that connection restricted.

The street improvements which I suggest would afford additional traffic facilities in the Charing Cross area, and at the same time provide for future traffic across the river by the proposed Charing Cross Bridge should it ultimately be built. The location of the bridge should be fixed with full regard to the best approaches procurable on the north side of the river, for it is to this point that the traffic to and from the proposed new railway station of the South Eastern and Chatham Railway and the existing station of the South Western Railway on the opposite side of the river would converge.

The possible developments in the district that are required in order to accomplish the proposed improvements are very large, but I am convinced that if they were all considered and undertaken in a thoroughly comprehensive and businesslike way the whole problem could be solved in sections, and largely by private enterprise controlled by the authorities. I also think that if the schemes were all worked out upon sound business principles, the capital invested in the improvements on the north side of the river would result in a dividend-paying investment, whilst in addition the benefits to the community would be very great.

The primary essentials are combination of the authorities as suggested above and the raising of the necessary capital. The amount required would be very large, but thousands of millions have been raised for war, and, I think, for the development of British trade it should be possible to raise the necessary amount of capital on a business basis from private sources if it were approved by the interested authorities and guaranteed by the security of public assets. If the improvements were undertaken on bold lines, they would, I think, result in a great trade development, not only of London and the country, but of the empire.

I, therefore, venture to submit the following list of improvements as indicated on the accompanying plans, together with some views thereon for consideration :—

The opening up of the Charing Cross district around the Strand area by the formation of a large open space or "Place" partly on the site of the present Charing Cross Station from which could radiate about ten important streets.

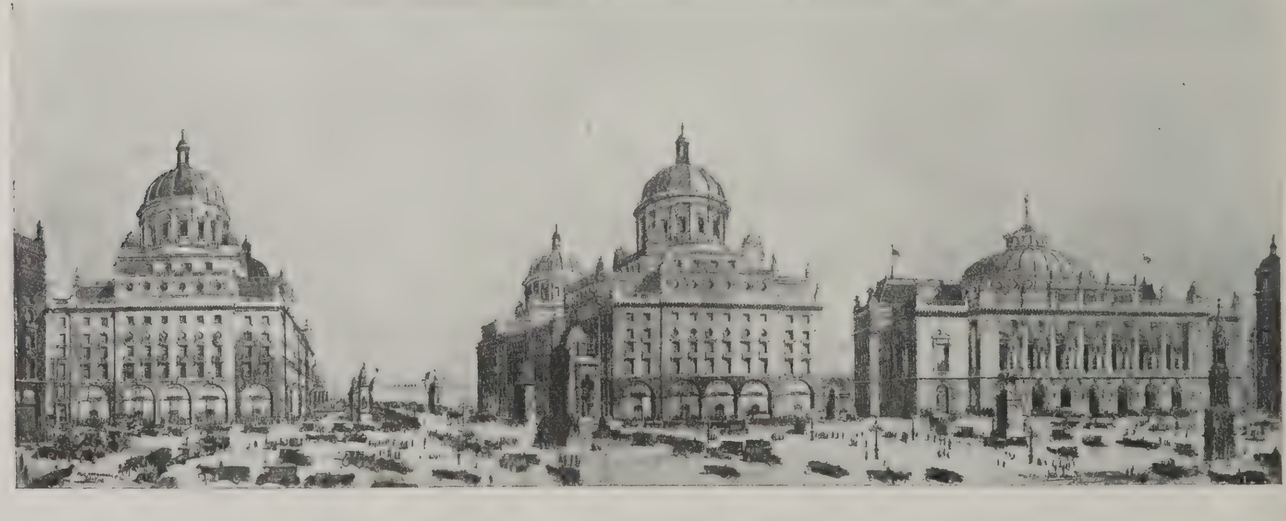
The enlargement of Piccadilly Circus and the formation of a new large open space, in the form of a new Piccadilly Square, by the removal of the Pavilion Theatre block, etc., from which would radiate seven important streets.

The connection of these two open spaces by a new broad Imperial Way running eastward from the north side of Leicester Square across Charing Cross Road and St. Martin's Lane, bending southward, skirting and affording ample additional access to Covent Garden Market, thence down Agar Street, widened on the east side, into the Strand and the new "Place." If, however, the bridge be not built, the Imperial Way would still supply a great traffic need by terminating at the Strand.

From about the centre of the "Place" at the Strand, opposite the centre of Coutts' Bank, a new high-level Charing Cross Bridge could, I submit, be best constructed.

It is impossible to provide adequately for the increased traffic from a new bridge solely by the existing roads on the north side of the river, as they are all at present congested by the existing traffic, and a new bridge would be a distributor of an enormous amount of additional traffic.

The transference of the present Charing Cross Station to the south side of the river, as proposed by the London Society would afford full scope for all these great improvements on the north side, and the pedestrian traffic across the river could be sufficiently provided for by motor-buses tube railways, and covered ways on the new bridge. The necessary compensation to the South Eastern and Chatham Railway Company, now amalgamated with the South Western, should not be an insuperable obstacle. No better position appears to be possible, or smaller site desirable, for the future enlarged South Eastern and Chatham Railway Station than the island site bounded by the southern approaches to Waterloo and Charing Cross Bridges, York Road, and



IMPROVEMENTS IN CENTRAL LONDON: VIEW FROM THE STRAND LOOKING OVER THE RIVER THAMES. SUGGESTED BY JOHN MURRAY, F.R.I.B.A., F.S.I ıe river. There a magnificent station ıd hotel could be built facing the river, ith the two bridges as main arteries ading to and from them. They could, oreover, be completed before the pre- nt Charing Cross railway bridge, sta- on, and hotel were interfered with in ıy way.

The cost of the new bridge itself, and ıy compensation for trade disturbance quired for the street improvements, if ised by public funds, would not be a

(ALSO SHOWING THE HOLBORN IMPROVEMENTS SUGGESTED BY SIR GEORGE PARKER.)

rious addition to the rates of the County London chargeable on the rateable lue of forty-nine millions, and the cost ould be fully justified by the additional tes from new buildings, and the in- eased trade and prosperity which would sue.

The extension of the tube railways om Waterloo Station to the London idge stations, in order to link up the ffic from those stations directly with West End of London.

The gradual construction of a system low-level tube railways from a large central underground station in the Covent Garden area, from which could radiate in practically straight lines tube railways out to the docks, and to the outskirts of London extending about 15 to 20 miles. By this additional and quite feasible means of transport the public, and also agricultural produce, could rapidly be conveyed daily between the open country and any part of London, whilst the roads of Central London would be greatly relieved of traffic and consequently of much wear and tear. Agricultural produce could be conveyed by road motor traction from the country to the outlying stations. The motor vans or lorries could be run at night on to train trucks and transported to Covent Garden or any part of London, being raised by means of lifts at the stations to which they were consigned. The empty vans or lorries could be similarly returned to the outlying stations and the country. The low-level tubes, if properly constructed, could run deep in the London clay, under buildings, the river, docks, etc., without any difficulty or detriment to property. The housing problem could thus be largely solved by building houses in the outlying districts where land would be cheap and rates low.

The rebuilding of the old property in Regent Street and the neighbourhood, which is now progressing rapidly, and the additional trading that will be produced thereby will certainly, in a few years, necessitate some substantially increased traffic facilities in this part of Central London.

The important road and housing improvement scheme which has been suggested by Sir George Parker for the Holborn district, and is shown on the plan to the north of St. Martin's Lane, could proceed simultaneously and could connect with the new Imperial Way at the north end of St. Martin's Lane, thus opening up the Holborn district and connecting it directly with the South of London.

With the exception of the new station and hotel, the construction of the proposed embankment and the laying out and rebuilding of the property on the south side of the River Thames could be more satisfactorily carried out after the more urgent improvements on the north side and the new bridge are completed. When this is done the value of much of the property on the south side would be very greatly enhanced, and the increased value might be credited to the improvements.

Breadth of outlook and the exercising of foresight are necessary in these very important and interdependent matters, and the full consideration of them should not be delayed until the necessity is overwhelming, otherwise additional vested interests, much increased expense and loss to the community would be involved, whilst an early commencement with some of the street improvement work would relieve much unemployment.

Properly organized loans, spread over a number of years and guaranteed by the authorities, should, I think, suffice to raise the large amount of capital that would be needed for the street improvements so far as the property and new streets are concerned.

The whole of the schemes could pro
ably be best considered by a special com
mittee to include representatives of a
the interested authorities.

As soon as a complete scheme is agree
upon for developing Central London
receive increased trade and traffic, th
time will then be ripe for considerin
the provision of additional and eff
cient transport for additional forei
and Colonial traffic and merchandi
in the form of the proposed ne
Channel tunnel under the Straits
Dover.

The Tragedy of the Adelphi

It is now definitely announced that the Adelphi—"one of the finest building sites in London"—is to be sold. Negotiations are now being opened, it is said, which may lead to a great hotel for American visitors to London being built. It was thought, after the Freemasons had decided not to build their memorial hall on the Adelphi site, that it would be allowed to remain a residential quarter. The owner, however, is determined to sell the estate, for which it is understood that he is asking £1,000,000.

Apropos of the present controversy which is raging upon the subject of the Adelphi's threatened destruction, Mr. Fisher Unwin has sent to us a copy of "A Literary History of the Adelphi and its Neighbourhood," by the late Austin Brereton, and to him we are indebted for the permission to reproduce illustrations and the following passages from the book:—

Within that small space which has been known as the Adelphi since 1772, a district so confined that it is contained within five hundred square yards, came, in its earlier years, several bishops and other clerical dignitaries, then that prince who was afterwards the fifth King Henry of England, anon, amid much pomp and pageantry, King Henry VIII. Queen Mary and Queen Elizabeth were familiar with it, and here lived, for twenty years, Sir Walter Raleigh, who inhabited one of the towers which is seen in Hollar's engraving of Durham House. Lady Jane Grey went hence to the Tower and thence to the scaffold. Dryden alluded to it in one of his plays, Voltaire drank wine here, and its memory is hallowed by Dr. Johnson, Oliver Goldsmith, Sir Joshua Reynolds, and a host of other celebrities. Here David Garrick began his career, and here, curiously enough, he ended it, the funeral procession of the "poor player" reaching from the Adelphi to Westminster Abbey, those who followed him to the grave numbering many men of rank and genius, including Johnson, and a large concourse of the general public who grieved for the loss of the great actor.

The history of the world-famous banking firm of Coutts & Co. is indelibly associated with the Adelphi. Dickens, when a boy, prowled about its dark arches—until lately one of the most degraded spots in London—and last, though not least, the Brothers Adam.

Underneath "Adelphi Cottages," and extending below the houses of the terrace, and John, Robert, and Adam Streets, are the famous arches, which few people have ever visited. The gloomy recesses do not conduce to joy, and, although the footpad has scant opportunity for indulging in his nefarious practices, he would be a venturesome person, a stranger to these parts, who would wander alone in this underground world after the sun, which
never enters these passages, had ceased
illumine the earth above. Hundreds
thousands of bottles of wine are in bri
here, and a most admirable place for th
purpose it is. The underground Adelp
is absolutely dry, and the temperatu
does not vary five degrees in the cour
of a year. Far removed from the nois
Strand—in regard to atmosphere an
surroundings—there is one arch, dar
indeed, and shut off from the outer wor
by huge gates, which are some distan
away, where, many feet below the surfa
of the streets, is a secret entrance to th
premises of Coutts' old bank.

One of the most notable residents
the Adelphi in modern times was M
Thomas Hardy, who, happily still wi
us, lived at No. 8 Adelphi Terrace in th
years 1863–67. During that time "I s
there drawing," he wrote to a frien
"inside the easternmost window of th
front room on the first floor above th

A New Branch Bank in Clapham

J. W. STANLEY BURMESTER, F.R.I.B.A., F.S.I., ARCHITECT

THIS branch bank has been erected in High Street, Clapham, for the London County Westminster and Parr's Bank, Ltd. Mr. J. W. Stanley Burmester, F.R.I.B.A., F.S.I., was the architect.

On the ground floor is a large banking hall lighted by means of overhead ceiling lights and by four windows on the principal front; the manager's room, a waiting-room, female clerks' room, telephone-room, a book lift, and the usual offices. At the back of the premises is a yard and area and above the bank are three residential flats.

The front of the building is of Portland stone. The entrance shown on the left of the illustration is for the use of the bank, and that on the right for the residential flats. The total cost of the work was nearly £18,000. The carving was executed by Messrs. Gilbert Seale & Sons, Ltd.

Messrs. Holliday and Greenwood, Ltd., were the general contractors, and the sub-contractors were as follows: Messrs. Haywoods, Ltd. (pavement lights); H. and C. Davis (iron staircases); H. Young & Co. (steel construction); Robert Adams (steel sashes); Marryat and Scott, Ltd. (bullion lift); Art Pavements, Ltd. (mosaic paving); Bratt Colbran & Co. (stoves); Wontner Smith, Gray & Co., Ltd. (heating); Ewart and Son, Ltd. (califorts); Zeta Wood Flooring Co. (wood block floors); Ogilvie & Co. (bank fittings); Ragusa Asphalte Co. (asphalting); Highton and Son (title lettering); and B. Finch & Co., Ltd. (sanitary fittings). The Portland stone front was executed by the Bath and Portland Stone Firms, Ltd.

Steel Frame Buildings*

An Explanatory Note upon the Joint Conference Report

By EWART S. ANDREWS, B.Sc.Eng., M.I.Struct.E.

THE design of steel-frame buildings in the London County area is governed by the L.C.C. (General Powers) Act, 1909. Several difficulties soon arose as to the meaning of some of the requirements of the Act, and in consequence the district surveyors convened a conference of representatives of the R.I.B.A., the District Surveyors' Association, and the Concrete Institute. The conference met in the early days of the war, with Mr. F. R. Farrow, F.R.I.B.A., s chairman, and Mr. H. Kempton Dyson s hon. secretary, and their report was elayed by the war and has just been ssued in the journal of the Concrete nstitute.

Experience has shown that it was unwise to include rules for design in an Act of Parliament, and that it would have been much better for the Act merely o authorize the preparation of regulations to receive the assent of the Government Department concerned, and to be placed on the "table of the House" for discussion in Parliament should any ggrieved person wish to ventilate his views. This procedure was, in fact, ollowed in the case of the Reinforced Concrete Regulations, and has the great dvantage that the regulations can be mended without involving the starting troubles of the machinery for bringing in an amending Act of Parliament.

As a matter of fact a new "omnibus" London Building Act for bringing into line the very many Building Acts of the past is long overdue, but we cannot hope for this to come into being for several years; meanwhile the Joint Conference Report will act as a very useful relief from some of the most onerous provisions of the Act. The report cannot, of course, alter the Act, but by giving liberal interpretation wherever possible some of the greatest hardships have been in part remedied, and the report is drafted with considerable skill, and merits a close study by structural engineers and architects.

In this article it is proposed to explain the principal provisions of the report, and to illustrate by numerical examples the effect upon detail design of some of its recommendations.

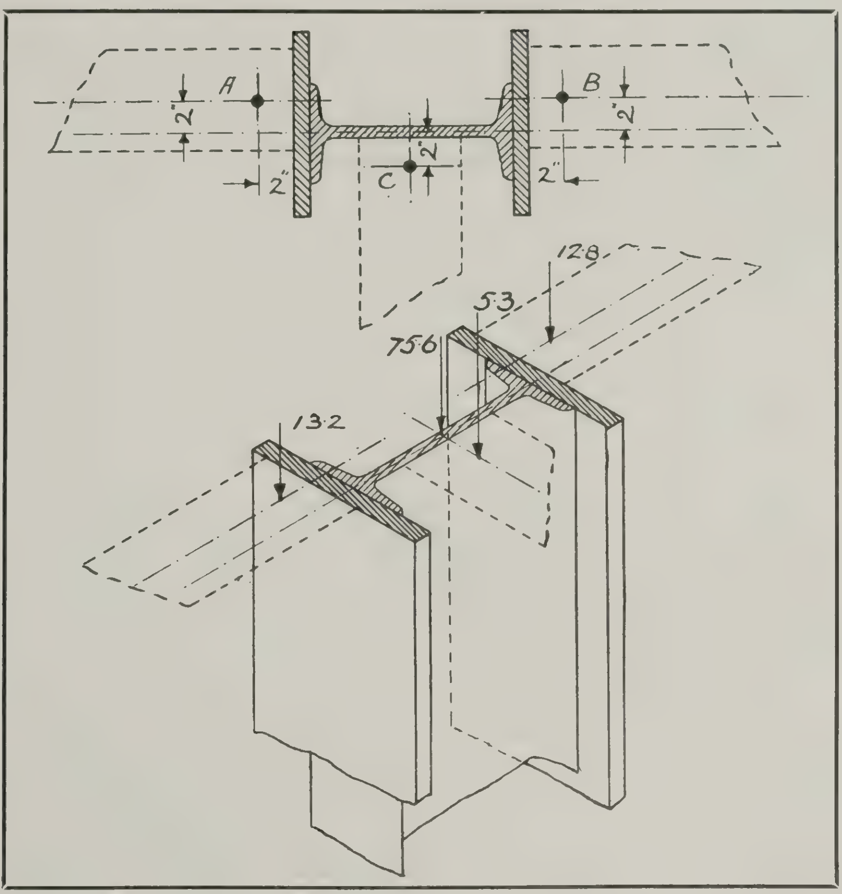

DIAGRAM INDICATING LOADS ON PILLAR.

The Design of Pillars

We will deal first with this question because it is one of the most important, and certainly the most complicated question, of the subjects in steel-frame design.

Fixity of Ends of Pillars.

Most district surveyors have held in the past, and rightly so, that the end condition of pillars employed in steel-frame buildings does not conform to the theoretical condition known as "both ends fixed," assumed in deriving pillar formulæ. But the stresses allowed by the Act for "both ends fixed" are lower than those given by the most reliable formulæ for "one end fixed and one end hinged." The report, therefore, wisely suggests that under certain conditions pillars may be regarded as having "both ends fixed."

These conditions may be summarized as follows:—

1. The pillar must be continuous and, if jointed, joints must occur at or near a beam-level.

2. The joints must have spice plates to each flange of thickness not less than $\frac{1}{2}$ in., and must be designed to comply with conditions specified.

3. A pillar must be connected in the direction of the radius of gyration under consideration by a beam connected by closely fitted cleats above and below. These cleats must not be less in thickness than $\frac{1}{2}$ in., or $\frac{1}{4}$ in. less than the rivet diameter; there must be at least two rivets of diameter not less than $\frac{3}{4}$ in. in any one leg of such cleats, and the sectional area of rivets in any one leg shall not be less than

$$\tfrac{1}{4}\cdot A_f\,\frac{d_p}{d_b},\ \text{where}$$

A_f = Sectional area of one flange of the beam.

d_p = Diameter or thickness of pillar in the direction of the beam.

d_b = Depth of beam.

---

* Copies may be obtained, price one shilling, from the ecretary of the Institute, Denison House, 296 Vauxhall ridge Road, S.W.1.

Any additional rivets necessary to carry the shear of the beam must also be provided in the bottom cleat.

Eccentric Loading of Pillars.

The report recommends a relief upon the usual practice in the troublesome matter of eccentric loading of pillars in the case of continuous pillars, but this concession does not apply to the top length.

If e is the eccentricity of the load, the resulting bending moment for a load P' may now be taken as $\frac{P'e}{2}$.

The value of the eccentricity e in the following cases is to be as follows :—

(*a*) Single-web Connections.—One-half the projection of the cleat or 2 in., whichever is greater.

(*b*) Double-web and Flange Connections.—One-half the thickness or diameter of the pillar measured in the direction of the length of the beam.

The report also makes clear a point which has in the past often been neglected by designers, namely, that in the case of oblique loading, when an eccentric load is not placed upon one of the principal axes, the flexional stresses due to each principal axis must be calculated separately and the results added together.

Numerical Example

To make clear the fact that these concessions have real effect in economizing the amount of steel required in pillars we will illustrate them by a numerical example. To save space we will take pillar P from the excellent detailed calculation given in Mr. W. Cyril Cocking's text-book on "Steel-Frame Structures," published by Messrs. Scott Greenwood and Son.

In the bottom length of this pillar the loads are made up as follows :—

Load from above = 75·6 tons
,, at A = 13·2 ,,
,, ,, B = 12·8 ,,
,, ,, C = 5·3 ,,
Total .. 106·9 tons

(*See Illustration on previous page.*)

On the previous method of calculation the equivalent central load 156·5 tons and the section adopted was a 12 in. by 6 in. by 54 lb. **I** with three 10 in. by ⅜ in. flats each side.

The length of the pillar is 132 in. (the report lays down that the length is to be measured between the upper surfaces of successive girders).

The area of the section is 38·4 sq. in., so that the stress per sq. in. is $\frac{156{\cdot}5}{38{\cdot}4}$ = 4·08 tons, whereas the permissible stress considered as one end fixed and one end hinged is 4·15 tons per sq. in.

Now let us see what section would be suitable if designed in accordance with the report.

As a first approximation we take the addition for eccentricity as one half of its previous value, viz., $\frac{156{\cdot}5-106{\cdot}9}{2} = 24{\cdot}8$

$\therefore$ design load = 106·9 + 24·8 = 131·7 tons.

It is clear that we shall be enabled to use a smaller section, the radius of gyration (g) of which will be less, and 2·00 in. will be a reasonable value to assume.

This gives $\frac{l}{g} = \frac{132}{2} = 66$, and for this slenderness ratio the permissible stress is 4·85 tons per sq. in. for pillars fixed at both ends.

$$\therefore \text{area required} = \frac{131{\cdot}7}{4{\cdot}85} = 27{\cdot}2 \text{ sq. in.}$$

A 12 in. by 6 in. by 54 lb. **I** with one 10 in. by ½ in. plate each side gives 28·4 sq. in.

Our saving is, therefore, 38·4 − 28·4 = 10·0 sq. in., which represents a saving of 26 per cent.

We have now to check back for this section : $g = 2{\cdot}16$ in. [See "Andrew and Cocking's Pillar Tables." Pitman.]

The loads at A and B are so nearly equal that we can neglect their eccentricity.

Eccentric load at 2 in.

$$= 13{\cdot}2 + 12{\cdot}8 - 5{\cdot}3 = 21{\cdot}7 \text{ tons.}$$

$$\therefore \text{effective BM} = B = \frac{21{\cdot}7 \times 2}{2} = 21{\cdot}7 \text{ in. tons.}$$

$A = 25.9$;

n = distance to extreme edge = 5 in.

$\therefore$ stress due to bending

$$= \frac{Bn}{Ag^2} = \frac{21{\cdot}7 \times 5}{28{\cdot}4 \times 2{\cdot}16^2} = {\cdot}82.$$

$$\text{Direct stress} = \frac{106{\cdot}9}{28{\cdot}4} = 3{\cdot}76 \text{ tons per sq.in.}$$

$$\therefore \text{total stress} = 3{\cdot}76 + {\cdot}82 = 4{\cdot}58 \text{ tons per sq. in.}$$

This is clearly less than the permissible stress which will be a little in excess of the 4·85 assumed, because the slenderness is now a little lower.

Solid Steel Pillars.

The report points out that by the bases specified by the Act the use of solid steel pillars are precluded, but states that they may be employed in isolated situations subject to the condition that such pillars shall not be considered as adding to the stability of the building, and provided that certain rules of design set out in detail are complied with.

Miscellaneous Provisions.

A number of other interesting and important points are dealt with in the report, a summary of which is as follows :

In calculations relating to rivets the diameter of the hole is to be taken as the diameter of the rivet.

Where twin beams are employed gas barrel and bolt separators may be used if the space between them is filled with concrete; but where the beams are close together cast iron separators should be employed.

The report is accompanied by four appendices.

The first, by Mr. H. Kempton Dyson, deals with the stresses in mansard roofs based upon the theorem of least work. The resulting formulæ are, of course, complicated, but they should be studied in detail, and it will be found that their application in practice is not nearly so troublesome as the mathematical expressions in the formulæ lead one to fear. Mr. Dyson is to be congratulated on having given a useful addition to the literature of the subject.

The second appendix is by Mr. W. C. Perkins, and deals with dimensions of rivet heads.

The third appendix comprises a note by Mr. Dyson on shear on rivets in compound girders.

The fourth appendix is written by Mr. Perkins, and Mr. E. F. Etchells deals with the design of splice plates in pillars.

The Stresses of Some Important Structures

At the last meeting of the Birmingham Architectural Association Mr. H. Jackson, A.M.I.C.E., A.M.I.M.E., read a paper in which he discussed the stresses in some important building structures and their transference to the ground. Members of the Birmingham Institute of Civil Engineers were invited to the meeting.

Mr. Jackson said that it was impossible to draw a hard-and-fast line of distinction between those structures which might be called architectural and those which might be called engineering. The former must of necessity comply with the laws of statics to be possible, while the latter, if they were to be pleasing as well as useful, must not offend architectural good taste. When, however, structures verged on the border line of the untried, when new and daring conceptions were anticipated, the co-operation of the two special branches of knowledge became desirable, and this joint meeting of the associations was an endeavour to foster this spirit of co-operation.

They had to live by their profession, and if part of an architect's fees were to go in paying for an engineer's co-operation so as to save his clients expense, and at the same time reduce the sum total of his own fees, he had little inducement to seek co-operation.

The first building Mr. Jackson discussed was the Roman Catholic Cathedral at Westminster. He showed several drawings and lantern slides, illustrating the construction of the dome and its supports, and also showed, by means of a small model, how the horizontal force necessary to prevent the bursting of the dome was supplied by the supports.

Passing to the question of the foundations, Mr. Jackson said that uniform stressing of foundations was necessary if local sinking was to be avoided, and instanced the case of St. Paul's Cathedral, in which serious sinkings due to the uneven distribution of loads had taken place.

The second building the lecturer referred to was the Liverpool Cathedral, in illustration of which he exhibited a blue print showing the plan of what was nominally the east end, and an original drawing showing sections, which, he said, Mr. Gilbert Scott had kindly lent him.

Lastly Mr. Jackson discussed the roof of the Westminster Hall, and showed a lantern slide of a model of the truss, illustrating the way in which the walls had been forced inwards.

At the conclusion of the paper a vote of thanks to the lecturer was proposed by Mr. C. S. Madeley, A.R.I.B.A., and seconded by Mr. J. B. Surman, A.R.I.B.A., and a discussion took place on the desirability or otherwise of introducing tension resisting members into buildings of a monumental character.

The vote of thanks to Mr. Jackson was then carried unanimously.

Professor Abercrombie on Universities

THE announcement of a lecture on the Site of London University aroused expectations of a lively ontroversy; but when Professor Aber- ombie rose to address the Town- lanning Institute it appeared that there ad been some slight misunderstanding, nd that the subject of his lecture was to e "The University in Relation to the lanning of the City."

The position in the City which the niversity should occupy is, said the eaker, one of those problems which the actitioner of town-planning must face, nd of which he must sooner or later tempt a solution. One of the interests well as one of the difficulties of the bject was the absence of well-known ata. On the superficial analogy of the ost office or library it might be thought at the university, occupying its logical osition at the apex of the educational dder, should be found invariably at the ltural focus of the City.

The university, however, was by no eans always the same type of institu- on, and within it were two factors con- nually attracting in opposite directions, e intellectual drawing it towards cen- al institutions, libraries, hospitals, useums, and even business life, and the sidential drawing it outwards into the untry for playing fields, fresh air, and quiet. In many cases, again, historic associations and sentiment outweighed practical reasonings.

The attitude of the thoughtful town-planner was neither, on the one hand, to allow that the university was right in growing up wherever it happened to find itself, either scattered or huddled, or, on the other, that very much more was involved besides planning grandiose groups of buildings on any vacant site that appeared to offer itself for a display of architectural virtuosity.

Professor Abercrombie then proceeded to illustrate various types of university towns, capital cities, commercial boroughs, university towns proper, and American universities.

Every capital city should possess its university, which would naturally have a certain national quality in it. Paris was the clearest type of the capital university, the city being formerly divided, and so marked on all the old maps, into three, La Cité, La Ville, and L'Université. This was the ideal arrangement, the quarter of learning—le Quartier Latin—self-contained, a world in itself, with its own valuations and standards.

The claims of open-air exercise had in recent years given strength to the pull of the country magnet. In the great Paris competition of 1920 two of the competitors projected a cité universitaire, both choosing the old Parc de Seeaux. The winning competitor proposed to transfer the whole teaching apparatus of the University of Paris to this spot, leaving the Sorbonne as the Grand Palais des Réunions Academiques, but this project was not likely to be realized.

There was considerable support for the alternative scheme for a cité universitaire purely residential, adjoining and forming part of a very large suburban development projected south of Moudon. There would thus be no suggestion of an isolated community of academic recluses.

In Berlin the chief building of the university was much more in evidence than the Sorbonne. It takes its place as one of the official buildings of the Empire, and next to it is the library.

In Edinburgh, the university was originally housed in a single large building designed by Robert Adam. It had now burst these limits, and there was the McEwan Hall for graduation ceremonies, the medical school and other institutions, grouped close together; next door to the original building was the Scottish Museum.

Trinity College, Dublin, introduced two entirely new elements; firstly, it was partly residential, and secondly, it possessed what was called elsewhere a campus—though centrally placed it had ample space and almost the seclusion of a country situation. It was enclosed in a block of twenty-eight acres in the heart of the city.

While Edinburgh and Dublin were building up their universities, London, relying on the vicarious offices of Oxford and Cambridge, remained without a university—a mistake for which she was paying now.

The problem of London was more complicated than that of any other city with a university in it. There was, firstly, the fact that it contained in its organization a feature which is to many the negation of a university function, it was in part an examining body which did not teach. Its teaching also, however, was on a colossal scale, three full colleges of which two were each as big as the larger provincial universities and a mass of smaller institutions of which the medical schools attached to the hospitals formed the most homogeneous block. Among many schemes to draw together some of the scattered fragments of the largest university in the world four were outstanding: (1) the concentration of as many as could be moved on to a site in Bloomsbury contiguous to University College, and the creation of an academic quarter of which the intellectual focus was the British Museum. For this purpose the Government had already given eleven acres; (2) the development of a new site at Lambeth, presumably for the administrative headquarters and King's College: the latter would give the south bank a teaching institution to balance University College on the north; (3) the removal to Kenwood, close to Hampstead Heath: but whether for teaching, administrative, or only residential, was not certain; (4) less remote, Holland Park had been suggested as a site large enough to allow a spacious lay-out almost

FROM A CARICATURE BY H. DE C

on the lines of an American campus, utilizing Holland House.

The first of these was the official scheme to which the others were suggestive alternatives.

The lecturer, after describing numerous other university towns both at home and abroad, proceeded to discuss the problem of location. He said: The three sorts of location are, urban, suburban, and country. In the case of an urban location a central situation has clearly many advantages on the academic side, particularly in a capital city where are co-related institutions on a national scale. Its drawbacks, however, become acute where the site is incapable of, or too expensive for, expansion, or where the centre of the town was unhealthy to live or work in.

The scattering of the parts of a university is generally found to be wasteful. The four colleges of the Welsh University are necessarily separated to serve the whole of Wales, and the shadowy headquarters would appear to be in Shrewsbury. But there does not seem to be the same necessity for separation in London, the whole Metropolitan district of Greater London being a single geographical unit with a clearly marked heart, the arteries of which grow in volume as they approach the centre.

It can hardly be said that there is a truly suburban university in this country except a part of Birmingham; New York and Chicago are, however, clear examples. The drawbacks are obviously remoteness from the central institution, loss of touch with extension and continuation work and city life generally.

In the country, if a central site were inevitable, then the most careful civic survey in all its bearings must be carried out in order to be sure that the right quarter of the city has been settled upon.

With regard to methods of planning and growth there are three broad types of universities: the continental or single building, the English or quadrangle, and the American or campus and group. The Sorbonne is the greatest example of this continental concentration of a university into one building. Efficiency of administration is the key note. In England the quadrangle is an inheritance from the monastery. The efforts aimed at may be described as internal to the college rather than external to the town; the typical front had originally a fortified character with a gateway as its chief feature. In its method of growth much might be said in favour of the quadrangle, proceeding by means of enclosed units which can be added *ad libitum* without the new endangering the old.

The openness of the campus was as natural to America, a new country, as the enclosed quadrangle to this old country. In the campus method the departments of the university were scattered about a park and were naturally among trees. At first this might suggest a lack of unity, but that depends upon the type of park, whether picturesque or formal. In some of the older universities after a first roughly grouped square the other and later buildings have almost been allowed to squat anywhere, and Princeton looks as though it is built in the open glades of a wood. In Virginia, a rotunda forming the library is the climax of the composition, a logical position which has become almost a recognized arrangement.

The effect of the campus on a university is seen at aglance, but as in all unified sonceptions, it is difficult to provide for future growth. Speaking of residential aspects, Professor Abercrombie said that it was possible to build dormitory blocks close to the teaching blocks of the college buildings, as was happening in many American colleges. For the non-residential student who lived at home, the central site was certainly the best as most routes converged, but it was dangerous to lay down rules. It was quite conceivable that a situation on a ring road that linked up all the suburbs and was capable of taking rapid cars would provide easier access.

Proposing a vote of thanks to Professor Abercrombie, Sir Gregory Foster said that he hoped his extraordinarily interesting and comprehensive lecture would be published.

The problem of university location was a difficult one, especially in London, where it was proportionate to its size. They had started late, and this added to the difficulty. It was impossible to locate the site of the University in one place. They had 36 colleges and 20,000 students, and it was undesirable, and might even be unsafe for London, to locate them all in one place.

In the University of the capital of the Empire undergraduate life and work were not the main feature; 70 to 75 per cent. of the students resided at home, and this state of affairs was likely to continue.

Extension was not as necessary as were facilities for making good gaps in the provision of post-graduate research, facilities which is most important. In pre-war times the majority of the students went to German universities for advanced work. Their task in relation to the general population was the provision of tutorial classes for the lower classes.

The heart of London was the best site for additional buildings. The University had no adequate headquarters, half of it being situated at the Imperial Institute. This was an inconvenient site for two-thirds of the senate and staff. They intended to erect a Senate House and administrative headquarters in Bloomsbury.

It had been proposed to move King's College to a position south of the river. This would be practicable if each college was to be a cosmos by itself. But staffs must co-operate if work was to be effective, and bringing the colleges together would effect a great educational advance.

Captain Swinton dwelt on the enormous advantage of space for purposes of extension and for the buildings to be properly seen. The desire of Paris University to keep to the Quartier Latin was unfortunate. In Edinburgh a fine building was hopelessly shut in, and they had bought 100 acres a mile and a half away. Cardiff had the advantage of belonging to an enlightened nobleman who had held up a large site in the centre of the city—castle, park, and 50 acres.

They were a town-planning body met to discuss town planning, and communications and power of expansion were, therefore, axiomatic. The 50 acres of South Kensington buildings were due to the forethought of the Prince Consort, and that, with the 70 acres now available in the Holland Park site, should be combined into a campus. When the Bloomsbury site was accepted they did not know Holland Park was available, but as soon as it was known a large majorit asked the Government to reconsider th matter. No reply had been received, bu he hoped they would stick to their guns They ought not to cram up old centres but to get new ones.

The University in Bloomsbury was between three great railway stations.

Professor Adshead said that the Tow Planning Institute had no view as to th location of the University. Circumstances differed all over the world, London, for instance, was totally differen from the campus type in America. Th first essential was a site for new administrative buildings and senate house, wit a great library as the centre. This the had in the British Museum, and University College was a real university, hug buildings with many departments co lected into the same area. The Bloomsbury area should develop into a Sorbonn and a centre of post-graduate research. would be impossible to uproot it at th stage.

A woman student at University Colle dwelt on the importance of the proble to the students themselves. They o jected to being removed from real li Lectures were not all-important. R search, reading, and university life we also essential.

Mr. Haywood on Amenit

For another of his town-planni lectures at the Birmingham Universi Mr. William Haywood, F.R.I.B.A., to for his subject "Amenity." He said th in the records of town building throu 4,500 years—reference to which he h made in previous lectures—the two ou standing factors to which attention h been directed, and by which success town design had been measured, we structural convenience and beauty of for

Where one of these factors had be deficient in early cities, convenience h usually given way to amenity. Athe did not forget convenience, she co demned it. She concentrated on beau Florence made no reference to utility her decree of 1294, but set about the building of Santa Maria Reparata w much "prodigality of magnificenc And it would usually be found that wh a community thought collectively gracious environment would accompa convenience, or exist without it.

In modern Paris beauty had been consistently sought for and as succe fully achieved as traffic convenience a general plan efficiency, although it probably more difficult to secure amen and convenience together than either them apart. It was also evident that the promoters of our own Town-Plann Act of 1909 both factors were of eq importance, yet it could not be said t they retained this relation in pract and hence it was necessary to stress value of beauty in towns. This va could be most effectively demonstra in the great building periods of the p but while the past might stimulate example, it could not properly serve a model. Modern cities which sought give their growth an appropriate exp sion must effect this by an imagina treatment of their own vital energ Industry and its equipment had m potential beauty, and industrial ci offered great opportunities for a new t of expression in civic design.

Correspondence

The Registration Bill

To the Editors of THE ARCHITECTS' JOURNAL.

IRS,—In view of the R.I.B.A.'s pro- al to bring before Parliament a Bill the registration of architects, I sug- t that it would help matters consider- y if each architect were to approach member of Parliament with a view btaining his support.

S. H. LOWETH.

luminating Engineering Relation to Architecture

To the Editors of THE ARCHITECTS' JOURNAL.

IRS,—May it be permitted to one who for many years been an ardent lent of illumination, in all its aspects, express regret at the narrow view ch the paper by Mr. Lawrence M. Tye blished in your issue for November 29) es of that wide and interesting sub- , which is, to architects especially, also extremely important one.

t is, I suggest, most unfortunate that author, instead of dealing with illu- ation, should have dealt exclusively n certain methods of obtaining it. l more unfortunate is it that these hods should have been illustrated, I ik exclusively, by the practice of one n, as if one would illustrate the rela- of wood-carving to architecture by cribing the chisels used by one eminent tsman.

he architect, as the responsible master tsman, is not so much concerned with s, theoretical or practical, as with the lt. He is concerned with illumina- in its utilitarian, hygenic, and hetic aspects. The minutiæ of light- he can leave to those whom he em- s to give him such illumination as he cifies. He should, of course, be able specify the intensity in foot-candles ch he requires, and to measure that nsity. He is also concerned with its ur, direct and reflected, with its con- ts no less than with its uniformity, the depth of its shadows, its free- from glare and its effect upon that ricious and apparently unreasonable bination the human eye and mind. is concerned with its broad utilitarian ects of first cost and running cost and suitability for the varying require- ts of human industry, and he must be unmindful of its hygienic aspect, e or eye-strain being to him the result bad craftsmanship, which he must and will not have at any price.

or are his interests confined merely rtificial light, any more than they are ricted to any one form, such as nent or gas-filled lamps. Gas is a thy rival of electricity, and rapid ances are being made in the use of light lamps, the light from which ld possess all the main physical acteristics of daylight and not merely same spectrum, as was stated in anation of one of the slides. We w of their adoption in drapers' shops manufacturers' test rooms, but they also coming into use elsewhere, in art ols, for instance. They may prove to involve less eye strain, and become the standard artificial illuminant. Daylight itself, with the photometry of which I have been more particularly associated, is to the architect really a form of illumination, his windows being the lamps. He needs not only data of the hours of sunlight to be expected to enter any window, but of the light from that window on dull or wet days, and over or beside obstructions. The photometer will tell him what he has got when the buildings are completed. It will not tell him what he is going to get.

It may be said that in the foregoing there is sufficient to occupy several evenings, and that the author was wise to limit his scope. Possibly that is so, but on the other hand a paper that might convey the impression that the art and science of illumination—for it is both—can consist of a few elementary formulæ and some tools, means even more than a lost opportunity of securing the sympathetic co-operation of architect; it gives an unfair start to an utterly false impression.

Much data on the subject which I have indicated is of comparatively recent growth; much more awaits research, and it is hoped that architects will in increasing numbers avail themselves of the labours of members of the Illuminating Engineering Society, and will assist in those labours. That society is by no means composed entirely of engineers; some of its members are scientists or physicists, some, like its president, are ophthalmic surgeons; others are architects. The society studies broad results and the best means of obtaining them. It collates information from all over the world. It welcomes new methods and tools, but it also criticizes them very freely.

In many ways it might assist architects by indicating the extent of knowledge which exists at any time with respect to any given problem, such as daylight lamps, the natural and artificial lighting of hospitals, cinemas, churches, factories, etc., in order that the architect may ascertain whether reliable data exists which he can use, or, if he must rely wholly on his own judgment, whether any boundaries have been set to the problem, so that his labour may be minimized.

The architect is responsible and must make his decisions. The illuminating engineer can help him, but that is all. If he tries to abrogate to himself the position of the architect, the latter will inevitably fall back upon rule of thumb and common sense, and do the best he can by himself. And it will not be a very bad best either, for by the time that a man of trained observation is satisfied (and there will be no final payment until he is) there will not be very much to grumble at.

His methods of predetermining results may seem rather crude and elementary to the engineer, and he may make mistakes; but the very crudity and simplicity of his mental deductions will probably protect him from any very glaring mistakes. The very slowness of trial and error methods may be his salvation, whereas the rapidity of more scientific methods applied to a new and partially explored subject may easily invite disaster. Unfortunately, when an illuminating engineer makes a mistake it is almost bound to be a "glaring" one, in some directions at least, and generally in all.

Scientific methods of calculation must necessarily depend for their accuracy upon accurate data, and wise illuminating engineers recognize, of course, that we are greatly in need of more and better data, if only to correct figures which were hurried prematurely into print in the early days, and have been copied and quoted wholesale.

Take, for example, the familiar American table of artificial illuminations which, as the paper states, appears in the catalogues, though not, I believe, in the practice, of many firms. I have often wondered whatever could have induced its compiler to recommend so many values which are so greatly in excess of what people need, or even of what they could endure. Too much artificial illumination can be far worse than too little, for our eyes are only accustomed to take in very moderate intensities of light. The illuminations of daylight are enormous, and they vary enormously, but the iris diaphragm of the eye stops them all down to a small amount, probably two or three foot-candles. Unfortunately the iris diaphragm does not work properly under artificial light, and we only need high illuminations, such as four to ten foot-candles, when viewing substances or fabrics which reflect only a small proportion of the light falling on them; dark clothes, for instance. Objects are not seen by the light thrown on to them, but by that which they reflect back into the eye. If the five foot-candles recommended were adopted in elementary school class-rooms where slightly glazed paper was in use the school medical officer would have his hands full.

The Committee of the Illuminating Engineering Society which investigated school lighting very exhaustively some years ago restricted its recommendations to a minimum of two foot-candles, and even in America a minimum of two and a half foot-candles is now suggested. General offices with the five foot-candles recommended may exist, but I have not yet discovered them, whereas rooms with half that quantity seem excellent. Ask a draughtsman to work on tracing cloth under an illumination of five to ten foot-candles as recommended. He will immediately tie a handkerchief round the bulb or rig up a translucent paper screen. The most recent recommendations of the Home Office Committee on Factory Lighting are three foot-candles for fine work and five foot-candles for very fine work. The list in the paper recommends five to ten for fine work.

I would venture to suggest that before embodying in a specification any value from this table an architect should compare it with some installation of known intensity, or better still, find one which pleases him and measure it with his own photometer.

Architects and scientists are both aiming at the same goal, viz., illumination which shall satisfy the human eye. In this the trained judgment of architects should be invaluable, especially if they would acquire the habit of using photometers for recording the intensities which satisfy their trained judgment, recognizing and noting contrasting surroundings which might tend to affect or prejudice the result.

But before they can do this there must be cheaper and simpler photometers. If some enterprising firm would place on the market something similar to the "Bee" exposure meter, which can be made into a good and reliable little photometer for many purposes, architects would speedily find the subject of absorbing interest and could do most useful work.

In conclusion I should like to deprecate the suggestion that photometers or bald photometric measurements have any magical value of themselves in all ancient light cases. Photometric measurements will tell you what light you have before or after the offending building is completed, but they will not make prospective or retrospective measurements, or determine what light you are going to have, or what you might have had. The case quoted did not turn on the measurements taken by one of the parties, but on the evidence based on those measurements, coupled with suitable sky diagrams. I have used several types of photometers and studied many more, but I have never yet met one which could mesmerize a Chancery judge.

P. J. WALDRAM, Licentiate, R.I.B.A.

The Organization of Acoustical Research

To the Editors of THE ARCHITECTS' JOURNAL.

SIRS,—Your leading article on the "Organization of Acoustical Research," in your issue for November 29, was preceded by an editorial in your scientific contemporary "Nature," for October 28, to which there appears, in the correspondence of the issue of the latter for December 9, a complaint from Prof. Lyman, of Harvard University, to the effect that "the practical problem of predicting the acoustics of an ordinary auditorium in advance of its construction, or of correcting one already built, was solved by Prof. Sabine some twenty years ago," and, therefore, the repeated assertion in this country that the acoustics of buildings is a subject of which we know nothing "implies a lack of respect for Sabine's profoundly accurate and thorough work."

Prof. Lyman points out that no one who has taken the trouble to acquaint himself with the subject can maintain such an attitude, and as Sabine's work has now been gathered into a volume of "Collected Papers on Acoustics," there is even less reason than before for not being acquainted with the subject.

It is interesting to repeat the whole sentence in the leader of "Nature," of October 28, to part of which particular exception is taken: "Many of our public buildings erected by eminent architects show considerable faults in this direction (i.e., acoustically), and *as we may assume that these faults are not due to professional apathy*, it would seem that the laws regulating the production of a successful building for hearing and speaking have yet to be worked out."

Prof. Lyman implies that the assumption regarding professional apathy is not admissible, for "Architects in the United States," he says, "have become aware of the importance of Sabine's results," and as the proof of the pudding may be reasonably assumed to be in the eating, "scores of cases could be cited in which the application of the principles worked out by him has led to *complete success*." So the distinction between architects in the United States and those elsewhere who still clamour to the scientist for guiding principles in the construction of auditoria is apparently one of enlightenment.

One wonders what would be his comment on Sir William Pope's assertions that "quite a small expenditure of time, money, and intelligence would suffice to provide architects with knowledge which would render every hall acoustically perfect," and, "since no knowledge is available concerning the acoustical properties of a chamber, the blame for faulty acoustics is not his" (the architect's). In view of Prof. Sabine's life-long labours, their proved value, their endorsement by scientific opinion in general, and the continuing of his work by a number of scientists, it is very surprising either that such statements are so often quoted and regarded as authoritative, or that Sir William Pope has not already been approached to undertake to provide the knowledge required.

That further work is necessary in architectural acoustics is admitted. Prof. Lyman himself points out that Sabine has left to his successors a programme which was being worked out at the time of his untimely death in 1919, and which included the experimental investigation of questions "such as the transmission of sound through walls, the effect of resonance, etc." So without disputing the completeness and thoroughness of W. C. Sabine's researches, the solution of the problem as a whole is still incomplete.

Undoubtedly architects must take the lead, as you suggest. They want the information, and naturally they should pay for it, after the example of the many industrial concerns who maintain research departments. There is an alternative in individual enterprise.

In conclusion, it is well, perhaps, to draw attention to the fact that the spirit of research is rather foreign to the proposal of a committee with an "experienced organizer" to speed up matters with a view to getting rapid results. Let the architectural committee find the money, collect its experience, state its requirements, offer facilities for work, then leave the rest to the scientific man, and exercise patience and understanding, whilst following closely the course of events. The results may be expected to be more rapidly achieved in proportion to the number of competent workers engaged on the research. "Team-work" is becoming the watchword of scientific research, and when we get several teams striving towards the same goal, Prof. Ruckmick's suggestion (quoted in "The Times") of establishing an Institute for Acoustic Research will follow naturally.

P. ROTHWELL.

Exhibition at Devonshir House of Paintings an Drawings by Art Student

This exhibition, which has been arrange by a students' committee, is on behalf the Hospitals' Combined Appeal. A lar part of the proceeds of the sales is go to the all-important cause of th hospitals.

Mostly the London schools are repr sented, chiefly, the Royal Academ Schools, the St. John's Wood School Art, the Heatherley School of Art, th London School of Art, the Royal Colleg of Art, and the Regent Street Polytechni

Architecture is represented by th Architectural Association alone. Th work is generally good, with here an there a sense of inexperience and lack essentials, and here and there the wor of the older or more accomplished stu dents. If this is a representative exhib tion of the work of the present-day ar student—and I trust that it is—then should say that many of the modern ar students are just a little afraid of worl There seems in some cases to be a avoidance of anything that require accurate drawing, few of the pictures cor tain figures, and then only in a highly conventionalized and hieroglyphic form.

The composition in many of the pic tures leaves much to be desired. Ther is a certain carelessness in correct ton values and colour design. All this woul seem to point to the fact that some student are rather forgoing the craft of picture making in order to obtain greater facili ties in expression—a striving after a quic effect rather than the pure pleasure giving qualities of a picture.

As an architect one would alway suggest that the art student should study our methods of design and presentation and paint first in monotone.

There are, however, many exception to these criticisms, and those intereste would do well in visiting Devonshir House and discovering these for them selves. They would, no doubt, find some thing that would well repay them fo their visit; for—who knows? from these— are to be the great men of the future.

The pictures are not high priced, an the sales of them are to help a very worthy cause; moreover, one has thus an oppor tunity of seeing the interior of a fine ol house before it is demolished.

Among the many noticeable works would mention the following: The litho graphs and black and white drawings are generally quite good. No. 105, a figure study by Mr. A. Burton, is good, but perhaps there is a lack of indication in the figure the emphasis being on head and hands which are well drawn. Mr. D. M. Stacey's etchings of heads, "The Flower Seller" and "The Longshoreman," have vitality and good drawing without being laboured. No. 144, an unobtrusive miniature of a child, should not be unnoticed. The delicate pencilled drawing, No. 40, by Alma Elliott, has the quality of fine lace but it is rather a pattern than a design.

As to the oil paintings, the work of Mr. A. M. Burton, of the Regent Polytechnic, is worth special notice, especially No. 234, a small landscape of hills, which has light and air and a way out of the picture. On the other hand, his "The Sedge withered from the Lake" appears lack unity, because it has no cal point. The eye wanders over the cture and finds no way into it. This is common enough experience in architec- re, and like an otherwise good façade, requires a "brooch" or an "entrance" the bottom.

I like Mr. W. Strachan's "Along the nal." Yet, although it has light and eerfulness, I feel that the sunlit brick- rk of the bridge lacks warmth.

Mr. D. S. Paynter's "The Toilers," is an bitious effort but it is a little faulty in nposition. It is, in fact, two compositions th no efficient link between them, and a ure in the left half, presumably in the ckground, is of the same tone value as e figure in front of it. This picture, vertheless, is one of the few figure com- sitions shown, and its author has empted something more than most.

I should say that Mr. C. J. Kennedy, o sends a picture, "A Morning Flight," . 268, knows his subject. Mr. Mac Ivor- ierson, of the Heatherley School, in his r picture, "Mud" (No. 405), displays mind that is striving for something ove the ordinary. He has chosen a y difficult subject, and although he s obtained an effect, it is, I fear, rather the expense of good composition and rity. The contrast between the bility of the figures behind and the tability of the sinking figures in front not sufficiently expressed.

An interesting picture called "Flight," a member of the R.A. Schools, attracts ention, but the figures, a man and man, in their effort to get out of the ture, are almost falling out. The ting of the figures with the long, wind- road behind them is expressive with- t them, and the picture might be ppier if they had disappeared from it ogether, leaving their footprints on road behind them.

Among the water-colours special men- n should be made of Mr. D. H. Banner's oat Fell." I like its feeling of space. . Banner has the courage to go on and sh his pictures. No. 310, a landscape Phyllis Dod, should be noticed.

The architectural drawings are a loan lection. They are not new, and so are niliar to most of us. A small sculp- ed group, "Hagar and Ishmael" . 457), by Cecil Gunthorpe, is one of best things in the exhibition; and head "Judas," by Michael C. Hamp- , although excellent in its way, is quite sufficiently convincing. F. E. T.

Irish Furniture at the V. and A. Museum

t appears not to have been generally ognized that during the eighteenth tury furniture of a very high standard execution was produced in Ireland, owing the main lines of the English les of the period, but with character- c differences. A group of examples of s class has now been arranged for ibition in the Loan Court of the Vic- ia and Albert Museum. Those lent by s. Bruce are of inlaid satinwood, hare- od, etc., and consist of a pair of com- des with finely executed decoration in Adam style, with a pair of tall estals and corner-cupboards of similar racter. Mrs. Bruce also contributes air of small tables and a wine-carrier ch correspond more with the style of raton.

R.A. Schools Prize-winners

Below is the list of prizes and prize-winners of the Royal Academy Schools. Sir Aston Webb, P.R.A., made the presentations.

As reported in our last issue, Sir Aston Webb, in his address, congratulated the students on the standard of work sent in, and hoped that the students of painting and sculpture would co operate more with those studying the allied art of architecture.

The speaker went on to say that everyone nowadays was trying to "learn without tears"; they knew, he was sure, that it could not be done. Like gold tried by fire, work must be learned with pain.

Speaking of the exhibition of mural painting, to be held at the Royal Academy in January, he said: mural painting was contemporary with the oldest of the arts—architecture; and as men began to build they also began to decorate their buildings in colour and relief. He would like to remind them that mural decoration does not mean painting pictures on panels and leaving the surrounding walls untouched. Mural decoration entails a knowledge of painting, and much sympathy with the architecture it is called on to decorate. Often in these days an architect erected a building, a sculptor was called in independently for certain work, and a firm of "decorators" was given a free hand to do the rest. There should surely be one controlling mind over the various arts employed to ensure a complete work of art.

It was this art of decorative painting—as it seemed to him—that provided a great opportunity for the student. The master mind prepared the general scheme, but many busy minds and brains were required to carry out the work under his constant advice and encouragement. The student would soon find the study of architecture indispensable to him. He would soon learn that colouring must extend beyond the limits of the picture if it was to become truly decorative, that mass was more important than detail, and that composition, proportion, colour, and form were all dependent one on the other to obtain a complete whole.

Touching on the power and versatility of the great mural painters of the past, from Giotto in his chapel at Padua to Michael Angelo in the Sistine Chapel, and on to our own times with such men as Alfred Stevens, Burns Jones, and G. F. Watts, the speaker said that we were fortunate in having some very fine decorative painters amongst our members to-day.

Design in Monochrome for a Figure Picture.	(a) The Pool of Bethesda .. (b) "Now when the sun was setting, all they that had any sick with divers diseases brought them unto Him; and He laid His hands on every one of them, and healed them."—*St. Luke*, iv. 40.	Armitage Prizes, 1st (£30) and Silver Medal.	Constance Emily Edith Grant.
		2nd Prize (£10) and Bronze Medal.	Not awarded.
Landscape Painting	A Country Road	Creswick Prize (£25) and Silver Medal.	Not awarded.
Design for the Decoration of a Portion of a Public Building	The Arts	1st Prize (£30) and Silver Medal.	Reginald Lewis.
		2nd Prize (£10) and Bronze Medal.	Constance Emily Edith Grant.
Composition in Colour		Prize (£10) and Silver Medal.	Barbara Cayley Robinson.
Set of Four Drawings of a Figure from the Life.	.. ..	1st Prize (£15) and Silver Medal.	Eleanor Barbara Georgina Shiffner.
		2nd Prize (£10) and Bronze Medal.	Kathleen Mary Hornung.
Two Paintings of a Figure from the Life.	.. ..	1st Prize (£10) and Silver Medal.	Margaret Maitland Howard.
		2nd Prize, Bronze Medal ..	Eleanor Barbara Georgina Shiffner.
Cartoon of a Draped Figure ..	A Suppliant	Prize (£25) and Silver Medal.	Margaret Maitland Howard.
Portrait Study of a Lady in Evening Dress showing Arms and Hands.	.. ..	Arthur Hacker Prize (£30) and Silver Medal.	Constance Emily Edith Grant.
Painting of a Head from the Life, Life Size.	.. ..	Arthur Hacker Prize (£20) and Silver Medal.	Violet Muriel Baber Mimpriss.
Set of Three Studies of Drapery.	.. ..	Silver Medal	Margaret Maitland Howard.
Drawing from the Antique ..	.. ..	Prize (£5) and Silver Medal	Not awarded.
Painting from Still Life ..	.. ..	Prize (£5) and Silver Medal	Margaret Maitland Howard.
Perspective Drawing in Outline (open to Painters and Sculptors only).	The Entrance Hall of the Royal Academy from the East End.	Prize (£5) and Silver Medal	No Competition.
Two Models of a Bust from the Life.	.. ..	1st Prize, Silver Medal ..	Daphne Mayo.
		2nd Prize, Bronze Medal ..	David Evans.
Set of Three Models of a Figure from the Life.	.. ..	1st Prize (£15) and Silver Medal.	Daphne Mayo.

Model of a Design	"Aquarius": a Fountain ..	Edward Stott 1st Prize (£50) and Silver Medal.	Not awarded.
		Edward Stott 2nd Prize (£20) and Bronze Medal.	David Evans.
Model from the Antique ..	.. ..	Prize (£5) and Silver Medal	No Competition.
Model for a Medal or Coin ..	The Visit of H.R.H. The Prince of Wales to India.	Prize (£5) and Silver Medal	No Competition.
Design in Architecture ..	A Memorial Chapel	Travelling Studentship (England) (£60) Tenable for one year.	John Oliver Brook Hitch.
Set of Architectural Drawings	The Lion Gate, Hampton Court.	1st Prize, Silver Medal ..	Richard George Cox.
		2nd Prize, Bronze Medal ..	Not awarded.
An Architectural Design (First Term Students only).	.. ..	1st Prize (£15) and Silver Medal.	Sidney Harold Loweth.
		2nd Prize (£10) and Bronze Medal.	Not awarded.
Perspective Drawing in Outline (open to Architects only)	The Lion Gate, Hampton Court.	Silver Medal	No Competition.
An Original Composition in Ornament (Architects only).	.. ..	Prize (£5) and Silver Medal	No Competition.

The Landseer Scholarships in Painting and Sculpture, of £40 a year each, tenable for two years, have been awarded—in Painting to Leslie J. G. Smith and Lilian J. Minard; in Sculpture to David Evans.

The following awards were given for Architecture :—

Travelling Studentship (England) £60 : John Oliver Brook Hitch.
Measured Drawing, Silver Medal, The Lion Gate, Hampton Court : Richard George Cox.
Architectural Design, £20 and Silver Medal : Romilly Bernard Craze.
Architectural Design, Silver Medal and £15 : Sidney Harold Loweth.

Housing and Town Planning

The Need for Revised Financial Co-operation

THREE alternative proposals with regard to the future terms of financial co-operation between the State and local authorities in connection with State-aided housing schemes are among the matters to be considered at a series of conferences which are being convened by the National Housing and Town Planning Council. These proposals are given in the course of a review of the progress made in the housing and town-planning movement during the past five months.

The Review states: In July last a representative deputation comprising leading members of local authorities and various associations interested in housing and town-planning administration was received on behalf of the late Government by the Minister of Health (Sir Alfred Mond) and the Secretary for Scotland (Mr. Munro). In the replies then given by these Ministers two points were made clear.

Replying to Mr. F. M. Elgood (Chairman of the National Housing and Town Planning Council) Sir Alfred Mond stated that proposals had been submitted to the Cabinet by his colleague and himself relative to the building of a further number of houses by local authorities when the 176,000 included in the present limited programme had been completed.

It was, however, made clear that in the event of a further instalment of the great housing programme of 1919 being sanctioned the terms of financial co-operation between the State and the local authorities would be profoundly modified. On this point Sir Alfred Mond said:—

"There is a considerable feeling throughout the country that the penny-rate scheme is by no means the best scheme that can be devised. That is shared by a good many local authorities, who prefer greater freedom. I personally feel that local authorities would have done better if they had been allowed greater freedom. I do not think public opinion would tolerate the continuance of the present scheme as it stands."

In view of the fact that, although no final decision was reached by the late Government relative to the proposals thus foreshadowed, a change in the terms of financial co-operation between the State and the local authorities would, without a doubt, form the basis of any new instalment of the housing programme of 1919; a joint meeting of the Committees of the National Council throughout England and Wales and Scotland has now been held for the purpose of preparing the agenda for a series of representative conferences of local authorities to be held throughout Great Britain early in the coming year.

The first of these conferences will be held in the McLellan Galleries, Glasgow, on January 23 and 24, with Sir Henry Ballantyne (Chairman of the Royal Commission on Housing in Scotland) in the chair.

On January 25 and 26 a conference for Lancashire and Cheshire will be held in the Memorial Hall, Manchester, with Councillor Harold Shawcross (Rochdale) in the chair.

On January 30 and 31 a conference for Yorkshire will be held in the Town Hall, Leeds, Mr. F. M. Elgood (Chairman of the National Housing and Town Planning Council) presiding.

Further conferences following these in quick succession will be held at various other centres in England and Wales.

With regard to the question of future terms of financial co-operation between the State and local authorities the representatives attending the conferences will be asked to consider the three following alternative proposals:—

Proposal I.

That a definite sum per house per year be given by the State to those local authorities undertaking assisted housing schemes in 1923, such definite sum to be payable (and not subject to revision) for the whole of the loan period for the houses in respect of which the annual grant is made.

The local authority should have freedom of action concerning both the details of their schemes and the administration of them when completed.

The State should, however, require that the accommodation in the houses should be up to a good standard and that the estates on which the houses are built should be laid out on good town-planning lines.

The definite sum per house should be greater for houses provided in rural districts and for houses built for the occupation of those dispossessed in connection with schemes for unhealthy areas.

Proposal II.

That the State should pay a definite sum per house built under an assisted housing scheme, such sum to represent a percentage of the loss as set forth in an estimate to be submitted to the Ministry of Health before the building tender is accepted by the local authority.

The percentage of the loss should be greater in the case of rural housing schemes and schemes for the re-housing of those dispossessed in connection with schemes for unhealthy areas.

When the definite sum has been determined on the percentage basis it shall not vary during the period of payment of the loan charges.

Subject to the Ministry of Health being satisfied that the accommodation to be provided is up to a good standard, and that the estates on which the houses are to be built will be laid out on good town-planning lines, the local authority should have freedom of action concerning both the details of their schemes and the adminsistration of them when completed.

Proposal III.

That the State should lend capital to local authorities at the rate of interest current before the war, viz., 3½ per cent., the difference between the rate at which the capital is thus lent and the rates at which the State borrows the money to represent the subsidy given by the State in aid of the housing schemes of lo authorities.

Subject to the Minister of Health bei satisfied that the houses to be provid will conform to good standards of acco modation, and that the estates on whi they are to be built will be laid out good town-planning lines, the lo authority should have freedom of acti concerning both the details of th schemes and the administration of the when completed.

The following correspondence relati to Proposal I. is made public with t permission of Sir Alfred Mond:—

NATIONAL HOUSING AND TOWN
PLANNING COUNCIL.

41 Russell Square,
London, W.C.1.
November 29, 19

DEAR SIR ALFRED MOND,

At a joint meeting of all the Co mittees of the Council held on Saturd last at York it was unanimously reco mended that the following propos should, *inter alia*, be submitted to series of conferences of local autho ties:—

"That a definite sum per house p year be given by the State to those lo authorities undertaking Assisted Housi Schemes in 1923, such definite sum to payable (and not subject to revision) f the whole of the loan period for the hous in respect of which the annual grant made.

"The local authority should have fre dom of action concerning both the deta of their schemes and the administrati of them when completed.

"The State should, however, requi that the accommodation in the hous should be up to a good standard, and th the estates on which the houses are bu should be laid out on good town-planni lines.

"The definite sum per house should greater for houses provided in rural di tricts and for houses built for the occ pation of those dispossessed in connecti with schemes for unhealthy areas."

In a letter you kindly sent to me pri to the general election you drew m attention to a paragraph in your electi address.

In this paragraph it is stated that t late Government had under considerati a scheme of your providing for the futu financial co-operation of the State and t local authorities.

It is believed by the Committee of t Council that the proposal set forth abo is not dissimilar to the proposal you su mitted to the Government, and I a desired to say that in the opinion of t Committee you will render a real servi to the housing movement if in the eve of the surmise that this proposal is harmony with your own be correct, yo will be good enough to permit the Counc to state that this is the case.

Believe me to be, yours sincerely,
HENRY R. ALDRIDGE,
Secretary.

35 Lowndes Square, S.W.1.
December 4, 1922.

AR MR. ALDRIDGE,

I am in receipt of your letter of the h ultimo respecting proposals to be omitted by the National Housing uncil to a series of conferences of local thorities.

When in office as Minister of Health I ne to the conclusion that some further ite assistance is necessary to bridge the nsition period before ordinary econo- c conditions are fully restored, and it the local authorities cannot be left deal with the housing shortage un- led. The question arises how and in at form this aid can best be given. As u will remember, Mr. Lloyd George in speech in the House of Commons on ly 21, 1921, intimated that in his inion the action of the Government s to call a halt in the programme then ng carried out in order to put the using question on a better and more siness-like footing. But he implied it this halt did not mean a cessation of necessary interest of the Government the housing shortage which still exists. e substantial reduction in the prices ought about by the policy which I ried out has resulted in a saving below present estimate of the annual charge something like £350,000 a year.

Before leaving office I formulated a eme which—reversing the policy of king the local authority a fixed partner th the State in housing—made the ate a contributor to a fixed grant per num of between £3 and £4 per house, ving to the local authority the responsi- ity of any further deficit between the nual charge and the rent it could tain, but also leaving to the local thority a free hand as to the manner which it would build, subject of course a general supervision by the Ministry Health as to a reasonable standard.

On the estimates presented to me it med probable that by such a partner- p some further 80,000 houses could be ovided without any increased charge the estimates of the Ministry of alth or any further burden on the tional exchequer. The figures of the st of building houses and of the lower e at which money can be obtained ve, I think, fallen since the date when it estimate was prepared and, conse- ently, the number is a tentative one. is number of houses would probably ve to be spread over some two years, d it would be essential in any future eme to be adopted to escape over- ding the somewhat limited market of use and cottage building capacity so not again to raise the price of housing ainst the prospective tenant, a policy ich has acted so disastrously in the st.

So far as I can gather this scheme is on lines of the recommendations of your uncil, which I am glad to see put ward and which I shall be happy to pport.

Yours sincerely,
ALFRED MOND.

R. Aldridge, Esq.,
National Housing and
Town Planning Council.
Russell Square, W.C.1

It will be seen from this correspondence it Proposal I, as tabled above, is ap- ved by Sir Alfred Mond on the ground that the financial responsibility of the State will be limited to a definite amount already made available by economies in the existing housing programme.

This fact will doubtless exercise great weight with Members of Parliament in dealing with the matter in the next session of Parliament.

The Housing Committees of local authorities will for their part be inclined to regard the proposal with favour on the ground that under it they would be given far greater freedom of action concerning the preparation of the details of their schemes and the administration of schemes when completed.

It should hardly be necessary to state that in the case of all three proposals it is taken for granted that the terms under which the first 176,000 houses have been built by local authorities (viz., with a limitation of the burden falling upon local authorities to the production of a penny rate) remain unaltered. The issue on this point is not in any doubt. It is legislatively provided that this limitation shall apply in the case of all housing schemes sanctioned and carried into effect under the terms of Section 7 of the Housing and Town Planning Act, July 1919 (England and Wales) and August 1919 (Scotland).

The meeting also discussed in close detail the practical possibilities of the proposal that the State should give financial aid to private enterprise. The conclusion definitely reached was to the effect that the lending of large sums of public money and the giving of subsidies to private enterprise of the ordinary kind would need to be so carefully safeguarded with regard to the securing of precedence to ex-service men and large families as tenants and with regard to the amount of rent to be charged as to render the proposal impracticable. It was, however, agreed that the activities of public utility societies established on well-ordered lines could with real service be made the subject of financial aid from the State. It was also agreed that financial aid to the purchasers of new houses built under the Small Dwellings Acquisition Act might with advantage be given by both the State and local authority.

Proposals relative to the terms on which financial assistance might suitably be given to these types of semi-public activity will therefore be submitted to and discussed at the conferences.

In view of the great public interest evinced in the proposal that new houses should be exempted from municipal rates for a series of years, the discussion of this matter will be included in the agenda of the conferences.

The view prevailing at the meeting already referred to was, however, to the effect that the resultant burden falling upon the ratepayers will be far heavier than the advocates of the proposal at present realize, and that on this ground it will prove to be inacceptable to local authorities.

Several of the vexed problems arising in regard to the administration of earlier Housing Acts concerning the clearance of unhealthy areas will be dealt with at the conferences. These will include questions as to the type of house which should be built, the desirability of re-housing on cleared sites, or the migration of the dispossessed to suburban areas, and the possibility of securing attention to the repair of houses not in all respects for human habitation.

The question of town planning will also be given a leading place in the agenda of the conferences.

With the passing of Clause 46 in the Act of Parliament of July 1919, under which all urban authorities with upwards of 20,000 population are required after January 1923 to prepare and administer town-planning schemes, the position has become one of real urgency. Additional interest will, moreover, be given to the discussions on this subject by the fact that local authorities throughout the country are now preparing large schemes of arterial road construction capable of absorbing unemployed labour.

It is urged that there is a special suitability in discussing this subject at the conferences called by the National Council. The Committee remember with pride that the great schemes of arterial road construction now being carried into effect in Greater London are due, to a large extent, to the town-planning activities of the Council in the years preceding the war. Following a conference held in 1913 at the Westminster Palace Hotel, under the presidency of the late Alderman Thompson, a deputation of representatives of Greater London local authorities was received by Mr. Asquith and Mr. John Burns, conjointly with a delegation from the leading technical associations of the country.

Two proposals were then submitted to the Government. On behalf of the technical associations the Government were urged to set up a Commission. The National Council urged that a series of standing conferences representing the local authorities concerned, as well as technical associations, should be set up for the purpose of working out in close detail schemes for arterial road construction.

The second proposal was accepted and work extending over a period of three years was then entered upon, with the result that in 1916 a report embodying the findings of the conferences was formally submitted to the Government.

The well-ordered schemes embodied in this report form the basis of the work of arterial road construction now being carried into effect on the borders of London with the aid of unemployed labour.

It is hoped that the coming series of conferences will render an equal service to the local authorities in the various areas concerned by making clear to them the fact that results of great public value —both social and economic—can be secured by the vigorous exercise of their new town-planning powers and duties.

Architects' Fees for State-aided Housing Schemes

The Ministry of Health and the tribunal appointed by the R.I.B.A. are anxious to obtain a settlement of all claims for architects' fees in connection with State-aided Housing Schemes without further delay. Architects who still desire the assistance of the tribunal are therefore requested to apply to the secretary of the R.I.B.A. on or before December 31, 1922. The tribunal cannot undertake to deal with cases submitted to them after this date.

The Week's News

More Houses for Woolwich.

Woolwich Council have decided to build fifty more houses at Well Hall at a cost not exceeding £400 each.

New Stained-glass Windows for Mansfield.

Bridge Street Church, Mansfield, is to be improved, and fourteen stained-glass windows inserted at a cost of about £600.

Sheffield University.

The Council of the University of Sheffield have appointed Mr. Charles D. Carus-Wilson, M.C., A.R.I.B.A., to the post of lecturer in architecture.

Bricklayers' Strike.

The strike of bricklayers employed in the iron and steel works of the North East Coast, which has extended over practically the whole of the current year, has collapsed.

Proposed Houses at Watford.

Plans have been submitted to the Watford Rural Council for the development of the Cassiobury estate. The surveyor reported that the drainage would be very costly.

Big Housing Scheme for Stainforth.

Hatfield Main Colliery are negotiating for the erection of several hundred more houses at Stainforth, and notice has been given to the Council that 50 per cent. of the new sewerage scheme will be required to deal with sewage from the houses.

The R.I.B.A. Exhibition of Architecture.

During the closing week (Dec. 15th to 22nd, inclusive), the Exhibition will be open from 10 a.m. to 8 p.m. (Saturday, 10 a.m. to 5 p.m.).

Wren's Bi-centenary.

In connection with the bi-centenary of Sir Christopher Wren, which it will celebrate in the new year, the Selborne Society is arranging a visit to Paris at Christmas. The special object is to study the architecture of that city, from which Wren obtained considerable inspiration.

Hastings Building Scheme.

The Ministry of Health has agreed to sanction a new building scheme at Hastings on the terms that the Government would provide thirty-two houses, it being understood that the Hastings Council would consider the erection of a further thirty houses without a subsidy.

Site of the Old G.P.O.

Negotiations for the purchase of the site of the old General Post Office, St. Martin's-le-Grand, are in progress. The Disposals Board is conducting the negotiations. The old General Post Office ceased to be used twelve years ago, and the demolition of the buildings was completed shortly before the outbreak of war in 1914.

Fireproof Thatching.

A fireproof and vermin-proof straw thatched roof has been invented by a Tunbridge Wells firm of builders. It is made of straw and cement, bound with copper wire. In appearance it is similar to an ordinary thatched roof. It has been approved by the Ministry of Health, and has been accepted for insurance against fire.

Large Building Scheme for Belgium.

The Brussels municipal authorities have authorized the construction of a large block of flats in one of the principal streets of the city. The building, which is to consist of 120 flats, and to provide garage accommodation for 100 motor cars, is to be erected by the Crédit Général Hypothécaire, 38 Boulevard Bischoffsheim, Brussels, to whom interested British firms may care to communicate offers of fittings, furnishings, etc.

New Bakery for Edinburgh.

A large bakery is to be erected on a site reclaimed from the canal area at Port Hamilton, Fountainbridge, Edinburgh. Plans have been prepared by Mr. T. P. Marwick, architect, of Edinburgh, and have been approved by the municipal authorities. The new building will be 250 ft. square by 70 ft. in height, and the total expenditure is estimated at £250,000. This large central bakery is for the St. Cuthbert's Co-operative Association, Edinburgh.

Cardiff Technical College Scholarships.

Ten scholarships, tenable in the various departments of the Technical College, covering tuition fees and maintenance grants of £40 per annum for three years, are offered each year by the City of Cardiff Technical Instruction Committee, for competition to residents and non-residents of Cardiff. At the scholarship examination recently held Mr. Alfred C. Light, of Hanley, Stoke-on-Trent, obtained one of the scholarships tenable in the department of Architecture and Civic Design.

Esperanto and the Finnish Fair.

The promoters of the International Fair of Finland, to be held in Helsingfors, July 1–6, 1923, have just issued a booklet in Esperanto. It is well illustrated, and contains a mass of information on matters connected with the land, population, imports and exports, and various branches of industry and commerce. The booklet, entitled "La Ekonomiaj Fortoj en Finnlando" (the economic resources of Finland), will be sent free on application to Konrad Ojala, Finland Foiro, Helsingfors.

Dundee Architects' Grievance.

Representatives of the Dundee Institute of Architects appeared at a meeting of the Reorganization Committee of Dundee Town Council and complained of the work of preparing plans for and superintending the erection of the new subsidy houses being performed by the City Architect and his staff. As the Council had already agreed that the City Architect should prepare the plans for the houses, the Committee felt that nothing could be done in the matter, but it was agreed that if any more houses were to be erected a Sub-Committee would be appointed to consider and report as to the better method of having the plans prepared.

The National Guilds.

A conference of guilds and trade unions, convened in London by the National Guild Council, adopted a formal constitution for the Guild movement provid
for an annual conference and the meth
of electing the National Guild Council,
well as the functions of the Council,
terms of affiliation, representation, etc.

Resolutions were passed by the co
ference concerning the necessity for
guilds being based upon the trade unio
and advocating workers' control in ind
try as an object of trade unions. C
outstanding resolution adopted was
favour of a mutual understanding
tween the Guild and co-operative mo
ments.

York Minster Windows.

Sir Aston Webb, P.R.A., was the ch
speaker at a meeting held in York Ma
sion House to assist in raising £30,000
make up the £50,000 required to compl
the work of restoring the stained glass
York Minster. The windows, he sa
were four or five hundred years old, a
were the most complete set of stain
glass windows in the world. They we
really English in design and workma
ship, and were irreplaceable and pricele

According to the Dean of York, w
spoke at the Hull Luncheon Club, t
windows are worth £73,000,000. I
Norris bases this stupendous figure on t
fact that in New York last year a piece
Early English glass, 30 in. by 31 in., so
for £18,500. There are 30,000 square fe
of glass in York Minster.

Liverpool University M.Arch. Degree.

The Court of the University of Live
pool have confirmed the resolutions of t
Senate and Council and thereby esta
lished the degree of Master of Archite
ture (M.Arch.) in the University. Th
degree may be given by the Senate
Bachelors of Architecture of not less tha
ten years' standing who have erected
building of distinguished merit in the
own names. This is the first degree of i
kind in any university, English or foreig
and should in the course of time form
distinction of considerable interest to t
profession. The establishment of th
new degree does not preclude Bachelors
Architecture of the University of Live
pool from proceeding to the ordinary M.
degree on the production of a thesis en
bodying historical or scientific research

Improvement of Scottish Insanitary Area

The Scottish Board of Health intima
that the local authorities who desire
share in the annual grant of £30,000 whi
has been provided to assist local autho
ties in Scotland in carrying out schem
for the improvement of insanitary area
must complete and send to the Board t
appropriate schedule that accompani
the Board's circular of August 18, n
later than December 31. Local authoriti
are not required at this stage to subm
schemes complete in all their details, b
merely to furnish the information
quested in the schedule. The elaborati
of the details, to comply with the stat
tory requirements in respect of schem
with which local authorities may deci
to proceed, can be done later, when lo
authorities have been informed by t
Board of the amount, if any, which the
are prepared to contribute out of t
grant.

The Future of the R.A. Schools

TIME was when the Royal Academy School of Architecture, Painting, and Sculpture was the preeminent art school in this country. The most brilliant of students fought hard for the right of try, and a good "place" in the school was regarded as first step on that steep and difficult ascent which led the Chair of a Royal Academician.

Now times have changed, and we imagine that those mbers of the Academy who take the work of the ools seriously must be somewhat perturbed at the sent exhibition of their students' work. The only one the three schools that appears to us to have any ality is the sculptors.

How far this is due to the work of one man, a young lptor from Wales, Mr. David Evans, we are not prered to say; but this exhibition, though small in compass d weak on the decorative side—the prize for the design a fountain was rightly withheld—is still sufficiently od as a whole to form an effective challenge to most her schools.

The case of the painters is not quite so happy; in spite some quite good individual work, the exhibition as a ole is not impressive.

There may be some excuse for the failure of the land- pe work—we do not remember that the R.A. School s ever been particularly successful in this department— t what excuse can be offered for so much of the weak awing and undecided colour ?

Compare this exhibition with a corresponding show at e Slade, for example, and we at once note the difference: the latter case the school is full of vitality and stands something definite in the art world, and, whether we e the work or not, we must admit that the students e taught to draw, and to express themselves forcibly in e and colour.

In a word the Slade School (and there are others) is a ive" school which, for good or ill, impresses itself on the dent and the art world—it stands for conviction and ality.

We do not propose to examine any further the asons that underlie the decay of painting at the R.A. hool; possibly one of the greatest is the fetish of e easel picture, and the unconscious standard set by e annual show with its big "gate" dependent on a pular appeal.

We are more particularly concerned here with the sition of the Architectural School and the performance the architectural students as exemplified in the present hibition, and we may say at once, that compared with average exhibition of any of the leading architectural hools, the standard of the work shown by the R.A. udents is quite poor.

We do not make these remarks in any unfriendly spirit. p to ten or fifteen years ago the R.A. School of Archi- cture held the proud position of the leading architectural school in this country; all other schools were in a sense contributory to it, their best students eagerly competing for the right to study there. If it no longer holds that position of authority to-day, there must be some deep underlying reason for the change.

Now, we do not for a moment believe that this failure of the school to maintain its old supremacy is in any way due to the personnel of the architect members of the Royal Academy. At probably no time in the history of the Academy have the architectural members been more representative of the best in British architecture.

Under the distinguished and able leadership of the President, Sir Aston Webb (who himself has done as much for architectural education as anyone in this country), are grouped some of the most famous and authoritative architects of to-day—Sir Reginald Blomfield, Sir Edwin Lutyens, Sir John Burnet, Mr. Baker, Mr. Gilbert Scott, and others. Neither can it be said that these gentlemen are representative of a past generation, and out of touch with present conditions. Many of them are in the prime of their artistic career, and we believe that Mr. Gilbert Scott, if not the youngest R.A., is one of the youngest. No, we believe the cause of the failure lies far deeper than can be explained by any personal or administrative reason.

Sir Aston Webb, in his presidential address to the students (which, by the way, was a model of sound advice and delightful geniality), said that we must remember—"that the students of this school did their work after a long, tiring day in an office"—so they did in the old days, but with far different results. Nevertheless, this remark of Sir Aston's probably conveys a hint of what is wrong with the school, for during the last twenty years or so our conception of architectural education has undergone very profound changes.

In place of the old system of pupilage, under which the pupil spent a not too strenuous day in the office of an architect and afterwards supplemented his education by evening work in one or other of the schools that then existed for that purpose, he now undertakes a very strenuous training lasting some four or five years and devoting his whole time to it, in one of the larger and more important of the architectural schools, such as the Architectural Association or those at Liverpool and London Universities.

When the student of to-day leaves his school or university he has received a very thorough grounding in the fundamentals of his art, and looks with a very critical eye on any school or system of design which shall offer him a lower achievement or inspiration than that which he found in his own Alma Mater.

Now, can the Royal Academy School, as at present constituted, offer such a student sufficient inducement to continue his studies, when he has completed his preliminary training ?

That some such continuance is to be desired, either at the R.A. or elsewhere, cannot be gainsaid. Five years is all too short to equip anyone for practice in one of the most difficult and exacting of all the professions.

The monetary value of the prizes offered by the Royal Academy are more than generous, and, as we have said, the eminence of the distinguished artists who are responsible for the guidance and training in the school cannot be questioned. Why is it, then, that the best type of architectural student is not to-day attracted to the school? That he is not so attracted cannot be disputed. Compare the work in the present exhibition with the work shown at any one of the more recent exhibitions of students' work at either the Liverpool or the Architectural Association Schools.

Except for the beautiful set of drawings and sketches by Mr. Cyril Farey, exhibited as the work of the returned gold medallist, and who was himself a pre-war student of the Academy and can hardly be reckoned amongst the present students — there is nothing that can compare with the best work of the students of the two famous schools we have referred to.

The R.A. School of Architecture was the pinnacle of the pupilage system, and when that system passed away the school was left like a great river with all its tributary streams dried up, except, perhaps, for a mere miserable trickle.

We believe the Royal Academy could, and should, exercise a very important influence in architectural education again, but we do not believe it will ever exert this influence through its own school, unless the conception and organization of the school undergo radical and fundamental changes.

The Architectural Association has a very flourishing evening school, formerly known as "the Atelier" and now as the "Design Club," in which the traditions of the Architectural School proper are maintained and developed by post-graduate students. It might be that the R.A. School could fulfil some such function as this, providing a post-graduate course for not one of the London schools, but for all the London schools. Or, it may be that the Royal Academicians would be better employed as a purely examining body, somewhat analogous to the École des Beaux-Arts in Paris, on which they would sit as a jury and award the prizes to be competed for by the various schools and ateliers.

What the future of the Academy Schools is to be we cannot say—that remains with the Royal Academicians themselves, but that they cannot continue on the present lines is more than obvious.

The Manchester Building Guild

According to "The Manchester Guardian" the National Building Guild, Ltd., of Manchester, has had to borrow capital to "carry on," and in return for the loan has handed over the control of its business to a Glasgow firm of contractors, by whom the business of the Manchester Guild will be controlled for three years. It is to be explicitly understood that the London Guild is not in any way involved in this transaction, which, however, discourages the sanguine hopes for the guild principle which had been enter tained in so many different directions. It does not, howeve finally dispose of the guild idea, which, as several architect have recently contended in our columns, has in it man elements of vitality, and so valiant an attempt to pu quality before profit, and to introduce more equitabl not to say more humane, conditions into the building indus try, is certain to be revived sooner or later in a new an possibly more effectual form, and on a sounder financi basis.

Mr. J. F. McRae

We reproduce below a portrait of Mr. John Findla McRae, Joint Editor of THE ARCHITECTS' JOURNAL, who leaving us to take up another appointment in the new yea Mr. McRae has been associated with Technical Journal Ltd., for the past sixteen years, during which time he ha not only been jointly responsible for the production of th Journal, but has exercised general supervision over th various publications of the fir on the literary side, besid contributing articles to man of them, especially to TH ARCHITECTURAL REVIEW.

A journalist of uncommo versatility, he has brought t the discharge of his duti an enviable combination qualities—fine scholarship, broad and sympathetic ou look, and a rare gift of literar expression. Together wit these qualities has gone a fu and intimate knowledge the art of architecture and the conditions and practic of the building industry.

A man of strong and in dependent views, he has nev failed to say in this Journ what he has thought to be tru even at the risk of some ten porary unpopularity. Witha he has consistently endea voured, in the many hundre of leading articles and note which he has written, t preserve an attitude of stri impartiality; and his sincerity of purpose an honesty of judgment have gained for him the esteem respect, and friendship not only of his directors an colleagues, but of many prominent architects an builders.

Westminster Hall Roof

Once again the King and Queen have demonstrated th keenness of their interest in the "things that matter. On this occasion their influential example has taken sha in a visit to Westminster Hall to inspect the roof repai that have been so long in progress there. But for the inte ruption caused by the Great War, the work would have bee finished long ago, and is now presumably nearing compl tion. Their majesties were greatly interested in the accou of the work given by Sir Frank Baines, whose ingenio device of strengthening the woodwork with invisible ste rods will preserve for future generations the virtuall unaltered appearance of the ancient woodwork which such a magnificent testimonial to the craftsmanship of ol English carpenters. Their majesties' visit will be widel interpreted as a vindication of the growing publi interest in building progress; and the visit is in som respects the more impressive from its purely privat character.

The Work of Herbert Baker, A.R.A.

(Specially Contributed)

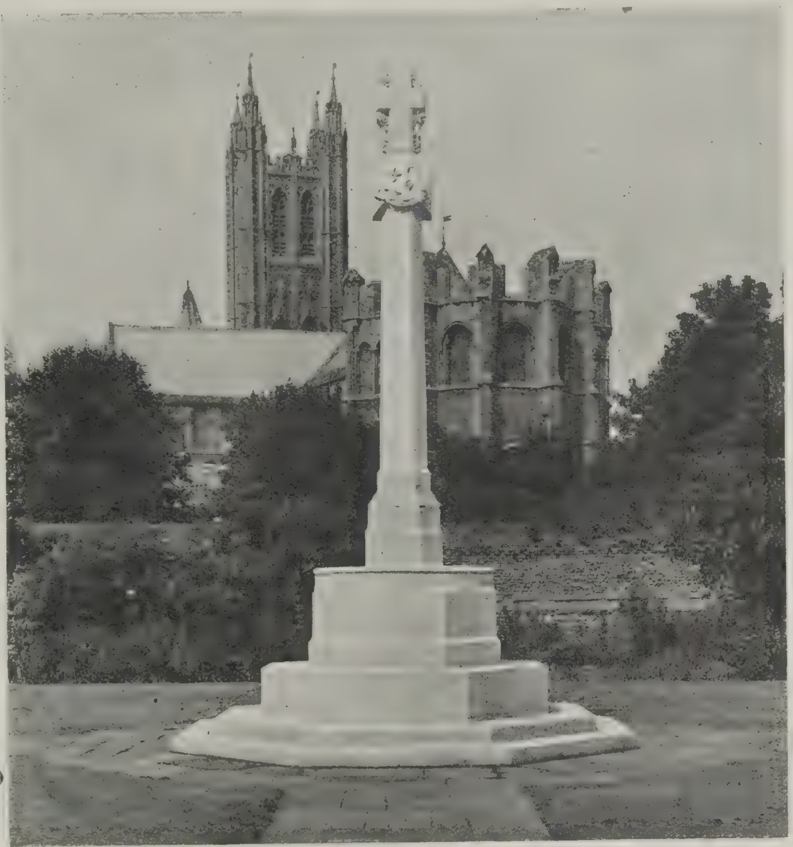
ENERGY, pent up and impatient, leapt the imaginary palisade that hems every country, and in the person of Herbert Baker one more pioneer joined those who had already set foot in South Africa, ountry that was then awakening from centuries of sleep. nong the many who were attracted to the new Land of omise, it was but very few who could make return for e country's hospitality; hive the bees or tend the cattle, her would they despoil each in turn. Fewer still, by nscious effort, left the land better than they found it. was an heroic age. The destiny of a continent was in e hands of the idealist, Cecil Rhodes, then in the full gour of his life, and he kept vigil ever for those whom he ew could help to ake real his vast eams, and could help n express himself.

Rhodes was much orried by the way ilding culture and ings of the home had nk in the slough, but was not until fortune rew Herbert Baker ross his path that he tered enthusiastically the complement of s great undertakings.

Herbert Baker had en in a short while e possibilities of the digenous architecture, manner of building, ough its origin was olland, yet was utterly ansformed by the new nditions to which the rdy settlers of the xteenth and seventeenth centuries accusmed themselves. He as well fitted for the eat work that was to ll to his lot. The fluence of the office Ernest George and eto, from which so any of our prominent chitects have graduated, was strong upon him. Two score etch-books of this period point to unremitting labours in ngland and on the Continent, a careful survey of the d Conway palace of Plas Mawr he had made the subject a book, and the "Archeologia Cantiana" contains much his research and recording.

Nevertheless, it was a situation in which character and tellect needed to be mentor to taste, and a lesser man ight easily have taken a road to disaster so far as a tional architecture was concerned. The great open aces, the liquid blue of the far-famed mountain, the soft inging lines of gables, and the great dreams of Cecil hodes were heady stuff for a young man. But out of it l he selected just the right things for perpetuation and nstructing into fresh harmonies. From the very first he alized that fundamental things had the true value, and e has never forsworn his hatred of sham and purposeless fairs in every form, a characteristic doubtless reinforced association with a man whose every idea was pregnant ith possibilities.

In the spirit of antiquarian reverence he restored Groot Schuur for Rhodes, replacing the slate with thatch as formerly. Fire destroyed it entirely, and in a larger, freer manner he rebuilt it in its present form, setting saw mills busy for the first time to supply ceiling beams of teak, and sounding the death-knell of the imported slate by encouraging the manufacture of tiles. This work probably gave rise to the first national consciousness in building. The people realized that there was a livelihood to be made from the manufacture of building materials, and there came about a constantly diminishing importation of the cast-iron filigree work that had been fashionable for so long, and many other things which can be built into a house by harking back to older and more rational methods he revived.



WAR MEMORIAL AT CANTERBURY CATHEDRAL.

Having made a beautiful home of his own, Rhodes turned his thoughts to creating beauty elsewhere. He therefore sent Herbert Baker on a tour "to see Thebes, Pæstum, Athens, and the tomb of Lars Porsena," as he curtly expressed it. Baker was so impressed with the value of this tour, after he had already tasted the difficulties of practice, that later in life he founded a scholarship for young South African architects, tenable for two years in Rome.

Reference to all the houses built and villages designed in the subcontinent is impossible, except to remark on their extraordinary diversity. There are homes for coloured farm labourers, gold miners and magnates. Not only is there diversity in the size and appointments of these homes, but they have been built with whatever material could be found at hand, and this gave rise to the charming series of stone houses which appear to grow out of the ridges of the kopjes around Johannesburg. Here, too, was a fresh problem, and further scope for capacity in that houses could not sit for ever on barren brown hills, so he terraced and planted and lawned, the directest way in each case, with resultant charm that can only be found in Italy where the climatic conditions are similar.

When the Governor's residence outside Pretoria was being built, Mr. Baker used to pass a kopje on the outskirts of the town which, with a big quarry in the centre, intrigued him greatly by its form. It was some years later, when the various provinces formed the Union of South Africa, and the dual capital was decided upon, that the Transvaal made arrangements to build the offices of the Government at Pretoria. Almost too good to be true, this hill was selected for the site, and the quarry became an amphitheatre where statesmen now address the people, flanked by two big buildings and terraced down to

valley below. It is too well known to require scription.

During these years many churches and several catheals were built by him, and perhaps in these even more an his other work may be seen Herbert Baker's faculty devising a design which shall be the best that each ality can be expected to achieve, that is, a sympathetic derstanding for the probable limitations of building perience, as, for example, in the more ornate manner of pe Town Cathedral, where builders of experience and desmen are plentiful, in comparison with the perfect nplicity of that in Salisbury some 2,000 miles away, or, ain, that of Pretoria, where the stone is extremely hard cut.

In 1912, during the final stages of the great building at etoria, the Imperial Government were considering the ilding of New Delhi, and Herbert Baker was appointed collaborate with Sir Edwin Lutyens, R.A., in its design. their younger days they had been together in Ernest orge's office, and had tramped England together, and it seems that, as has happened, only the best could result from their combined experiences and the different angle of approach, the outcome of those experiences. It was this work which made it necessary to begin practice once more in a hostile world. His energy is unabated, and besides the work in India, working with the Imperial War Graves Commission, he is one of the three principal architects for France. He is responsible for many memorials in England, notably that at Canterbury within the Precincts, to the County fallen; that at Winchester also to the County; Harrow School, Winchester College, and King's School, Canterbury; also the memorial work to W. G. Grace at Lord's.

The Royal Academy honour is well awarded if only that Mr. Herbert Baker found Rome, not of brick, but of cast and corrugated iron, and left it with the precious heritage of a sound condition, a vigorous school and renown for beautifying a continent from the sea to the Zambesi; a fitting and faithful work for the disciple of an Empire builder.

"Camilla Lacey," near Dorking, Surrey

HEATON COMYN, F.R.I.B.A., Architect

"CAMILLA LACEY" is situated in the hamlet of West Humble, near Dorking, Surrey, commanding extensive and magnificent views towards Box Hill and the surrounding country. It is out 200 ft. above sea level, and the whole estate extends an area of over 80 acres. It was in 1919 that the iginal mansion was completely destroyed by fire, and e new one, which has been planned and designed by r. Heaton Comyn, F.R.I.B.A., to meet the special needs d wishes of the present owner and his wife, stands on e site of the old one.

Memories of "Camilla Lacey" fill the letters of Fanny urney, for it was here, as Madame D'Arblay, that she st set up housekeeping. The original house was built om the fortune produced by Fanny's third novel, Camilla." Dr. Burney delighted in referring to his ughter's future residence as Camilla Cottage, and the name as adopted by her many friends. The house stood on the rders of Norbury Park, at that time the residence of anny's close friends the Locks. Near by also was niper Hall, which housed the colony of distinguished fugees from the French Revolution, to which General 'Arblay had belonged. So idyllic was the existence led the D'Arblays thus "in the bosom of their most rling friends," that Fanny could not bring herself to ave it and resume her position as Maid of Honour, though the Queen would gladly have had her back after r marriage. Madame de Staël and Talleyrand were two the most distinguished frequenters of the house, while . de Narbonne, the exiled French Minister of War, was vited to make his home there.

The new house planned by Mr. Heaton Comyn is approached by a long carriage drive, guarded by a lodge, and inding through well-timbered parkland terminating in a oad sweep. Actually the house is divided into two parts -the main building and the servants' wing, both of which e connected by a turret. This was one of the essential quirements, that the servants' quarters should be olated from the rest of the house. Externally the walls the main building are constructed of Kentish rag with ath stone dressings; the servants' wing is of brick up to e first floor and half timber above, and the turret and ays on the south front are of Bath stone.

The accommodation provided includes a hall, morningom, living-room, study, dining-hall with gallery, nine incipal bedrooms and dressing-rooms, four bathrooms, d five secondary bedrooms and bathroom. Other buildings on the estate and connected with the house include stabling for fifteen horses, a riding-school, a laundry, a garage with chauffeur's quarters, a lodge, and eight cottages.

Notable features of the house are the fine oakwork, much of which is carved, the stained-glass panes in the bay window of the living-room, and the stone canopy fireplace, having the trusses carved in grotesque figures and on the upper part heraldic bosses and fabulous animals, in the dining-hall. The fine carved oak panelling is mostly fifteenth- and sixteenth-century English work, and in several of the rooms there are some fine specimens of Italian and Flemish carving.

The first floor is approached from the hall by a fine wide oak staircase, with carved spandrels and banisters terminating in the upper hall from which open the principal bedrooms. All the most important rooms of the house face south and overlook the terrace and the sunk garden. The dining-hall is carried up two stories, and the gallery situated at the end of the room is approached from the staircase landing at first-floor level.

The house is fitted with every modern convenience and labour-saving device. Central heating and electric light have been installed throughout, and there are "Magicoal" electric fires in the reception and principal bedrooms. Surrounding the house are gardens laid out in a very attractive manner.

The old-world grounds form an attractive feature of the property and are disposed in a wide gravel terrace running the entire length of the house on the south side. The parkland and pastures extending to about 62 acres are studded with fine specimen trees, and provide some of the best feeding land in the county. Other attractive features are a rock-garden with lily ponds, and tennis and croquet lawns.

Messrs. Trollope and Colls, Ltd., of London and Dorking, were the general contractors, and the sub-contractors were as follows: Wenham and Fowler, of Croydon (central heating and lead glazing); Ames and Finnis (roof tiling); Shanks & Co. (sanitary fittings); Art Pavements and Decorations, Ltd. (bathroom floors); Berry's Electric, Ltd. (electric fires); and T. Crowther and Son (oak panelling, stone carving, fireplaces, furniture, ornamental plaster ceiling in living-room, ornamental lead rain-water heads and pipes, and stained glass panels). A considerable portion of Messrs. T. Crowther and Son's work was carried out from the direct instructions of the owner.

The British School at Rome

The Aim of its Scholarships

NO prize that is open to the archi-
tectural student carries with it
more fame and prestige than the
ome Scholarship; and no other prize
ers such valuable opportunities for
hitectural study. It is the blue
and of the architectural year, and
tunate, indeed, is the man who wins it.
prospective candidates for the honour,
rticularly, the following account of
e scholarships of the Rome School
tracted from a booklet by Mr. Evelyn
aw, M.V.O., the hon. general secretary,
d recently published by the Faculties)
ll be of considerable interest.

It is not generally known that the
itish School at Rome was founded
marily as a school of archæology in
01 by a body of scholars and archæo-
gists under the inspiration of the late
ofessor Henry Pelham, President of
inity College, Oxford. Its activities were
voted to the study of antiquity, but it
s established on a broad enough basis
make it a valuable bureau of informa-
n for students of art travelling in Italy.

It was not, however, until 1911 that
movement was set on foot to reconsti-
te the school, with the view to bringing
o it fresh elements representative of
e Fine Arts in order that practising
dents of architecture, sculpture, and
inting, wishing to further their studies
Italy, might enjoy such facilities as
re offered by the American, French,
d other foreign academies in Rome.

This movement owed its inception to
e Royal Commissioners of 1851, who,
der the chairmanship of Viscount
her, in 1910 decided to extend their
stem of research scholarships, which
d proved beneficial to science and its
plications, so as to include provision
the study of the Fine Arts.

With the aid and advice of eminent
tists, the Commissioners were enabled
lay down the main lines of a system
of travelling scholarships which were designed especially for the encouragement of monumental art, and which, like the prizes awarded by the French Academy of Arts and analogous bodies in America and Spain, were to be made tenable in Rome, as the city whose traditions and atmosphere offered to art students generally more advantages for final training than any other city in the world.

Negotiations had hardly been opened with the Committee of the School of Archæology in Rome, with the view of ascertaining to what extent that body would be able to assist the travelling scholars, when the Commissioners received an unexpected offer from the Municipality of Rome of a site on the outskirts of the Villa Borghese for the purpose of an English educational institution. It was difficult to refuse an offer which presented at once a chance of finding accommodation and supervision for the scholars, and an opportunity to secure for the nation greater educational facilities for its most promising students of Art and Letters. The offer, with its conditions as to the structure to be erected on the site, was promptly accepted, and the Commissioners set about the organization of a National Academy of Arts, which was to embrace the existing School of Archæology, History and Letters, and a new department devoted to the study and practice of the Fine Arts.

In the early days of these negotiations the Commissioners received the support of a few eminent artists, among whom were the late academicians, Edwin Austin Abbey and Sir Thomas Brock. But the importance of the scheme, as it developed, called for something more than personal support; and so the Commissioners sought, and in due course obtained, the co-operation of the principal professional bodies concerned, reserving, however, to themselves the direction and control of things in the desire to set up an institution that would be free from sectional control and thoroughly representative of all the interests affected.

The result of these proceedings was made public in November 1911, and by June of the following year a Royal Charter of Incorporation was granted to the school, conferring upon the new organization the power to recreate and maintain in Rome a national institution for the study and practice of the Fine Arts, and for the study and investigation of the archæology, literature, and history of Rome and Italy at every period.

Under the Charter the general management of the school is in the hands of a council and executive committee, and the direction and control of the archæological and artistic interests are entrusted to five faculties representing (*a*) archæology, history, and letters; (*b*) architecture, (*c*) painting; (*d*) sculpture; (*e*) engraving. The school itself is under the immediate supervision of a resident director; and the building, which occupies a beautiful position in the Valle Giulia, overlooking the gardens of the Villa Borghese, provides both working and living accommodation for the students who are fortunate enough to gain admission.

Although the school undoubtedly gives exceptional advantages to a few chosen scholars in search of knowledge and inspiration amid the august surroundings of the capital of the ancient world, its chief aim is to promote the advanced study of the arts and to assist in raising the standard of art education throughout the Empire. As the Grand Prix de Rome has helped to make the Ecole des Beaux-Arts in Paris the foremost art school in the world, and as the national competitions instituted by the American Academy in Rome have undoubtedly increased the efficiency of universities and art schools in America, so it is

THE STUDIOS OF THE EDWIN AUSTIN ABBEY WING

THE BRITISH SCHOOL AT ROME.

lieved the British School at Rome will ve an impetus to artistic training roughout the Empire, and will enable udents of art schools not only to com-te with their fellow students, but with e picked students of other institutions.

The scheme of scholarships to be held / students of art at the British School Rome was framed with the intention at the holders should be enabled to mplete their education by a term of udy and residence in Rome. Thus, it as hoped, they would acquire an en-rged culture and a wider outlook rough acquaintance with the monu-ents, collections, and associations of the lace. It is not asked or desired that ome scholars should become simple pyists. But if a student fails to give share of his interest and attention to his rroundings in Rome, he is not thought be doing his part to carry out the urpose of the endowment, of which he is njoying the benefit. The great objects r which the school was founded can only e realized through its influence on the ind and art of the individual. Scholars re, therefore, urgently advised to take e fullest advantage of the opportunities fforded them by the inestimable privi-ege of residing in a city and country ich in historic memories and artistic radition. The association with students f other arts should be counted not the ast of these opportunities. A proper se of the literary equipment of the school ts library, the lectures, and demonstra-ions given by the staff and students) hould equally be sought. Such oppor-unities can be turned to profit at this eriod of a student's training, and are not kely to occur again at any time in his areer.

In the Fine Arts Section a Rome Scholarship is offered for annual competition among British subjects in each of the following branches of art: architecture, sculpture, decorative painting, and engraving. These scholarships, which are administered by the Art Faculties of the school, are of the value of £250 per annum, and are tenable for three years. An additional studentship is offered annually by the R.I.B.A. to the student or associate of the Institute who passes next in order of merit to the candidate placed first in the competition for the Rome Scholarship in Architecture.

This, the Jarvis Studentship, is of the same value as the Rome Scholarship, but is tenable for two instead of three years. The age limit in the architecture and painting competitions is twenty-seven. In the sculpture and engraving sections it is at present thirty.

A further post-graduate scholarship, namely, the Bernard Webb Studentship, which is worth not less than £250 per annum and is tenable for one year, is offered by a special committee of the school for the encouragement of the historical and critical study of architecture. It is open to bona fide students of architecture not exceeding thirty-two years of age who have been members of the Architectural Association for not less than four years.

The Faculty of Archæology, History, and Letters administers at present only one studentship, awarded by the Gilchrist Trust, which is of the value of £75 and tenable for not less than five months in one session. The award is made by selection, and the age limit is at present thirty years. The Pelham Studentship, value £100, is awarded by the University of Oxford, and is tenable for one year at the school. The holders of other university research scholarships and prizes may, by arrangement with the faculty, be granted the full or partial privileges of a scholar.

The syllabus and list of studies drawn up for the Rome and Jarvis scholars in architecture are contained in a special memorandum issued by the Faculty of Architecture. The course of study is so arranged as to make it possible for the architect, at the end of his scholarship period, to submit the results of his studies in a complete set of drawings showing the restoration of some important ancient building. The faculty encourage associative work in design problems undertaken with the painters and sculptors. The Rome scholar is allowed to spend his third year, and the Jarvis student six months of his second year, away from Rome.

The sculptor is not called upon to produce to the Faculty any plastic work until the end of his second year in Rome. Like the painter he spends his first year in acquiring a greater knowledge of his art and in generally preparing himself for the work of his second and third years, in which he is required to execute in plaster a figure and a relief or group life size. The Faculty reserve the right to retain a cast of each work. Evidence of the sculptor's collaboration in design with students of other Faculties is always welcome.

Engraving students are asked to produce each year, in addition to studies in black and white and colour, at least three complete plates in any one of the methods of engraving. The engravers are expected to continue their studies from the nude and to follow the Faculty's recommendation as regards general training.

SIR EDWIN L. LUTYENS, R.A., F.R.I.B.A., ARCHITECT

How to Look at Architecture

Professor Reilly's Lecture at Manchester

BOTH the Manchester Society of Architects and the Manchester Branch of the Institute of Builders have been collecting funds to help to found a Chair of Architecture at the University. Hitherto funds for the school of architecture have been provided jointly by the University and the Corporation, but this arrangement has come to an end, and the school is now under the sole control of the University. Both architects and builders have felt that it is not enough to teach architects, but that the general public must be enlightened as well. With this latter object in view lectures are being given in the lecture theatre, which is being lent by the University for the purpose.

For the past two years the lectures have been provided by the joint efforts of the Manchester Society of Architects and the Institute of Builders, but this year the Manchester Royal Institution has joined with the architects and builders, and the first of this session's lectures was provided by the Royal Institution, and given by Professor C. H. Reilly, F.R.I.B.A. Mr. T. D. Barlow was chairman, and briefly introduced the lecturer.

The subject was "How to Look at Architecture," and a large audience found very evident pleasure in following the lecturer through a great number of lantern slides, depicting most of the famous buildings of the world, ancient and modern, while he analyzed the architectural qualities which have given them their renown. According to the "Manchester Guardian," Professor Reilly, in the course of his lecture, said that architecture was the one art which could turn this very material civilization of ours into something spiritual and beautiful. The changes could be achieved by very simple means—an alteration of dimensions which did not involve the expenditure of great sums of money. A good building was often differentiated from a bad building by a few inches or a few feet.

The Greeks understood this best. They realized that in proportion lay the secret of interpreting the soul. By slightly altering the length, breadth, height, and every part of a building, so they might make the kind of building which appealed to the imagination of all the ages which lifted man from a kind of creeping creature to a creature for whose abilities there was no limit. Anything that could be done to increase the popular appeal of architecture was tremendously worth while, and he congratulated Manchester on the attempts which were now being made in the city to bring back architecture to the public, or, rather, to bring back the public to architecture.

In all the great ages of art there was a great popular sentiment behind it. It was so in the fifth century in Greece, when architecture was chosen as the symbol of all the great aspirations of the Greek race, when great buildings on the Acropolis were built as memorials of a war that had saved civilization. There was a popular critical opinion behind and acting as a check upon the exuberance of design during the Renaissance in Italy. In our own Georgian period we had a very rigid taste. It belonged to one class of society rather than to all. No one could call himself a gentleman in the days of Horace Walpole who could not express an opinion upon the proportions of the buildings which were then being erected. This opinion existed in some countries to-day.

In America, which was sometimes regarded as a crude place, where crude ideas flourished, architecture, as the sign of a great civilization, was an art that prospered most.

As showing the want of popular interest in architecture in England Professor Reilly expressed a doubt whether any average citizen could mention the name of a single great architect working in England to-day. "And yet," he remarked, "we have had the streets of Liverpool blocked by people anxious to see a beautiful girl. I am not quarrelling with that. The Greeks would have done it. What I should like to see would be the same enthusiasm and excitement shown when the scaffolding is removed from a beautiful new building."

How should they look at architecture? It should be looked at like the product of any other art. They should allow it to move them like a picture. A great building had this curious faculty, that it made an immediate appeal to the imagination. It should cause the heart to leap and a lump to rise in the throat just as any other authentic work of art did. Architecture was not a remote art demanding great knowledge for its appreciation. It was a homely art answering practical needs. It reflected the thoughts of the times, and regard for our honour with posterity alone should prompt us to build beautifully.

A New Sports Pavilion at Teddington

C. WESTCOTT REEVES, F.S.I., and STANLEY P. SCHOOLING, A.R.I.B.A., Architects

THIS pavilion has been erected from the designs of Messrs. C. Westcott Reeves, F.S.I., and Stanley P. Schooling, A.R.I.B.A., architects, for the Old Merchant Taylors' Sports Club on their new ground at Teddington. The ground and pavilion form a part of the Merchant Taylors' School War Memorial, and were opened last month by the Lord Chancellor, the Right Hon. Viscount Cave, G.C.M.G., who, at the same time, unveiled a memorial in the pavilion. This latter memorial, which is inscribed with the names of more than 300 Old Boys who fell in the war, takes the form of a fireplace in the tea-room. Centrally over the fireplace is the school's coat-of-arms, and the name panels are on either side. The arms and panels have been executed in English oak, and the coat-of-arms is carved in bold relief and emblazoned to the design of the architects. The pavilion provides accommodation for two teams and their visitors, and has been planned to admit of future extension. It is faced with multi-coloured red bricks, is fitted with standard metal windows, and the roof is covered with hand-made sand-faced tiles. Ample washing arrangements are provided and two large pools are sunk in the floor of the bathroom. A tea-room, 40 ft. by 20 ft., is the central feature of the plan, with a verandah facing the cricket ground. The kitchen is placed at one end of the tea-room, while immediately over is a self-contained flat for the resident groundsman.

Architecturally the pavilion makes a very effective composition, the veranda, with its well-proportioned colonnade, tying the two wings together, besides serving the very practical purpose of an open shelter and a possible extension of the tea-room. The entrance front, which is rather more simply composed, forms an effective contrast.

The general contractors were Messrs. Walter Gladding & Co., the sub-contractors being B. Finch & Co., Ltd. (heating and hot water supply); Jesse King & Co. (plasterwork); William Brown and Son, Redhill (multi-coloured red facing bricks); S. and E. Collier, Ltd., Reading (hand-made sand-faced roofing tiles); W. F. Baker & Co., Ltd., Newport, Mon. (standard metal windows). The arms of the school and the panels were executed by Messrs. W. Aumonier and Sons.

Mr. C. Westcott Reeves acted as consulting surveyor for the levelling and turfing of the ground, which was carried out by Messrs. W. H. Gaze and Sons, Ltd., Kingston-on-Thames

Strengthening the Forth Bridge

MR. WILLIAM ALEXANDER FRASER, M.Inst.C.E., in reading a paper on the "Strengthening of the Floor, etc., of the Forth Bridge" before the Institution of Civil Engineers, gave a description of the renewal of the inner rail-troughs and the buckled plating of the floor of the bridge, the strengthening of the cross transoms of the internal viaducts, and the provision of additional cross bracing between the main girders of the approach spans. He said that the rails which form the up and down lines on the bridge are carried on timber waybeams, laid in four continuous steel troughs. The two outer troughs form the top boom of the main girders of both the north and south approach spans and the internal viaducts. The two inner rail-troughs, on the other hand, are carried on cross transoms which span between, and connect to, the side plates of the top booms of these girders. From bay 4 of the cantilevers, where the internal viaduct terminates, to the ends of the cantilevers and across the central spans, the four troughs are carried on cross transoms spanning between the bottom booms of the cantilevers and the main girders of the central spans.

The section of the old troughs was uniform throughout the bridge, with the exception of the troughs over the cantilever ends and central spans, which had a heavier section to suit the wider spacing of the transoms. The troughs were side-stiffened by sloped supports riveted to the troughs and the cross transoms. Buckled plating, with the buckle convex, closed the floor between the troughs, the plates being riveted to the lower flanges of the troughs. The cross transoms are of ordinary plate-web construction, 12 in. deep in the internal viaducts and 24 in. and 47½ in. maximum depth in the approach viaducts and central girder spans respectively. The internal viaduct transoms, unlike the others, have a central support. The maximum spacing of the transoms ranged from 7 ft. in the approach viaducts to 15 ft. and 22½ ft. in the internal viaducts and central spans respectively.

In the course of renewing the timber waybeams in 1906, it was discovered that the bottom plates of the inner troughs were fractured between the rivet-holes in many places at the support of the trough on the cross transom, and that a large number of the rivets connecting the trough and transom had worked loose. The horizontal rivets in the cross transom connecting the top angle and web immediately beneath the inner troughs had also worked loose through lack of rigidity in the transom, these rivets having on previous occasions given trouble. The defects were attributed previously to (*a*) the heavier loads passing over the floor of the bridge, and (*b*) the lack of rigidity of the inner troughs as compared with the outer troughs, the destructive effect being accentuated by water and grit discharged from the inside of the troughs. In 1890, when the bridge was opened for traffic, the weight of a locomotive was 77¼ tons, with a maximum axle-weight of 15½ tons, whereas to-day these weights amount to 119¾ and 20 tor respectively.

Before the new waybeams were placec all the loose rivets were cut out; the frac tured bottom plates were reinforced wit covers placed inside the troughs, and ne rivets were inserted. In 1908, while th renewal of the timber waybeams wa still in progress, it was evident that th repairs were not likely to prove satisfac tory, as a large number of the new rivet had again worked loose. In 1909 it wa decided as an experimental measure t insert an additional cross transom be tween the existing transoms at bays 3 an 4 of the cantilevers, so as to give add tional support to the lighter inner rai troughs. The provision of these transom did not, however, provide a remedy fc the deterioration at the bearings, whic by 1911 had developed to such an exten as to necessitate consideration of furthe remedial measures. It was decidec therefore, to renew the inner rail-trough and buckled plating on the approach an internal viaducts, to strengthen an stiffen the cross transoms of the interna viaducts, and at the same time to provid additional cross bracing between th main girders of the approach spans so a to brace each panel-point, the existin bracing being arranged at alternate panel points only.

The new troughs are constructed c three steel channels 17 in. deep, whic had to be specially rolled, and which giv a very stiff section with a minimun amount of riveting—a matter of consider able importance in a floor of this type

o prevent the percolation of water from e inside of the troughs, a close rivettch was adopted, the edges of the bottom annel being caulked. The stresses in e new troughs were calculated on the sis of the latest axle-loading, assuming e troughs to be continuous, and adoptg a modified unit stress of 4 tons per . in. The section-modulus of the iginal troughs for spans up to 15 ft. was o units as against 137 units in the new oughs, and for the larger spans 184 units against 197 units. The old type of oped lateral support, the riveting of hich gave considerable trouble, was discarded in favour of a flat right-angled support which, after experiment, was found to be sufficient and which enabled an efficient connection to be made between the trough and transom without the necessity of riveting the trough and transom directly. This was important in view of the trouble experienced with the rivets connecting the old troughs to the transoms, and was a decided improvement from a maintenance point of view, as in future repairs could be carried out without disturbing the permanent way, which was impossible under the old arrangement.

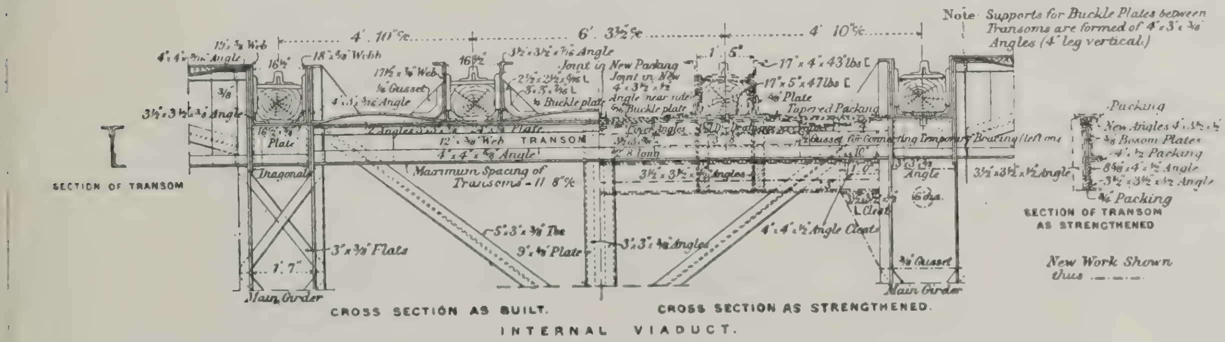
The strengthening of the internal viaduct transoms and the reduction of shear on the web rivets have been effected by increasing the depth of the transoms by means of additional angles riveted to the lower flange and by providing heavy bosom plates on each side of the web immediately below the inner troughs. The section-modulus of the original transom was 35·3 units, while that of the stiffened transom is 87·4 units.

The new buckled plates between the troughs are riveted to the bottom flange of the troughs as before, but the curve of the buckle is reversed. This alteration was made with the object of throwing all debris and surface water to the centre of the plates, instead of to the sides as formerly, difficulty having been experienced in keeping the junction of the floor-plate and the bottom flange of the trough in a satisfactory condition, owing to lodgment of debris and water there.

The work was carried out by means of timber platforms hung from the main girders. The renewal of the troughs and work in connection therewith was done on Sundays, the remainder of the work, which did not interfere with the running-lines, being carried out in stages during the week. On Sundays it was necessary to retain one line for traffic, and for this purpose a fully-equipped electric tablet system of single-line working was installed. The up and down lines were closed on alternate Sundays, the troughs in both lines for one section being completed before the work on another section was commenced. An extensive system of temporary horizontal bracing was adopted so that the old floor plates could be cut out and the rivets could be removed during the week, without materially impairing the rigidity of the viaduct under traffic conditions.

The work, the greater part of which was carried out under war conditions, was commenced in May, 1914, and was completed in September, 1920, the number of troughs laid being 340, occupying 145 Sundays.

The approximate weight of old steelwork removed from the bridge was 2,400 tons, and the weight of new steelwork used was 3,212 tons. The net cost of the work, exclusive of the cost of the work in lifting and replacing the timber waybeams, rails, etc., was £147,299. The contractors for the renewal of the steelwork were Messrs. Sir William Arrol & Co.



THE FORTH BRIDGE: SECTION THROUGH THE INTERNAL VIADUCT.

Economy in Roof Construction

WHICH type of roof is the most economical to use for spans of from 12 ft. to 15 ft. and from 20 ft. to 23 ft., with no intermediate support? This question has arisen out of the hints for counteracting the weaknesses of collar roofs, given by Mr. Edwin Gunn, A.R.I.B.A., in our issue for October 18, and the further suggestions made by Mr. W. B. Hopkins, A.R.I.B.A., in our issue for November 8.

The question is raised by "Architect," who writes: "Mr. Hopkins' suggestions for strengthening collar roofs appear only too sound, but in what class of work nowadays does one have the money to spend in the expensive construction necessarily entailed in such a roof?

"Surely for a 14 ft. span it is most extravagant to use one 11 × 6 in. beam, and four 7 × 5 in. purlins, exclusive of upper purlins, etc. I should be interested to see what in your opinion you consider the soundest and most economical type of roof showing the scantlings and joints such as would be used in everyday practice for spans of from 12 ft. to 15 ft. and from 20 ft. to 23 ft. respectively. . . ."

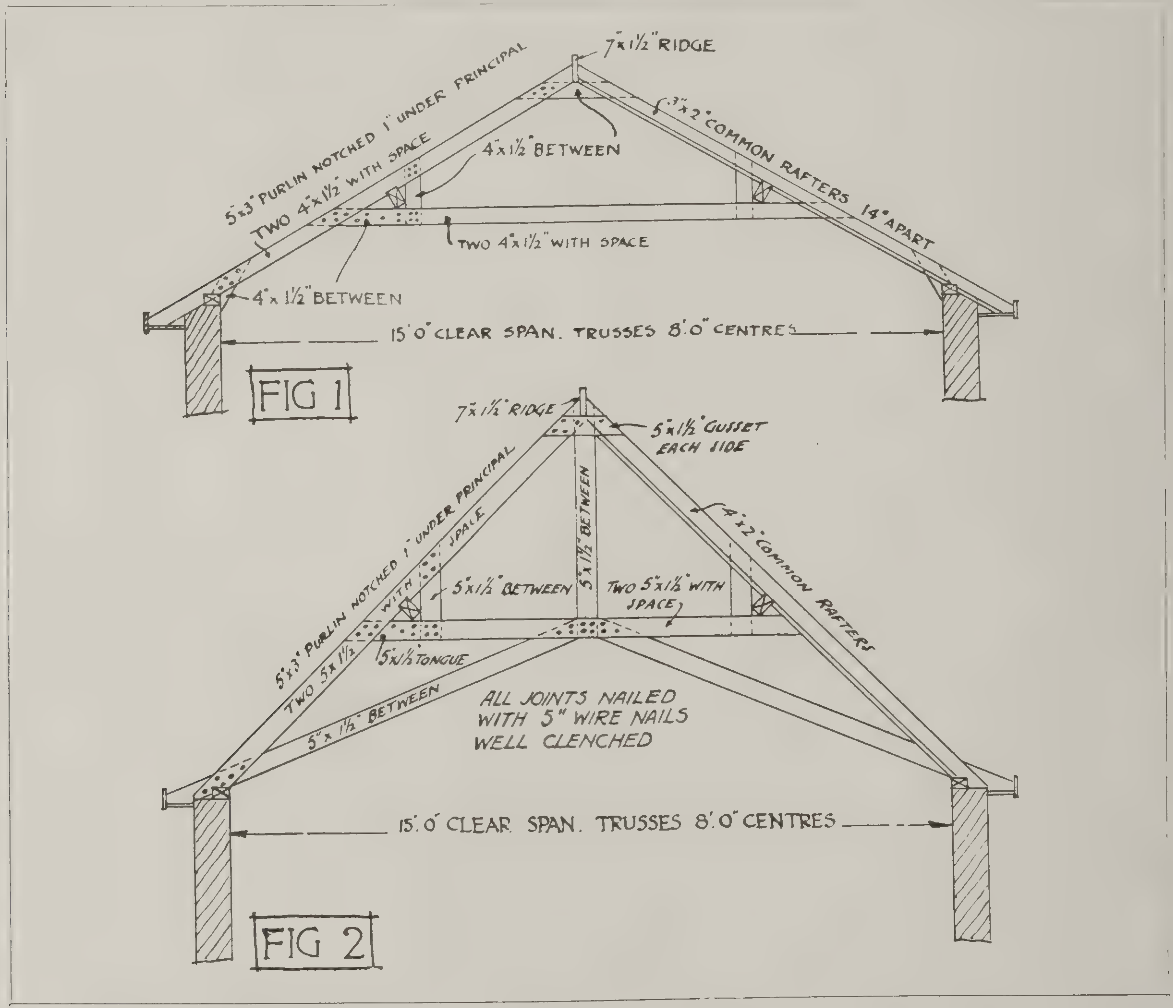
Mr. A. Ewart Aston, to whom we submitted the query raised by "Architect," says: Your correspondent's request for suggestions as to roofing buildings of 12 to 15 and 20 to 23 ft. span is extremely vague, inasmuch as he gives no idea whatever as to (1) the pitch of the roof, which fixes the length of rafter; (2) the roofing material, which is necessary for gauging the strengths of the timbers and joints; (3) the shape of the underside, which fixes the line of tie-beam or collar-beam, and (4) whether there is to be a plastered ceiling, which will require stiffness as well as strength in the lower members. A further factor in some buildings would be whether and how much the timber structure is to be seen.

There has certainly been a tendency in the past to use timbers of a much heavier scantling than necessary — probably originating in the ease of obtaining it large and the desire to avoid spending time in cutting it smaller. Elaborate joints have been evolved to hold these heavy timbers together, but none of them can ever be as strong as the members themselves; in consequence we frequently find in old buildings that the very weight of the roof members is pulling away the joints and thus causing a thrust upon the walls. Structurally, of course, the joints must always be the weakest link, and given a strong enough joint there is no real reason why the roof members should not be reduced so that they are no weaker than their necessary fixings.

I consider an extension of Mr. Gunn's suggestion for collar roofs, that is dou ling the rafter at intervals and fixing th collar between, can be applied to ma forms of truss, and in practice I ha found that there is very great strength this "sandwich" construction, provide that careful thought is given to the pos tions of the various members and obtaining a large "fixing area" whe they cross. I am all in favour of the naile joint as against the bolted one, as scarce any fibres are cut by the nails, and t act of clenching gives a decided grip the joint.

The making of a series of these truss is remarkably cheap as there are "joiner's joints" to make, and when o truss has been carefully set out and fixe together, the others may be made after another above it. The trusses extremely light for handling and erecti —it will hardly be realized that the truss in figures 1 and 2 weigh less than 120 and 200 lb. respectively.

A pardonable economy in a straight of roofing is to save two common raft over every principal by placing the purl on the *underside* of the principal raft This is a very difficult matter with so construction, but I think it will be agre that as shown in the accompanying figu it is no detriment to the strength of structure.



ROOF TRUSSES FOR A PITCH OF 30 DEGREES AND 45 DEGREES RESPECTIVELY.

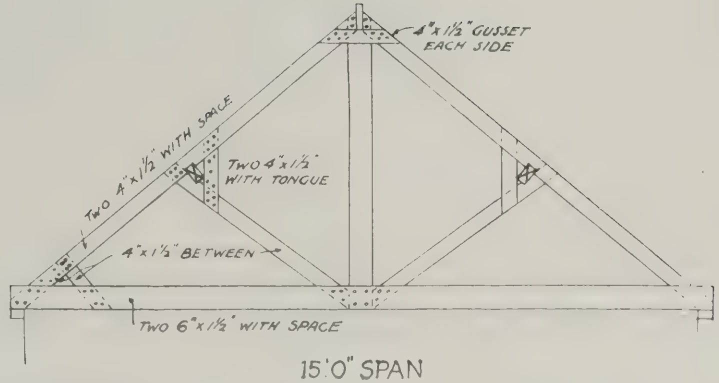

FIG 4.

A KING POST 'SANDWICH" TRUSS.

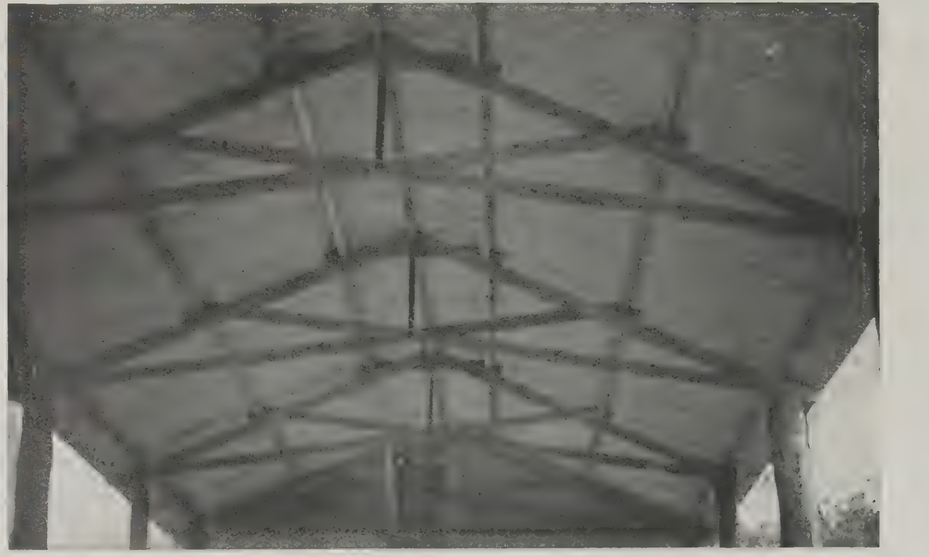

FIG. 6. A ROOF FOR A SPAN OF 18 FEET.

ECONOMY IN ROOF CONSTRUCTION.

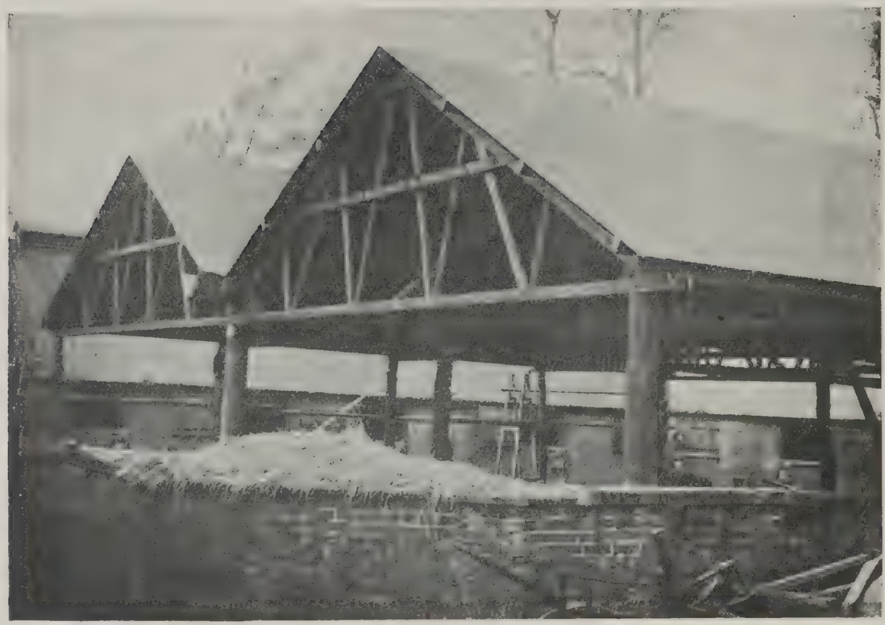

FIG. 7. TWO ROOF TRUSSES, EACH WITH 27 FT. SPAN.

Figure 1 is a design for 15 ft. span at 30 deg. pitch, and is suitable for a slated roof, either open to the ridge or ceiled on the collar line. The common rafters have only a 4 ft. 3 in. bearing, and lie flat on the centre purlin. The hip rafters may be 7 in. × $1\frac{1}{2}$ in. as the ridge, and no half truss is necessary at the hipped end.

Figure 2 is drawn for a 45 deg. pitch, and is suitable for a somewhat heavier roof covering than Fig. 1. The collar being higher, additional ties are provided to the foot of the truss, and 4×2 in. common rafters are used. As shown, it can be used as an open roof or with the ties only left exposed.

I have drawn Fig. 3 for a $\frac{5}{12}$ in. pitch with two intermediate purlins between the plate and the ridge. Although looking elaborate, in reality the construction is extremely simple, being composed entirely of $5 \times 1\frac{1}{2}$ in. singles spiked between $5 \times 1\frac{1}{2}$ in. doubles. To support the hipped end either a half truss in the centre or part trusses in the lines of the upper purlins would be necessary. The hips could be $9 \times 1\frac{1}{2}$ in. For an open or partly-open roof this enables small scantlings to be used. Alternatively a truss similar to Fig. 2 can be used, but built of $6 \times 1\frac{1}{2}$ in. material supporting one 6×4 in. intermediate purlin, but as the clear bearing of common rafters would be 7 ft. 6 in., they must either be spaced proportionately closer or a heavier section used.

For roofs with the ceiling at plate level an ordinary king post or queen post form is probably simplest, but even here the sandwich construction may be used with advantage, as shown in Figs. 4 and 5.

For buildings of a semi-permanent character this "sandwich" construction is invaluable owing to the rapidity with which it can be built and the ease of handling and erection. Three photographs are shown. Fig. 6 is a Dutch barn, 18 ft. span, with trusses built of 4×1 in. at 10 ft. centres. Fig. 7 is a covered yard, with two 27 ft. spans, built up from $4 \times 1\frac{1}{2}$ in. scantling, and trusses 11 ft. centres. The cowhouse in Fig. 8 is roofed with corrugated iron and lined with boarding. The trusses are 10 ft. 6 in. centres, and built from $4 \times 1\frac{1}{2}$ in., the posts being three thicknesses of $6 \times 1\frac{1}{2}$ in.

The British Empire Exhibition

All the engineering and electrical trade exhibits at the British Empire Exhibition are being organized by the British Engineers' Association and the British Electrical and Allied Manufacturers' Association. The following gentlemen are serving on the General Committee nominated by the B.E.A. for the shipbuilding, marine, mechanical, and general engineering section :—

Mr. Harry Allcard, M.I.Mech.E. (Easterbrook, Allcard and Co., Ltd., Penistone Road, Sheffield).
Mr. Harry Allcock (W. T. Glover & Co., Ltd., Trafford Park, Manchester).
Mr. S. E. Alley (Chislehurst, Kent).
Col. O. C. Armstrong, D.S.O. (London).
Mr. Duncan G. Bailey, O.B.E., M.I.Mech.E. (Chapelthorpe, near Wakefield).
Mr. Herbert Ballard (Purley).
Mr. Stanley J. Benham (Benham and Sons, Ltd., London).
Mr. Claude T. Berthon (Pott, Cassels and Williamson, Motherwell, N.B.).
Mr. R. A. Blakeborough (J. Blakeborough and Sons, Ltd., Brighouse, Yorks).
Mr. J. D. Brunton (Messrs. Bruntons, Musselburgh, Scotland).
Mr. H. M. Butler (Kirkstall Forge Co., Ltd., near Leeds).
Lt.-Col. E. Kitson Clark (Airedale Foundry, Leeds).
Mr. Basil T. Courtney (Joshua Buckton & Co., Ltd., Leeds).
Col. Percy B. Crewe (London).
Mr. J. E. Durbishire (Hydraulic Engineering Co., Ltd., Chester).
Sir John Dewrance, K.B.E. (Dewrance & Co., London).
Mr. C. E. Douglas (Douglas and Grant, Kirkcaldy).
Sir Arthur M. D. Duckham, K.B.E., M.I.C.E. (London).
Mr. D. N. Dunlop (British Electrical and Allied Manufacturers' Association, London).
Mr. Fredk. C. Fairholme, A.M.Inst.C.E. (Thos. Firth and Sons, Ltd., Sheffield).
Mr. L. M. G. Fraser (W. F. Fraser and Sons, Dagenham, Essex).
Mr. Arnold Gamble (Retford).
Eng. Vice-Admiral Sir George G. Goodwin, K.C.B. (Carshalton, Surrey).
Mr. Nevile G. Gwyne, C.B.E. (Gwyne's Engineering Co., Ltd., London).
Mr. Wm. Hay Howden (Jas. Howden & Co., Ltd., Glasgow).
Mr. F. E. Howard (Hayward-Tyler & Co., Ltd., London).
Mr. Jas. H. Humphreys (Braithwaite & Co., Engineers, Ltd., London).
Mr. Arthur Jacob (British Aluminum Co., Ltd., London).
Mr. J. R. C. Kearns (H. W. Kearns & Co., Ltd., Broadheath, near Manchester).
Col. H. P. Lawson (Coles, Marchant and Morley, Ltd., Bradford).
Mr. Fredk. H. Livens, J.P. (Lincoln).
Mr. A. Ernest Owen (Sutton Coldfield).
Mr. Ernest W. Petter (London).
Mr. W. B. Richardson (Richardson, Tuer & Co., Ltd., Farnworth, near Bolton).
Mr. Robert S. Rowell (Westminster).
Capt. H. Riall Sankey, C.B., C.B.E. (London).
Sir Wilfred Stokes, K.B.E. (London).
Sir John E. Thornycroft, K.B.E., M.Inst.N.A. (London).
Lt.-Col. F. W. Turner (Ipswich).
Mr. Douglas Vickers, J.P., M.P. (London).
Mr. A. Vines (Evershed and Vignoles, Ltd., Chiswick).
Mr. Gilbert C. Vyle (Moseley).
Mr. Herbert J. Ward (J. and E. Hall, Ltd., London).
Brig.-Gen. C. H. Whittington, C.M.G., C.B.E. (Mather and Platt, Ltd., London).
Mr. E. Wilson (General Electric Co., Ltd., London).

Sir William Joynson-Hicks, Bart., M.P., who is making an inquiry on behalf of the Government into certain aspects of the British Empire Exhibition, has held a meeting at the Board of Trade with representatives of the Executive Council, the Management Committee, and the General Management of the Exhibition, together with the High Commissioners for the Dominions and India.

At this meeting plans were made as to the procedure to be adopted in connection with the inquiry, which will now proceed immediately.

The terms of reference governing the inquiry are as follows : To inquire into the following questions in connection with the British Empire Exhibition :—

(1) What steps are being taken to provide for full consultation with representatives of the Dominions and the Colonies in order to secure the use of

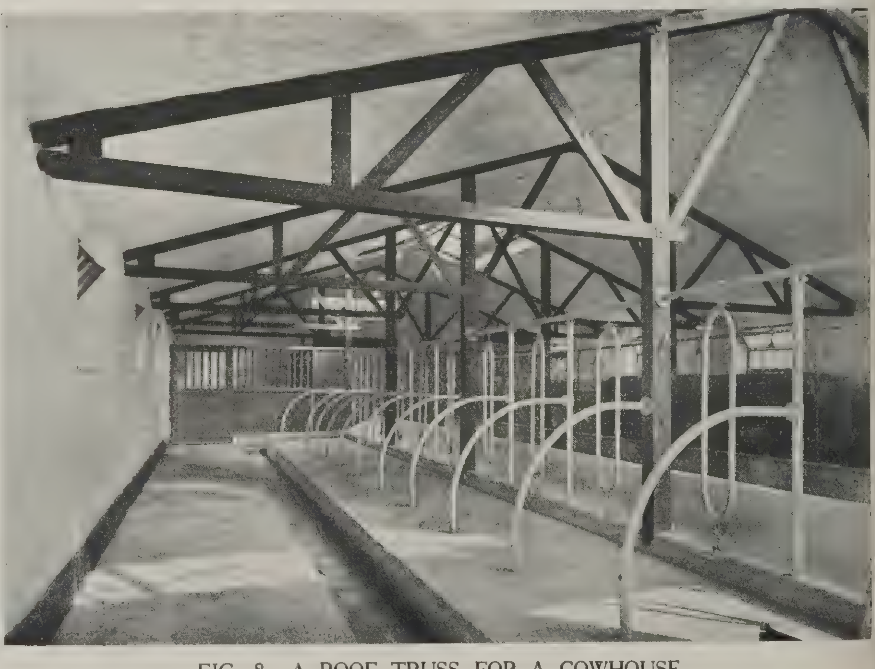

FIG. 8. A ROOF TRUSS FOR A COWHOUSE.

Imperial produce in connection with the exhibition.

(2) The granting of concessions for entertainments and amusements.

(3) The criticisms of certain members of the Publicity Committee as to the limited opportunities afforded to that committee to assist in the publicity work of the exhibition;

And to report thereon to the Colonial Office, the India Office, and the Board of Trade, and to the Executive Council, and also in this connection to consider and recommend whether any further steps can usefully be taken to strengthen the control of the Executive Council over the general conduct and administration of the exhibition.

Sir William Joynson-Hicks will be prepared to receive communications from any organizations or individuals who may desire to give evidence.

Mr. R. W. Dalton, His Majesty's Trade Commissioner in New Zealand, who is now in this country and will shortly proceed to Canada as His Majesty's Senior Trade Commissioner, will act as secretary, and communications in connection with the inquiry should be addressed to him at the Department of Overseas Trade, 35 Old Queen Street, Westminster, London, S.W.1.

Mr. John F. P. Rawlinson, K.C., M.P., has agreed to advise Sir William Joynson-Hicks in regard to any legal questions which may arise out of the investigation.

Parliamentary Notes

BY OUR SPECIAL REPRESENTATIVE.

Unemployment and Housing.

In the House of Commons Mr. T. Thomson asked the Chancellor of the Exchequer whether he could see his way to remove the restriction placed by the last Government on the making of grants by the Unemployment Grants Committee to local authorities for the purpose of building houses, in view of the fact that such houses no longer received the State assistance formerly provided by the Housing Act, 1919.

Mr. Baldwin replied that the matter had been carefully considered, and the Government had decided that the extension of this system of grants to house building would tend to check private enterprise, which was showing hopeful signs of development, and so do more harm than good. In any case such grants could have little effect in relieving unemployment in the building trade during the coming winter, and the Government considered that such relief could best be afforded by putting in hand works of repair and decoration. They were doing this in the buildings under their charge, and they trusted that local authorities and private owners would do all they could in the same direction.

The Regional Housing Staff.

In answer to Mr. Short, Major Boyd-Carpenter said that in 1920 there were fifty-seven inspectors and thirty sub-inspectors on the Regional Housing Staff of the Ministry of Health. To-day there were employed on similar work fourteen inspectors and no sub-inspectors.

Land for Housing.

Major Boyd-Carpenter informed Mr. M. Jones that the total area of land acquired in connection with housing schemes was approximately 48,800 acres. The total cost was £9,272,000, being an average of £190 per acre.

Slum Areas.

Replying to Mr. John Davison, who asked the total number of condemned insanitary and slum areas under the local authorities in England and Wales, and the total number of houses on such areas certified as unfit for human habitation but at present occupied, Major Boyd-Carpenter, Parliamentary Secretary to the Ministry of Labour, said that according to a survey made by local authorities in 1919 official representations under the Housing Act, 1890, had been made in respect of 855 areas containing 28,511 houses and a population of 142,857. Information was not available as to the last point in the question.

Unemployed Building Operatives.

Sir M. Barlow, Minister of Labour, informed Lt.-Col. Dalrymple White that on November 20 the Employment Exchange registers included 56,502 building trade operatives in skilled occupations, and 74,406 in unskilled occupations. In certain of the skilled branches of the building industry there was no large amount of unemployed labour, but rather the reverse.

State-aided Housing Schemes.

Sir M. Barlow, Minister of Labour, informed Major Kelly in the House of Commons that local authorities were fully empowered under the Housing Acts to borrow money for the carrying out of housing schemes, subject to the sanction of the Minister of Health. Such sanction was readily granted for satisfactory schemes. There was, generally speaking, no difficulty at present in raising capital for this purpose. The Public Works Loan Commissioners would consider applications from local authorities whose rateable value did not exceed £200,000. The rate of interest on loans made by the Commissioners for housing was at present five per cent. The large local authorities could generally make their own arrangements for borrowing on at least as favourable terms, and, in addition, they might borrow through the Public Works Loan Commissioners one-half the money raised in their areas by the sale of National Savings Certificates.

Glasgow House Shortage.

Mr. Buchanan asked the First Commissioner of Works, as representing the Secretary for Scotland, if he was aware that the City of Glasgow required 57,000 new houses, and that in that city the number of houses condemned as unfit for human habitation was 13,000; and what steps would he take to urge and help the local authority to solve both problems.

Sir J. Baird replied that the Secretary for Scotland was aware of the estimates on which the figures given were based. As regarded the last part of the question, the provision to be made under the State-aided housing scheme included the building of 4,854 houses by the corporation, 102 houses by public utility societies, and 142 by private enterprise. It was understood that the corporation were also preparing a slum clearance scheme in respect of which, if approved, they would be entitled to participate in the annual State grant of £30,000 earmarked for this purpose. The question of giving further assistance by the State to enable local authorities to deal with the housing problem was at present engaging the attention of the Government.

Grants to Private Enterprise.

Answering Mr. A. Herbert, who asked if the grant for houses built under the scheme of the late Minister of Health could be given to builders who have exceeded the regulations and have built houses on a more generous scale than that dictated by the late Minister of Health, Sir M. Barlow said that the Minister of Health was unable to authorize the payment of the Grant under Section 1 of the Housing (Additional Powers) Act, 1919, in cases where the houses did not comply with the published regulations.

Mr. Sitch asked whether the Ministry of Health was pressing local authorities who had building sites not built on to dispose of them.

Sir M. Barlow replied that no general instructions as to disposal of land had been issued, but local authorities had been asked to give the matter special consideration where it appeared that disposal on advantageous terms could be effected.

Parliament rose on Friday, December 15, until Tuesday, February 13.

Recreative Areas

Mr. W. Haywood, F.R.I.B.A., in a lecture at Birmingham University said: The town plan is a complex of highly specialized subdivisions, of which the systematic provision of recreative areas is not the least in importance. For more than thirty years this aspect of civic improvement has been developed in the United States, where "park systems" have been made a groundwork for schemes of municipal recreation designed to bring physical and mental fitness to every member of the community.

Recreation on this scale makes a demand upon the town plan which will be better understood from analysis of a typical "park system." This consists of: (1) Park reservations on the borders of the city (comparable with the Lickey Hills or Sutton Park, near Birmingham); (2) parks of 60 to 200 acres in the suburbs of the town; (3) parkways or boulevards of from 120 to 400 ft. wide, which link the parks together, and which, although traffic routes, are given a park-like character; (4) neighbourhood centres, if possible at one-mile intervals, each with an area of from 10 to 20 acres; and (5) children's playgrounds (which may be as small as 2 acres) at half-mile intervals.

The neighbourhood centres referred to are used intensively. Workers during the day are accommodated by an elaborate system of artificial lighting which permits all but the larger ball games to be played at night, so that the equipment available is often used consecutively for fourteen hours each day. In the development and administration of these games areas, the fundamental point of view is, that park facilities should be brought to the people, and not people to the parks; also that school accommodation should be utilized to its limit and that the development of the "system" should progress with the growth of the city.

Fashion and Form

MR. E. BERTRAM KIRBY, F.R.I.B.A., in reading a paper on "Fashion and Form" before the Liverpool Architectural Society (Incorporated), gave the personal views of a practising architect on the general character and tendency of the type of design which is prevalent at the present day. He said: The main point of this address is to suggest that it is not only excusable, but necessary that every architect and, more especially, every student of architecture should deliberately cultivate his own unfettered and uninspired opinions on the art he professes and aspires to practise. I submit that it is equally important that he should dare to make himself articulate, since it is chiefly by free and open discussion that the inherent truth or falsity of his views and prejudices can be tested. Although I quite sincerely believe in my own point of view, I feel disposed to beg that you will not agree with me, provided that your disagreement is sincere and founded on your own convictions, and not on someone else's, however authoritative. By all means "let us all praise famous men," but on no account should any of us immolate our own individuality on the altar of their worship. Such an oblation is simply artistic suicide.

It may save a little misunderstanding if I explain that I am dealing with architecture solely as an art and without reference to its business aspect. Also that when I use the word "classic," I am not confining it to the architecture of the ancients, but also to what the French term "the high Renaissance" and its modern interpretation.

I think one is safe in saying that the almost universal method of expression in the architecture of this country to-day consists of variations in the classic style, or, rather, a particular rendering of that style. I do not propose to search for an exact definition of the aspect of the classic tradition to which I refer, as it is perfectly familiar to you all. It lies between the obsolete pedantry of Stuart and Revett and the robustious extravagances of the later Renaissance. Its purpose is apparently to achieve harmony between orthodox classic forms and the material requirements of our own day, and, consequently, is easily distinguished from the work of the great classic architects of the nineteenth century who produced such excellent designs and such highly uncomfortable buildings.

In itself, *qua* architecture, it has attained a very high level. The average achievement in building design compares very favourably with any period since the Renaissance, and the architectural education of to-day is—within the scope it prescribes for itself—incomparably superior to that of former times. Well it may be, in view of the immense amount of information which is at the disposal of every architectural student.

This form of architectural expression has steadied and been standardized into a uniformity to which the exceptions grow beautifully less. It is usually adaptable to most of our modern requirements, its æsthetic excellence is hardly to be questioned, it is respectable and reasonable, its prophets and protagonists do not permit its virtues to be challenged, and it has the unquestioning adherence of the vast majority of the architectural profession. In fact, one may well be convinced that out of the welter and chaos of conflicting styles diverging down every by-road and cul-de-sac, we have at length emerged on to the great high road down which with progressive grandeur and increasing efficiency we shall, like John Brown's soul, go marching on. It is, in fact, claimed by many authorities that on these lines alone can the art of architecture pursue its logical and satisfactory development.

It might seem that the mere statement of such a thesis is sufficiently convincing to dispose of any question. I am, however, convinced that this is not the case, and propose to submit to you my reasons for this opinion. I am not suggesting that the classic tradition will ever die or that I, for one, would not sincerely deplore such a catastrophe even were it possible. But I submit that instead of humbly following the greatest of all architectural traditions in those instances where it can be the appropriate vehicle for the expression of our individual purpose, we are tending to subordinate it to the service of a cult which shows signs of degenerating into a kind of religious fanaticism of so dogmatic a character that any departure from it is regarded as heresy. I suggest that, especially in this country, any attempt to confine the broad stream of architectural development within the comparatively narrow limits of any selected channel is an offence against the mother of the arts, and tends to divert the understanding and sympathy of the public from the very thing to which it is designed to direct them. I am glad to believe that in this city the principal architectural instructor takes, in theory at least, a broader view.

It is mainly this tendency that I am criticizing, and if incidentally I decline to credit the classic style with all the virtues which are claimed for it, it is not because I dislike or oppose it, but because I esteem it as perhaps the highest form of architecture, and desire it to occupy its appropriate place. But its appropriate function is not that of a juggernaut beneath whose triumphant progress other forms of architectural expression are to lie crushed and obliterated.

I believe it has been seriously suggested that architecture might properly be practised on the lines of a syndicate. In fact, it is actually done. It is, however, a point of view I find difficulty in discussing, as, frankly, I do not understand it.

If art is not the self-expression of the individual, what is it? I mean self-expression which reflects the character and aspiration of the author, the language of his soul, so to speak. It is surely a thousand times better that he should express himself, however unsatisfactory the result, than exhibit an expurgated translation of another's mind. However that may be, the fact remains that the former is art, whether good art or bad, whereas the latter is not art at all, and its contribution is neither more nor less valuable than a crib to the classics. Compare such a state of affairs with any other art and the contrast is obvious. Of course, a student trained on these lines may become a great architect. The fire of genius is not easily quenched. If so, his expansion and the realization of his own identity must be deferred until a time when the mind is naturally less expansive and his vision more blurred by other influences.

We are told that this is the age of reason, and that the modern forms of classic architecture are its only adequate expression. Assuming for the sake of argument the latter proposition to be true, it may be interesting to analyze the former. Personally, I cannot admit that this age can claim a predominance of reason. If it is the age of anything in particular, I should describe it as the age of hysteria. At the best it is the age of successful experiment, but it may be argued that we are peculiarly unreasonable in the conclusions we draw from our discoveries. The ages at which pure reason, i.e., metaphysics, attained its highest development were the time of Aristotle and Plato and the thirteenth century, which curiously enough synchronize with the prime of the only two original forms of architecture, in comparison with which every other is bastard and derivative.

But, in any case, an appeal to reason alone, especially in matters of art, does not carry us very far. The average man is influenced far more frequently and profoundly by his habits and emotions than by his reason, especially the Englishman.

It is all very well talking about educating the public. It is true much requires to be done in that line up to a point, but though the public are ready to acquire information they are not prepared to change their inherent tastes at the bidding of an architectural clique. I used the word "tastes," I might more truly have said "needs." I am certain that if we are to capture the interest and sympathy of the British public we must feed them on something a shade more romantic—at any rate, for a change. Otherwise it is like a perpetual diet of beefsteak with consequent indigestion.

I do not believe that the architecture of the seventeenth and eighteenth centuries in its more formal aspects truly reflected the essential character of the people. In a highly artificial age it was a foreign importation by a still more artificial and affected aristocracy, mainly designed for their own aggrandisement. Its ultimate assimilation into our architectural history was accomplished by its submission to our national impress, and by the assumption of characteristic features which its progenitors would hardly have recognized.

If students were trained more as architects and less as propagandists, and were allowed the scope to express themselves more naturally, they could be depended upon to give their countrymen the architecture they require and understand. The problem of the education of the public would then be solved automatically.

It is merely a platitude to remark that particular architectural forms do not usually survive longer than a generation. Styles, however, in their broader sense are considerably more enduring. My contention is that even the fundamental styles move not progressively, but like st other forms of human development, cycles, and are far more affected by e wind of fashion than we care to admit. lo not believe that the tiller of the ship architecture is set straight for any en port, try as we may there is always slight cant on it, and our ultimate stination, if any, to say nothing of our urse, remains uncertain.

If one cursorily reviews the architecral history of the last century, one arts with the pure classic form subseently deteriorating into the stereoped dullness which we see in the old ndon suburbs. Then came the Gothic evival with its fanaticisms and misplication of form to requirements. is was followed by the school of rman Shaw, which, having revived the e-classic domestic architecture of England, ran quickly through practically the ole gamut of the Renaissance, finishing th a somewhat exaggerated Queen ne type. In later years this has come increasingly purer and more fined, with a marked reversion to eek forms rather than Roman. This ries of changes approximates very sely to a microcosm of the architecral history of Europe since the fall of the Roman Empire, so that there is some evidence for suspecting that it represents the normal cycle of change. If that should be so the time is almost ripe for the astonishing spectacle of another Gothic revival. I do not think that such a thing could happen on any scale in this country, since I see no purpose it could reasonably fulfil (except, of course, ecclesiastical), provided that the conditions of life remain roughly as they are.

I trust I shall not be accused of attempting to fan the ashes of the war of the styles. In my opinion there need and should be no war. My point is that the complex and diverse temperaments of nations and individuals should be free to express themselves in whatever manner they feel to be appropriate. It may be urged that if the hidden forces of my nature demand expression in the form of a Saracenic cinema, which, by the way, sounds rather attractive, and if I can find anyone who is fool enough to pay for it, there is nothing to prevent it with the possible exception of the municipal authorities. This is perfectly true, but what would be the result? So long as the tide of architectural design runs solely in one direction I should be merely a mutineer affecting a singularity which, however satisfactory to my subconscious self, would not contribute anything to architecture as a whole.

But what if the tide turns as, for the reasons previously mentioned, I think it may? Then there follows a split in the camp and consequent conflict resulting in chaos. That large number of architects who possess no personal convictions, but subsist on the bits, politely termed *motifs*, which they snatch from the great man's table, will hungrily pounce on any new manifestation of form. What, then, is the remedy? I suggest that it lies in the hands of those who are responsible for the training of architects that they should not negatively tolerate, but positively teach how to use sanely and suitably those other forms of architectural expression which, without such training, are so constantly misused and misapplied. Variety, not only of treatment, but even of style, does not necessarily imply chaos. The unity of diversity can be the most delightful and satisfactory of all, as most people realize who know the City of Brussels as contrasted with, say, Berlin, which has only achieved uniformity and consequent dullness.

The Law of Building Outside London

MR. A. N. C. SHELLEY, M.A., of H.M. Ministry of Health, read a paper on the above subject before e R.I.B.A. last week. We give a few the points made by the lecturer.

I have chosen "building law" rather an "by-laws with respect to buildgs" for my title, because by-laws are t by any means the only method of ntrol exercised by the provincial local thority. In addition there are regutions which are not the same as by-laws.

It is as well that everyone concerned ith building should grasp the distincn between these various methods of ntrol, and it is essential for those to do who are seeking to reform the present stem. Let me explain it briefly. arliament says that you shall not build living-room above a privy or two ck-to-back houses; these are direct actments, and a local authority has concern but to enforce them. Then says that you shall not bring your ilding in front of a certain line without e local authority's consent: or that if ur private streets are not to the local thority's satisfaction they can require u to make them up; these are *ad hoc* scretions vested in the local authority. gain, the communication of your house ain with the sewer is controlled by regulations," fixed in advance, and so ffering from an *ad hoc* discretion, but t the same as by-laws, as you will see a moment.

The by-laws in which you are interted are local laws made by a town uncil, urban, or rural district council, d have no validity unless confirmed by central authority, originally the Home cretary, then from 1871 to 1919 the cal Government Board, and now the inister of Health. And not only must by-law be confirmed, it has two other atures which are worth remembering. s making must be advertised in the cality, and it must be open to public spection for a month before the Minister can legally confirm it. These requirements sound formal, but they have corollaries of the first importance.

An Act of Parliament is inherently static, and for controlling a progressive art in the public interest you do not want a static code of law.

In by-laws it is simple—you have four classes—those with no by-laws, those with the fullest code, and two classes in between. The local authority itself says which code it wishes to apply, and the central department, comparing its circumstances with those of other districts determines whether those circumstances justify such strong measures as the local authority desires.

There can be no doubt, looking to the history and form of the governing Acts of Parliament, that one of the objects of having these matters controlled by bylaws has been to secure definiteness in the requirements imposed. Discretionary powers such as were given in the Act of 1848 must lead to far greater varieties than any possible system of by-laws, and the Local Government Board—whose office was staffed in early days by men familiar with both the definite and the discretionary systems — always looked upon certainty as the primary object to be secured. In a Circular Letter of 1877 they laid it down (and they were incessantly repeating the same doctrine) that a person who has to obey the law is entitled to claim a statement, as precise as circumstances warrant, of the requirements which he must obey.

On this subject I commend paragraphs 50 to 58 of the Departmental Committee's Report to the notice of those persons who like to speak of the need for some "appeal against by-laws," whatever that may be. This is a phrase constantly used, but possessing no particular meaning and, therefore, very dangerous. It may mean at least two things which are quite distinct.

This Report, the only attempt made in this country to set out in coherent shape the law, the history, and the practice of the control of building by local authorities is little known, but its study is essential to an understanding of the English law of building and to the framing of a system for the future. If I may summarize it in a few sentences I should do so thus :—

1. The system adopted in 1858 and since maintained by which the local authorities who have to enforce the law are also to make the law, has on the whole worked well. No case has been made out for scrapping the authorities or the system.
2. Experience since 1875 has revealed various gaps and possibilities of overlapping which ought to be set right.
3. Experience has in particular shown that building law, like every other invention of the human mind, grows old and needs renewal. With the progress of invention that law may grow obsolescent quickly, and it is essential that a central authority in close touch with professional opinion, and in a position to study the practice and requirements of the country as a whole, should be enabled to revoke local laws which have become oppressive.
4. Parliament recognized this in 1909, but the enactment has proved to be so badly drawn as to be unworkable in practice.

If this section could be brought up to date and made to work, a large part of the difficulty which now exists would vanish.

These are the four main points. The Committee made twenty-three recommendations, and some are of more weight than others. Let me conclude by saying that, as far as the central department is concerned, what we want is more co-operation between architects, local authorities, and ourselves.

A vote of thanks to Mr. Shelley was moved by Mr. W. E. Hart, Town Clerk of Sheffield, and seconded by Major Harry Barnes, F.R.I.B.A.

Law Reports

Question under a Housing Scheme

Williams & Co. v. *Curd.*

Nov. 29. Official Referees' Court.
Before Mr. G. A. Scott.

The tiling of certain houses at Shoreham-on-Sea, Sussex, as part of the District Council's housing scheme, was the subject of an action in which Messrs. John Williams & Co., of Dinorwick Slate Wharf, Rotherhithe, S.E., claimed from Mr. Ernest Harry Curd, builder, of Shoreham, £115 balance of charges for tiling eight houses and damages for breach of contract.

The plaintiffs' case was that they contracted with the defendant to tile sixteen houses, but they were only allowed to do eight; the defendant denied that there was any contract in writing, and alleged bad workmanship, which made him refuse to allow plaintiffs to complete the job. He further pleaded that if there was any contract it only related to four houses.

The work was commenced on May 18 of last year and completed on September 14, when some of the tiles for the remaining eight houses remained on the site. The plaintiffs' contention was that Mr. Curd repented of his contract for the reason that he thought he could get the second eight houses done more cheaply by someone else. He asked plaintiffs if they could not do the work more cheaply, and when they replied in the negative he set about, said plaintiffs' counsel, trying to discover small defects, but the defects of which he complained could have been set right for a five-pound note.

The plaintiffs having called evidence in support of their claim, the defendant, in the course of his evidence, denied that he had entered into any contract with regard to the sixteen houses.

Mr. James Latham, employed by the local authority as clerk of the works for the Shoreham district housing scheme, said that part of his duty was to superintend and inspect the buildings, and he found the tiling done by the plaintiffs so badly done that he had to condemn it. He called Mr. Curd's attention to the defects, and told him he could not pass the work until they were remedied.

The Official Referee, in giving judgment, said he did not feel he would be justified in finding that there had been an approved contract for the sixteen houses. The burden of proof was on the plaintiffs, and they had failed to establish the contract for the sixteen houses. Under all the circumstances the plaintiffs could only recover £57 15s. 7d., and judgment would be for that amount, without costs.

Building Scheme. Question of Covenants

Kelly v. *Barrett.*

Dec. 1. Chancery Division.
Before Mr. Justice Russell.

Mr. C. J. Mathew, K.C., moved on behalf of the plaintiff, Mr. Edward Kelly, for an interim injunction to restrain Lady Elizabeth Florence Barrett from carrying on Nos. 40 and 42 Fitzjohn Avenue, Hampstead, as a nursing home or for any purpose other than that of a private dwelling-house in contravention of the provisions of the estate's building scheme.

Mr. Courthope Wilson, K.C., for the defendant, contended that the whole character of the neighbourhood had changed, and that with the knowledge and acquiescence of the plaintiff the scope of the scheme had been altered. When she purchased her houses in 1920 they were in a deplorable condition and an eyesore, and she spent £2,000 on the drains, footpaths, etc. She claimed that what she had done had greatly improved the value of the houses on the estate, which had very much deteriorated during the last seven or eight years. With regard to the restrictive covenants, she carried on a high-class nursing home, where people of the professional class who were unable to pay heavy fees were attended to at reduced prices. It was not advertised, there was no name-plate, and the nurses were not allowed to go out in uniform. To the knowledge and with the acquiescence of the plaintiff, there were several doctors, a Baptist training college, two schools, and a studio on the estate, which had been used for other than residential purposes for many years.

Mr. C. J. Mathew replied that the schools were outside the estate, and that he did not regard the doctors or the studio as breaches of the covenants. He denied that the neighbourhood had deteriorated.

His Lordship said that Mr. Courthope Wilson had made out a case for trial and there would be no order on the motion, except that the costs be costs in the action.

Mr. Courthope Wilson said that the home would be carried on as quietly as possible meanwhile.

Builders' Claim

Chadleigh v. *Dimon.*

Dec. 11 and 12. Official Referees' Court.
Before Mr. G. A. Scott.

This was an action by Messrs. Chadleigh Bros., builders, of 96 Shepherd's Bush Road, Hammersmith, against Mr. Christy Dimon, to recover £158 10s. for repairs and alterations of his house 205 The Grove, Hammersmith.

The defendant, according to plaintiffs' counsel, disputed the claim on the ground that some of the work had not been properly done, that the charges were excessive, and that there was a contract to carry out the work for £50. There was, said counsel, nothing in writing nor was there any estimate, and the work was done at a time when it was extremely difficult to get any work done. The defendant, it was true, asked for an estimate, but Mr. Jarrett, the plaintiffs' foreman, declined to give any, but stated casually that he thought the work would cost from £85 to £100, and it was under these circumstances that the work proceeded. From time to time the defendant gave orders for extras, which amounted in all to about £48. It was true that defendant impressed upon plaintiffs' representative that the extra work was to be done as cheaply as possible, and it w so done. Until the bill was sent in t defendant made no complaint of t quality of the work. The house w an old one, and the sanitary authoriti had made an order relative to alteratio in the drainage, etc., and that work w included. It was put in hand in Ju and completed in August, and the defen ant went into possession soon after co pletion, and his complaints were ma after the demand for payment and threat of action. The job was booked a time job from beginning to end, and t profits worked out at 15 per cent. of t overhead charges. The local authoriti raised no complaint as to the charact of the work, and the evidence of a su veyor would prove that it was proper done.

Evidence was called on both sides, t taking of which occupied nearly two day relating to the circumstances und which the arrangement between t parties was made and the character the work done.

The Referee, in giving judgment, sa the order to do the repairs was placed a time when building operations were mo difficult, both wages and materials havi reached their limit. Not only were wor men claiming high wages, but they we not doing the work they had done befo for their wages. Therefore, every o engaged in building operations had feeling, when the bills were presented, th they were being charged too much, a he had consequently had the disagreeab task of going into cases where builde were said to have charged too muc He looked at this case from that poi of view. There was in it a question fact as to the basis under which t builders undertook to do the work. seemed that Mr. Jarrett had made quotation of from £80 to £100, and doubt he explained the work he propos to do for that amount. Had the matt stopped there he would have had hesitation in holding that plaintiffs we bound to carry out the work for a fix sum of £100 approximately. But it d not stop there, because when Jarre reported that the plaintiffs would do t work, the defendant said that £50 wou be his limit, and it was said that Jarre had said without the consent of t plaintiffs that he was willing to do t work. Defendant said that was a co tract to do work which could not possib be done for that sum. He (the Refere could not accept that as the basis up which the work was done. That bei so, and there being no special barga he had to consider what was a fair pr to be paid. Accepting the basis of t arrangement as being that the pr should be approximately £100, he fix the amount at £110, but that would clude some of the items which plainti had charged as extras. He thought t builders were entitled to £8 for extras. against that he had to set off some the matters complained of by defenda As a result he reduced the plainti claim to £105, for which amount he ga judgment for plaintiffs, with costs of t counter-claim.

Current Prices of Materials

NDON PRICES.—The following information is intended to serve as a guide only, and should be confirmed by Trade inquiry. The Labour Rates are se current at the time of issue and are the Union Rates The prices are for good quality material, and are intended to cover delivery at works, wharf, station, or yard as customary. The measured prices are based upon the foregoing.

Investigate the Merits of

Ironite

REGISTERED TRADE MARK **BRAND**

Cement for **FLOORING**

the Flooring that resists wear, oil and water. It is dust-proof and increases the efficiency of Factory, Shipyard, Quay and Garage.

The ideal material for the economical construction of any floor that has to withstand successfully the stress and strain of heavy traffic.

Trade and Craft

Transmission Equipment.

n these times when increased produc-
ı is absolutely vital it should be the
ı of all who are responsible for manu-
turing output to reduce factory leak-
s to a minimum. Some of the ways
which this may be done are clearly
plained in the new catalogue of the
kefko" Ball Bearing Co., Ltd., whose
nsmission accessories have been spe-
lly designed to ensure a reliable,
cient, and economical power trans-
sion service. One of the most frequent
ms of leakage in a factory is the loss of
ver occasioned when the driving trans-
sion is mounted on defective or un-
table bearings. In the "Skf" self-
gning bearings the bearings themselves
l instantly and automatically, through
rolling of the balls, with any slight
lection of the shafting. Owing to the
t that this self-alignment occurs
ough the medium of rolling motion the
tional loss is the minimum possible,
l shafting mounted on this type of
ring has every opportunity of answer-
easily and immediately to any strains
this nature. Other special features
sessed by these ball bearings are the
ıble row of balls so arranged that the
k of the load at any given moment
y be carried by three balls, and their
imed ability to withstand end-thrust
hout loss of efficiency due to the plane
rotation of each row of balls being
ical. The firm have been at con-
erable pains to arrive at definite con-
sions regarding the performance of
kf," not only in their laboratory, but
o in analysing voluminous data brought
their notice in daily work. The result,
s claimed, is that a net power saving
ying between 12 and 24 per cent. may
obtained by the installation of "Skf"
l-bearing equipment. Another im-
tant claim made for these bearings is
t by reason of their low friction loss
y never run hot, and as a consequence
need for attention and the risks of
ppage or fire from this cause are re-
ced to a minimum.

In order that the most reliable and
luring service may be obtained from
use of "Skf" hangers, plummer
cks, etc., users are urged to submit
ir problem to the company's trans-
ssion department, who undertake to
ce proper size bearings and arrange-
nts before prospective buyers without
y obligation on the part of the latter
adopt them. The various specialities
ıstrated in the catalogue will be found
suitable construction, applicable to a
de range of factory work, and manu-
tured on a mass production, so that
iformity of material and finish can be
ied upon. "Skf" specialities cover a
ge range, and in all of them special
ention has been paid to design and con-
uction. The catalogue is produced in a
ry attractive manner, is profusely illus-
ted by means of photographs and
awings, and full particulars and prices
given of the many accessories. Full
d clear instructions, accompanied by
ıstrations, are embodied for the erec-
n of transmission bearings and for the
ting of split belt pulleys. The catalogue is full of valuable information, and should be in the possession of every manufacturer. Copies may be obtained from the head office and works of the company at Luton, Bedfordshire.

The Sentry Duplex No. 6.

The accompanying illustration shows a new and original design of hot-water boiler, called the Sentry Duplex No. 6, which has been specially produced by Messrs. Wood, Russell & Co. to meet a very definite and growing demand. While all large heating installations require a separate boiler for this duty alone, it is becoming more usual for a small hot-water heating system to be installed in moderate-sized houses, in which there is neither the room nor the labour available to operate two separate boilers for heating and domestic hot-water supply respectively. The alternative has been either to make the domestic supply subsidiary to the heating system and heated by a coil taken from the latter, or to work the radiators off the domestic supply boiler. By employing a Sentry Duplex No. 6 the makers claim that the user obtains all the advantages of a single fire, together with the following advantages :—

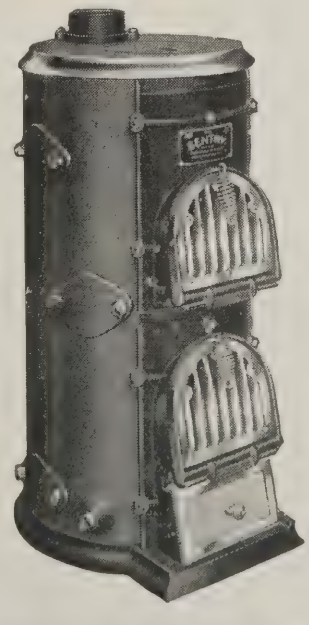
(1) A constant temperature is maintained in the heating system, irrespective of demands made on the domestic supply.

(2) The efficient domestic hot-water supply is direct from the boiler, and is of higher temperature than obtainable by an indirect method of heating.

(3) The heating system is entirely free from the sediment which in most localities collects in the domestic supply system.

(4) For summer work, the size of the boiler and the fire is reduced, so as to be commensurate with the demand made by the hot-water supply only.

(5) The heating system is kept charged through the hot-water supply system, and the employment and maintenance of a separate cistern and ball-valve is rendered entirely unnecessary.



SENTRY DUPLEX BOILER No. 6.

These results, it is claimed, are obtained by the special design of the Sentry Duplex No. 6, which is so constructed as to operate as two entirely separate boilers, which can be combined at will to operate as a single boiler. Externally, the Sentry Duplex No. 6 presents generally the appearance and embodies all the features of the "Sentry" boilers of the ordinary pattern—that is to say, the fire is always visible through large and well-protected mica windows, the boiler can be operated with an open fire if desired, the furnace doors are designed to act as trivets when open, and a large and efficient hot plate is always available for cooking. The Sentry Duplex No. 6 has a heating capacity sufficient for 125 sq. ft., and at the same time is claimed to supply seventy gallons of water at bath temperature per hour, with broken gas coke. Anthracite, or a mixture of coke and coal, can be used, and the boiler will also consume all the combustible domestic refuse. Owing to the arrangement of the smoke outlet and the pipe connections, the back of the boiler can be placed close up to a wall, and at the same time close to objects on both sides. This renders the Sentry Duplex No. 6 particularly suitable for installations where space is limited. Other special features claimed for the boiler are that the waterway extends below the firebars to allow any sediment to fall to the coolest part of the boiler, whence it can be easily removed through the cleaning covers conveniently placed for the purpose; that clean stoking is facilitated by a special fuel funnel provided free of charge with each boiler; and that the loose night hopper increases the fuel capacity and is useful if the boiler has to be left for over twelve hours. The address of the manufacturers is 36 Oxford Street, London, W.3.

Standardized Pipe Fittings.

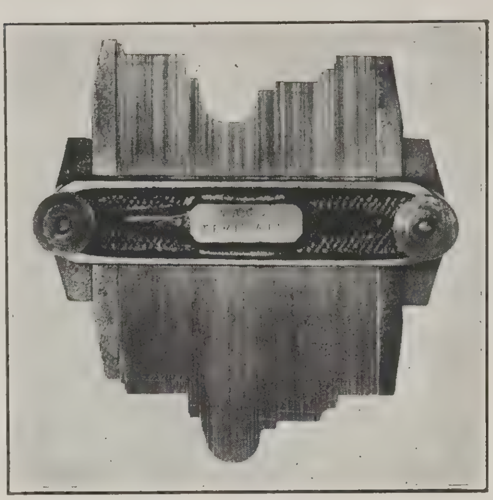
A new "Standard English Price List," No. 4a, 1922, has just been issued by Messrs. Crane-Bennett, Ltd., to cover the work, recently completed, of the British Engineering Standards Association on the standardization of malleable and soft cast-iron pipe fittings for gas, water, steam, oil, air, etc. The advent of these two British Standard Reports, which standardize the specifications of fittings in both ordinary and long sweep types, marks a step of great importance to heating and sanitary engineers, and in conjunction with the existing British specification on pipes should go a long way towards that ideal—the standardized pipe line. The importance of these two reports is emphasized by the official support indicated by the folllowing bodies being represented on the committee of standardization : War Office, H.M. Office of Works, R.I.B.A., Royal Sanitary Institute, British Waterworks Association, Institution of Heating and Ventilating Engineers, Institution of Water Engineers, Association of Railway Locomotive Engineers, National Association of Master Heating and Domestic Engineers, and various industrial and manufacturing organizations. The malleable and soft cast-iron pipe fittings illustrated in the list, which are included in the British Standard Reports are supplied to British Standard dimensions. All the designs shown embody all modern requirements and the latest improvements. Whether plain, banded, or cast-iron, the British standard fittings of the company have the same face to face measurement, length of thread, and internal dimension. All are full bore, and have a high factor of safety over the specified working-pressures. Copies of the list may be obtained on application to the company at their head office and warehouses, 45–51 Leman Street, London, E.1.

Gas in the Printing Trade.

In the current number of "A Thousand and One Uses for Gas" (No. 100), published by The British Commercial Gas Association, 30 Grosvenor Gardens, S.W., the illumination of printing works is dealt with in an interesting manner and is illustrated by a number of photographs taken in well-known establishments. Power and heating questions are touched upon, and particulars of recent special developments in the application of gas are also referred to. This issue and the previous one (No. 99) show what an important part gas plays in the production of printed matter, and should be read by all who are desirous of effecting improvements in efficiency and working conditions in the printing works, large or small. The booklet (6d. post free to the general public) will, we understand, be sent free of charge to those engaged in the printing industry who enclose a business card.

A Handy Template.

One of the greatest difficulties confronting the architect when measuring old or new buildings is that of securing correct profiles of mouldings, window openings, etc. By the usual method, which takes a great deal of time and requires much patience, it is often doubtful whether the accuracy of some particular profile can be guaranteed. All difficulties have now been overcome by the invention of a handy template, which will secure with the greatest accuracy and ease the shape of anything in a few moments. The machine, known as the "Maco" patent (adjustable) template, is a British patent and of British manufacture. It is composed of hundreds of very fine pieces of steel or brass, the thickness of each being .007 in. These are held in position by two cast-iron or aluminium clamps, secured by two thumbscrews and springs, by the tension of which the pieces of steel take the shape of anything they are pressed against. The accompanying illustration shows the template after a profile has been taken, and it will be seen that the impression—which, of course, must be absolutely correct—is obtained in both forms. After the impression has been plotted, the threads are simply pushed back level with the clamps, and the template is again ready for use. The template, which may be obtained from Mr. E. James Brown, of 12 Montserrat Road, Putney, S.W.15, is compact and convenient, and should be in the possession of all architects and draughtsmen.



THE "MACO" ADJUSTABLE TEMPLATE.

Shaftesbury Homes and "Arethusa" Training Ship

The ball which is to take place on July 14 at the Hyde Park Hotel in aid of the Shaftesbury Homes and "Arethusa" Training Ship will be under the following Royal and distinguished patronage:—H.R.H. the Duke of York, H.R.H. the Prince Henry, H.R.H. the Princess Royal H.R.H. the Princess Louise Duchess o Argyll, H.H. Apply Office of the Metropolitan Asylums Board, Embankment, E.C.4. Deposit £1 in respect of each work.

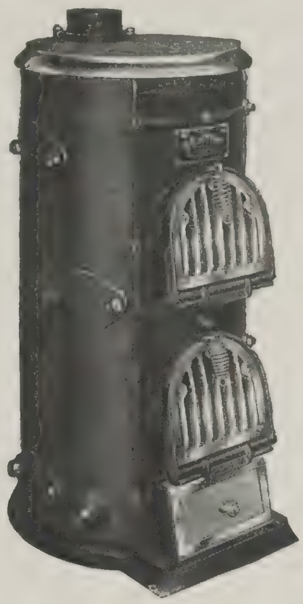
July 19.—**LOCOMOTIVE REPAIR. Edinburgh.**—Overhaul and repair of a locomotive engine at Holmes Siding, Drumshoreland, near Edinburgh, for the Edinburgh Corporation. Apply Inspector of Cleansing, 331 High Street, Edinburgh.

(*Continued on page* xxiv.)

IN WINTER, the house of medium size, the bungalow, and the country or sea-side ottage all require an adequate and reliable Hot Water Supply as well as a Hot Water Radiator System *rom one fire only*, and without the drawbacks hitherto inseparable from the use of only one Boiler.

IN SUMMER, the same apparatus must supply the domestic Hot Water only— — — n a correspondingly reduced fuel consumption.

ALL THE YEAR ROUND, it must be possible to see the fire, to keep it alight all ight, cook the breakfast, have an open fire when required, nd burn all the rubbish.



THE SENTRY

REGD.

DUPLEX No. 6

MEETS THIS DEMAND

aving been specially produced for this purpose.

It operates as two separate boilers with one fire in winter and as one boiler nly with a reduced fire in summer. It is a new, entirely original, and fully rotected design, and there is nothing else remotely like it in existence.

Made in Cast Iron Wrought Iron or Copper

Trade and Craft

Cabot's Quilt.

'Cabot's Quilt, the Scientific Sound
adener and Heat Insulator," is the
le of an interesting booklet which has
;t been issued by Messrs. Building
oducts, Ltd., of Columbia House,
-46 King's Road, Sloane Square, S.W.3.
bot's Quilt is a scientifically construct-
lining for making houses warm in
nter and cool in summer, for deadening
ınd in floors and partitions, for insulat-
; cold stores, refrigerators, ice-houses,
:., and for numerous other purposes.
ıce it was invented about twenty
ars ago it has been constantly im-
oved, but the radical improvements
:ently made are claimed to have so
eatly strengthened it and developed its
efulness as to have increased its value
ɔre than 50 per cent. Quilt is a felted
ıtting of cured eel-grass stitched with
:ong thread, securely fastened between
'o layers of exceedingly strong, tough
Kraft" paper. The eel-grass fibres are
ıg and flat, and cross each other at
ery angle. This makes a thick, elastic
shion filled with dead-air spaces, and
ad air is said to be the most perfect
n-conductor of heat.

The frontispiece to the booklet is an
ustration of the Old Pierce House,
orchester, Mass., which was built in 1635,
d is an admirably preserved specimen
the earliest New England type of
ilding. In 1893 the walls of this house
ere opened for repairs, and they were
und to be stuffed between the studding
th eel-grass, which was in a perfect
ate of preservation after more than two
d a half centuries. The Babcock House,
ilton, Mass., built in 1723, and other old
uses in Connecticut, Nova Scotia, etc.,
ve since been found to be insulated in
e same way, and the eel-grass unde-
yed, thus proving the permanence of
is fibre with which Cabot's sheathing
d deafening quilt is made. A number
illustrations are taken from the United
ates and Canada because the quilt was
ell established and in great demand
ere long before any real attempt was
ade to bring it before the British public.
umerous illustrations, however, are
ven of its use in this country, and a
rusal of the pages shows that it already
s a most influential and convincing list
well-satisfied British users.

Among the buildings illustrated in
hich the quilt has been used are St.
ul's Girls' School (Music School),
ammersmith (Gerald C. Horsley,
R.I.B.A., and Dendy Watney, archi-
cts), The National Institute for the
lind (Claude Ferrier, F.R.I.B.A., archi-
ct), The Gramophone Audition Rooms
the Chappell Piano Co., Ltd., London
. Crowe, A.R.I.B.A., architect). Among
e residences in the United Kingdom
hich have been insulated with Cabot's
uilt are the following: Hackness Hall,
alby; Upper Grove House, Roehamp-
n; Cottesbrooke Hall, Northampton;
ewchapel Farm, Lingfield; Beaufort
ouse, Ham Common; Milton Hill,
eventon; Old Mains Farm, Mont-
eenan; Broomlands Farm, Dreghorn;
esford Court, Besford; Leadenham
state, Lincoln; Preston Manor House,
righton; Three Arts Club, London. The
sidences of: The Rt. Hon. Lord Middle-
n, Wollaston; The Rt. Hon. The Earl
Fortescue, Castle Hill, Devon; The Rt. Hon. Lord Hotham, Titchfield.

Cabot's quilt was also used with success for one of the shelter huts at the South Pole of the Scott Antarctic Expedition, for a house at Etah, North Greenland, by Mr. Donald B. McMillan, the explorer, and at "Naulakha," Waite, Vt., by Mr. Rudyard Kipling.

London County Westminster and Parr's Bank, Ltd.

The directors of the London County Westminster and Parr's Bank, Limited, have declared an interim dividend of 10 per cent. for the half-year ended June 30 on the £20 shares, and the maximum dividend of 6¼ per cent. on the £1 shares for the same period. The dividends, 10s. per share and 1s. 3d. per share respectively (both less income tax), will be payable on August 1.

Brilliant Sign Company's Annual Outing.

On July 1 the employees of The Brilliant Sign Company, Ltd., held their annual outing at Hindhead, Surrey, under the presidency of the Governing Director, Mr. F. G. Lucas. The party journeyed by charabanc. After luncheon sports were held, and many valuable prizes were contended for. At 4.30 o'clock the party had tea at Guildford, where they were entertained by the string band of the restaurant. The party left Guildford about eight o'clock. The weather kept fine throughout the whole day, which gave the men an opportunity of enjoying the scenery provided by the Surrey Hills—Devil's Punch Bowl, Hog's Back, etc. At the luncheon the usual toasts were given and responded to, and nine telegrams were read out from the chair, including one from each of the company's provincial branches, also one from their head office, 38 Gray's Inn Road, London, one from their London representatives, and from the cashier and staff. There were eight departments represented out of fourteen departments, or just over 25 per cent. of the total number of the company's employees.

Osglim Lamps.

The Osglim discharge lamps, introduced some twelve months ago, rapidly found favour for use as night-lights, indicators, and for advertising purposes by reason of their low current consumption, and the novel nature of their light. The Osglim lamp, which is manufactured at the Osram G.E.C. Lamp Works at Hammersmith, is now firmly established, and new types, together with special fittings for use with them, have recently been introduced. These are illustrated and described in a series of attractive leaflets and folders, copies of which may be obtained on application from The General Electric Co., Ltd., at Magnet House, Kingsway, London, W.C.2, or from any of the company's branches. Two forms of Osglim lamp were originally supplied—the lighting type and the letter lamps. The letter lamp series has now been supplemented by a set of figure lamps, so that complete signs with both words and numbers can be made up. Another innovation is a lighting type lamp in a ruby varnished bulb for use in photographic dark-rooms. This lamp provides a safelight of the right intensity for the dark room, and emits no fumes and practically no heat. In addition to the hanging, bracket, and pedestal signs specially designed for use with Osglim lamps, a new fitment which can be arranged either as a standard or as a ceiling fitting with one, two, or three lights has been introduced. These are specially intended for house numbering in connection with the Osglim figure lamps. Leaflet No. O.S. 2725 deals particularly with the Osglim dark-room lamp, leaflet O.S. 2742 with the lighting and figure lamps, and O.S. 2743 with the letter and figure lamps, Osglim signs, etc. These are available for overprinting with dealers' names and addresses, and supplies will be sent on application. As a further aid to sales, a novelty showcard depicting a night nursery has been produced. The showcard is in the form of a collapsible model, and is intended to be illuminated by an Osglim lighting type lamp. A showcard will also be sent to dealers on request.

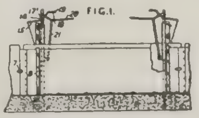
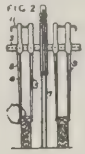
179703.—Moulding walls in situ.—Hillman, E. B., Kimber, H., and Dadisman, H., 314 West Tenth Street, Los Angeles, U.S.A.—In building hollow or solid concrete walls course by course, the shutters 4, 5 are supported by uprights 8 which are adjustably carried by a crossbar 3 slidably supported on a standard 1. The shutters are raised to different levels by a friction ratchet 17′, 18, 19, 20, 21, and are supported at these levels by a friction collar 14 and arm 15. The bottoms of the shutters are caused to grip the completed course by screws 11 at their upper ends. The shutters have overlapping joints with hook members 7.





The above particulars are specially prepared by Messrs. Rayner & Co., Registered Patent Agents, of 5 Chancery Lane, London, W.C. 2, from whom readers of the Journal may obtain all information free relating to patents, trade marks, and designs. Messrs. Rayner & Co. will obtain printed copies of the published specifications and forward on post free for the official price of 1/- each.

The Use of White Lead in Paint

Draft regulations with regard to the use of white lead or sulphate of lead in paint have been prepared by the Home Office in collaboration with the Painters' and Decorators' Industrial Joint Committee of Great Britain.

Lead paint is defined as any paint, filling, or painter's material containing more than 2 per cent. of lead, expressed in terms of metallic lead when present as white lead or sulphate of lead.

The regulations for employers set forth that white lead, sulphate of lead, or products containing these pigments shall not be used in painting operations except in the form of paint or paste ready for use, and shall not be stored, transported, or used otherwise than in receptacles legibly marked as containing lead paint. The latter provision, however, does not apply to receptacles for mixing paint for immediate application or for actual use at place of painting. Lead paint must not be applied in the form of a spray in the interior painting of buildings, nor must surfaces painted with lead paint be rubbed down or scraped by a dry process.

Persons employed in filling, or painting with lead paint, shall be provided with a sufficient supply of water, soap, nail brushes, and towels, and at least one bucket or basin for every five persons so employed, and they shall each be allowed five minutes for washing before each meal-time and before leaving work. Suitable arrangements shall be made to prevent clothing put off during working hours being soiled by lead paint, and where practicable the accommodation provided shall be outside the apartment in which painting is taking place.

On notice being given to an employer by the Chief Inspector of Factories that the incidence of lead poisoning amongst his employees is excessive, the employer shall make arrangements for all painters employed by him to undergo periodic medical examination, under such conditions as the Chief Inspector may prescribe, by the certifying factory surgeon for the district or other qualified medical practitioner appointed by the Chief Inspector.

Under these regulations, the employees shall wash their overalls at least once a week, and clean and wash their hands before each meal-time and before leaving work, and shall present themselves at the appointed time for medical examination. They will also have to take precautions that when working with lead paint the clothing they have meantime discarded is prevented from being soiled by the paint.

Parliamentary Notes

BY OUR SPECIAL REPRESENTATIVE.

Housing Progress.

Sir A. Mond stated, in reply to a question from Sir A. Holbrook in the House of Commons, that on June 1 the number of houses completed under State-aided schemes was 149,207, including 115,899 provided by local authorities and public utility societies, and 33,308 by private builders. On the same date, 40,970 houses were under construction by local authorities and private utility societies, while preliminary certificates had been issued to private builders in respect of 8,846 houses. The latter, in order to qualify for subsidy, had to be completed by June 23. In addition, there was a balance of 19,131 houses to be built by local authorities which had not been started. The total capital cost of the assisted housing scheme of local authorities and public utility societies was estimated at £190,000,000, of which approximately £160,000,000 had been expended by June 1. Up to that date £7,800,000 had been paid in subsidy to private builders.

Eastern Canadian Timbers

Eastern Canadian Timbers is the subject of a report just issued by the Imperial Institute Advisory Committee on Timbers, and sent to the High Commissioner for transmission to the Government of Canada. The Committee, which includes members nominated by the R.I.B.A., the Timber Trade Federation, the Institute of Builders, the Carpenters' Company, the National Federation of Furniture Manufacturers, the Institute of British Carriage and Automobile Manufacturers, and the Timber Sub-Committee of the Empire Development (Parliamentary) Committee, has been inquiring for some time past into the possibilities of using British Empire woods in greater quantity in this country, and has already issued a number of reports dealing with the timbers of British Columbia, West Africa, New Zealand, India, etc. The Committee conclude that the technical qualities of Eastern Canadian timbers are such as warrant a far larger use of the woods in this country than obtains at present. As regards softwoods, spruce and red pine (notably the former) are most likely to find an extended market since they form admirable substitutes for Baltic white and red deal respectively. Yellow (white) pine should also be more widely used. The Committee, however, emphasize the fact that if Canadian softwoods are to compete more successfully with European timbers it is important that they should be well seasoned and that the sawn lumber should maintain a high standard of manufacture and accuracy of measurement. The timber should also be available in as full a range of sizes as is possible. The report is published in the Bulletin of the Imperial Institute, Vol. xx, No. 1, 1922, copies of which may be obtained from Mr. John Murray, 50A Albemarle Street, price 3s. 10d. post free.

The Domestic Revival.

Home building, compulsorily abandoned during recent years, has again become a matter of supreme interest to Englishmen, and the Domestic Architect is once more coming into his own.

The best work of the present century has been selected and illustrated in the June number of the "ARCHITECTURAL REVIEW," of which a few copies still remain.

Architects will find in this Special Domestic Issue a rich variety of suggestions for themselves and their clients.

HY-RIB

For Plaster and Concrete Work

HY-RIB is a steel sheathing of great rigidity, which is both a centering and a reinforcement for concrete work.

HY-RIB eliminates timber shuttering or "false-work."

HY-RIB is used for Concrete Floors, Walls, Roofs, Partitions, Suspended Ceilings, etc.

HY-RIB is used in conjunction with any kind of framework—Reinforced Concrete, Structural Steel or Timber.

HY-RIB is suitable for every type of construction—large or small.

Electrical Notes

I.E.M.A. Visit Magnet Club

During the convention of the Incorporated Electrical Manufacturers' Association a visit was paid to the Witton Engineering Works of the General Electric Co., Ltd., at Birmingham. Prominent among the social work carried out by the company at these works is the provision and erection of a new club house, in memory of the many who went from Witton to the front and who did not return. The club possesses an up-to-date electric kitchen, the whole of the equipment for which was manufactured at the company's heating and cooking works at Birmingham. The kitchen is planned for the supply of meals to the staff and employees, approximating 2,000, and has now been in operation for over eighteen months with complete success. The main equipment comprises four ranges, each fitted with three ovens, grillers, steaming ovens, vegetable boilers, fish fryers, stock pots, hot cupboards, saucepans and boilers, together with the necessary control gear. In considering the planning of the kitchen, it had to be borne in mind that whilst large numbers had to be catered for, there was no need to make provision for great variety in the type of meal. Any portion of the plant for cooking in any particular way had to be capable of providing for the full number of diners at any one time. In the design of the whole of the appliances, the guiding principle adopted was simplicity of construction, so that access could be easily obtained to any particular part. In the ovens the whole of the electrical portion can be readily removed, leaving an entirely free space for cleaning. There are no crevices for fat or dirt to accumulate, and all seams are welded. With the exception of the stock pots, all appliances have self-contained elements, whilst the problem of vegetable boiling has been solved by providing such loading that an ample reserve of heat is available to raise the temperature quickly to the boiling point.

Incorporated Municipal Electrical Association

Following are the new officers and council of the Incorporated Municipal Electrical Engineers' Association :—

President, Lieut.-Col. W. A. Vignoles, D.S.O. ; Vice-President, Mr. S. E. Britton ; Hon. Treasurer, Mr. H. Faraday Proctor ; Hon. Secretary, Mr. A. C. Cramb ; Hon. Solicitor, Mr. P. M. Heath ; Councillor Members, Ald. A. Wilkinson and Ald. H. Leese ; Engineer Members, large towns, Messrs. R. B. Mitchell, W. J. H. Wood, and H. R. Burnett ; Engineer Member, small towns, Mr. T. Hall. Mr. F. Ayton was elected an honorary member of the Association.

Extensions to Municipal Electrical Undertakings

Among the local authorities who have decided to carry out extensions to their electricity undertakings are the following : Douglas (Isle of Man), £62,000 for work authorized by the Corporation Electric Light and Power Act, 1921 ; Edinburgh, £1,100 to extend electricity main to Cramond ; Fulham, £2,875 for mains and switchgear and £1,750 for additions to linking up plant ; Halifax, £4,045 for high-pressure switchgear ; Leyton, £4,000 for electric light services ; Reigate, £33,000 for extension of generating station ; Watford, £35,000 for additional plant at electricity works. The following local authorities are applying for loans for electrical work : Barnstaple Town Council, £1,300 for extensions to plant ; Hereford, £21,000 in connection with electricity undertaking ; Stretford, £25,000 for extension of mains ; Wrexham, £6,586 in connection with electricity scheme, and £5,000 for the laying of cables. At Hanover a proposal to erect a central electricity supply station for the supply of electricity to the whole of the district between Göttingen and the River Aller was presented to the Prussian Landtag. It is intended to erect a supply station near Hanover, on the banks of the canal which connects Hanover with the coal basin of the Ruhr, and to generate electricity by means of steam turbo-dynamos.

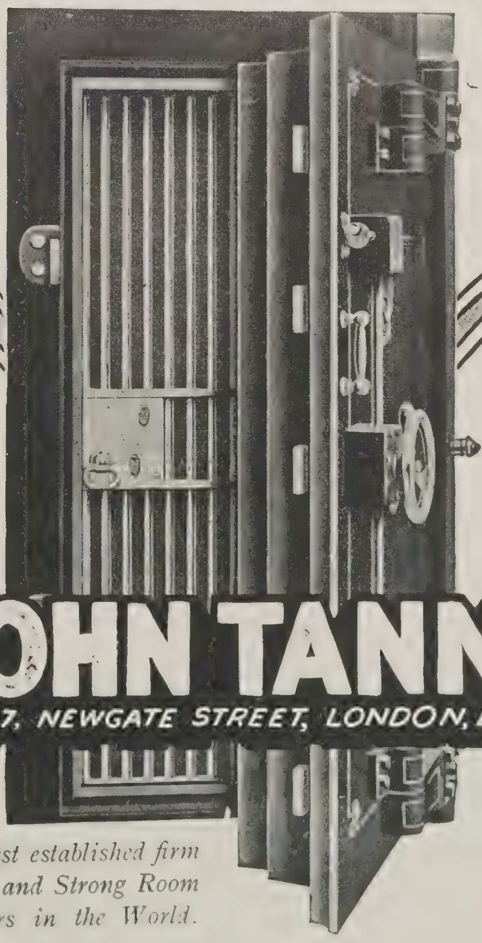
JOHN TANN'S RELIANCE SAFE
117, NEWGATE ST LONDON, E.C.

JOHN TANN LTD.- -the World's leading Safe & Strong-Room manufacturers:

Recent tests carried out in the presence of eleven leading Bank Representatives to ascertain the degree of security afforded by a John Tann Banker's Safe or Strong Room, have proved conclusively that it is far in excess of any known contingency.

Architects desirous of advice on any question of security are invited to consult the Technical Dept. of the firm, with the assurance that we shall consider them under no obligation.



JOHN TANN LTD.
117, NEWGATE STREET, LONDON, E.C.1

The oldest established firm of Safe and Strong Room Engineers in the World.

CONTRACTS OPEN

Unless expressly stated to the contrary, all deposits required for bills of quantities, etc., are returned on receipt of bona-fide tenders. The words "Fair Wages Clause" inserted in certain paragraphs signify that persons tendering must conform to a fair wages clause in the contract, which requires them to pay the rates of wages current in the district.

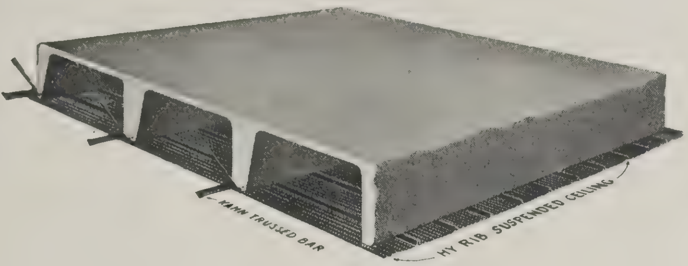
TRUSCON HOLLOW FLOOR

Long Span Slabs with Flat Ceilings



THIS floor, being hollow, is soundproof, as well as fireproof, and is invaluable for Offices, Hospitals, Schools, Hotels, Flats and similar buildings.

It is the lightest floor procurable, and owing to its simplicity of construction is very economical.

This floor has been used in some of the largest buildings in England.

Cornell Wood Board

This pure wood product can be applied directly to joists and studdings or over old walls without removing the old material.

Turn the attic, basement, spare room and other waste places into attractive useful quarters by finishing the walls and ceilings with strong, rigid panels of Cornell-Wood-Board.

The pebbled surface of Cornell-Wood-Board takes a perfect spread of paint or calcimine because it is Mill-Primed (both sides) and it saves you the cost and labour of a priming or sizing coat.

The 32- and 36-inch widths, called "Cornell 32" and "Cornell 36," produce the most charming panels for hallways and small rooms. For large work the 48-inch width, called "Cornell 48," is recommended.

Cornell's Triple-Sizing process protects against moisture, expansion and contraction. Guaranteed not to crack, warp, buckle or chip, if the directions for applying are followed.

Let us give you samples of this remarkable board, estimates, and names of those who are delighted with the results it gives.

General Agents for United Kingdom : **EDWARD CHALONER & CO., Brown's Buildings, Liverpool.**

August 25.—**STEEL CASTINGS. Johannesburg.** —Supply at Zwartkopjes pumping station, Selborne Siding No. 114, of 38 steel castings, 456 phosphor-bronze valves, and other materials for the inverted vertical marine-type pumping engines of that station. Marseilles Tiles

The general utility of Marseilles tiles for roofing purposes has long been recognized on the Continent, and their employment, not only in many parts of Europe, but in Asia, Northern Africa, and Australasia, has increased so rapidly that the present demand necessitates an annual manufacture of 250 millions.

In England, however, where for centuries only plain tiles and pantiles were n ordinary use, it was not until the manufacturers of patented interlocking roofing tiles had achieved some success in popuarizing this form of roof covering that Marseilles tiles—probably the oldest of the interlocking type—found their way nto this country, and established for themselves the favourable position they still hold.

These tiles originated in Marseilles about one hundred years ago, and are made from non-ferrous clays—peculiar to the locality in which the famous old seaport is situated.

The earliest authentic examples known to the writer of the use of genuine Marseilles tiles in England occur in a arge house and several other buildings at Dorking, in Surrey, and date from the year 1875. These are to-day in excellent condition, although they have not been touched since they were originally laid.

It is quite possible that instances exist which go back even farther than those ust mentioned, but it is difficult to trace them, and the point must be left undetermined. Nevertheless, roofing tiles which have remained exposed to the climatic conditions of this country for close on half a century, and at the end of that period show no signs of flaking or disintegration, have obviously been very everely tested.

The extent to which the use of Marseilles iles has grown during the last few years may be inferred from the fact that they have been adopted by the architects of over a hundred housing schemes in Great Britain, and that last year upwards of hree millions were supplied by the manuacturers.

Besides interlocking on all four edges, these tiles are extremely hard, and of even colour.

A square of roofing requires 127 tiles and weighs from six to seven cwt., while a single tile measures 16¼ in. × 9½ in.

The following suggestions for laying Marseilles tiles will be found of practical value to those who seek reliable information on the subject :—

1. Start fixing at the bottom right-hand corner of the roof.

2. Arrange the roof battens so that no cutting of tiles will be necessary, either to the top or bottom row; but if the depth of the roof is such that a course of tiles must be cut, then cut the bottom one.

3. A course of plain tiles should be securely fixed in all eaves and verges, and the Marseilles tiles firmly bedded to them. If, instead of seating the bottom course, it is decided to wire it, the bottom batten should be of double thickness.

4. The usual gauge of the battens is 13¾ in. from centre to centre, but this gauge should be checked when the tiles are delivered and before the exact spacing of the battens is decided. It is an advantage if the tiler who fixes the tiles also fixes the battens. The size of the battens can be 1¼ in. by ¾ in., or 1 in. by ¾ in., with the rafters spaced at 14-in. centres.

5. Marseilles tiles have been effectively used at all pitches from 30 deg. to 50 deg.

6. In the north of England the tiles are generally secured with 18-gauge copper wire, the cost of which does not, as a rule, exceed 4s. 6d. per square. The best method of wiring is to pass the wire round the batten and give the wire a twist on top of the batten. Then pass the wire upwards through the hole in the back of the tile and give the wire another twist. If the wire is first placed through the hole, and then round the batten and fastened, the wire may become "slack." In the south of England the tiles are very seldom wired, and the roofs appear to be quite satisfactory. Some firms in the south recommend bedding the tiles every third or fifth course, or torching the heads every third or fifth course. This method appears to give good results.

7. The tiles should not be tightly jammed up to one another, but put down normally. It is easier to fix the tiles if there is plenty of "play."

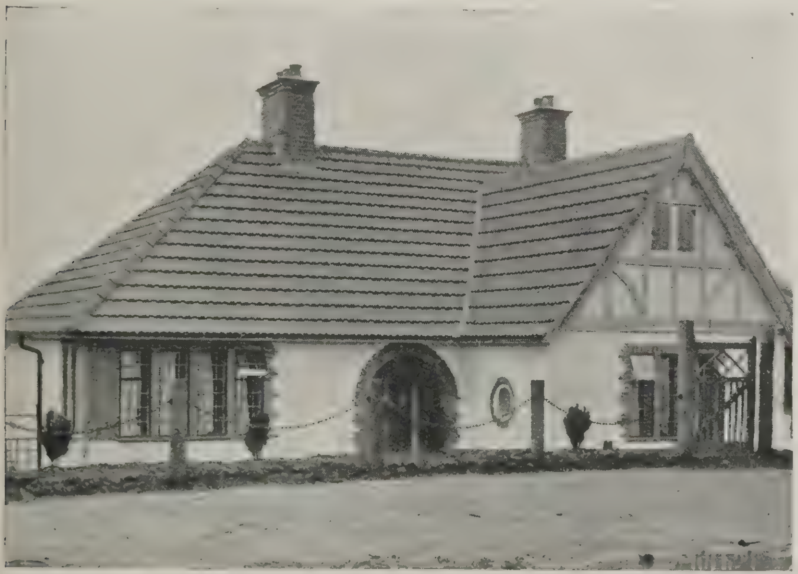
8. Ridge-hip tiles are supplied to match the tiles, and should be cut so that they practically meet on top of the beam which forms the hip.

9. Valleys can be of lead or zinc, and tilting fillets should not be used, but a slate undercloak about 5 in. wide may be securely nailed up each side of the valley with a projection of 2½ in. over it. The Marseilles tiles should then be cut up the valley in a line with the slate, and securely bedded and pointed between it and the tile.

10. Broken and damaged tiles can nearly always be used for cutting to the verges, hips, and valleys.

11. For verges a half-tile is required at each alternate row, and these can be cut from damaged tiles.

The accompanying illustration of a bungalow at Golders Green—designed by Herbert A. Welch, A.R.I.B.A.—shows the effect which is obtainable with Marseilles tiles as a roof covering.



A BUNGALOW AT GOLDERS GREEN, ROOFED WITH MARSEILLES TILES.
HERBERT A. WELCH, A.R.I.B.A., ARCHITECT.

Trade and Craft

The Woman's Exhibition.

We are asked to state that the London Gas Companies' stand at the Woman's Exhibition was not only furnished by Messrs. Heal & Son, Ltd., but also erected by them.

The Relay Automatic System Adopted by the G.P.O.

The new Director of Telephones has converted the telephone exchange in the Lancashire town of Fleetwood to relay automatic working. This is the latest step in the direction of giving practical effect to the promised telephone reforms. Automatically operated exchanges have been on their trial in England during the last decade, and their pronounced success in eliminating operating errors and delays combined with the present urgent demand for a more rapid service has given a marked impetus to their general adoption.

Fleetwood's exchange is unique in that it is the first of its kind opened for public as distinct from private service. All modern telephone systems, whether manual or automatic, utilize small electro-magnetic "relays" to a very large extent for controlling the various electrical circuits, but the system installed at Fleetwood is remarkable for the fact that it performs the whole work of establishing and controlling subscribers' connections entirely by means of such "relays," without the intervention of mechanical switches or continuously rotating shafting employed in other automatic exchanges. The system has been aptly termed the Relay System; it might also be characterized as the silent and motionless system, for the moving parts are so light, and their travel so minute, that it is difficult to detect any movement when the apparatus is in operation.

Fleetwood exchange has an ultimate capacity for 920 subscribers. The whole of the service is automatic, the nearest operator being at Blackpool (a distance of eight miles); even trunk calls, which are negotiated via Blackpool, are set up automatically at Fleetwood.

The requirements of any telephone service are exacting and complex, and particularly is this true of a public exchange such as Fleetwood. The new automatic installation, however, experiences no difficulty in meeting the many and varied demands of the service with far greater precision and speed than could be attained by human agency. The operator's usual salutation "number please" is replaced by a humming tone which is audible on the line within a fraction of a second of a caller lifting the receiver. The Fleetwood caller accepts this as an invitation to deliver the number required, which is done by rotating the numbered dial in the approved fashion. The desired connection is established and a signal indicating the ringing of the distant subscriber's bell is distinctly audible the moment dialling is completed. Owing to the almost imperceptible movements the entire operation of establishing connection with the number dialled is effected almost instantaneously. The connection is severed with the same speed on the conclusion of conversation.

The Post Office has now thirteen automatic exchanges in use, and in due course others will be added.

FIG. 3.

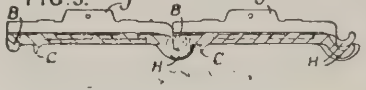

FIG. 2.

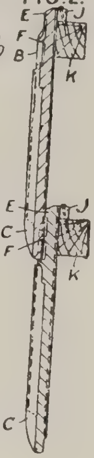

Abstract Published.

180862.—Roofing-tiles.—Wainer, G. W. and March, W., 2 Victoria Villas, Sneinton Dale, Nottingham.—A roofing-tile is provided on its upper face with two horizontal ribs, E, F and in continuation therewith are two side ribs B, C of greater height; the other side of the tile is formed with an over-lapping portion H to fit the rib B of the adjoining tile. The tile is retained in position by means of a lug J which engages the roofing-lath K.

The above particulars are specially prepared by Messrs. Rayner & Co., Registered Patent Agents, of 5 Chancery Lane, London, W.C. 2, from whom readers of the Journal may obtain all information free relating to patents, trade marks, and designs. Messrs. Rayner & Co. will obtain printed copies of the published specifications and forward on post free for the official price of 1/- each.

West Ham's Electricity Supply

The recently completed extensions at the West Ham Corporation Generating Station at Canning Town have been officially opened by the Mayor. After a tour of inspection of the station he set in motion the new 10,000 kilowatt turbo-alternator which has been installed. Subsequently votes of thanks were accorded to the Mayor and to Mr. Councillor J. T. Husband, the chairman of the West Ham Electricity and Tramways Committee, and the proceedings included the presentation of a gold watch to the Mayor from the contractors for the generating plant, and one of a dressing bag to Councillor Husband from the contractors for the boilers; while the workmen at the generating station presented the Mayor with a framed portrait of himself in his robes.

The Mayor, in the course of his reply, spoke of the difficulties the Corporation had had to contend with, and suggested that with the new 10,000 kilowatt turbo-alternator a practically continuous supply of electricity would now be assured. They hoped to install another 10,000 kilowatt alternator in the near future. One feature of the work of the West Ham Electricity Committee was that it had advertised the vacant building plots in the borough, and the result of that was that now the borough had an additional £50,000 a year coming in in rates.

Are Great Cities a Menace?

"England has demonstrated that the garden city is a practical scheme of benefit to the workers, of benefit to industry, of benefit to the community, of benefit to the nation." This conclusion is reached by Mr. Laurence Veiller, in a booklet entitled "Are Great Cities a Menace? : The Garden City a Way Out," published (price 25 cents.) by the National Housing Association of New York City. Mr. Veiller puts forward many reasons why a great city is a great evil, gives particulars and illustrations of the schemes at Welwyn and Letchworth, and states that the vital features of the garden city idea have just as much value for America as for England. Will America, he asks, heed this example, or will she be content to blunder on in the same old way?

HY-RIB

For Plaster and Concrete Work

HY-RIB is a steel sheathing of great rigidity, which is both a centering and a reinforcement for concrete work.

HY-RIB eliminates timber shuttering or "false-work."

HY-RIB is used for Concrete Floors, Walls, Roofs, Partitions, Suspended Ceilings, etc.

HY-RIB is used in conjunction with any kind of framework —Reinforced Concrete, Structural Steel or Timber.

HY-RIB is suitable for every type of construction—large or small.

Better *and* quicker building with the Léan System

BETTER building because Léan-built walls are hollow walls ensuring perfect insulation—acting like a Thermos flask—proof against damp and extremes of heat and cold. Léan walls are fire-proof and rot-proof, too.

Quicker building, because Léan houses are built with concrete blocks made by the Léan block-making machine, which is hired, and employed on the site. Three men and a Léan machine can produce and stack daily sufficient blocks for erecting 40-50 square yards of Léan Wall. One man can wall-in half this amount in the same time.

The Léan System is adaptable to any design.

CONTRACTS OPEN

Unless expressly stated to the contrary, all deposits required for bills of quantities, etc., are returned on receipt of bona-fide tenders. The words "Fair Wages Clause" inserted in certain paragraphs signify that persons tendering must conform to a fair wages clause in the contract, which requires them to pay the rates of wages current in the district.

BUILDING.

August 10.—**HOUSES. Langholm.**—Erection of four blocks of two houses each, for the T.C. Apply Mr. G. Irving Bell, Town Clerk, Langholm. Deposit £1 1s.

August 10.—**HOUSES. Llanharran.**—Erection of 26 "A" type houses and 24 "B" type houses on the housing site at Llanharran, for the Cowbridge Rural District Council. Apply Mr. E. Loveluck, A.R.I.B.A., 12 Dunraven Place, Bridgend.

August 10.—**ADAPTATION. Liskeard.**—Adaptation and repair of Trenant Farm, Menheniot, Liskeard, for the Cornwall County Council. Apply The County Land Agent, County Hall, Truro. Deposit £1 1s.

August 11.—**PUMP AND FILTER HOUSE. Trichinopoly.**—Erection of pump and filter house for the water supply of the Trichinopoly workshops scheme (constructional steelwork), for The South Indian Railway Co., Ltd. Specifications and forms of tender will be available at the Company's Offices, 91 Petty France, Westminster, S.W.1. Tenders addressed to the chairman and directors of the South Indian Railway Co., Ltd., must be left with A. Muirhead, Managing Director, 91 Petty France, S.W.1. Copies of the drawings may be obtained at the offices of Messrs. Robert White and Partners, Consulting Engineers to the Company, 3 Victoria Street, Westminster, S.W.1.

August 11.—**HOUSES. Chopwell.**—Erection of about 70 houses at Chopwell. Apply Surveyor at the Council Offices, Blaydon.

August 12.—**CINEMA THEATRE. Huddersfield.**—Conversion of offices and warehouse in Northumberland Street, Huddersfield, into a cinema theatre for Messrs. Freedman's Pictures, Ltd. Apply Messrs. Stock, Sykes and Hickson, Architects, 1 St. Peter's Street, Huddersfield.

August 12.—**HOMES. Coxhoe.**—Erection of six aged-miners' homes, for the East Hetton Lodge, Durham Miners' Association. Apply Mr. Dixon, Master Mason, Kelloe Pit, Coxhoe.

August 12.—**ALTERATIONS. Aberystwith.**—Alterations to the Students' Union at the University College of Wales, Aberystwith. Apply Mr. G. T. Bassett, A.R.I.B.A., and Mr. H. McGregor Wood, A.R.I.B.A., Architect, 13 North Parade, Aberystwith.

August 14.—**DWELLINGS. Yeovil.**—Erection of 20 working-class dwellings. Apply Mr. H. C. C. Batten, Town Clerk, Yeovil.

August 14.—**THEATRE. Belfast.**—Erection of new picture theatre at Castle Lane, Belfast, for Classic Cinemas, Ltd. Apply Mr. A. Ferguson, F.S.I., Building Surveyor, 2 Wellington Place, Belfast. Deposit £5 5s.

August 14.—**HOUSES. Kirkcaldy.**—Erection of 22 houses of 3 rooms at Glencraig site, Lochore, for the Kirkcaldy District Committee. Apply Messrs. W. Williamson, F.R.I.B.A., and G. B. Deas. Deposit £1 1s.

August 14.—**COMPLETION. Campden.**—Completion of one part of stone cottages at the Campden (Station Road) site, for the Campden Rural District Council. Apply Mr. W. L. Lissaman, M.S.A., Broadway.

August 14.—**WAR MEMORIAL. Scarborough.**—Construction of an obelisk, 75 ft. high, stone faced with brick core, on Oliver's Mount, Scarborough, for the Scarborough War Memorial Committee. Apply Mr. H. W. Smith, A.M.I.C.E., Borough Engineer, Town Hall, Scarborough. Deposit £1 1s.

August 14.—**HOUSES. Sheffield.**—Erection of 57 additional houses (4th instalment) on the Stubbin Estate, Firth Park, for the Estate Committee. Apply Mr. F. E.P. Edwards, City Architect, Town Hall, Sheffield. Deposit £2.

August 14.—**INN. Treodyrhiwfuwch.**—Erection of the Rising Sun Inn, Troedyrhiwfuwch, Tirphil, for Messrs. Crosswells Cardiff Brewery, Ltd. Apply Mr. J. T. Jenkins, M.S.A., Architect and Surveyor, Porth, Rhondda. Deposit £2 2s.

August 14.—**STAND. Weymouth.**—Building a spectators' stand at the recreation ground for the Weymouth Football Club. Apply Mr. A. J. Bennett, C.E., Architect and Surveyor, Gloucester Street, Weymouth.

August 15.—**HOUSES. Nottingham.**—Erection of 54 houses and bungalows on the Sherwood site, in groups varying from two to twelve in number, for the Housing Committee. Apply Mr. W. A. Kneller, Architect, 3 Victoria Street, Nottingham. Deposit £2 2s.

August 15.—**REPAIRS. Welsh Area.**—War Dept. Contracts for repairs and materials. Artificers' works contracts from September 1, 1922, for following stations and division in R.E. district. Contract 1, Rhyl Hutments; 2, Wrexham; 3, Shrewsbury; 4, Brecon; 5, Newport (Mon.); 6, Cardiff; 7, Barry; 8, Pembroke Dock. Apply Commanding Royal Engineer, R.E. Office, 3 Belmont, Shrewsbury.

August 16.—**CHAPEL. Harrogate.**—Demolition of the former St. Mary's Church, Harrogate, and the erection and completion of a chapel in the college grounds, Clarence Drive. Apply Mr. Hutchinson, Head Gardener, The College, Harrogate. Deposit £1 1s.

August 17.—**ALTERATIONS, &c. Holywell.**—Alterations and addition to the Vicarage, Holywell. Apply Mr. Gronwy R. Griffith, Architect, 2 Post Office Lane, Denbigh.

August 17.—**OFFICES, &c. Leeds.**—Erection of offices and stores in Bridge Street, Leeds, for the Sewerage Committee. Apply Mr. W. T. Lancashire, City Engineer, Municipal Buildings, Leeds.

August 18.—**EXTENSION. Kidwelly.**—Extension to the vestry of "Sardis" Congregational Chapel, Trimsaran, near Kidwelly. Apply the Secretary, Mr. D.Thomas, 19 New Houses, Trimsaran, or Messrs. George and Price, P.A.S.I., M.S.A., &c., Architects, Aberavon and Cross Hands, near Llanelly.

August 18.—**HOUSES. Birkenhead.**—Erection of 54 "A" type houses in connection with the Hoylake Road (3rd portion) revised scheme, for the Corporation. Apply Mr. T. T. Rees, F.R.I.B.A., F.S.I. (Housing Architect to the Corporation at 64 Rodney Street, Liverpool). Deposit £2 2s.

August 19.—**LODGE. Chesterfield.**—Erection of a lodge at the Walton Sanatorium, Chesterfield, for the Derbyshire County Council. Apply Mr. G. C. Copestick, New County Offices, Derby. Deposit £1 1s.

August 19.—**OFFICES. Wokingham.**—Erection of two additional offices to their boardroom buildings, for the Board of Guardians. Apply Mr. P. H. Phipps, Clerk, Union Offices, Board Room, Barkham Road, Wokingham. Deposit £1 1s.

August 24.—**HOUSES. Rosyth.**—Carpenter and joiner, glazier, slater, and roughcast, of 15 shops, with eight houses over same, at Rosyth, with addition of 40 houses, also at Rosyth. Apply Mr. A. H. Mottram, A.R.I.B.A., Scottish National Housing Co., Ltd., Parkgate, Rosyth, Dunfermline.

August 30.—**HOUSES. Mansfield.**—Erection of 24 houses, type A, in connection with the housing scheme No. 2, Bull Farm site, for the Town Council. Apply Mr. W. Thompson, A.M.I.C.E., Borough Engineer and Surveyor, Market Street, Mansfield.

August 30.—**WALL. Oughtershaw.**—Taking down and rebuilding a retaining wall at Hazelgill, near Oughtershaw, for the Skipton Rural District Council. Apply Mr. A. Rodwell, Surveyor, Skipton.

August 31.—**REPAIRS, &c. Pontllanfraith, Mon.**—Carrying out of certain repairs and painting to their council office and caretaker's house, Pontllanfraith, Mon., for the Mynyddislwyn Urban District Council. Apply Council Offices, Pontllanfraith, Mon. Deposit £1 1s.

September 19.—**HOUSES. Gosforth.**—Erection of 20 semi-detached houses on road No. 6 of the Corlodge Housing site for the U.D.C. Apply Mr. George Nelson, A.M.I.C.E., Engineer and Surveyor, to the Council, Council Chambers, High Street.

No Date.—**BUNGALOW. Ben Rhydding.**—Erection of a bungalow at The Drive, Ben Rhydding. Apply Mr. W. H. Herbert Marten, L.R.I.B.A., 50 Cookridge Street, Leeds.

No Date.—**BARN. Coverdale.**—Erection of a barn in Coverdale. Apply Mr. A. W. Chaytor, Scrafton Lodge, Middleham.

No Date.—**STORES. Farnsfield.**—Reconstruction of small branch stores at Farnsfield, for the Southwell Co-operative Society, Ltd. Apply Messrs. W. V. Betts and Son, Architects, 630 Radford Road, Old Basford, Nottingham.

No Date.—**BUNGALOW. Hawksworth.**—Erection of a bungalow at Hawksworth. Apply Messrs. Spencer and Sharp, Architects and Surveyors, Old Bank Chambers, Great Horton.

No Date.—**CHURCH. Rycroft, Rawmarsh.**—Erection of the first portion of new church at Rycroft, near Rawmarsh. Apply Mr. W. H. Wood, F.R.I.B.A., Architect, 20 Collingwood Street, Newcastle-on-Tyne. Deposit 10s.

ELECTRICAL.

August 14.—**CABLE, &c. Warrington.**—Supply of the following, for the Electricity and Tramways Committee: (a) High and low tension paper and lead-covered cable; (b) earthenware conduits. Apply Mr. F. V. L. Mathias, Borough Electrical and Tramways Engineer, Howley, Warrington. Deposit £1 1s.

August 15.—**PLANT. Oxford.**—Supply, delivery, erection of:—Contract No. 10, section A, one 1,000-kw. turbo-alternator, complete with condensing plant; B, one 500-kw. conversion plant, from 3,000 volts, 3-phase, to 1,100 volts d.c., complete with switchgear, for the Oxford Electric Co., Ltd. Apply Mr. F. H. Francis, M.I.E.E., Chief Engineer, Russell Street, Osney, Oxford. Deposit £2 2s.

August 16.—**TELEPHONES. Rochdale.**—Installing a system of automatic telephones at their Institution, Dearnley, near Rochdale, for the Guardians of Rochdale Union. Apply at the Institution.

August 31.—**TURBO-ALTERNATOR, &c. Wimbledon.**—Supply, delivery, and erection at their electricity works, Durnsford Road, Wimbledon, of a 3,000-kw. turbo-alternator, condensing plant and auxiliaries, for the Town Council. Apply Mr. A. E. McKenzie, M.I.E.E., Borough Electrical Engineer, Electricity Works, Durnsford Road, Wimbledon, S.W.19. Deposit £2 2s.

September 5.—**CRANES. Edinburgh.**—Conversion of two overhead cranes from mechanical to electrical operation, for the Corporation. Apply Tramways Manager, 2 St James Square, Edinburgh.

September 27.—**TELEPHONE APPARATUS AND PARTS. Brisbane.**—For supply and delivery of telephone apparatus and parts, schedule No. 561, for Deputy Postmaster-General at Brisbane. Apply Department of Overseas Trade (Room 49), 35 Old Queen Street, London, S.W.1.

ENGINEERING

August 11.—**STEELWORK. London, S.W.**—Supply of pump and filter-house for the water supply of the Trichinopoly workshops scheme (constructural steelwork), for the South Indian Railway Co., Ltd. Apply Company's Offices, 91 Petty France, Westminster, S.W.1.

August 11.—**BOREHOLE. Newmarket.**—Sinking a borehole and test pumping for obtaining a supply of water for the parishes of Dullingham, Westley, Brinkley, and Borough Green, for the Newmarket Rural District Council. Apply the Engineers, Messrs. Sands and Walker, Milton Chambers, Nottingham.

August 12.—**BOILER. Manchester.**—Supply and fixing of a heating boiler at the Deansgate Library, for the Libraries Committee. Apply City Architect, Town Hall. Deposit 10s. 6d.

August 15.—**LAUNDRY MACHINERY. London, E.**—Supply and fixing of the following belt-driven machines in the hopital laundry, Bow, for the managers of the Poplar and Stepney Sick Asylum District, viz.: 1 ironing, drying, and finishing machine complete; 1 washing machine, 36 in. by 72 in.; 1 30 in. hydro extractor underdriven. Apply Mr. S. G. Wright, Clerk, Clerk's Office, St. Andrew's Hospital, Devon's Road, Bow, E.3.

August 15.—**CENTRIFUGAL PUMP. London, S.W.**—Supply and installation of a centrifugal sewage pump and motor at the main sewage pumping station in Toronto to deliver 40 million imperial gallons per day of 24 hours. Apply Mr. Dempster, of the Engineering Section, Room 50, 35 Old Queen Street, London, S.W.

☛August 16.—**PIPING. Buenos Aires.**—8,000 tons of cast-iron piping. Apply Department of Overseas Trade, 35 Old Queen Street, S.W.

August 17.—**ENGINES, &c. Matlock.**—Supply and erection of two gas engines (of about 25 b.h.p.) gas producing plant, electric generators and motors and pumping plant, &c., for the Matlock Urban Distric Council. Apply Messrs. J. Diggle and Son, Civil Engineers, 14 Brown Street, Manchester. Deposit £5.

August 22.—**RESERVOIRS. Bampton, Devon.**—Construction of two covered concrete reservoirs—one with a capacity of 40,000 gals. and one of 60,000 gals. engine house with oil engine and pump; and the laying of about 300 lineal yards of 3 in. suction and rising mai and about 900 lineal yards of 3 in. and 4 in. distributin mains, and other works, for the Bampton Urban Distric Council. Apply Mr. H. Monson, A.M.I.C.E., Surveyor Bampton, Devon.

August 25.—**STEEL CASTINGS. Johannesburg**—Supply at Zwartkopjes pumping station, Selborn Siding No. 114, of 38 steel castings, 456 phosphor-bronz valves, and other materials for the inverted vertica marine-type pumping engines of that station. (Contrac 229). Apply Department of Overseas Trade (Room 50a) 35 Old Queen Street, S.W.1.

August 31.—**PLANT, &c. Grimsby.**—Installatio of new centralized heating and hot-water supply plant fuel economizer, water-softening plant, and additions t cooking apparatus at the Scartho Road Institution Grimsby, for the Guardians. Apply Mr. J. F. Wintring ham, Clerk, St. Mary's Chambers, Great Grimsby Deposit £2 2s.

September 1.—**BRIDGE SUPER-STRUCTURE, &c Sydney, N.S.W.**—Construction of the superstructur and substructure of a cantilever bridge across Sydne Harbour from Dawes Point to Milson's Point, for Govt of N.S.W. Application to the Agent-General. Mr. J. J C. Bradfield, Chief Engineer, will be in London durin June and July, 1922, address care of the Agent-Genera for New South Wales, Australia House, Strand, London W.C.2.

September 1.—**RATE OF FLOW CONTROLLER Victoria.**—Supply and delivery of a rate of flow controller for the Victoria Water Supply. Apply Department of Overseas Trade (Room 50), 35 Old Queen Street Westminster, S.W.1.

September 2.—**DECK JOISTS. Bournemouth.**—New deck joists, decking, &c., required on the Bournemouth Pier, for the Town Council. Apply Mr. F. P Dolamore, Town Hall, Bournemouth. Deposit £1 1s.

September 13.—**MACHINERY. Surbiton.**—Supply and erection at their Surbiton pumping station, Surrey, of one steam turbine with centrifugal pumps having a maximum capacity of 20 million gallons per 24 hours, for the Metropolitan Water Board. Apply Offices of the Board (Room 182), Chief Engineer's Department, 173 Rosebery Avenue, Clerkenwell, E.C.1. Deposit £3 3s.

September 13.—**MACHINERY. Eynsford, Kent.**—Supply and erection of two Diesel or high compression solid injection oil engines, with well and surface pumps, &c., at their Eynsford Works, Kent, for the Metropolitan Water Board. Apply Offices of the Board (Room 182), Chief Engineer's Department, 173 Rosebery Avenue, Clerkenwell, E.C.1. Deposit £3 3s.

September 15.—**WHARF. Guayaquil.**—Construction of a Custom-house wharf at Guayaquil, for the Government of Ecuador. Apply Consul-General of Ecuador, 23 College Hill, Cannon Street, E.C.

September 18.—**BEACON. Edinburgh.**—Construction of a concrete beacon on a tidal rock which lies off the northern end of South Rona, for the Commissioners of Northern Lighthouses. Apply Mr. D. A. Stevenson, 84 George Street, Edinburgh. Deposit £1.

September 20.—**ENGINES, &c. Richmond.**—Contract No. 1, supply, erecting, and setting to work at the Water Lane pumping station of two steam pumping engines; No. 2, supply of one electrically driven centrifugal booster pump for the high-level district supply, for the Town Council. Apply Mr. H. W. Apted, A.M.I.C.E., Water Engineer, Waterworks, Richmond (Surrey). Deposit £1 1s.

October 1.—**BRIDGE SUPERSTRUCTURES. Bangkok.**—Supply of superstructures of steel railway bridges, B.E.2465, for the Siam State Railways. Apply Messrs. C. P. Sandberg, 40 Grosvenor Gardens, London, S.W.1.

October 14.—**FURNACE. Johannesburg.**—Supply and erection of a pig singeing furnace at the abattoirs, for Municipal Council of Johannesburg. Apply Room 91 Municipal Offices, Johannesburg. Deposit £1 1s.

October 18.—**PLANT. London, W.C.**—Supply and erection in South Africa of plant in connection with the electrification of the Glencoe-Pietermaritzburg section of the South African Railways, as follows:—Tender D. 1417, coal-handling plant for power station. Tender D. 1418, ash-handling plant for power station. Tender D. 1430, circulating water screening plant for power station. Apply office of the High Commissioner for the Union of South Africa, Trafalgar Square, London, W.C.2., and Messrs. Merz and McLellan, 32 Victoria Street, London, S.W.1. Deposit £5.

December 6.—**HARBOUR WORKS. Madeira.**—Construction of an artificial harbour at Funchal. Apply Department of Overseas Trade, 35 Old Queen Street, London, S.W.1.

No Date.—**BOILER. Drogheda.**—New or short-time-used Lancashire boiler, 16 ft. by 6 ft. dia., capable of working at 100 lb., for the Drogheda Gas Department. Complete with best pattern injector, gauges, and all necessary fittings, and fitted with Meldrum or other furnace suitable for using cheap quality fuels. Apply Mr. P. J. Fitzpatrick, Manager and Secretary.

No Date.—**WALL. Matlock Bath.**—Rebuilding of the deep retaining wall near Masson Mills, for the U.D.C. Apply Surveyor's Dept., Council Chambers, Matlock Bath.

No Date.—**WATER SUPPLY. Alnwick.**—Execution of the Lowick water supply scheme, for the Glendale Rural District Council. Apply Messrs. G. Reavell, F.R.I.B.A., and W. A. Tebbs, L.R.I.B.A., Architects and Surveyors, Alnwick.

PAINTING.

August 12.—**PAINTING, &c. Oswestry.**—Painting, distempering and limewashing at the Powis Hall, for the Oswestry Town Council. Apply Mr. G. W. Lacey, C.E., Borough Surveyor, Guildhall, Oswestry.

August 14.—**PAINTING. Whittlesea.**—Painting the whole of the outside wood and iron work of their Workhouse and premises, for the Guardians. Apply Mr. J. W. Bowker, Clerk, Whittlesea. Deposit £1 1s.

August 17.—**PAINTING. Essex.**—Carrying out certain painting and redecorating work at their Children's Homes at Stifford, near Grays, Essex, for the Board of Guardians. Apply Mr. A. J. Smith, Clerk, Guardian's Offices, Barnes Street, Commercial Road East, E.14. Deposit £2 2s.

August 21.—**PAINTING. Shoeburyness.**—Painting two gasholders and water tank at their works, Shoeburyness, for the Shoeburyness Urban District Council. Apply Mr. A. W. Goodchild, the Waterworks, Shoeburyness.

No Date.—**PAINTING. Sleaford.**—Exterior painting, including residences, of (1) Alvey's School, Eastgate; (2) Westgate Infant School; also for certain interior painting and redecoration at the latter school. Apply Mr. N. E. Snow, Clerk to the Managers.

No Date.—**REPAINTING. Falkirk.**—Repainting of greenhouses and entrance gate at Falkirk Cemetery, Camelon, for the Parish Council. Apply Mr. J. Geddes, Clerk, Parish Council Chambers, Falkirk.

No Date.—**PAINTING. Horbury, Yorks.**—Painting of the whole of the trust property, for the Trustees of the Horbury Common Lands. Apply Mr. E. L. Quarmby, Secretary, Town Hall, Horbury.

No Date.—**PAINTING. Leicester.**—Painting and decorating of the exterior of the Melton Mowbray Isolation Hospital, for the Leicestershire Isolation Hospitals Committee. Apply Mr. J. Baylis, Clerk, 6 St. Martin's, Leicester.

ROADS AND SEWERS.

August 14.—**SEWER. Hayes.**—For the Constr
tion of about 400 yards of 9 in. sewer in the Uxbri
Road, in the urban district of Hayes, for the Ha
Urban District Council. Apply Mr. D. C. Fidler,
gineer and Surveyor, Council Offices, Hayes, Middles

SOUTHWARK STREET, LONDON, S.E

Waterproofing of Concrete

The writer's interest in integral waterproofing was first aroused through the necessity of waterproofing a large number of structures of various types in connection with which it was necessary to obtain first-class results.

At that time his feeling on the subject of integral waterproofing was sceptical, and his first use of integral waterproofing material was dictated by curiosity. The results obtained, however, and subsequent experience, have confirmed the correctness of the opinion that was at once formed—namely, that integral waterproofing is a useful and trustworthy process yielding satisfactory results.

In the first place, the widely prevalent opinion that there is a direct conflict between the integral and membrane methods, and that the choice of one instead of the other is simply a matter of personal preference, does not seem to be substantiated by full consideration of the facts involved.

Thin concrete sections subject to wide temperature variations, vibrations, or impact, will inevitably crack, and the waterproofing problem is not one of correcting absorption or permeability, but of waterproofing cracks. Obviously, the only way to effect this result is to protect the cracks with a membrane or elastic coating enough to span and waterproof these cracks when they are open. On the other hand, occasion arises, such as in deep foundations and wet excavation, where a waterproofing is required, yet where constant presence of water or conditions of excavation preclude the use of a membrane, because a membrane cannot be applied to a wet or an unprepared surface. As in such cases as these there would be no temperature variation and mass concrete would probably be used, it would be obviously desirable to use integral waterproofing. Furthermore, it is being recognized more and more every day that concrete is not permanent unless waterproofed, any more than steel or wood is durable without a protective coating. And, again, cases arise where surface coatings are not practicable, and where integral waterproofing could be advantageously used.

After careful and prolonged study, the writer is convinced that the theories on which some at least of the integral waterproofing materials are produced are technically correct.

In any effort to render concrete or mortar intrinsically waterproof two factors must be borne in mind. These are, that water enters in two ways, by absorption through minute pores, and by percolation through pores of appreciable size. This difference of action can easily be shown by trying to force water through a neat Portland cement sample and a 1 : 2 : 4 (say) concrete sample. In the first case no water could be forced through, while in the second probably considerable would go through. On the contrary, if both are immersed in quiescent water, the neat cement sample will absorb much more than the concrete one.

Taking cognizance of these facts, waterproofing materials seem to have been produced mainly on two theories which appear diametrically opposed at first sight, but on closer examination are not so divergent as at first they seemed. These theories are represented respectively by (1) Water-repellent materials; (2) Water-absorbent and lubricating materials. The first is designed to kill absorption, the second to correct porosity.

As far as mortars and stucco are concerned, the first theory seems entirely rational, because, as the mortar consists of finely particled materials applied under pressure, there are no real voids, or there should be none, and water enters chiefly by absorption.

As regards concrete there is, however, room for difference of opinion. The water-repellent theory assumes that if the mortar is rendered non-absorptive the concrete is waterproof because the coarse aggregate does not absorb. The lubricating and water-absorbent theory, going more boldly at the subject, assumes that as the mortar is but a small part of the volume absorption is a minor factor, and that the elimination of the permeability through the elimination of porosity is the end to be accomplished. Porosity is largely due to field manipulation; that is, too much water, too little tamping; to vertical chuting; insufficient mixing; segregation of material and insufficient absorption of water by the cement. If the lubricating element can be introduced, the liability to defects from superfluous water, insufficient tamping, and vertical chuting, is certainly lessened, to say the least; while if absorption of the water by the cement can be increased, and this accompanied by a slight swelling action, the liability to porosity from the evaporation of unabsorbed water is lessened.

The sceptic will, perhaps, say that this is all very well in theory, but why can it not be proved. By which he means, apparently, proved by laboratory experiment. The writer submits, with all due respect, that this may be due to defective experiments, and not to defective materials. It is possible to test in a laboratory the absorption-killing effects on mortars, but nullification of field errors cannot be tested until laboratory experiments can reproduce the field errors. It is difficult to see, too, on what basis of reasoning the result of a laboratory experiment can be considered more convincing than results obtained in actual field operations. Most certainly the actual results obtained in field operations have convinced a very large number of practical users of the value of integral compounds when properly used.

As regards laboratory tests, however, no really authentic and comprehensive tests have ever been made as far as the writer's knowledge goes, nor would the results of laboratory tests alter the fact that some thousands of successful works have been dealt with. And, further, most of these reported tests do not include concrete, but have been made exclusively with mortars. In no other factor pertaining to good concrete would it be considered valid to reason from mortar to concrete in view of to-day's knowledge, and certainly it is not valid to do so in regard to waterproofing.

In the writer's opinion this whole subject has been and is obscured by lack of comprehensive ascertainment of the facts, and that if this obscuration can be cleared away, much of the antagonism to integral waterproofing would also disappear. It can no longer be disputed that the entrance of water is destructive to concrete and its permanence, and means must be produced to exclude it, and that the means suitable for one condition may not be applicable for another.

I am hoping that this article will start a movement for ascertaining what is the best concrete possible for every condition that may arise, and certainly this end is not furthered by banging the door in the face of effort to obtain that result, along whatever line it may be expected.

CECIL T. LEWIS, M.C.I.

Birmingham Civic Society Annual Report

The new Advisory Art Committee for Birmingham is full of great possibilities, and given the goodwill of all concerned should mark the beginning of a new era in the artistic expression of that city. According to the last annual report just issued of the Birmingham Civic Society the setting up of a committee to which civic matters involving artistic judgment can be referred for experienced and impartial consideration was one of the first proposals put forward by the Society in 1918. As a result of persistent advocacy by the Society, and the generous attitude of important members of the City Council and their advisers, this proposal has now advanced to the stage of trial, and the Society are at present engaged in drawing up a working basis for carrying the proposal into effect. Birmingham is the first city in Great Britain to undertake an important reform of this character.

As reported in a recent issue of the JOURNAL, the gold medal of the Society for 1921–22 was awarded to Mr. Barry V. Jackson in recognition of the high civic importance and the artistic distinction of his work at the Repertory Theatre.

The original booklet of the Society dealing with the Lickey Hills was primarily intended to suggest the provision of certain desirable accommodation to an agreed plan. It has been found, however, that it was largely purchased as an interesting and useful guide to the Hills, and the Society therefore decided to remodel the booklet and to publish a further edition of 500 copies as a guide only. This edition having been exhausted in nine months, a third edition is now in the press. The welcome given to the Lickey Guide led to the consideration of a Guide to Sutton Park, a nature reserve more than five times the area of the Lickeys, and much frequented by Birmingham people. This guide has therefore been produced and has been on sale since the beginning of April.

As a direct outcome of the scheme for replanning the junction of Pebble Mill Road and Pershore Road it is probable that the Calthorpe Estate will present to the city the land required for the re-arrangement of Pebble Mill Road and Pershore Road Junction, as a direct outcome of the scheme for revision prepared by the Society. Under these circumstances it is proposed to allocate £1,000 of the fund for purchase of open spaces towards the cost of the lay-out advocated by the Society, who have every reason to be gratified with the success of this project. Copies of the report, which is full of useful information, may be obtained, price 1s. 6d. net, from 37 Bennetts Hill, Birmingham.

Trade and Craft

Automatic Extinction of Fires.

At the Holborn Cinema, Messrs. Mather and Platt recently exhibited, to specially invited members of the London insurance fraternity, architects, and press a film dealing with the extinguishment of fires, by means of "Grinnell" automatic sprinklers. Almost every insurance company having offices in London was represented, as also were nearly all the leading insurance brokers and architects.

The chief film, entitled "The Menace," was produced in the United States and was accompanied by an explanatory lecture. The film was produced to give unanswerable testimony to the superiority of automatic sprinkler protection and to show that a sprinkler installation is tantamount to a fireman "always on the spot," ready to extinguish any fire in its insipiency and before it has time to grow to dangerous dimensions. It is claimed that through the reduction of fire insurance premiums granted for the adoption of a sprinkler installation, an installation pays for itself in a very short period, so that it eventually costs nothing, and that it is a first-class investment.

The film was accompanied by lantern slides showing cases of actual destruction of property by fire, in the absence of sprinkler protection, and was finally followed up by a second film entitled "Who Pays?" showing the fire which occurred in January last at the Goods Station of the North British Railway Company in Glasgow.

Further exhibitions of this film will be given in the autumn, and any of our readers interested in the subject can obtain an invitation by application to Messrs. Mather & Platt, Ltd., 14 Great Smith Street, Westminster, S.W.1.

Bush House, Aldwych.

Messrs. Doulton & Co., Ltd., of Lambeth, have received the order from Messrs. Helmle & Corbett, of London and New York, architects, for the sanitary fittings for Bush House, Aldwych, London. An interesting departure is being made from the usual practice in that no w.c. cisterns are being used—all the w.c.'s being flushed by Doulton's new patented "London" flushing valve. This water-waste preventing valve is approved by the Metropolitan Water Board.

Surveying Instruments.

Messrs. T. Cooke and Sons, Ltd., of 3 Broadway, Westminster, S.W.1, have sent us a copy of their revised price list (home edition) of surveying instruments, etc. The new price list cancels all previous lists of surveying instruments, and is intended to be used with the company's general catalogue No. 526, and their loose sheets describing other manufactures not included in it. The new catalogue of astronomical instruments is not quite ready, but full particulars and prices of any type or size of instrument will be sent on application.

Eastwoods, Ltd.

The second annual general meeting of the shareholders of Eastwoods, Ltd., has been held in London under the presidency of Dr. T. Cato Worsfold, M.A., J.P., M.P., chairman of the company. Before giving a résumé of the year's work the chairman conveyed to the meeting the great regret of the vice-chairman, Mr. Horace Boot, in not being able to attend owing to his undergoing a serious operation, which, fortunately, has had a most successful result. In the course of his address the chairman dealt with the report of the directors for the past year, which showed, after providing adequately for depreciation, and writing off £5,000 from preliminary expenses, a profit of £25,294 15s. 5d. The directors recommended a dividend of six per cent. for the year, less income tax, leaving a balance of £27,401 15s. to be carried forward to the next account. One of the most satisfactory features of the accounts, said Dr. Cato Worsfold, was that nothing had to be provided for any loan or debenture, and that there was nothing on the credit side for goodwill, which was a very considerable factor with the company. Under all the circumstances he thought that the year's working was one for congratulation. Notwithstanding many difficulties the company during the past year made 51,500,000 bricks and disposed of over 58,000,000. As to the future, it looked as though the company were in for a good time. One was justified in assuming a considerable improvement, if not a boom, in the building trade, in which the company was bound to participate to a very large extent. The report was put to the meeting and carried unanimously, and Dr. Cato Worsfold and Colonel Sir Henry Goold-Adams were re-elected to the Board.

Electrical Notes

Electrical Development in China.

There has been a striking increase, during the past year, in the imports of electrical materials and fittings into China. During last year, according to the report of the Maritime Customs, the imports reached a total value of 13.2 million taels, compared with 6.3 million taels in 1920, and 5 million taels in 1919. With regard to the decline in the sale of small lighting plants it is stated in an article in "The Board of Trade Journal," that this was expected owing to adverse trade conditions. This decline, it is pointed out, "may also be partly due to the installation of new, or the improvement of existing plants for public light services. Several contracts for large power and light plants for places in the interior were settled during the year, and an increasing tendency to install larger units of 1,000, 2,000, and 5,000 kilowatts is noticeable, while only a couple of years ago 200 and 400 kilowatts were considered sufficient to meet requirements. It is interesting to mention here, as an indication of the progress that is being made in the use of electricity, that current is now supplied during the day in several important centres instead of the plant being run during the night only, as has hitherto been the practice: Nanking, Soochow, and Hangchow are cases in point. As regards electrical accessories, fittings, and lamps, Japanese manufacturers have held the market for wires and cables, porcelain insulators, etc., Dutch manufacturers for lamps, and American manufacturers for the better-class fittings and glassware. Towards the end of the year German glassware fittings appeared on the market at prices which undersold the American product. Altogether this line of trade is in a flourishing condition, with good prospects ahead."

Big Electrical Scheme for Dublin.

Great progress is being made with the formulation of the scheme for harnessing the River Liffey to supply electrical energy to the City of Dublin. The scheme is estimated to cost about £1,000,000, and it is suggested that power stations should be built at Poulaphouca, Ballymore Eustace, Salmon Leap, and Connell Ford. To provide sufficient power to supply all the electricity it is proposed to build a dam, forming a lake of 3,000 million cubic ft. capacity about 200 yds. above the walls of the Poulapouca Valley, Co. Wicklow. Subsidiary stations are proposed at Lockstown on King's River and at Cloghleagh. It is thought that storage will be needed above Poulaphouca and above Leixlip, and that the latter would be necessary both for peak loads and for daily regulation owing to the fact that the water allowed to flow down from Poulaphouca would only reach Leixlip about twenty hours later. Ballymore Eustace would be capable of dealing with a peak load of about 20,000 h.p., and Leixlip with a peak load of 10,000 h.p. Representatives of the Free State Provisional Government, the Dublin Corporation, and Messrs. Buchi and Fey, of Zurich, consulting engineers, have made an inspection of the site.

Electric Light and Power Extensions.

Schemes for developing electric light or power supplies are being considered by the following local and other authorities:—Bathurst (New South Wales) Municipal Council, supply of electricity, £37,000; Colchester Electricity Supply Committee, new station at the Hythe; Formby Urban District Council, electricity for power and lighting; Homerton, installation of half-watt lamps at the Eastern Hospital, Homerton Grove, Homerton, E.9, for the Metropolitan Asylums Board; Leek Urban District Council, new generating set at the electricity works, £15,000; Manchester Corporation, sub-station plant, £100,000; Tooting, renewal of electric storage battery and repairs to the battery floor at the Grove Hospital, Tooting Grove, for the Metropolitan Asylums Board, £815; Walsall Corporation Electricity Committee, machines and tools for the fitting shop and asbestos mattresses and planished steel required for certain pipes and valves at the Birchills electricity station, £464; Wrexham Town Council, supply of electricity from Gresford Colliery, £1,570.

CONCRETE REINFORCEMENT

The Bank of Ireland, Sackville Street, Dublin. Architects: Messrs. McDonnell & Dixon.
Reinforced entirely on B.R.C. System.

B.R.C. Fabric is made from steel in its strongest form for structural purposes, fifty per cent. stronger than ordinary rolled steel. The wires are accurately and permanently fixed beforehand and the Fabric arrives on the job ready for simple laying. Ease and accuracy of construction are secured with this regular high quality material, and out of them comes strength and safety. Columns and Beams reinforced with B.R.C. Hoops. Helicals and Grouped Stirrups made by machine and delivered ready for fixing have the same high degree of correct workmanship. Buildings reinforced with B.R.C. Fabric are the strongest of all reinforced concrete constructions.

CONTRACTS OPEN

Unless expressly stated to the contrary, all deposits required for bills of quantities, etc., are returned on receipt of bona-fide tenders. The words "Fair Wages Clause" inserted in certain paragraphs signify that persons tendering must conform to a fair wages clause in the contract, which requires them to pay the rates of wages current in the district.

BUILDING.

August 17.—**ALTERATIONS, &c. Holywell.**—Alterations and addition to the Vicarage, Holywell Apply Mr. Gronwy R. Griffith, Architect, 2 Post Office Lane, Denbigh.

August 17.—**OFFICES, &c. Leeds.**—Erection of offices and stores in Bridge Street, Leeds, for the Sewerage Committee. Apply Mr. W. T. Lancashire, City Engineer, Municipal Buildings, Leeds.

August 17.—**HOUSE WORKS. Galashiels.**—Excavator, concretor, and brick works, carpenter and joiner works, glazier work, slater and roughcast works, plumber and gasfitter works, and plaster work of five blocks, each containing two houses, for the Town Council. Apply Town Clerk.

August 17.—**RESIDENCE. Corstorphine.**—Brick, joiner, slater, plumber, plaster, glazier, and painter works of residence to be erected at Drumhead Brae, Corstorphine. Apply Mr. J. Gentles, F.F.S., Surveyor and Valuer, 184 High Street, Kirkcaldy.

August 18.—**CABLE HUT. Dover.**—Erection of a cable hut at Dover. Apply Postmaster, Dover, and at Contracts Branch, H.M. Office of Works, King Charles Street, London, S.W.1. Deposit £1 1s. (Cheques payable to the Secretary, H.M. Office of Works.)

August 18.—**EXTENSION. Kidwelly.**—Extension to the vestry of "Sardis" Congregational Chapel, Trimsaran, near Kidwelly. Apply the Secretary, Mr. D. Thomas, 19 New Houses, Trimsaran, or Messrs. George and Price, P.A.S.I., M.S.A., &c., Architects, Aberavon and Cross Hands, near Llanelly.

August 18.—**HOUSES. Birkenhead.**—Erection of 54 "A" type houses in connection with the Hoylake Road (3rd portion) revised scheme, for the Corporation. Apply Mr. T. T. Rees, F.R.I.B.A., F.S.I. (Housing Architect to the Corporation at 64 Rodney Street, Liverpool). Deposit £2 2s.

August 19.—**LODGE. Chesterfield.**—Erection of a lodge at the Walton Sanatorium, Chesterfield, for the Derbyshire County Council. Apply Mr. G. C. Copestick, New County Offices, Derby. Deposit £1 1s.

August 19.—**OFFICES. Wokingham.**—Erection of two additional offices to their boardroom buildings, for the Board of Guardians. Apply Mr. P. H. Phipps, Clerk, Union Offices, Board Room, Barkham Road, Wokingham. Deposit £1 1s.

August 19.—**BUNGALOW COTTAGE. Sandwich.**—Erection of a bungalow cottage at St. Bartholomew's Hospital, Sandwich, for the trustees. Apply Surveyor's Office, The Barbican, Sandwich.

August 19.—**ALTERATIONS. Castle Caereinion.**—Alterations and additions to Berwydd Congregational Chapel (about 3½ miles from Castle Caereinion and 4 from Berriew). Apply Messrs. Mills and Ford, Llandyssil, Montgomery.

August 19.—**REPAIRS. Islington.**—Repairs and painting, &c., to the operating theatre and to two other rooms at their Infirmary, Highgate Hill, N., for the Guardians of St. Mary, Islington. Apply Mr. E. J. Harrison, L.R.I.B.A., 23 Berkeley Road, Crouch End, N.8. Deposit £2.

August 21.—**BRIDGE REPAIRS. Marlow.**—Sundry repairs to woodwork, &c., and cleaning down and repainting Marlow Suspension Bridge, for the Berks and Bucks County Councils. Apply Mr. E. Winfield, County Surveyor of Bucks., County Hall, Aylesbury.

August 21.—**HOUSES. Greenock.**—Erection of 52 or, alternatively, 36 tenement houses, for the Corporation: Digger and brick work; carpenter, joiner, and ironmongery works; slater work and roughcasting; plumber work; plaster and concrete work; glazier work; electric lighting; and painter work. Apply Office of Public Works, Municipal Buildings, Greenock. Deposit £1 1s. for each schedule.

August 21.—**OUTBUILDINGS. Lanchester.**—Providing 13 sets of sanitary outbuildings and coalhouses, yard fencing, and concreting and roadmaking, drainage, &c., at Lanchester, near Durham. Apply Mr. J. T. Pegge, Surveyor, The Anchorage, Durham City. Deposit 10s.

August 23.—**COTTAGES. Llangwyllog.**—Erection of two cottages at Cerrigddewi, Llangwyllog. Apply Shire Hall, Llangefni.

August 23.—**HOUSES. Carnarvon.**—Construction of six houses at Cae Hampton, Bethel Road, Carnarvon, for the Corporation, according to Class B of the plans of the Ministry of Health. Apply Mr. R. O. Roberts, Town Clerk, 2 Market Street, Carnarvon.

August 24.—**JOINERY WORK. Wigan.**—Joinery work required to be executed in connection with the construction of a portable floor to cover the second-class plunge bath at the Municipal Public Baths, Millgate, Wigan. Apply Mr. R. B. Donald, M.I.C.E., Borough Engineer, Municipal Buildings, Wigan. Deposit £1 1s.

SOUTHWARK STREET, LONDON, S.E.

(*The Week's News—continued.*)

ght-story warehouse in Glasgow to place buildings destroyed by fire, the timated expenditure being £65,000. The roperty Investment Company, Glasgow, ive taken warrant to construct roads, wers, footpaths, etc., at Kilmarnock oad, in order to encourage building of uses on their land.

New Buildings for Glasgow.

New warehouses are being erected for essrs. William McLaren, Sons & Co., td., at Glasgow. The site is at the rner of George Square and South anover Street. The buildings will be ght stories high with, in addition, a isement; and the total floor area is lculated at 81,600 sq. ft. The architect Mr. James Miller, A.R.S.A., Glasgow. new building is being erected at Bath reet, Glasgow, for Messrs. Pettigrew id Stevens, dry goods merchants, from ie designs of Messrs. Keppie and Henerson, of Glasgow, architects.

Historic Church on Fire.

The historic parish church of All Saints, uth Wingfield, Derbyshire, situated on ie banks of the River Amber, and under ie shadow of Wingfield Manor, famous one of the prison-houses of Mary Queen Scots, has been almost completely estroyed by fire, only the chancel being ved. During the recent heavy rains ie church was flooded, and after the ater had subsided, the heating apparatus iving been put out of action, a large oil ove was introduced to dry the interior, id the fire is believed to have been used by this stove.

New London Tube.

Three miles of the City and South ondon Railway, from Moorgate Street its terminus at Euston, has been closed r reconstruction. The reconstructed ibe is to be connected by a new short innel with the Hampstead Railway at amden Town. This will enable trains run from Clapham Common to Golders reen, and by the time this is done the tension of the Hampstead line to dgware, now under construction, will so be nearing completion. These improvements, it is estimated, will double ie carrying capacity of the City and uth London Railway.

Old Arch of London Bridge.

The Bridge House Estates Committee the City Corporation are considering hat support, if any, they can give to the fort to save the original arch of London ridge which was recently discovered iring the demolition of certain old iildings. A scheme to preserve the arch id make it accessible to the public has een prepared by the architects of the ew building, and the owners have proised to contribute towards the cost if ie balance can be raised from other urces. The Bridge House Estates Comittee are invited to make a contribution money or to remit for a time a portion the ground rent.

Alphabet Avenue Novelty.

The first "alphabetical avenue" in ngland has been planted by Sir William eary in his park at Oxon Heath, Hadw, near Tonbridge, Kent. It is nearly alf a mile long, and the trees—at present ily saplings—are planted in alphabetical der. The alphabet of trees is made of aspen, beech, catalpa, chestnut, morphanthus, elm, fraxinus, gum, hornbeam, idesia, juglans, koelreutia, larch, maple, negundo, oak, plane, poplar, quince, rowan, sycamore, tulip tree, umbrella pine, viburnum, willow, xanthoceras, yellow tree, zelcova. There are several other trees as well.

New Lung for London.

Part of Castlewood Estate, Shooter's Hill, Kent, with Severndroog Castle, the mansion house, two lodges, stabling, and twenty-two acres of magnificently timbered park land, by the will of the late Mr. Probyn Godson, is to become one of the London County Council's parks and be open to the public for ever. The estate will be shortly transferred to the L.C.C. Severndroog Castle is the highest point between London and Paris, being 450 ft. above the level of the sea. It was erected in 1784 by the widow of Sir William James in honour of her husband, who distinguished himself against the pirates of the Indian seas.

Housing Progress in Scotland.

The following figures show the progress that has been made in State-aided housing schemes in Scotland to July 31: Permanent houses completed, 10,155; temporary houses completed, 665; reconstructed houses completed, 89; houses completed under the private subsidy schemes, 2,028; making a total of 12,937. There are 8,710 houses at present under construction in connection with housing schemes carried out by local authorities and public utility societies. The total amount paid by the Scottish Board of Health in respect of the 2,028 houses completed under the private subsidy schemes is £490,583 6s. 8d.

Building Guild's Operations.

At the annual conference of the National Building Guild Ltd., at Birmingham, the chairman, Mr. H. Frankland, of Manchester, said the movement had grown to such an extent during the past two years that of 150 committees in existence seventy had work in hand, and compared with last year's contracts of £666,000, at the present moment they were engaged on contracts totalling £2,500,000. They had already completed contracts of £1,250,000. Unfortunately, owing to the action of the Ministry of Health, contracts with local authorities amounting to £4,000,000 had been cut down to £1,500,000. Under the new building scheme prepared by the guild board they believed they could supply the wants of the community and provide houses for all.

Battersea Baths and Tenements.

An inquiry has been held by the Ministry of Health into the application of the Battersea Borough Council for sanction to borrow £3,500. The council propose to purchase the disused fire station which was erected in Chatham Road, Battersea, in 1906. It is intended to adapt part of the premises for use as public baths, including a swimming-bath. The price of the site and existing buildings is £8,000, but to a private purchaser it would be £12,000. Special terms are offered to the local authority by the County Council because it will utilize the former quarters of the firemen as tenement dwellings. No opposition was offered to the proposals. The inspector said the Ministry of Health regarded the provision of baths as urgent.

Trade and Craft

New Sewage Lifting Plants for Thatcham Factory.

Messrs. Daniel Adamson & Co., Ltd., of Dukinfield, near Manchester, have received an order for one of their latest patent electrically driven crude sewage lifting plants for Messrs. Cropper's new factory at Thatcham, Berks. The design of this installation is of special interest in that the motor-driven compressors deliver the air direct into the sewage ejectors. Mr. W. C. Easdale, F.I.S.E., M.S.E., M.R.S.I., of Westminster, is the consulting engineer to the scheme.

Cafferata Plaster Slabs.

The method of fixing Cafferata plaster slabs is clearly explained in a handy little booklet which has just been published by Messrs. Cafferata & Co., of Newark-upon-Trent. Simple instructions, accompanied by diagrams, are given of the most satisfactory way in which the many problems encountered in the use of the slabs may be overcome. Although the booklet has been prepared primarily to guide the ever-increasing number of new users, it should be of every-day assistance to those who are already familiar with the slabs. Cafferata slabs have been used recently on a large number of housing schemes and similar contracts throughout the country.

British Manufacturers of South Africa.

Much information concerning the various activities of the British Manufacturers' Representatives' Association of South Africa (Incorporated) is given in the last half-yearly report of the council, a copy of which has come to hand. Efforts are being made by the council to safeguard and promote the interests of overseas firms, and active propaganda work is being undertaken. In connection with the agitation for protective duties the Association has been successful in securing the definite assurance of the Board of Trade and Industries that where necessary the views of importers and others interested in the imported article will be taken before any decision is come to. In addition the Association has taken many other steps in the interests of its members. The membership of the Association continues to increase steadily, and now reaches a total of 440. Mr. H. Edwards is President, and Mr. Fred W. Richmond, hon. secretary. The offices of the Association are at Remington Buildings, 96 St. George's Street, Cape Town.

"Power Plant at a Telephone Factory."

The above is the title of an interesting booklet, which has just been published by Messrs. Francis Polden & Co., Ltd., to describe the prime movers at the Dagenham Works of the Sterling Telephone and Electric Co., Ltd. The exigencies of the war-time expansion created a position in connection with the power plant which was far from satisfactory and necessitated drastic changes when still further demands were made for power. From quite small beginnings the plant had grown until, within the space originally allocated for an output of 70 h.p. plant capable of generating about ten times that figure had been crowded. It was ultimately decided to erect an entirely new engine house and to re-arrange the complete plant upon modern lines, and within the last few months this change-over has been completed. The results that have been achieved reflect great credit upon Mr. W. A. Tookey, M.I.Mech.E., the general consulting engineer for the scheme, and Mr. A. Hugh Bourne M.I.E.E., who was responsible for the electrical side. Mr. J. O. W. Hurd, the power house superintendent of the company, gave general supervision and arranged the details of removal from the old to the new building. Messrs. Francis Polden & Co., Ltd., were the contractors for the whole of the electrical work. Copies of the booklet, which is profusely illustrated, may be obtained from Messrs. Francis Polden & Co., Ltd., 56 Cannon Street, London, E.C.4.

Ruston Oil Engines.

A new and profusely illustrated catalogue of Ruston airless injection cold-starting oil engines has been issued by Messrs. Ruston and Hornsby, Ltd. The Ruston engine is one of the most economical prime movers using low-grade furnace fuel and crude oils in existence, and embodies the results of considerable research and experience. It is an engine with many distinctive features, and it is claimed to be safe in the hands of a man of average intelligence, and that previous knowledge of the engine is not essential. In the catalogue engines of the horizontal type, made in sizes from 15 to 340 b.h.p., are shown, together with testimonies of British and foreign users, and particulars of the successful tests carried out with the engine by a technical representative of the Anglo-Mexican Petroleum Company and by Capt. H. Riall Sankey, C.B., C.B.E., R.E. (ret.), M.Inst.C.E.

To establish the high thermal efficiency of the Ruston airless injection oil engine, the firm invited Capt. Sankey to carry out tests upon one of their standard twin engines of 236-260 b.h.p. erected in their commercial test shop. This engine was placed entirely under his control so that he was in a position to check all measurements and observations made and also the apparatus used during the test. The minimum fuel consumption was as low as ·401 lb. per b.h.p. hour which, with the oil used during the test (calorific value 18,050 B.Th.U.), was equivalent to a high efficiency of 35·3 per cent. Capt. Sankey, in his report, says, "Throughout the trial the engine ran remarkably well and so uniformly that it was impossible to tell by sound what load was on the engine and when such load was changed."

The amalgamation in 1918 of the firms of Ruston, Proctor & Co., Ltd., of Lincoln, and Richard Hornsby and Sons, Ltd., of Grantham, was important from the fact that both had unique experience in the design and manufacture of internal combustion engines, each being recognized as a pioneer in its own branch of work. At the time of the fusion the two companies had collectively produced over 120,000 engines, to work under varying conditions in all parts of the world, and the wealth of experience thus gained, together with the immense resources of the combination, are invaluable in assisting design and the economical production of high-class engines.

Copies of the catalogue may be obtained from Messrs. Ruston and Hornsby, Ltd., engineers, Lincoln.

Scaffolding (Great Britain), Ltd.

Scaffolding (Great Britain), Ltd., have sent us an announcement of the amalgamation under that name of the Tubular Scaffolding Co., Ltd., with the Patent Rapid Scaffold Tie Co., Ltd., which has been carried through to enable them efficiently to cope with the ever-increasing demand for modern patented scaffolding in all branches. They are exceedingly well placed in this respect as the amalgamation puts them in possession of the patent "Scaffixer" scaffold ties and putlogs, which are now extensively used on all scaffoldings, and also of their paten tubular scaffolding and couplers. Th company have also acquired the sol agency for the patent suspended scaffolding as now in use on the New Bush Building, Aldwych. It will thus be seen tha with the aid of the three branches o scaffolding above mentioned the compan holds a strong position and is enable thereby to meet all the requirements o up-to-date scaffolding in all its branches The business of general builders' merchant on terms of sale or hire will continue t be carried on, and builders will find thei requirements in this respect well covere by the ample plant which the compan now have available.

Ancient Egyptian Town Planning

Mr. C. L. Woolley, lecturing at a meeting held in London of the Egyptian Exploration Society, said that during th second season's work at Tell-el-Amarn the exploring party found the ruins of village, which was probably the earlies effort in town planning. He said that peculiar feature of this village was tha the doors of all the houses faced one way a blank wall in each street occupying th opposite side of the narrow thoroughfar The houses were well preserved, and gav a vivid idea of the domestic life of th poorer classes of Egypt in the fourteent century B.C. A further site explored b the party had proved to be uniqu amongst Egyptian discoveries. It was royal pleasure garden of a religiou nature, where, amid trees and flower bed surrounding an ornamental lake, wer grouped a number of buildings in ston or mud brick.

Mr. Woolley also mentioned the discovery of a range of buildings which appeared to have served as a home farm In sheds were discovered the bones cows, and close by was a kennel full dead greyhounds.

Battle Memorial at Thiepval.

The application of the 18th Division to erect a battle memorial at Thiepval has been approved by the Battle Exploits Memorial Committee and by the Imperial War Graves Commission. The exact site of the memorial to be raised has, however, not yet been finally determined.

New Church for Hammersmith.

The Lord Mayor of London will lay the foundation stone of the new Church of St. Catherine, in Western Avenue, Hammersmith, next month. It is to be built from funds to be derived from the sale of the site of the old City church, St. Catherine Coleman, in Fenchurch Street, now being demolished.

Wooden Buildings and Fire.

The report of the American Board of Fire Underwriters states that in eighty-three American cities, with a population of over 20,000, 16·5 fires per thousand were in timber frame buildings, 24·3 fires per thousand in brick and stone buildings and 25·0 fires per thousand in buildings other than brick and stone.

Cenotaph for Toronto.

The War Memorial Committee of the Legislature are completing plans for the erection of a cenotaph at Toronto in memory of the soldiers of Ontario who gave their lives during the war. It is expected that the monument will cost in the neighbourhood of $40,000. Efforts will be made to have it an exact replica of the Cenotaph in London.

Brighton Road Widening.

Considerable progress has been made with the widening of the Brighton Road over the six miles stretch between Patcham and Pyecombe. The work was undertaken at the instigation of the Ministry of Labour in order to provide employment for a large number of unemployed. Brighton contributed £35,000 towards the cost.

Proposed New Town Hall at Pretoria.

According to a newspaper report forwarded from the office of H.M. Senior Trade Commissioner at Johannesburg, the Chairman of the Finance Committee of the Pretoria Town Council, when seeking for formal authority to raise a loan of £750,000, stated that it is anticipated that the Council will soon have in hand some £200,000, which it is proposed to devote to the construction of a town hall.

The R.I.B.A. Visit to Hampton Court.

Except in the number of those who took part the visit of the R.I.B.A. to Hampton Court was a complete success. Mr. Goodison, of the Office of Works, undertook the duty of guiding the party. Professor Adshead and Mr. F. R. Hiorns (who represented the Art Standing Committee) expressed to Mr. Goodison the thanks of those present for all that he had done.

Beckenham Cottage Hospital.

The Committee of the Beckenham Cottage Hospital have decided to proceed with the extension of the institution, proposed some time ago as a war memorial. The work has been commenced, and will cost £17,000, of which £12,500 has been obtained. The Committee have secured the services of Mr. W. A. Pite, F.R.I.B.A., the architect of King's College Hospital at Denmark Hill, to design and superintend the work.

New Sports Ground at Folkestone.

The Folkestone Council have decided to proceed with the provision of a new sports ground at Cheriton Road. They have decided to purchase 30 acres of land, including the present cricket and football ground, from Lord Radnor for £13,650. It is anticipated that £5,000 can easily be spent on levelling and preparing the ground and so providing remunerative employment for unemployed labour during the coming winter.

The Privy Council for Scientific and Industrial Research.

Engineer Vice-Admiral Sir George Goodwin, K.C.B., late Engineer-in-Chief of the Fleet, and Dr. James Colquhoun Irvine, C.B.E., F.R.S., Vice-Chancellor and Principal of St. Andrews University, have been appointed by an Order of Council, dated the 10th day of August 1922, to be members of the Advisory Council to the Committee of the Privy Council for Scientific and Industrial Research.

University College School of Architecture.

In connection with the Bartlett School of Architecture of the University of London, the new building for the atelier, presented by Messrs. Goodman and Lorden, will be open in October. The new building is situated in Malet Street, immediately north of the British Museum. The atelier is intended for the study of advanced architectural design, and will be open to those who have already obtained their first qualifications in architecture.

New Cottage Hospital for Towyn.

Sir Osmond Williams, Lord-Lieutenant of Merionethshire, has officially opened the new cottage hospital which has been erected at Towyn as a war memorial. The building accommodates eight beds, is equipped with electric lighting and central heating, and contains an operating theatre. The cost was £8,000. A bronze tablet inside the building bears the names of the sailors, soldiers, and nurses from the town and district who laid down their lives in the war. Mr. F. Howorth was the architect.

New Partnership.

Mr. Thomas Adams, F.S.I., and Mr. Longstreth Thompson, B.Sc. (Eng.Lond.), have entered into partnership and will practise as town-planning consultants. Mr. Thomas Adams is Past President of the Town Planning Institute of England and Canada; hon. member of the Institute of Municipal and County Engineers; town-planning adviser to the Canadian Government and the West Middlesex Town Planning Committee; lecturer on Civic Design to the Massachusetts Institute of Technology; and formerly was town-planning inspector of the Local Government Board.

Mr. Longstreth Thompson, who is a Chadwick Gold Medallist in Municipal Engineering (Univ. Coll. Lond.), holds the following distinctions: A.M.Inst.C.E., P.A.S.I., Member of the Town Planning Institute, and formerly was assistant architect to the Housing Department, Ministry of Health. The firm will act in close collaboration with Messrs. Thomas H. Mawson and Sons, architects and landscape architects, of Lancaster. The offices of the firm are at 121 Victoria Street, Westminster, S.W.1 (Telephone: Victoria 7087), and 16 East 41st Street, New York.

Birmingham Exhibition of Hubbard Etchings.

During the whole of September and October there will be on view in the foyer of the Birmingham Repertory Theatre an exhibition of etchings and drawings by Mr. E. Hesketh Hubbard, R.O.I., A.R.W.A. Mr. Hubbard is the founder of The Print Society, an international society of etchers and print collectors, and the editor of an authoritative work on etching. We understand he is at present engaged on another work on etchings, and is making a series of drawings of "Building Modern London."

Hull Town Planning Scheme.

An inspector of the Ministry of Health, Mr. C. H. Eyles, F.S.I., has held an inquiry at Hull into preliminary proposals in connection with a town planning scheme prepared by the Hull Corporation for the south-eastern area of Hull, which includes a portion of the city and the adjoining district. The chief feature of the scheme is a road from Hull to Hedon through land purchased by the North-Eastern Railway for commercial purposes. There is another main road proposed for the East Hull housing site to a point north of Hedon, which would allow the traffic to avoid passing through Hedon. There is also proposed another main road from the corner of Sutton and Hedon main road to Paull Road. Objections were raised on behalf of the Pegton Parish Council, the Sculcoates Rural District Council, and private landowners. Ald. T. B. Atkinson (the chairman of the City Improvement Committee) stated that the scheme had the approval of all the local authorities interested.

Architect wanted for Hong Kong.

The Secretary of the R.I.B.A. has received the following cablegram from Messrs. Little, Adams & Wood of Hong Kong:—

"Kindly select for us energetic competent essentially real architect businesslike able to take charge designer essential single age under thirty efficiently vouched for professionally and personally salary 350 Mexican dollars monthly yearly increment twenty - five dollars three years' engagement free quarters or allowance fifty dollars free passage early partnership prospects refer selected candidate Pollock Lloyds Avenue for engagement.—Little Adams & Wood."

Any architect desirous of applying for this post should write at once to the Secretary, R.I.B.A., 9 Conduit Street W.1.

S.E. and C.R. Electrification.

The Electricity Commissioners, who held an inquiry into the application of the South-Eastern and Chatham Railway for consent to the establishment of a generating station at Angerstein's Wharf, Charlton, and of the West Kent Electric Co., Ltd., for the establishment of a generating station at Belvedere, have adjourned their decision to enable the parties to have a further opportunity of conferring in order to arrange a mutually acceptable contract. During the inquiry offers to supply the railway company were made by the West Kent Company and by the County of London Electric Supply Company, and the Commissioners decided in the affirmative the question which arose under the Act as to whether there was an undertaking in a position to give the railway company an adequate supply. The S.E. and C.R. expect to complete the first stage of the electrification of their lines by June, 1925.

A.A. Annual Excursion.

The first A.A. Annual Excursion held since 1914 will take place between September 22 and 30, and will be to Holland. It is proposed that Amsterdam should be the centre from whence various excursions will be made to Haarlem, Delft, Zuyder Zee, etc. The old and modern architecture of Amsterdam will be visited under the guidance of Dutch architects and also the great housing schemes which have aroused much interest. There will be various social functions. Full details will be announced later, but members wishing to join the excursion are requested to send in their names to the Secretary immediately as the number of the party will of necessity be limited. The cost will be about £15, but this amount will be settled definitely in due course.

London Housing.

Regulations have been issued by the Minister of Health with reference to losses by metropolitan borough councils in connection with the London County Council assisted housing scheme. For the purposes of the schemes of borough councils the loss in the carrying out of which is repayable by the L.C.C. under Section 8 of the Housing Act, 1921, the councils are directed to keep separate accounts, which will be submitted to the Ministry of Health. The Minister, who will notify the L.C.C. of the amount which is to repaid by it, takes power to direct the making of payments on account of probable deficits of the borough councils. Differences of opinion will be referred to the tribunal appointed under Article 7 of the regulations of 1919, and its decision will be final and conclusive

HY-RIB

For Plaster and Concrete Work

HY-RIB is a steel sheathing of great rigidity, which is both a centering and a reinforcement for concrete work.

HY-RIB eliminates timber shuttering or "false-work."

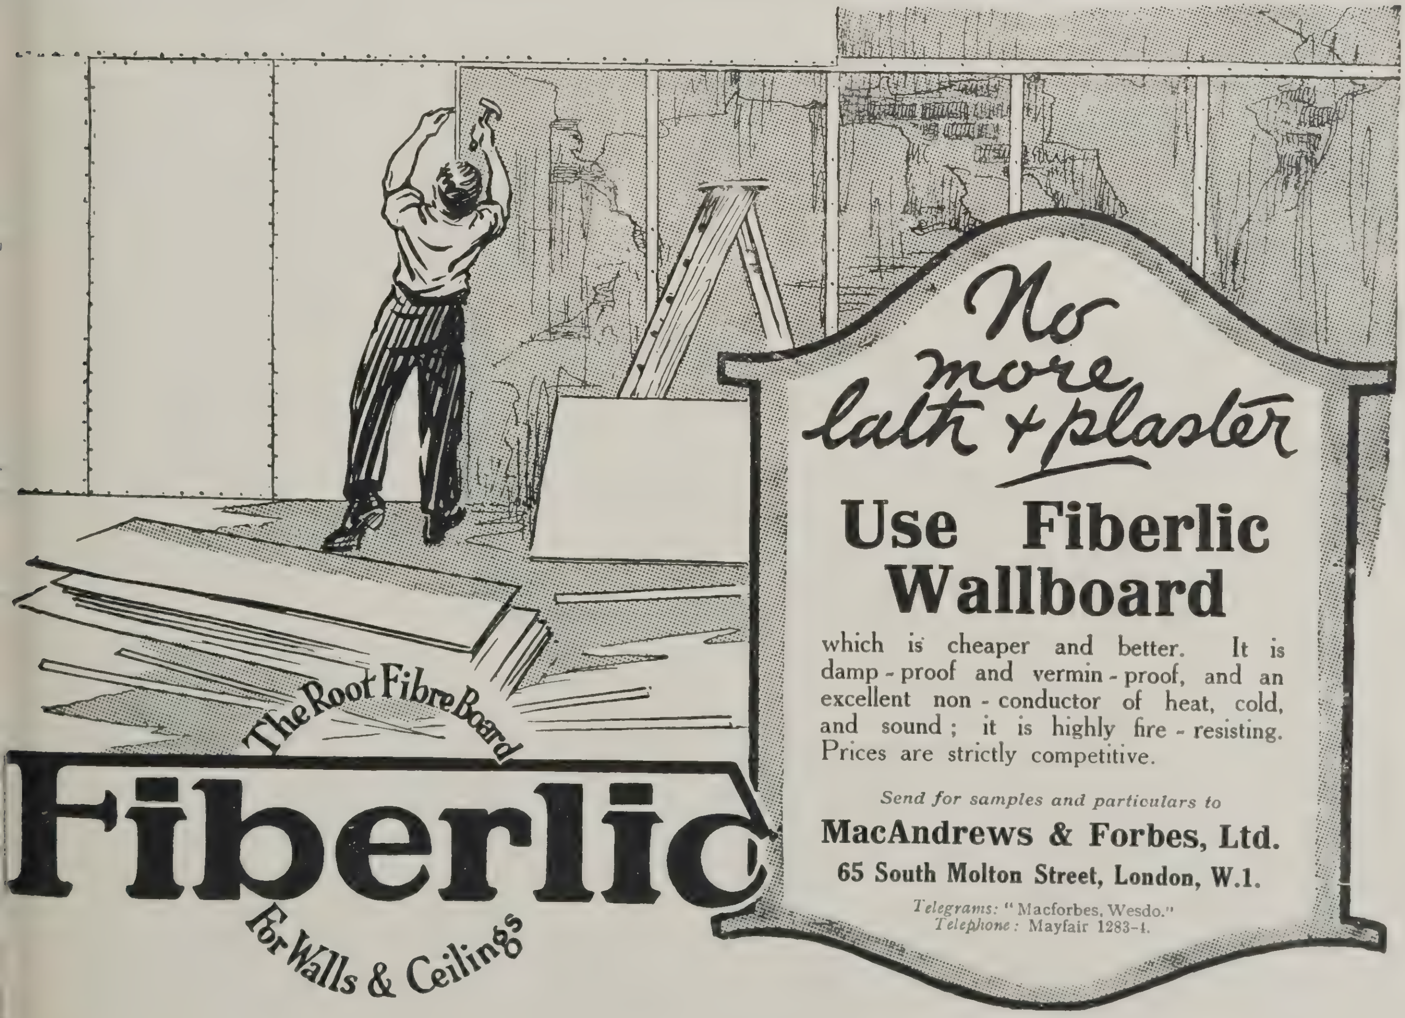
HY-RIB is used for Concrete Floors, Walls, Roofs, Partitions, Suspended Ceilings, etc.

HY-RIB is used in conjunction with any kind of framework—Reinforced Concrete, Structural Steel or Timber.

HY-RIB is suitable for every type of construction—large or small.

The TRUSSED CONCRETE STEEL CO · LTD

22 Cranley Gardens · South Kensington · S.W.7



Use Fiberlic Wallboard

which is cheaper and better. It is damp-proof and vermin-proof, and an excellent non-conductor of heat, cold, and sound; it is highly fire-resisting. Prices are strictly competitive.

ARCHITECTURAL REFERENCE LIBRARY.

The attention of Architects, and of those interested in Architecture, is called to the facilities afforded by the specially appointed Reading Room at 27–29, Tothill Street, Westminster.

This Room has been set apart in order that the numerous Works in the Library may be referred to in quietude and ease.

Overseas Members of the Profession, and also Architectural Students, are cordially invited to make the fullest use of the Library.

No Date	Designs and Estimates for a Public Hall and Baths, etc., to be erected at Lytham. Premiums of 100, 50, and 25 guineas will be awarded under the advice of Mr. A. W. S. Cross, M.A., Vice-President of the R.I.B.A., as professional Assessor. Apply Mr. Chas. A. Myers, Clerk to the Council, Council Offices, Lytham. Deposit £1 1s.
No Date	Bournemouth. Plans for a pavilion to cost £100,000 at Pier Approach. Premiums £300, £200, and £100. Apply Municipal Offices, Bournemouth.

Trade and Craft

An Artistic Catalogue.

Although Messrs. F. and C. Osler, Ltd., of 100 Oxford Street, are one of the oldest established firms in London, they have always kept well abreast of the times. In their new catalogue of electric light fittings, just published, the range and variety of designs shown is quite remarkable. Adam, Sheraton, Chippendale, Queen Anne, Dutch, and Georgian styles have all been cleverly and artistically adapted to modern lighting purposes. Examples of fittings suitable for every type of building—country cottages, large and small private houses, public halls, banks, and churches—are shown, and the work of the artist is evident in even the simplest of the designs. Alabaster is used with great success, and the cut-glass fittings are charming. The introduction of the half-watt lamp has made dish lighting in either glass or alabaster particularly pleasant and effective in softening the tone of the light. There are a number of really inexpensive fittings, but the design and workmanship is equally good in all. One of the best all-round collection of electric fittings in London can be seen at Messrs. Osler's galleries.

THE TUDOR ROOM AT MESSRS. F. AND C. OSLER, LTD.

Eliminate the Dust Evil!

This is the title of a circular which has been issued by the Dusmo Company, Ltd., of West Ham Lane, Stratford, E.15, to show how the dangers of disease carrying dust in business and public buildings may be overcome. It is pointed out that the daily use of Dusmo when sweeping floors or carpets will absorb every particle of dust. Further, it is claimed that Dusmo will so clean plain floors as to render wet scrubbing a quite unnecessary expense.

Marseilles Roofing Tiles.

An interesting illustrated booklet describing the many advantages to be obtained by the use of Marseilles roofing tiles has just been issued by Messrs. Langley London. These tiles are claimed to be the only ones for which non-ferrous red clay is used. This material is said to exist only in one place, namely, Marseilles, and it is in this district that the tiles are produced. Their extreme hardness is due to the high temperature needed to fire non-ferrous red clay. Kilns have to be raised to 1,800° F. The tiles weather well, and assume a delightfully mottled and mellow appearance with age. It is stated that roofs laid fifty and more years ago have never had a penny spent upon them, and are as good to-day as when they were put on. And there are still finer records of long service, for Marseilles roofing tiles have been made without intermission since the reign of William IV.

What will interest both architect and client alike are the economies claimed to be effected by using Marseilles roofing tiles. During the past year over 4,000 houses in the United Kingdom have been covered with Marseilles tiles—not to mention numerous churches, schools, hotels, cinemas, and public buildings. Some idea of their popularity can be gauged from the fact that the present annual output of the works exceeds 240 million pieces. Copies of the booklet may be obtained from Messrs. Langley London, at 161 Borough High Street, London, S.E.1.

Medway's Electric Pulley Block.

Messrs. Medway's Safety Lift Co., Ltd., have just issued an illustrated pamphlet describing their patent electric pulley block. Made in two sizes, capable of lifting loads up to one and two tons respectively; this pulley block is claimed to possess the following advantages: It occupies the minimum of headroom; loads are lifted by a single hook; no fall block is necessary; it is absolutely foolproof; loads are self-sustained without the use of brakes; it is practically silent in working; all parts are efficiently lubricated; the loads are easily controlled; and it cannot over-run, either in lowering or lifting. Copies of the leaflet may be obtained from the sales department of the Company, 35 Surrey Street, Strand, W.C.2.

"The Waterproofing of Concrete"

Messrs. Kerner-Greenwood & Co., Ltd., of King's Lynn, have sent us the following communication:—

The contributor of the article under the above heading, published in your issue for August 16, states that, although at one time sceptical, his experience in actual work under field conditions convinced him that "integral waterproofing is a useful and trustworthy process, yielding satisfactory results."

This experience is one which has been shared by some of our most eminent constructional engineers who to-day consistently employ waterproofed concrete and renderings, yet prior to their first use of this material were frankly distrustful of the claims made for it.

Your contributor rightly attaches greater importance to the results obtained in actual field work than to results which are the outcome of laboratory experiments, but it is unlikely that a material which failed under the carefully controlled conditions which are possible in the testing laboratory, would achieve better results under the less favourable circumstances which are inseparable from field work. We agree that it is possible to conduct experiments on such a small scale and in such a manner that the results do not give a true indication of the behaviour of the materials concerned under working conditions, but the highly skilled research worker is careful to avoid falling into such errors.

To those of your readers who are interested, we should be pleased to send particulars of various tests which have been carried out, both in this country and abroad, by authorities of the highest eminence, for instance by Messrs. David Kirkaldy and Son, and by Messrs. Henry Faija and Co. These tests fully establish the claims made regarding the waterproofing qualities of "Pudlo" brand powder. The results of the tests made with both concrete and mortar demonstrate the reason for the success which has always attended the use of this well-known waterproofer, even under the most drastic conditions.

Abstracts Published.

182345.—Roof scaffolding.—Kinsey, W., 61 Upper Moss Lane, Hulme, Manchester.—In roof scaffolding, the stepping-board is supported by means adapted to bear on the opposite incline, or vertical wall in a single incline roof, and clear the ridge tiles. For this purpose, brackets 2 attached to the stepping-board are pivoted to a pin 6 carried by arms 7, the distance between which can be varied to receive different widths of board. By adjusting the angle between the brackets and the arms, the arms bear on the opposite incline or the vertical wall and clear the ridge 17. The arms may have hooks 15 to support a ladder 16 or for hooking to a rope or the like. The parts of the pivot 6 may be provided with toothed gripping faces or conical friction surfaces.

FIG 3

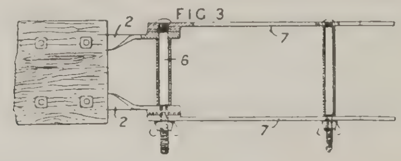

FIG 5

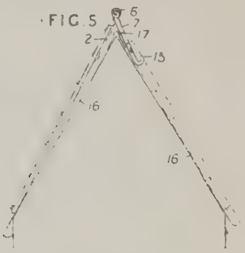

182640.—Indiarubber paving.—Hawthorn, H., of 16 Upper Gloucester Place, and Huntley, H. A., of 28 Budge Row, Cannon Street, both in London.—Rubber or like slabs for paving roads, tennis courts, and other surfaces are formed with integral studs or projections on the under surface, and with metal cone-shaped anchoring devices, with flanged heads embedded in the slab, which, with the studs, are adapted to enter and key into a concrete foundation. For this purpose the upper foundation layer is of finely sieved concrete into which, while in a plastic condition, the slabs are pressed. The slabs may be formed of layers of different resiliences, and may be reinforced with canvas, wire gauze, or the like, and coloured or ornamented. An adhesive or preservative medium may be introduced between the slabs and the foundation. Fig. 2 shows the underside of a slab *a*, having projecting studs a^2. The anchoring device has a flange b^1 embedded in the slab *a*, and has openings b^3 in the sides to permit the concrete to be distributed evenly round the cone. The edges of the slabs are bevelled at a^4 to form a groove for a cementing medium; alternatively these edges may interlock.

FIG.2.

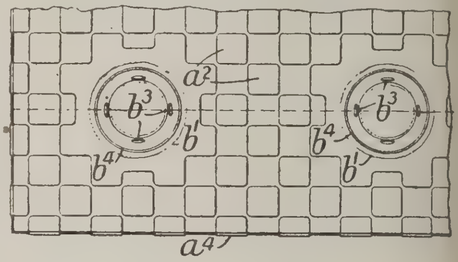

FIG.3.

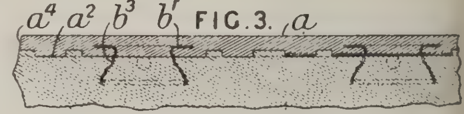

The above particulars are specially prepared by Messrs. Rayner & Co., registered patent agents, of 5 Chancery Lane, London, W.C. 2, from whom readers of the Journal may obtain all information free relating to patents, trade marks, and designs. Messrs. Rayner & Co. will obtain printed copies of the published specifications and forward on post free for the official price of 1/- each.

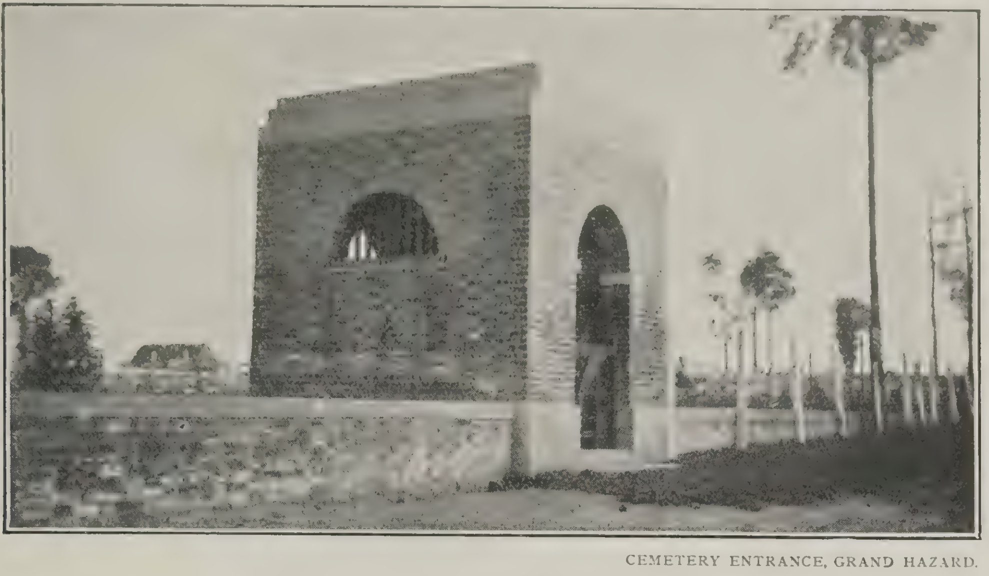
ARCHITECTURAL REFERENCE LIBRARY.

The attention of Architects, and of those interested in Architecture, is called to the facilities afforded by the specially appointed Reading Room at 27–29, Tothill Street, Westminster.

This Room has been set apart in order that the numerous Works in the Library may be referred to in quietude and ease.

Overseas Members of the Profession, and also Architectural Students, are cordially invited to make the fullest use of the Library.



CEMETERY ENTRANCE, GRAND HAZARD.

"Somewhere" in France

The photographs herewith illustrate portions of large and important contracts now being completed in France for the Imperial War Graves Commission, and in some degree illustrate the diversity and the activities of the Somerville organization. The work has been carried out on all the old battle fronts in the heart of the devastated areas, and on sites as far apart as Etaples and Poperinghe.

It was necessary, owing to the isolated position of many of the sites, to construct roads, and also to provide housing and canteen arrangements for the workmen. The success of the work, with the multiplicity of detail involved, has only been made possible by the organization evolved by D. G. Somerville & Co. Ltd. from their experience in France and Belgium during the War.

D. G. Somerville & Co. Ltd. are ready to place the benefit of their unique experience at the service of companies, corporations, and individuals who contemplate the erection of factory buildings, bridges, water towers, silos, warehouses, cinemas, bungalows, etc. Consultations to suit your own convenience.

Electrical Notes

Electrical Developments at Glasgow.

Ultimately the electrical requirements of Glasgow will render necessary the erection of another power station. This prediction was made by Mr. R. B. Mitchell, chief engineer of the Glasgow Electricity Department, in a lecture to the Rotary Club. After tracing the growth of the department since its inception, the lecturer said that he thought the recently inaugurated station at Dalmarnock would not satisfy the requirements of the community for all time. In due course a site for another station would have to be acquired—probably in the western district of the city.

With regard to the development of the domestic uses of electricity, Mr. Mitchell said he believed there was a great future in that direction. The rapid growth of the use of electricity in the industrial spheres had been phenomenal, but it was more than probable that the domestic load would ultimately, and before long, be greater than the industrial load. The prospects of the domestic field were almost illimitable. Meanwhile that field had hardly been touched, but the day was not far off when the terms "Ideal Home" and "The Home Electrical" would be synonymous.

Dealing with electrical heating by accumulation, Mr. Mitchell said that the solution of the problem was the provision of appliances which would accumulate energy when the generating plant was not fully loaded, and release it when required by the consumer. He was glad to say that so far as the heating load was concerned there were indications that such appliances would soon be on the market. If heat-accumulating methods developed as expected the effect on supply undertakings would be of boundless importance.

Australia and Electricity.

Great progress is being made in Australia with the Morwell scheme. According to a report sent to the Department of Overseas Trade by H.M. Senior Trade Commissioner in Australia, all the principal contracts for the plant and machinery for the main power station at Yallourn have been placed, and the reports indicate that the progress with the manufacture of the machinery is good. A considerable portion of the transformers, switchgear, etc., has already been delivered, while the manufacture of the five large turbo-alternators and of the condensing plant, Victoria, is well advanced.

The greater part of the preparatory work of the site has been completed; the contractors for the steel work for the power station are at work on the ground, and steel work is now arriving. Gangs have been organised for the erection of the transmission line (over a distance of 112 miles) for which much of the material has now arrived. The erection of the auxiliary station at Newport is proceeding satisfactorily and justifies the anticipation that the station will be in operation by May, 1923, as originally intended.

On the coal-winning operations, the removal of overburden has already commenced, and it is expected that the winning of coal will be commenced by the end of this year. The plant and machinery is expected to be operating by the end of 1923.

The Government has authorised the erection of a model township at Yallourn, on the site of the works, and this is being put in hand with all speed. The township scheme, which is estimated to cost £224,000 provides, in its first stages, for accommodation being made available for the Commission's employees by the erection of 200 tenements, but the final scheme makes provision for a population of 3,000.

Rural Telephones Development.

The Post Office is actively engaged in developing telephonic facilities in rural districts. It is estimated that out of 3,110 existing exchanges, 1,930 serve purely rural districts. In addition, the service has been extended in the form of a public call office to 2,250 villages where no exchange exists. Since the beginning of May last 151 rural call offices have been opened. A prominent feature of the urban telephone system is the development of a private branch exchange service. There are upwards of 990,000 telephones in the Post Office system; 142,163 provincial stations are joined up to private branch exchanges and 106,464 London stations are similarly connected. The Post Office is devoting a good deal of attention to the subject of automatic telephony.

CONTRACTS OPEN

Unless expressly stated to the contrary, all deposits required for bills of quantities, etc., are returned on receipt of bona-fide tenders. The words "Fair Wages Clause" inserted in certain paragraphs signify that persons tendering must conform to a fair wages clause in the contract, which requires them to pay the rates of wages current in the district.

BUILDING.

September 13.—**URINAL. Wombwell.**—Extension of urinal at Wombwell John Street Council School, for the West Riding Education Committee. Apply Education Department, County Hall, Wakefield.

September 14.—**DWELLINGS. Bethnal Green.**—Erection of a block of dwellings in Collingwood Street, Bethnal Green, for the London County Council. Apply Architect to the Council, County Hall, Westminster Bridge, S.E.1. Deposit £3.

September 14.—**ALTERATIONS. Nantwich.**—Alterations and additions to buildings at the Nantwich Workhouse, for the Guardians. Apply Mr. C. E. Davenport, Architect, 152 Hospital Street, Nantwich. Deposit 10s.

September 14.—**HOUSES. Prickwillow.**—Erection of houses at Prickwillow, near Ely, for the Ely Urban District Council. Apply Mr. A. K. Campbell, Clerk, Market Square, Ely. Deposit £1 1s.

September 14.—**RENOVATION. Llandudno.**—Renovation and decoration of the Assembly Room, Town Hall, for the Urban District Council. Apply Mr. W. T. Ward, Engineer and Surveyor, Town Hall, Llandudno.

September 14.—**ENGINE AND COMPRESSOR HOUSE. Lymm.**—(1) Erection of an engine and compressor house constructed in either brickwork or ferro-concrete at the Gasworks, Lymm; (2) supply and erection of one 25-h.p. gas engine, also one compound belt-driven air compressor capable of compressing air to a pressure of 35 lb. per square inch and dealing with 9,000 cubic feet of free air per hour, also necessary shafting, pulleys, and belting. Apply Surveyor, Council Offices, Lymm.

September 15.—**COTTAGES. Croydon.** Erection of two cottages at the Selhurst well and pumping station; three ditto at the Addington well and pumping station; one ditto at the Russell Hill reservoir, for the Croydon Town Council. Apply Office of the Borough Engineer, Town Hall. Deposit £1 1s. each set of quantities.

September 15.—**EXTENSIONS. Batley.**—Mason's, joiner's, plumber's, plasterer's, slater's, painter's, heating engineer's, and electrical engineer's work in the erection of extensions to the Batley and District Hospital. Apply Messrs. W. Hanstock and Son, Hon. Architects, Branch Road, Batley. Deposit 5s.

September 15.—**REBUILDING BRIDGE. Lanchester.**—For rebuilding the parapet and spandril walls, &c., of the Fenhall Bridge, near Lanchester, for the Durham County Council. Apply Mr. A. E. Brookes, M.Inst.C.E., County Engineer and Surveyor, Shire Hall, Durham.

September 15.—**REPAIRING, &c. Welney, Norfolk.**—Adapting and repairing the farm buildings at Young and Dyson's Farm, Welney, near Wisbech, Norfolk, for the County Small Holdings Committee. Apply County Land Agent, Shirehouse, Norwich. Deposit £1 1s.

September 15.—**GENERATING STATION. Bideford.**—Construction of the new generating station at Nutaberry Works, Bideford, for Bideford and District Electric Supply Co., Ltd. Apply Mr. R. Blackmore, Secretary, Alexandra House, Bideford.

September 16.—**REPAIRING. Aberdour.**—Works required in repairing the church manse and manse offices at Aberdour. Apply Mr. G. B. Mitchell, Architect, 1 West Craibstone Street, Bon-Accord Square, Aberdeen.

September 16.—**RESIDENCE. Usk.**—Erection of a principal's residence on the Institute Farm, Usk, for the Monmouthshire Agricultural Institution. Apply Mr. J. Bain, F.R.I.B.A., County Hall, Newport. Deposit £2 2s.

September 16.—**REPAIRS. Semer, Suffolk.**—Repairs to the roof of their institution at Semer, for the Guardians of Cosford Union. Apply Master of the Workhouse, or Mr. A. Newman, Clerk, 6 Churchgate Street, Hadleigh.

September 16.—**REBUILDING. Sherburn Hill.**—Various works in connection with the proposed rebuilding of the Sherburn Hill Workmen's Club at Sherburn Hill. Apply Mr. F. Charlesworth, Heather View, Littletown, near Durham.

September 16.—**BUNGALOW. Silloth, Cumberland.**—Erection of a bungalow at Silloth for Mr. T. J. Osborn. Apply Mr. G. Armstrong, Architect and Surveyor, 24 Bank Street, Carlisle.

September 16.—**HOUSES. Rotherham.**—Erection of a further 52 houses on section D of the Doncaster Road housing site, for the Housing Committee. Apply Mr. C. A. Broadhead, Housing Architect, St. George's Hall, Rotherham. Deposit £2 2s.

September 16.—**ALTERATIONS. Clacton-on-Sea.**—Alterations and additions to Headquarters, 5th Battalion Essex Regiment, "Green Lodge," Old Road, Clacton-on-Sea, for the Territorial Army Association of Essex. Apply, accompanied by a cheque for £2 2s., to the Secretary, Essex Territorial Army Association, Market Road, Chelmsford.

September 18.—**HOUSES. Azette, Jersey.**—Erection of 35 houses at Greve-d. Azette, Jersey, for Mr. Trevor J. Matthews. Apply Mr. S. Newcombe, Architect, 52 Ravenscourt Gardens, London, W.6. Deposit £2 2s.

September 18.—**HOUSES. Grimsby.**—Building 24 houses in blocks of four, of non-parlour and-or parlour types, in Laceby Road, Grimsby, for the Housing Committee. Contractors may tender for a block of four or the whole of the 24 houses, regard being had to the necessity for the completion of the 24 houses before January 31, 1923. Apply Town Clerk. Deposit £2 2s.

September 18.—**SUB-STATION. Barrow-in-Furness.**—Erection of an electricity sub-station at Rampside, for the Corporation. Apply Borough Engineer, Town Hall.

September 18.—**SCHOOL. Bexley, Kent.**—Erection of a Council school at Bexley (Welling), in the county of Kent, for the Kent Education Committee. Apply Mr. W. H. Robinson, F.S.A., Room 69, Sessions House, Maidstone. Deposit £2.

September 18.—**ALTERATIONS, &c. Conisborough.**—Alteration to Council offices; heating to Council offices; wiring, &c., for electric lighting to Council offices; erection of a public convenience, Denaby Main, for the Conisborough U.D.C. Apply Office of the Surveyor, Mr. H. Shirlwell, Council Offices, Old Albion House, Conisborough, via Rotherham.

September 18.—**ALTERATIONS AND ADDITIONS. Forfar.**—Alterations and additions at Forfar Post Office, for H.M.O.W. Apply Post Office, Forfar, or H.M. Office of Works, 4-5 Drumsheugh Gardens, Edinburgh. Deposit £1 1s.

September 18.—**HALL. Otterburn, Scotland.** – Erection of a hall at Otterburn, for the Otterburn Memorial Hall Committee. Apply Mr. C. F. Murphy, Lloyds Bank Chambers, Morpeth, or Mr. G. MacDougal, Tower Cottage, Otterburn.

September 18.—**HOUSES. Rhydfelen.**—Building of 20 houses on the Duffryn Land, Rhydfelen, for the Pontypridd Urban District Council. Apply Mr. W. E. Lowe, Engineer and Surveyor, Municipal Buildings, Pontypridd. Deposit £3 3s.

September 19.—**HOUSES. Glasgow.**—Erection of 68 houses of the cottage and terrace type in Cathcart Road, for the Corporation. Apply Town Clerk, Glasgow.

September 19.—**CONVERTING. Chingford.**—Works, for the Chingford Urban District Council, viz. :—(1) Conversion of an existing building formerly used as a brick kiln into a cottage bungalow; (2) erection of a suitable covering over the refuse incinerators; (3) erection of new storage sheds. Apply Mr. L. C. Bowen, Clerk, Council Offices, Chingford, E.4. Deposit £2 2s.

September 19.—**HOUSES, &c. Bolton-upon-Dearne.**—For erection of 78 dwelling-houses of various types, and the construction of roads and sewers in connection therewith in Furlong Road, Bolton-upon-Dearne, for the Bolton-upon-Dearne Urban District Council. Apply Messrs. Garside and Pennington, Ropergate, Pontefract.

September 19.—**ALTERATIONS TO COTTAGES. High Houghall.**—Builder's work in connection with the following: High Houghall Farm—(1) alterations to cottages; (2) conversion of farm buildings into poultry station. Apply Mr. F. Willey, F.R.I.B.A., 34 Old Elvet, Durham.

September 19.—HOUSES. Gosforth.—Erection of 20 semi-detached houses on road No. 6 of the Corlodge Housing site for the U.D.C. Apply Mr. George Nelson, A.M.I.C.E., Engineer and Surveyor, to the Council, Council Chambers, High Street.

September 19.—**HOUSES. Heywood.**—Erection of 20 houses (in pairs) at Barley Hall, Heywood, for the Corporation. Apply Mr. J. B. Nuttall, Borough Surveyor. Deposit £2 2s.

September 19.—**HOUSES. Hull.**—Erection of 50 houses on the Cottingham Road Estate, for the Corporation. Apply City Architect's Office.

September 19.—**WORKS AND REPAIRS. Windsor.**—Execution of ordinary works and repairs in the Windsor district, for H.M.O.W. Apply Contracts Branch, H.M. Office of Works, King Charles Street, London, S.W.1. Deposit £3 3s.

September 20.—**POST OFFICE. Chepstow.**—Erection of a post office at Chepstow, for the Commissioners of His Majesty's Works, &c. Apply Post Office, Chepstow, or Contracts Branch, H.M. Office of Works, King Charles Street, London, S.W.1. Deposit £1 1s.

September 20.—**CLASSROOMS. Hemsworth.**—Erection of three additional classrooms at Hemsworth, Kinsley Council School. Trades :—Excavator, concretor, and bricklayer, carpenter and joiner, slater, plumber and glazier, plasterer, painter. Apply Education Department, County Hall, Wakefield.

September 20.—**POST OFFICE EXTENSION. Maidenhead.**—Extension of the post office, Maidenhead, for the Commissioners of His Majesty's Works. Apply Head Post Office, Maidenhead, and Contracts Branch, H.M. Office of Works, King Charles Street, London, S.W.1. Deposit £1 1s.

September 20.—**EMPLOYMENT EXCHANGE. London.**—Erection of an employment exchange in the Borough, London, S.E., for H.M.O.W. Apply Contracts Branch, H.M. Office of Works, King Charles Street, London, S.W.1. Deposit £1 1s.

September 25.—**RECONSTRUCTING BATHS. Buxton.**—Reconstruction of the natural mineral water baths, situate in The Crescent, Buxton, for the Corporation. Apply Mr. F. Langley, Borough Engineer and Surveyor, Town Hall, Buxton. Deposit £5 5s.

September 25.—**CUBICLE BLOCK. Stoke-on-Trent.**—Erection of a new cubicle block, &c., at th Bucknall Infectious Diseases Hospital, for the Corporation. Apply Mr. E. Jones, F.S.A., 10 Albion Street Hanley; or Messrs. Martin, Martin and W. H. Ward Architects, 106 Colmore Row, Birmingham.

September 29.—**COTTAGES, &c. Littleton, Staines** —Demolition of 14 cottages and farm buildings, includin outbuildings, walls, fences, and paving, &c., and also th construction of 12 cottages, formation of drainage fences, paving, and paths, &c., at Littleton, in the rura district of Staines, Middlesex, for the Metropolitan Wate Board. Apply Offices of the Board, Chief Engineer' Department (Room 201), Metropolitan Water Board New River Head, 173 Rosebery Avenue, Clerkenwell E.C.1. Deposit £5.

October 2.—**SANITARY CONVENIENCES. Lichfield.**—Erection of sanitary conveniences in the Marke Place, Lichfield. Apply Mr. P. A. Benn, F.S.I., City Surveyor, Guildhall, Lichfield. Deposit £2 2s.

October 3.—**COTTAGES. Putney.**.—Erection on the Roehampton Estate, Putney, of 168 cottages, comprised in contracts, as follows :—(a) 99 cottages; (b) 43 cottages; (c) 26 cottages, for the London County Council Apply Architect to the Council, County Hall, Westminster Bridge, S.E.1. Deposit £3.

specially designed for Architects' and Engineers' requirements.

A Surface like Porcelain!

BLUNDELL'S PETRIFYING LIQUID ENAMEL

PETRIFYING LIQUID ENAMEL dries with an extremely hard, glossy surface, resembling glazed tiles, and forms a wonderfully durable covering for Walls, Wood and Ironwork. The fact that it will withstand heat, steam, constant washing, and the most severe wear, makes it specially suitable for **Hospitals, Public Institutions, Schools, Factories, Breweries,** &c. It is also largely used in **Dwelling Houses** for **Bathrooms, Kitchens** and **Corridors.**

Made in White and a range of attractive colours.

Blundell's PETRIFYING LIQUID ENAMEL can be used on PLASTER, WOOD, BRICK, STONE & IRON.

Write for Colour Card, Descriptive Folders, and sample Bricklet showing effect produced. Sent free on application.

BLUNDELL, SPENCE & Cº LTD.
Established 1811.
PAINT, COLOUR & VARNISH MAKERS.
HULL & 9, UPPER THAMES ST., LONDON, E.C.4

Library Planning and Design

There has been a great change in the point of view from which the library building is regarded. To-day much less importance is attached to the situation of the site, and it is considered essential that the building should be capable of easy adjustment and internal alteration. To quote from "The Librarian," it is now realized that the public library is in need of constant alteration: that the library of the future may bear little resemblance to the present public library. And for that reason the building should be either of a less permanent nature than the typical erection of the past, raised in brick and stone, with the prospect of a hundred years of changeless and uneventful life; or it should be capable of easy adjustment and alteration internally. The building should be regarded as a mere shell, the walls should be designed from their true standpoint, as a means of protection. The greatest change of the past has been the introduction of open access. How great that change has been, and how little adapted to open access the older buildings were is known to most librarians, at least to those who have had anything to do with the stuffy, smelly old type of building. But this change or development, great as it has been, may be as nothing to the changes that are even now becoming apparent in the future more or less distant.

This shell building may be as solid and as lasting and as ornate as desired. It depends entirely upon the amount of money available. And so long as the interior is not robbed it does not very much matter what happens. In other words, the æsthetic sense of the librarian is not our immediate concern; the question of the outside is a matter to be decided by the local authority familiar with local tastes and the surroundings of the building. Because the relationship of the exterior to the interior has undergone such a vital change during the last few years, the importance of the one is now immeasurably greater than that of the other. But, curiously enough, this change in values justifies the building of the exterior more solidly, with more dignity, and with greater beauty than in the past. The disassociation, as it were, of the exterior from the interior makes it possible to erect a lasting exterior that will not require alteration, however much the interior may be changed. The principle involved may be seen in use in many large business houses throughout the world. From a spacious interior, architectural knowledge, engineering skill and practical craft, can erect and re-erect any desired scheme of rooms, halls or chambers. The architect has this knowledge, but both he and the librarian must realize the possibilities before any great building impetus can take place.

Of course this idea of a shell building is not new. It has been familiar for many years. Even in this country it is to be found in at least two public libraries. But the existing shell buildings are not so developed on these lines as future buildings are likely to be, if only because building science was not so far advanced when these buildings were erected as it is now.

A.A. Design Club

The new session of the Architectural Association Design Club is about to commence, and application for membership should be made at once to the jury and addressed to the hon. secretary. The jury is as follows: Stanley H. Hamp, Chairman; Robert Atkinson, Howard Robertson, Vice-Chairmen; H. Chalton Bradshaw, Hon. Secretary; John Anderson, Ferdnand Billery, L. H. Bucknell, R. A. Duncan, H. S. Goodhart-Rendell, P. D. Hepworth, E. R. Jarrett, V. O. Rees, L. S. Sullivan, L. de Soissons, T. S. Tait, Members' Committee (to be re-elected at a general meeting on October 27); R. J. Troup, J. H. Greenwood, Joint Hon. Treasurers. The subjects will form a graduated course. The subscriptions are £3 3s. for the year and 10s. for subjects, the fees being payable for at least three subjects whether taken or not. No fee is made for the life class, sketch subjects, or lectures. On Wednesdays at 5 p.m. during the session Mr. Robert Atkinson will lecture on theory, on Thursdays from 7.30 to 9.30 p.m. the life class will be held, and on two nights each week two members of the jury will attend during the execution of each subject. Members who receive first mention (M.15) will receive £2. All the meetings will be held at 36 Bedford Square, W.C.1. Appended is a table giving the dates and time allowed for each subject:—

Competition.	Sketch, twelve hours, Sat.-Sun.	Finished Drawings by 10 p.m.	Meeting of Jury, 4 p.m., on Tuesday.	Exhibition and Criticism, 8 p.m., on Tuesday.

Twelve hours' sketch	April 7/8	April 9	,,	,,

The Programme of the A. and S.A.P.U.

The following extracts from the programme of the Architects' and Surveyors' Assistants' Professional Union are set forth on a recruiting circular which has just been issued. The President of the Union is Mr. A. J. Penty, L.R.I.B.A., the Chairman of the Executive Council is Mr. Chas. MacLachlan, A.R.I.B.A., and the General Secretary is Mr. J. Mitchell. The offices of the Union are at 36 Victoria Street, London, S.W.1:—

To organize the salaried architects, surveyors, civil engineers, and technical assistants in all branches of the building professions, e.g., private practice, government service, local government service, statutory and industrial companies, building contractors, etc., and to make our membership 100 per cent. strong in each of the above groups.

To combat the very serious state of overcrowding in the building professions, to press for the regulation of entry into same, and to bring into being the necessary machinery for securing our just aims. To urge the formation of a National Whitley Council for the building professions where employers and employed will meet to solve their common difficulties, and to work for their common welfare.

To secure to all entering the professions an adequate standard of training which shall be under the direct control of the recognized professional bodies.

To eliminate all forms of unpaid and underpaid assistance, whether of pupils or assistants, all of which tend to undermine the status of the average assistant who has to stand on his own feet after training and earn his own living.

To enforce the recognition of an assistant as being a professional man, no matter where or by whom employed, and to dispel from all minds the popular illusion of his being a sort of "technical clerk."

To endeavour to secure the exemption from Income Tax of such charges as—(i) Payments to learned and protective associations (such as this Union); (ii) Out-of-pocket expenses for technical books, instruments, unsuccessful competitions, etc.

To help capable and qualified assistants about to start in practice on their own account, and to raise a fund from which they could borrow if necessary.

To organize and maintain a central employment bureau for all professional and technical assistants connected with the building industry. (Our own bureau during the past fifteen months placed over 200 men in positions.)

To provide for members requiring same the services of our legal advisor. (The Union is ready to support and take up any presentable case.)

To publish a monthly journal containing all information regarding the Union's activities and dealing with all matters of general professional interest. (At present the Journal is published quarterly, but more frequent issues are needed for our requirements.)

To institute the principle of a minimum salary for all assistants. This was fixed by the National Convention of Delegates in 1920 (when the cost of living was

125 per cent. above the 1914 level) at £6 6s. per week for a man of 26 years of age.

To maintain a hostel for the accommodation of members visiting or taking appointments in London which shall also serve as a social centre for London members, and shall include a suite of offices for the Union.

The Cost of Building

"It is more than probable that the cost of housing will become stabilized for some years at a little above pre-war figures." This conclusion is reached by the General Committee of the National Federation of House Builders, in a statement just issued. With regard to Sir Charles Ruthen's remarks on the decrease in the cost of building the Committee state that it is impossible to make a comparison in cost between council houses and those erected to be sold to an occupying owner.

The Committee, in the course of the statement, remark: The cost of building at the present time varies in different parts of the country, but on the average it may be said to be 125 per cent. above the cost in 1914.

It is impossible to state any general figure of cost for a house of given accommodation built for sale to an occupying owner; the cost of houses even of the same size in the same town varies, for the value of the land, the nature of the fittings, and the design of the house all have a direct effect upon the cost of building.

The prospect of any further substantial reduction is remote, for wages are now fixed until March 1, 1923, and the item of wages amounts to 75 per cent. of the total cost of building including the wage on the manufacture of material used in the job. There is little prospect of any great fall in the rate of wages, which is governed by the final law of supply and demand. There are probably only half the number of men available for house building in the immediate future as compared with the number who were engaged in the various trades when building was at its height, and any revival in the trade is bound to lead to a very serious shortage of labour which will prevent any further reduction in the rate of wages.

In conclusion the Committee remark: "The house builders of the country have been prevented by various circumstances from carrying on their business during the past ten years. Investors have been discouraged from buying houses by the various Acts of Parliament affecting house property, which have destroyed all confidence. Prices have been rushed up to impossible figures by reckless schemes, and the people of the country have been encouraged to expect housing conditions which were absolutely unattainable. When all this chaos has subsided and the country realizes that housing must be an economic business governed by hard financial rules, the house builders will be able to resume their business and the acute house famine which we are now experiencing will become a nightmare of the past."

Shop Lighting.

The current number of "A Thousand and One Uses for Gas" (No. 102) contains a series of photographs of shops and shopping parades brilliantly lighted by low and high pressure gas lamps, and contains a wealth of useful advice as to the latest and most efficient types of lamps, burners, reflectors, and shades for shop lighting. Every shopkeeper who is dissatisfied in any way with his existing system, or whose lighting tends to be "eclipsed" by that of his neighbouring competitors, should write for this thoroughly practical little magazine, which will be sent (6d. post free) on application to the Secretary, The British Commercial Gas Association, 30 Grosvenor Gardens, S.W.1.

PLANNING THE LIBRARY

FOR PROTECTION AND SERVICE.

Two-Story "Standard" Stack, University of Edinburgh Library.

WHETHER you are planning a new library or remodelling an old one; whether this new library is to be small, medium, or large in size, there are certain fundamental features that must be considered in each case to secure the maximum of protection and service. Your finished plan must provide:—

1. Maximum accessibility to every volume with minimum steps.
2. Versatile Stack arrangement so as to care for volumes of any size, shape, and binding, in minimum space.
3. Practical illumination, natural where possible, artificial when necessary.
4. Complete ventilation to prevent deterioration of books.
5. Elimination as far as possible of dust.
6. Flexible stacks providing ample means of classification and rearrangement, including growth of your library which is certain to come.
7. Durability of equipment and ease of operation.
8. Low initial cost for maximum efficiency.

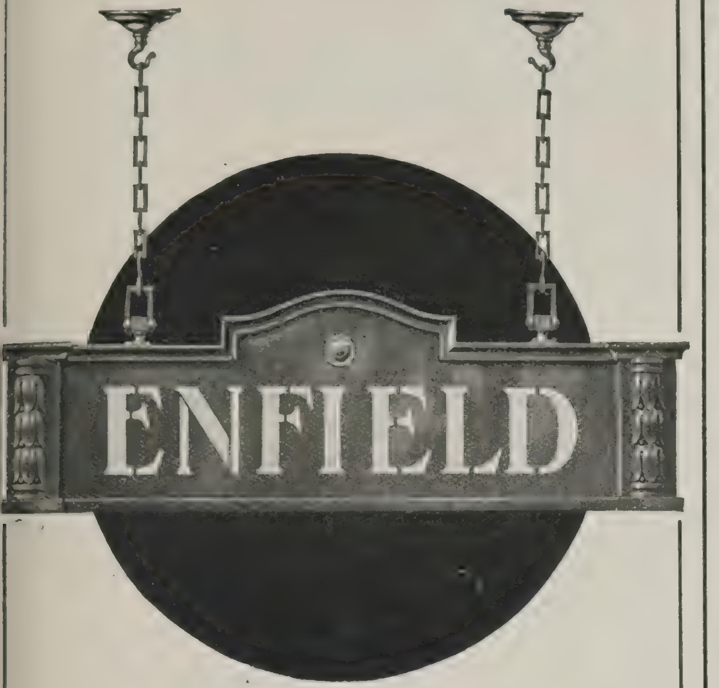
ARCHITECTURAL REFERENCE LIBRARY.

The attention of Architects, and of those interested in Architecture, is called to the facilities afforded by the specially appointed Reading Room at 27–29, Tothill Street, Westminster.

This Room has been set apart in order that the numerous Works in the Library may be referred to in quietude and ease.

Overseas Members of the Profession, and also Architectural Students, are cordially invited to make the fullest use of the Library.



SIMPLEX TRIPLE PURPOSE SIGNS

THE "Triple-Purpose" Sign—the most eminently practical form of economy yet offered to all interested in the efficient lighting of shop windows.

An unrivalled combination of scientific lighting by night, distinctive decoration by day, and forceful advertising by day and night—and at one cost only.

The Company, being actual manufacturers of 25 years' standing and experience in electric lighting, etc., wish particularly to emphasize their ability to produce, at a very reasonable figure, signs both carefully designed and constructed with a full knowledge and appreciation of their triple purpose.

Lists or Special Designs willingly sent on request.

CONTRACTS OPEN

Unless expressly stated to the contrary, all deposits required for bills of quantities, etc., are returned on receipt of bona-fide tenders. The words "Fair Wages Clause" inserted in certain paragraphs signify that persons tendering must conform to a fair wages clause in he contract, which requires them to pay the rates of wages current in the district.

BUILDING

October 5.—**HOUSES. Doncaster.**—Erection of 60 houses of the "A" class in Theobald Avenue and Chequer Avenue, in one or more contracts, for the Corporation. Apply Mr. R. E. Ford, Housing Surveyor, 3 Priory Place, Doncaster. Deposit £2 2s.

Burntisland.**—Excavator, concretor and brick works; carpenter, joiner and ironmonger works; glazier work; slater and roughcast works; plumber and gasfitter works; and plaster work of five blocks of houses (10 houses in all) proposed to be erected on Haugh site, Burntisland. Also for proposed levelling of ground and formation of stone terrace stairs in connection with houses erected at Rossend site. Apply Mr. G. C. Campbell, Architect, Methil Brae, Methil; or at the office of Messrs. Peter Lawrence and Co., F.F.S., Surveyors, 50a Frederick Street, Edinburgh. Specifications from Burgh Surveyor, Burntisland, on payment of £1 1s.

October 14.—**NURSING BLOCK. Colwyn Bay.**—Erection of new nursing block (47 beds), and additions and alterations to the existing hospital in Hesketh Road, Colwyn Bay, for the Building Committee of the Colwyn Bay and West Denbighshire Hospital. Apply Mr. S. Colwyn Foulkes, A.R.I.B.A., Architect, Central Chambers, Colwyn Bay. Deposit £3 3s.

October 16.—**ALTERATIONS. Birkenhead.**—Alterations and additions to the maternity block, at the Birkenhead Union. Apply Mr. A. E. Shennan, Guardian Assurance Buildings, 35 Dale Street, Liverpool. Rate of wages, etc., clauses to be observed. The contractor will also be required to have special regard to the employment of local (Birkenhead and Wallasey) unemployed persons and to a preference being given to ex-Service men.

October 16.—**ROOF. Birkenhead.**—Provision of a roof to an open-air passage at the Birkenhead Infirmary, for the Guardians. Apply Mr. A. E. Shennan, Guardian Assurance Buildings, 35 Dale Street, Liverpool. Rate of wages, &c., clause to be observed.

October 17.—**HOUSES. Walsall.**—Erection of 20 houses, in two blocks of 10, in Lord Street, Walsall, and 19 houses, in three blocks of six and seven, in Green Lane, Walsall, for the Town Council. Apply Mr. J. Taylor, M.I.C.E., Council House, Walsall. Deposit £1.

November 30.—**PALACE. Barcelona.**—In construction of the Grand Palace of Nations. Apply Don José y Cadafalch, offices of the exhibition (Lerida Street).

ELECTRICAL.

October 6.—**RUBBER-INSULATED CORDS. Montevideo.**—Supply of 15,000 metres of rubber-insulated cords of 2 × 0.75 mm.^{2} section for interior use. The tinned copper conductors are to be covered by a minimum thickness of 0.8 millimetres of vulcanized rubber with an external braiding of cotton. Apply Department of Overseas (Room 49), 35 Old Queen Street, Westminster, London, S.W.1 (Ref. 6666/F.L./E.P.(B.).)

October 9.—**LEAD-COVERED CABLE. Montevideo.**—Supply of lead-covered cable. Apply Department of Overseas Trade (Room 49), 35 Old Queen Street, Westminster, London, S.W.1. (Ref. 6666/F.L./E.P.(E.).)

October 11.—**STORAGE BATTERY. Melbourne.**—Supply and delivery at the Electric Light Station, Spencer Street, Melbourne, of an electric storage battery with accessories and spares. (Contract No. 35090.) Apply Room 49 of the Department of Overseas Trade, 35 Old Queen Street, London, S.W.1.

October 18.—**TELEPHONE EXCHANGE. Ostend.**—Equipment of a manual telephone exchange at Ostend and the provision of 1,200 subscribers' instruments for connection to the exchange. Apply Department of Overseas Trade (Room 49), 35 Old Queen Street, Westminster, London, S.W.1. (Ref. 16733/F.W./E.C.)

October 18.—**TURBO-ALTERNATORS. Barking.**—Supply and erection of steam turbo-alternators for their Barking power station, for the County of London Electric Supply Co., Ltd. Apply Mr. F. C. McQuown, Manager and Secretary, on payment of £5 5s. for the first copy, and £2 2s. for every subsequent copy.

October 23.—**TURBINES AND GENERATORS London, W.C.**—The New South Wales Government invite tenders for the manufacture, supply and erection of two water turbines and generators, required in connection with Barren Jack hydro-electric development. Apply Consulting Engineer, 64 Victoria Street, London, S.W.1, or at the office of the Agent-General.

October 31. — **SWITCHGEAR. Montevideo.**—Supply of switchgear for fifteen transformer sub-stations converting a.c. at 50 cycles from 6,600 to 220 volts. Apply Department of Overseas Trade (Room 49), 35 Old Queen Street, Westminster, London, S.W.1. (Ref. 6666/F.L./E.P.(D.).)

November 4.—**CABLES. Montevideo.**—Supply of three-phase high-tension (6,600 volts) cable and accessories. Apply Department of Overseas Trade (Room 49), 35 Old Queen Street, Westminster, London, S.W.1. (Ref. 6666/F.L./E.P.(C.).)

November 11.—**TURBO-ALTERNATOR. Montevideo, Uruguay.**—Construction, delivery, and erection in the State power-house at Montevideo of a turbo-alternator of 10,000-kw. capacity to run at 3,000 r.p.m., together with the necessary condensing plant and accessories, for the State Electric Light Works. Apply Department of Overseas Trade (Room 49), 35 Old Queen Street, Westminster, S.W.1. (Ref. 3667/F.L./E.P.)

November 21.—**SWITCHBOARD PARTS. Australia.**—Supply of switchboard parts, schedule 6 (Nov. 21) for the Commonwealth of Australia. Apply Supply Officer, Room 101, Australia House, Strand, London, W.C.2.

November 28.—**SWITCHGEAR. Mangahao, N.Z**—Supervision of the erection, and of the testing afte erection, of outdoor switchgear (section 21) and indoo switchgear (section 33) for the Khandallah sub-statio forming part of the Mangahao power scheme, for th Public Works Tender Board. Apply Department o Overseas Trade, Room 49, 35 Old Queen Street, Westminster, S.W.1. (Ref. 9468/Ed./E.P.) Deposit £100

January 9.—**CRANE. New Zealand.**—Supply and delivery of one electric travelling crane in connectio with the Waikato power scheme, section 58. The crane is to be designed for lifting, traversing and travelling loads up to 27 tons. Apply Department of Overseas Trade (Room 50) 35 Old Queen Street, Westminster, London, S.W.1.

January 15.—**PLANT. Melbourne.**—Tenders are invited for the supply and delivery of structural steel-work, &c., for the Morwell power scheme, for the State Electricity Commission of Victoria. Apply Agent-General for Victoria, Melbourne Place, Strand, London, W.C.2.

February 1.—**CRANE. Auckland, N.Z.**—The Auckland Harbour Board are inviting tenders for one 1-ton pedestal crane to be operated by electric power. The crane is to have a fixed base and must have three motions, namely, lifting, slewing, and luffing, each o which shall be mechanically operated. Tenders will be considered only from British manufacturers who specialize in the construction of electric cranes. Apply Department of Overseas Trade (Room 50), 35 Old Queen Street, Westminster, London, S.W.1. (Ref. 9460/E.D./E.P.)

ENGINEERING.

October 6.—**STEEL CASEMENTS. London.**—Supply and delivery of steel casements, sashes, &c., at the New Science Museum, South Kensington. Apply Contracts Branch, M.H. Office of Works, King Charles Street, London, S.W.1.

October 7.—**WATER MAIN. Yedingham.**—Laying of about 1,800 yards of 2 in. steel water main at Yedingham, for the Norton Rural District Council. Apply Mr. J. L. Chapman, Clerk, Town Hall, Malton, or at the Office of the Engineer, Mr. J. Hutton, 1 Harcourt Place, Scarborough.

October 9.—**STEELWORK. Preston.**—Supply and erection of steelwork at Oxheys Bridge, over the L. and N.W. Railway, for the Corporation. Apply Office of the Borough Surveyor, Town Hall, Preston. Deposit £1 1s

October 10.—**BOILER. Liverpool.**—Supply of one Cornish boiler, 19 ft. by 6 ft., to be installed at Lodge Lane baths and washhouse, for the Corporation. Apply Engineer and Chief Superintendent, Baths Department, 75 Dale Street, Liverpool. Deposit 10s.

October 11.—**AQUEDUCT. Aberdeen.**—Transporting, laying, and jointing of two miles of 48 in. mild steel piping and ancillary works between Gateside of Inchmarlo and Banchory Railway Station, for the Aberdeen Town Council. Apply Water Engineer's Office, 41½ Union Street, Aberdeen. Deposit £5.

October 12.—**VACUUM DUST EXTRACTORS. Johannesburg.**—Supply and delivery of one or more vacuum dust extractors (contract No. 956) of a portable type, having a capacity of approximately 2,000 to 2,500 cubic feet per hour, fitted with suction hose, and suitable for the purpose of sweeping and cleaning down the interiors and exteriors of tramcars and the interiors of motor cases. It is also desired to purchase a similar outfit for cleaning large electrical machinery, particularly Bruce Peebles-La Cour motor converters, the sizes in use being 1,250–2,000-kw. capacity, for which purpose a 220-volt universal motor would be more suitable. Apply Department of Overseas Trade (Room 50), 35 Old Queen Street, London, S.W.1. (9528/E.D./E.P.)

October 12.—**PUMP. Runcorn.**—Supply and fixing of a 10,000 gallons per hour motor-driven pump, and foundations for same, &c., at their waterworks pumping station, Ship Street, Frodsham, for the Rural District Council. Apply Offices of the Engineers, Messrs. E. Timmins and Sons, Ltd., Bridgewater Foundry, Runcorn. Deposit £1 1s.

October 14.—**FURNACE. Johannesburg.**—Supply and erection of a pig singeing furnace at the abattoirs, for Municipal Council of Johannesburg. Apply Room 91, Municipal Offices, Johannesburg. Deposit £1 1s.

October 16.—**LATHE. Dublin.**—Supply of one heavy-duty railway wheel lathe, for the Midland Great Western Railway of Ireland Co. Apply Mr. P. A. Hay, Secretary, Broadstone Terminus, Dublin.

(Continued on page xxvi.)

TRUSCON HOLLOW FLOOR

Long Span Slabs with Flat Ceilings

THIS floor, being hollow, is soundproof, as well as fireproof, and is invaluable for Offices, Hospitals, Schools, Hotels, Flats and similar buildings.

It is the lightest floor procurable, and owing to its simplicity of construction is very economical.

This floor has been used in some of the largest buildings in England.

The ' Glow Worm " Boiler.

Size No. 2 of the "Glow-worm" boiler is now ready to be placed on the market. These boilers—now made in two sizes—have been specially designed to meet the ever-growing demand for a small and inexpensive boiler capable of providing a constant supply of hot water. The construction of the boiler is claimed to ensure maximum efficiency with the minimum consumption of fuel, in fact, the boiler will burn coke, coal, anthracite, or household refuse. It may be fixed in the kitchen or scullery, and occupies very little space. The waterways of the boiler are specially constructed to form a baffle, resulting in the maximum of heat being transmitted to the water, while the hot gases are directed by the baffle to traverse the underside of the hob, making it an effective hot plate. The fire is always visible; if desired, an open fire is obtained by dropping the door. The door will then provide a useful trivet upon which flat irons can be heated at the open fire. The large hot plate is most effective for boiling kettles and for simple cooking operations. The sole manufacturers are Messrs. O. Bruster and De Launoit, of 4 Lloyd's Avenue, London, E.C.3.

An Interesting Window Display.

The window display of the products of Messrs. Robt. Ingham & Co., Ltd., of West Ham, exhibited at the Fleet Street offices of "The Evening News" during the last week in September, aroused considerable interest. Special prominence was given in the display to "Tessaline" floor varnish, which we understand is becoming very popular for use over linoleum and wood floors. Other materials of the firm's manufacture exhibited included "Pearline" enamel and "Carmalac," a high-grade enamel for use in renovating motor car bodies. The display is illustrated by the accompanying illustration.

The Gas Industry in Conference.

The British Commercial Gas Association, a research and advisory body representing the whole gas industry, will hold its eleventh annual conference in the Lecture Theatre of the Museum and Art Gallery, Bristol, on October 16, 17, and 18, 1922, under the presidency of Alderman Sir George Davies, J.P., Deputy Chairman of the Bristol Gas Company. Members of the conference will be welcomed by the Rt. Hon. The Lord Mayor of Bristol at a reception on October 16, when Sir Henry Gauvain, M.D., will deliver a lecture on "Light and Life." The subjects before the conference, at the public sessions which will be open to visitors, will be "The Gas Industry as a Public Service" and "Gas as a Service to Industry."

Housing Progress in Scotland

The following figures show the progress that has been made in State-aided housing schemes in Scotland up to August 31: permanent houses completed, 10,818; temporary houses completed, 665; reconstructed houses completed, 89; houses completed under the private subsidy scheme, 2,107; making a total of 13,679. At present 8,301 houses are under construction in connection with housing schemes carried out by local authorities and public utility societies. The total amount paid by the Scottish Board of Health in respect of the 2,107 houses completed under the private subsidy schemes is £509,927.

A WINDOW DISPLAY OF FLOOR VARNISH AND ENAMELS.

Marble and Bronze Sculpture Exhibition

An exhibition of portraits in marble and bronze by an Italian sculptor, Mr. F. La Monaca, will open this month at the Fine Art Gallery of Bromhead, Cutts & Co., Ltd., 18 Cork Street, W. About thirty portraits will be shown, including those of the Archbishop of Canterbury, the Bishop of Birmingham, Dean Inge, Sir Martin Conway, Sir Rider Haggard, Señor Capablanca, G. Bernard Shaw, T. P. O'Connor, Sir L. Worthington Evans, Miss Sheila Kaye-Smith, Miss Sybil Thorndike, Hon. Mrs. Dudley Ward, and others. The exhibition represents about seven months' work, and Mr. La Monaca's introduction to the British public is dealt with in the catalogue by Mr. T. P. O'Connor, who describes amusingly his own experiences as a sitter.

Town Planning: Interim Development

The Minister of Health has issued a General Order under Section 45 of the Housing, Town Planning, &c., Act, 1919, to enable development to proceed in areas for which resolutions have been passed or authority given to prepare town-planning schemes. The section provides that if works are carried out in accordance with the conditions prescribed in an order made by the Minister, a claim for compensation under the scheme in respect of the works shall not be prejudiced. It is highly important that persons wishing to develop land shall not be delayed on account of the preparation of a town-planning scheme, and the General Order has been made with the object of preventing any such delay. At present local authorities can allow development, but the consent of the Minister has to be obtained in each individual case. This is a cumbersome procedure, and under the General Order local authorities will be able to allow development themselves without reference to the Minister, except in disputed cases.

Architects' Fees for Abandoned Housing Work

The Council of the R.I.B.A. have appointed Messrs. H. T. Buckland, Francis Jones, and Herbert A. Welch to form a tribunal, whose duty it will be to examine all applications received by the R.I.B.A. from housing architects under the provisions of Clause E (4) of G.H.M. 61, and to act generally on behalf of the R.I.B.A. upon this matter. These three gentlemen represented the R.I.B.A. during the negotiations which resulted in the issue of G.H.M. 61, and it is regarded as fortunate that they are able again to serve the R.I.B.A. and the profession. It has been decided to charge a nominal fee of two guineas to all architects who desire the support of the R.I.B.A. The funds thus obtained will be devoted entirely to the expenses in connection with the tribunal. All housing architects from whom applications have been received to date have been notified of this. Those who wish for support but have not yet applied should do so without delay as a speedy settlement of all accounts is now anticipated.

Institution of Sanitary Engineers

Mr. John H. Blizard, the president, speaking at the opening sessional meeting in London of the Institution of Sanitary Engineers, said that the Government did not help the builders very much with regard to housing. Private enterprise needed to be helped not by subsidies in the sense in which these had been given, but by financial assistance on a sound business basis. Was the subsidizing of air services, he asked, of more importance than a real effort, founded on financial assistance of the kind that the builder needed, to get rid of our slums? Housing, sanitary, and general hygienic works could not be carried out unless the position of private enterprise under existing conditions was properly faced. Mr. Blizard expressed great disappointment at the fact that, though the Bank rate was now 3 per cent., 5 per cent. was demanded for accommodation money, even if ample security were offered. He had hoped that when the Bank rate was reduced to 3 per cent. the building trade would boom, because in pre-war days a builder or engineer could always obtain money at 1 per cent. above the Bank rate, and he suggested that the banks, like some manufacturers, were profiteering.

Speaking on the financial state of local governing authorities, Mr. F. Owen Moore, chairman of the council, said it was not surprising that many engineering works were held up. Promoters of necessary works which were now shelved hoped against hope for a fall in prices and in the rate of interest, for not until costs and the rate of interest had become stabilized could an increase in engineering works be expected. The cost of labour had recently been very considerably reduced, partly by the lowering of wages, but principally, he was glad to say, by increasing output. "The manual worker," Mr. Moore observed, "is beginning to realize that the 'ca' canny' method cannot bring prosperity to anyone, and I think that the labourer—the man who works with pick and shovel—began to appreciate this fact before the artisan."

The meeting was principally of a social kind. There was a reception, a concert, and brief speeches. Among those present were Messrs. H. E. C. Shenton, president-elect, J. Martin, past president, W. Golding, hon. treasurer, W. Whitaker, and P. N. Hasluck, secretary.

The Institution has steadily increased its membership lately, and no fewer than 100 have joined during the past year, bringing the total roll up to 700.

The Barcelona Exhibition

The Commercial Secretary to H.M. Embassy at Madrid (Captain U. de B. Charles) reports that tenders are invited by the Barcelona Exhibition Authorities for the construction of the Grand Palace of Nations which is to be built for the exhibition. The contract includes earth works, ordinary masonry, steel work, reinforced concrete, artificial stone work, cut stone and marble work, joinery, metal work, etc., water and drainage, brass work, and plaster and paint work. A preliminary deposit of 100,000 pesetas is required from every tenderer.

Tenders drawn up in the French or Spanish language must be delivered by hand at the Oficinas de la Exposicion, calle de Lerida, Barcelona, by November 30. Tenders sent by post will be excluded. Local representation is necessary. In the event of a firm not being represented locally the Department of Overseas Trade will endeavour, through their representatives in Spain, to place them in communication with firms who may be willing to act on their behalf in connection with the present tender.

A copy of the specification (in Spanish) can be seen by United Kingdom firms at the Department of Overseas Trade, Room 50, 35 Old Queen Street, Westminster, S.W.1, and a copy will be sent on loan, in order of application, to United Kingdom firms outside London who are unable to arrange for its inspection at these offices.

No copies of the plans mentioned in the specification have been received, but these, together with the specification, can be obtained from the offices of the exhibition, price 250 pesetas. Firms who desire a translation of the documents and are prepared to pay their pro rata share of the cost should at once notify the Department in order that the necessary arrangements can be made. The total cost of preparing the translation should not exceed £18.

In all that relates to the employment of materials the contractor is subject to the provisions of the law of February 14, 1907. A copy of this law can be consulted at the Department together with a list of articles or products for which foreign tenders are admitted by Departments of State during the year 1922.

Dr. Waldo's Quarter Century of Service

Dr. Waldo, J.P., who has just completed twenty-one years' service as coroner for the City of London and Southwark, has done much good work in connection with removal of some of the squalor of London. He has been responsible for the clearance of several big slums in Southwark; he initiated the movement for the clearance of the Tabard Street area; and called attention to the dangers, both to the public and the baker, of the cellar bakehouse. As a direct result of the inquest held by Dr. Waldo into the fatal celluloid fire in Queen Victoria Street the London Building Acts (Amendment) Act was enacted in 1905, and a new fire station was erected in that street.

TERRA COTTA

for Commercial Buildings

◆

THE modern commercial building should express the ideals of the business which occupies it. For Store Fronts, Offices, Business Buildings of any kind, there is no material to equal Terra Cotta for giving an effect of dignity, brightness, up-to-dateness, and permanent beauty.

Terra Cotta is clean, beautiful, durable, and inexpensive. It is fire-proof, weatherproof, and time-proof. Terra Cotta expresses the spirit of enterprise. It makes a building stand out in fine relief amongst its drab surroundings.

For new buildings or alterations to old store or office fronts, therefore, the up-to-date architect will

Specify

TERRA COTTA

BEAUTIFUL and DURABLE

◆

You are invited to write for a copy of "Terra Cotta," which contains many beautiful illustrations of buildings faced with Terra Cotta. Sent free and post paid.

Electrical Notes

German Electrical Exports.

"Before the war the output of electrotechnical products of the whole world amounted to a value of about four milliard gold marks. According to the then development of the electrotechnical industry, and the world's demands for its products, it might be reckoned that, saving any great disturbance of production, this output could be doubled in seven years. Whether that has occurred or not the statistics to hand do not allow of our ascertaining. A considerable increase in the world's electrical output since the period before the war has, however, actually taken place, albeit the economic power may have received a serious setback. The greatest increase in output possibilities has undoubtedly occurred in the United States. The extension of their electrical industries in the other combatant countries was hindered by the war.

"A considerable increase in later years has taken place in France, where there is talk of a doubling of the production. England, too, may institute a notable extension of its electrotechnical industry. Germany, which before the war produced about one-third of the aggregate production of the world in the electrotechnical department, was forced by the hostile alliance to take a back seat and yield up its preponderating lead as regarded quantity of products—not to England as was believed in some quarters—but to the United States. How far German production in some branches, which depends less on the economic conditions (as weak current articles, meters, glow lamps, etc.), has reached the peace level, or even a little beyond, cannot at the moment be stated. An exact estimate of the development and present position of the world's output of electrotechnical products is difficult to ascertain owing to the currency situation in each country. . . .

"In 1913 Germany occupied the first position as an exporting country, and England, although a good way back, the second, America, France, and Switzerland following; now the order is: America, England, Germany, France, and Switzerland. While, therefore, all the other countries have been able to see their exports rise, and even France (from 3·6 to 4·6), Germany's volume of 30,000,000 gold marks in 1913 has shrunk in 1921 to 12,000,000 gold marks monthly mean value, or, in other words, the share of Germany in the aggregate exports of the principal countries has fallen from 32 per cent. to 21 per cent. But it is not to be wondered at that Germany's electrotechnical exports should have gone back, both actually and relatively, to this extent. Middle and Eastern Europe are economically bankrupt and unable to buy. The hostile alliance withholds with all its might from importing German products, while a circle of neutral States, under the pressure excited by cheap German products, have set up a wall of import taxes and restrictions against German goods. The English colonies forbid, for the most part, the import of German electrotechnical products. The United States have always levied high protective duties, i order to destroy all industrial competitio in their home market. The rest of th world is too small to be considered, an has, moreover, suffered from the consequences of the war, so that it has no grea meaning for the German electrotechnica industry." — "Elektrotechnische Zeitschrift."

Extension to Municipal Electrical Undertakings.

Among the local authorities who ar considering the extension of their electrica undertakings are the following: Barne Urban District Council, installation o turbo-alternator, with the necessary converting plant; Monmouth Corporation repairs at electric lighting works, £6,000 West Ham Corporation, laying mains, conversion of lamps to electricity, £35,000 and laying further high-tension feeders £5,000; Wolverhampton, main laying £8,700. The Amble, Bangor, and Sidmouth Urban District Councils ar applying for power to install electricit schemes in their districts.

South African Electricity Act.

H.M. Trade Commissioner at Cap Town has forwarded to the Departmen for Overseas Trade the text of an Act t provide for the supply and control o electricity and for other purposes incidental thereto. United Kingdom firm interested may consult the text on application to the Department of Oversea Trade at 35 Old Queen Street, London S.W.1.

CONTRACTS OPEN

Unless expressly stated to the contrary, all deposits required for bills of quantities, etc., are returned on receipt of bona-fide tenders. The words "Fair Wages Clause" inserted in certain paragraphs signify that persons tendering must conform to a fair wages clause in the contract, which requires them to pay the rates of wages current in the district.

BUILDING

October 12.—**REPAIRS. Rainham.**—Repairs to the farmhouse and sea wall at Motley Hill, Rainham, Kent, for the Rochester and Chatham Joint Sewerage Board. Apply Board's Office, Town Hall, Chatham.

October 12.—**ALTERATIONS. Abergavenny.**—Alterations and extensions to the Vine Tree Inn, and the pulling down of the adjoining premises for that purpose, in St. John's Street. Apply Mr. B. J. Francis, Architect, Abergavenny. Deposit £1 1s.

October 12.—**ROOF AND SKYLIGHTS. Grimsby.**—Separate tenders for the following work at the Fisheries Institute, Orwell Street: (a) Removal of boilers; (b) boiler setting; (c) new roof and skylights over the swimming baths; and (d) reconstruction of lavatory accommodation. Apply Office of the Borough Engineer, Mr. H. Gilbert Whyatt, M.I.C.E., 170 Victoria Street.

October 12.—**DIVING STAGE. London.**—Construction of a reinforced concrete diving stage to be erected at Highgate Bathing Pond, Parliament Hill Fields, for the London County Council. Apply Chief Officer, Parks Department (Room 393c), County Hall, Westminster Bridge Road, S.E.1.

October 13.—**REPAIRS. Hammersmith.**—Repairs to the properties included under its housing schemes for six months, for the Hammersmith Borough Council. Apply Borough Engineer and Surveyor, Mr. R. H. Clucas, M.I.C.E., Town Hall, Hammersmith, W.6.

October 13.—**ADAPTING. Attleborough.**—Adapting and repairing the farm buildings at Haverscroft House Farm, Attleborough, Norfolk, for the Small Holdings Committee of the County of Norfolk. Apply County Land Agent, Shirehouse, Norwich. Deposit £1 1s.

October 14.—**PUBLIC HALL. Glasgow.**—Following works in connection with the proposed erection of a public hall in Wellshot Road, Tollcross, viz.: (1) Excavator, brick, mason, &c., works; (2) steel and smith works; (3) carpenter, joiner and ironmongery works; (4) glazier work; (5) slater work; (6) plumber work; (7) lath, plaster, &c., works; (8) Terrazo, pavior, and tile works; and (9) painter work, for the Corporation. Apply Office of Public Works, 64 Cochrane Street. Deposit £2 2s.

October 14.—**HOUSES. Burntisland.**—Excavator, concretor and brick works; carpenter, joiner and ironmonger works; glazier work; slater and roughcast works; plumber and gasfitter works; and plaster work of five blocks of houses (10 houses in all) proposed to be erected on Haugh site, Burntisland. Also for proposed levelling of ground and formation of stone terrace stairs in connection with houses erected at Rossend site. Apply Mr. G. C. Campbell, Architect, Methil Brae, Methil; or at the office of Messrs. Peter Lawrence and Co., F.F.S., Surveyors, 50a Frederick Street, Edinburgh. Specifications from Burgh Surveyor, Burntisland, on payment of £1 1s.

October 14.—**NURSING BLOCK. Colwyn Bay.**—Erection of new nursing block (47 beds), and additions and alterations to the existing hospital in Hesketh Road, Colwyn Bay, for the Building Committee of the Colwyn Bay and West Denbighshire Hospital. Apply Mr. S. Colwyn Foulkes, A.R.I.B.A., Architect, Central Chambers, Colwyn Bay. Deposit £3 3s.

October 14.—**EXCHANGE. Falkirk.**—Erection of an employment exchange at Falkirk. Apply Employment Exchange, Falkirk, and at H.M. Office of Works, 4–5 Drumsheugh Gardens, Edinburgh. Deposit £1 1s.

October 16.—**FLATS. Birkenhead.**—Erection of one block of eight flats in connection with their housing scheme, for the Corporation. The acceptance of any tender by the Town Council is subject to the approval of the Ministry of Health, to the execution of a formal contract and to the provision of security approved by the Corporation for the performance of the work. Apply Mr. T. T. Rees, F.R.I.B.A., F.S.I. (Housing Architect to the Corporation), 64 Rodney Street, Liverpool. Deposit £1 1s.

October 16.—**REFRESHMENT ROOMS. Bridlington.**—Erection of refreshment rooms at Bridlington Station, for the North-Eastern Railway Co. Apply Station Master, Bridlington, or Mr. S. Wilkinson, the Company's Architect at York.

October 16.—**ALTERATIONS. Birkenhead.**—Alterations and additions to the maternity block, at the Birkenhead Union. Apply Mr. A. E. Shennan, Guardian Assurance Buildings, 35 Dale Street, Liverpool. Rate of wages, etc., clauses to be observed. The contractor will also be required to have special regard to the employment of local (Birkenhead and Wallasey) unemployed persons and to a preference being given to ex-Service men.

October 16.—**PUMPING STATION. Desford.**—Erection of engine and pump house with caretaker's cottage in the parish of Desford, close to Desford Station, for the Water Committee of the Leicester Corporation. Apply Mr. G. T. Edwards, M.I.C.E., Water Engineer, Bowling Green Street, Leicester.

October 16.—**ALTERATIONS. Dumfries.**—Mason, joiner, slater, plumber, and plaster works in connection with alterations proposed at the Sheriff Courthouse, Dumfries, for the Dumfries County Council. Apply Mr. J. Robson, County Clerk, County Buildings, Dumfries. The Council are also prepared to receive tenders for certain mason works at the County Buildings.

October 16.—**ROOF. Birkenhead.**—Provision of a roof to an open-air passage at the Birkenhead Infirmary, for the Guardians. Apply Mr. A. E. Shennan, Guardian Assurance Buildings, 35 Dale Street, Liverpool. Rate of wages, &c., clause to be observed.

October 16.—**CONVENIENCE. Hendon.**—Construction of an underground public convenience, Brent Street, Hendon, for the Urban District Council. Apply Mr. A. O. Knight, A.M.I.C.E., Engineer to the Council, Town Hall, Hendon, N.W.4. Deposit £2 2s.

October 17.—**READING-ROOM. Nottingham.**—Erection of the northern branch reading-room and lending library, on Highbury Road, Bulwell, for the Public Libraries and Museum Committee. Apply Messrs. Bright and Thoms, Architects, 9 St. Peter's Church Walk. Deposit £2.

October 17.—**HOUSES. Walsall.**—Erection of 20 houses, in two blocks of 10, in Lord Street, Walsall, and 19 houses, in three blocks of six and seven, in Green Lane, Walsall, for the Town Council. Apply Mr. J. Taylor, M.I.C.E., Council House, Walsall. Deposit £1.

October 18.—**EXTENSIONS. Sunderland.**—Extensions to the Redby Council School for the purpose of a pupil teacher centre, for the Town Council. Apply Education Offices, 15 John Street. Deposit £1 1s.

October 18.—**DEMOLITION. Halifax.**—Demolition of premises on the site of the Post Office extension, Halifax, Yorks. Apply Contracts Branch, H.M. Office of Works, King Charles Street, London, S.W.1.

October 18.—**HOUSES. Brighton.**—Erection of 112 houses on the portion of the Queen's Park Road housing site, fronting to Down Terrace and Freshfield Road, for the Corporation. Apply at any of the following architects: Messrs. Clayton and Black, T. Garrett and Son, E. Wallis Long, and W. H. Overton, at Brighton. Deposit £1.

October 19.—**REPAIRS. Walthamstow.**—Execution of repairs at the Monoux and Collard's Almshouses, 60–68 (even), Wood Street, and 2–14 (even), Church Path, Walthamstow, for the trustees of the Walthamstow Parochial Charities. Apply Mr. G. Houghton, Clerk to the Trustees, 195 Hoe Street, E.17.

October 20.—**BUILDINGS. Lizard.**—New buildings at H.M. W/T. Station, Mile End, Lizard, Cornwall, for the Admiralty. Apply Superintending Civil Engineer, H.M. Dockyard, Devonport, or Wireless Telegraphy Station, Mile End, Lizard.

October 20.—**BEDROOMS. Brierley.**—Additional bedrooms, bathrooms, water-closets, &c., at the administrative block at the Isolation Hospital, Brierley, for the Hemsworth Joint Hospital Committee. Apply Mr. W. T. Lynam, F.S.I., Surveyor to the Joint Committee, Union Offices, Hemsworth. Deposit £1 1s.

October 21.—**HOUSES. Ebbw Vale.**—Erection of 28 houses on the Gantre site, Ebbw Vale, for the Ebbw Vale Urban District Council. Apply Mr. P. I. Davies, Housing Architect, Council Offices, Ebbw Vale. Deposit £5, which must be in postal orders.

November 30.—**PALACE. Barcelona.**—In construction of the Grand Palace of Nations. Apply Don José y Cadafalch, offices of the exhibition (Lerida Street).

ELECTRICAL.

October 17.—**AUTOMATIC SWITCHBOARD. Australia.**—Supply of automatic switchboard, Schedules 39 and 40 (October 17); brass and ebonite sheets and rods (October 26); insulated cable, Schedule 958 (November 16). Apply Supply Officer, Room 101, Australia House, Strand, London, W.C.2.

October 18.—**TELEPHONE EXCHANGE. Ostend.**—Equipment of a manual telephone exchange at Ostend and the provision of 1,200 subscribers' instruments for connection to the exchange. Apply Department of Overseas Trade (Room 49), 35 Old Queen Street, Westminster, London, S.W.1. (Ref. 16733/F.W./E.C.)

October 18.—**TURBO-ALTERNATORS. Barking.**—Supply and erection of steam turbo-alternators for their Barking power station, for the County of London Electric Supply Co., Ltd. Apply Mr. F. C. McQuown, Manager and Secretary, on payment of £5 5s. for the first copy, and £2 2s. for every subsequent copy.

October 23.—**TURBINES AND GENERATORS London, W.C.**—**The New South Wales Government invite tenders for the manufacture, supply and erection of two water turbines and generators, required in connection with Barren Jack hydro-electric development. Apply Consulting Engineer, 64 Victoria Street, London, S.W.1, or at the office of the Agent-General.**

October 27.—**TRANSFORMERS. Nottingham.**—Manufacture, delivery, and erection of the following engineering works in connection with the North Wilford power station, for the Nottingham Corporation, viz: Section C—two 650-k.v.a. three-phase static transformers; two 900-k.v.a. six-phase static transformers; one 150-k.v.a. single-phase static transformer. Section G—three steam turbine-driven boiler-feed pumps, each for 25,000 gallons per hour, with three exhaust steam heating nozzles. Section L—four gravity bucket coal conveyors, with crushers, &c. Section M—accumulators, &c. Apply Messrs. Preece, Cardew and Rider, 8 Queen Anne's Gate, Westminster, S.W.1. Deposit £5 for each section.

October 30.—**ELECTRIC PLANT. Alexandria.**—Supply of a direct-coupled steam-engine and alternator, and switchboard for the Electric Power House, Gabbary, Alexandria. Apply Room 49 of the Department of Overseas Trade, 35 Old Queen Street, London, S.W.1.

October 31. — **SWITCHGEAR. Montevideo.**—Supply of switchgear for fifteen transformer sub-stations converting a.c. at 50 cycles from 6,600 to 220 volts. Apply Department of Overseas Trade (Room 49), 35 Old Queen Street, Westminster, London, S.W.1. (Ref. 6666/F.L./E.P.(D.).)

November 4.—**CABLES. Montevideo.**—Supply of three-phase high-tension (6,600 volts) cable and accessories. Apply Department of Overseas Trade (Room 49), 35 Old Queen Street, Westminster, London S.W.1. (Ref. 6666/F.L./E.P.(C.).)

November 11.—**TURBO-ALTERNATOR. Montevideo, Uruguay.**—Construction, delivery, and erection in the State power-house at Montevideo of a turbo-alternator of 10,000-kw. capacity to run at 3,000 r.p.m., together with the necessary condensing plant and accessories, for the State Electric Light Works. Apply Department of Overseas Trade (Room 49), 35 Old Queen Street, Westminster, S.W.1. (Ref. 3667/F.L./E.P.)

November 21.—**SWITCHBOARD PARTS. Australia.**—Supply of switchboard parts, schedule 67 (Nov. 21) for the Commonwealth of Australia. Apply Supply Officer, Room 101, Australia House, Strand, London, W.C.2.

November 28.—**SWITCHGEAR. Mangahao, N.Z.**—Supervision of the erection, and of the testing after erection, of outdoor switchgear (section 21) and indoor switchgear (section 33) for the Khandallah sub-station forming part of the Mangahao power scheme, for the Public Works Tender Board. Apply Department of Overseas Trade, Room 49, 35 Old Queen Street, Westminster, S.W.1. (Ref. 9468/Ed./E.P.) Deposit £100.

November 28.—**TRANSFORMERS. Wellington.**—The Public Works Tender Board, Wellington, are inviting tenders for the manufacture, supply, and delivery, ex ship's slings Auckland, of two exciter transformers in connection with the Waikato power scheme, section 57. The transformers are required to transform three-phase 50-cycle power at 5,250 volts between phases to power at 400 volts between phases, and will be used for supplying power to 220 k.w. exciter units in the power house at Horahora. They are to be of the oil-filled and self-cooled type, and to be rated 275 k.v.a. 93 per cent. power factor. Apply Department of Overseas Trade (Room 49), 35 Old Queen Street, Westminster, London, S.W.1.

December 20.—**ELECTRIC CRANES AND LIFTS FOR EGYPT. Alexandria.**—The Administration of Ports and Lighthouses, Alexandria, is inviting tenders for fixed and moveable lifting apparatus for service at the port of Alexandria. Apply Department of Overseas Trade (Room 50), 35 Old Queen Street, London, S.W.1.

December 15.—**PLANT. Wellington.**—The Southland Electric Power Board are calling for tenders for supply and delivery of plant and material. Apply Department of Overseas Trade (Room 49), 35 Old Queen Street, Westminster, S.W.1.

ENGINEERING.

October 12.—**VACUUM DUST EXTRACTORS. Johannesburg.**—Supply and delivery of one or more vacuum dust extractors (contract No. 956) of a portable type, having a capacity of approximately 2,000 to 2,500 cubic feet per hour, fitted with suction hose, and suitable for the purpose of sweeping and cleaning down the interiors and exteriors of tramcars and the interiors of motor cases. It is also desired to purchase a similar outfit for cleaning large electrical machinery, particularly Bruce Peebles-La Cour motor converters, the sizes in use being 1,250–2,000-kw. capacity, for which purpose a 220-volt universal motor would be more suitable. Apply Department of Overseas Trade (Room 50), 35 Old Queen Street, London, S.W.1. (9528/E.D./E.P.)

October 12.—**PUMP. Runcorn.**—Supply and fixing of a 10,000 gallons per hour motor-driven pump, and foundations for same, &c., at their waterworks pumping station, Ship Street, Frodsham, for the Rural District Council. Apply Offices of the Engineers, Messrs. E. Timmins and Sons, Ltd., Bridgewater Foundry, Runcorn. Deposit £1 1s.

October 12.—**CASTINGS. Southampton.**—Supply of about 360 tons of 12 in. diameter c.i. s. and s. pipes and about 4 tons of special castings, for the Corporation. Apply Waterworks Engineer's Office. Deposit £1 1s.

October 12.—**WATER MAIN. Southampton.**—Laying and jointing of about 3,350 lineal yards of c.i. water main, 12 in. diameter, from Swaythling Station to New Inn, West End, together with contingent works, for the Town Council. Apply Waterworks Engineer's Office. Deposit £1 1s.

October 14.—**MOTOR FIRE-ENGINE. Trowbridge.**—Supply of a new motor fire-engine capable of pumping 400 gallons per minute, with alternative prices for (a) a detachable escape and (b) extension ladders, for the Trowbridge Urban District Council. Apply Mr. G. T. Fletcher, Clerk, Town Hall, Trowbridge.

October 14.—**VAN BODY. Manchester.**—Supply of one motor bedding van body, for the Public Health Committee. Apply Public Health Office (Medical Section), Civic Buildings, 1 Mount Street, Manchester.

A Surface like Porcelain!

BLUNDELL'S
PETRIFYING LIQUID
ENAMEL

PETRIFYING LIQUID ENAMEL dries with an extremely hard, glossy surface, resembling glazed tiles, and forms a wonderfully durable covering for Walls, Wood and Ironwork. The fact that it will withstand heat, steam, constant washing, and the most severe wear, makes it specially suitable for **Hospitals, Public Institutions, Schools, Factories, Breweries,** &c. It is also largely used in **Dwelling Houses** for **Bathrooms, Kitchens** and **Corridors.**

Made in White and a range of attractive colours.

Blundell's PETRIFYING LIQUID ENAMEL can be used on PLASTER, WOOD, BRICK, STONE & IRON.

Write for Colour Card, Descriptive Folders, and sample Bricklet showing effect produced. Sent free on application.

BLUNDELL, SPENCE & Cº LTD.
Established 1811.
PAINT, COLOUR & VARNISH MAKERS.
HULL & 9, UPPER THAMES ST., LONDON, E.C.4

October 14.—**FURNACE. Johannesburg.**—Supply and erection of a pig singeing furnace at the abattoirs, for Municipal Council of Johannesburg. Apply Room 91, Municipal Offices, Johannesburg. Deposit £1 1s.

October 14.—**SINKING SHAFTS, &c. Margate.**—Sinking of shafts and extending adits for a length of about 1,000 yards in connection with the Margate Corporation waterworks at Wingham, near Canterbury. Apply Mr. E. A. Borg, 13 Grosvenor Place, Margate.

October 16.—**LATHE. Dublin.**—Supply of one heavy-duty railway wheel lathe, for the Midland Great Western Railway of Ireland Co. Apply Mr. P. A. Hay, Secretary, Broadstone Terminus, Dublin.

October 16.—**WATER SUPPLY. Newington.**—A water supply scheme for the parish of Newington, Oxon, for the Crowmarsh Rural District Council. Apply Office of Mr. P. C. A. Slade, Clerk, 7 St. Martin's Street, Wallingford.

October 16. — **RECONSTRUCTING BRIDGE. North Warnborough.**—Reconstruction of Swan Bridge, carrying the Reading, Odiham, and Alton main road over the Basingstoke and Woking Canal at North Warnborough, for the Southampton County Council. Apply Mr. W. J. Taylor, County Surveyor, The Castle, Winchester. Deposit £1 1s.

October 16.—**WHEELS AND AXLES. Bengal.**—For the Bengal-Nagpur Railway Co., Ltd., viz. : Wheels and axles. Apply Company's Offices, 132 Gresham House, Old Broad Street, London, E.C.2. A fee of £1 1s. will be charged for specification, which will not be returned.

October 17.—**STEEL TYRES. Madras.**—Supply of 1,200 steel tyres for carriage and wagon wheels, for the Madras and Southern Mahratta Railway Co., Ltd. Apply Company's Offices, 25 Buckingham Palace Road, Westminster, S.W.1. The charge for each specification is £1 1s., which will not be returned.

October 18.—**PLANT. London, W.C.**—Supply and erection in South Africa of plant in connection with the electrification of the Glencoe-Pietermaritzburg section of the South African Railways, as follows :—Tender D. 1417, Coal-handling plant for power station. Tender D. 1418, ash-handling plant for power station. Tender D. 1430, circulating water screening plant for power station. Apply office of the High Commissioner for the Union of South Africa, Trafalgar Square, London, W.C.2., and Messrs. Merz and McLellan, 32 Victoria Street, London, S.W.1. Deposit £5.

October 21.—**DESTRUCTOR UNIT. Birmingham.**—Supply and erection of a new destructor unit at the Montague Street destructor works, for the Salvage and Stables Committee. Tenders are to include pneumatic suction plants, the dismantling of the existing building and old cells, the erection of new building and approach roadway, also erection and supply of machinery for screening and elevating the refuse. Apply Mr. J. Jackson, Superintendent, Salvage Department, Council House, Birmingham. Deposit £1 1s.

October 21.—**BOREHOLE. Stevenage.**—Sinking a borehole at the bottom of an existing well and supplying a pump for use in such borehole, for the Stevenage Urban District Council. Apply Mr. W. O. Times, Clerk, Council Offices, Stevenage. Deposit £2 2s.

October 28.—**DREDGING PLANT. Newcastle-upon-Tyne.**—Construction and delivery in the Tyne of one non-propelled centre ladder barge-loading bucket dredger, four single screw steel steam hopper barges, each with a hopper capacity of 800 tons, for the Tyne Improvement Commissioners. Apply Mr. J. MacDonald Manson, General Manager and Secretary, Bewick Street, Newcastle-upon-Tyne. Deposit £5 5s.

October 30.—**BRIDGE. Hull.**—Railway bridge in connection with Chanterlands Avenue extension, for the Hull Corporation. The work consists of abutments, wing walls, piling, &c., and steel girders, stanchions, flooring, &c., total weight of steelwork 150 tons. Apply Mr. F. W. Bricknell, M.I.C.E., City Engineer, Guildhall, Hull. Deposit £1.

SOUTHWARK STREET, LONDON, S.E.

Officialism & Architecture

Mr. J. R. Wigfull in his presidential address to the Sheffield and South Yorkshire Society of Architects dealt with the depression in trade, and its effects on the profession. He said that building costs remained enormous. Nobody could understand why, but the "money for nothing" feeling was being exploded day by day among the public. The building by-laws remained a hindrance, they remained antiquated; it was very desirable they should be reviewed at least every ten years. After all, it was not the by-laws so much as the way they were administered which hurt the profession and the builder. The war had been responsible for a great growth of officials, and much vexatious interference. Within his own knowledge was a case wherein, on a small job, six inspectors were present, and when expostulated with, the reply was that while "Inspector Smith" was there to inspect closet drains, "Inspector Jones" was inspecting the drains from the sinks. It seemed to him that that little fact showed clearly what present-day officialism meant.

Housing and Penny Rate

A clerk to a local authority, in a letter to "The Daily Telegraph," says: The danger of allowing an Act of Parliament to be nullified by regulations purporting to be made thereunder is well exemplified by the regulations made under the Housing and Town Planning Act, 1919. Under the Act the liability of a local authority is limited to the produce of a penny rate, and Ministers have repeatedly emphasized the point. Under the regulations, after houses are completed, an estimate has to be submitted to and approved by the Minister of Health showing what the average annual loss of a scheme will be over the period up to 1927 and thereafter over periods of ten years. The Government subsidy is based upon the estimate so approved, and if the loss is greater in any year than the subsidy so fixed, plus the proceeds of the penny rate, the local authority has to pay it. No one can accurately foretell what the average loss will be, but the actual loss each year can be seen from the accounts of local authorities, which are all properly audited, so why should regulations made under the Act throw upon local authorities a risk which is not consistent with the Act and is contrary to the statements made by Ministers?

Obituary

The late Mr. J. Barlow Fraser.

We regret to record the death, at Leeds, of Mr. James Barlow Fraser, architect, at the age of eighty-seven. A Scotsman, born in Lancashire, the son of a civil engineer, Mr. Fraser, when in practice as an architect, was associated with his late brother, Mr. John Fraser, and the late Mr. John Fowler, civil engineers, in connection with railway developments, especially on the Great Northern Railway. He designed many railway stations, including the Wakefield Westgate passenger station and the Hunslet goods station, and a number of railway bridges. He was also architect for St. Augustine's Church, Wrangthorn, the Presbyterian Church in Cavendish Road, and the spire of Horsforth Church; and for many residences in the district. He also designed and supervised the erection of the Festival Gallery at the Leeds Town Hall. When the building was opened in 1858 there was no gallery in the Victoria Hall. For a great many years Mr. Fraser was a Fellow of the R.I.B.A. He was one of the early members of the Leeds and Yorkshire Architectural Society, of which he was president for one or two years. He retired from the active practice of his profession some years ago.

Scientific Lighting

At the invitation of Messrs. Holophane, Ltd., a number of scientific, technical, and trade journalists last week visited the new showrooms and laboratories of the company, and were given a lecture demonstration on the latest methods of scientific lighting.

The guests were received by Mr. Hepworth Thompson, the managing director of the company, who referred to the increased importance of the lighting problem, due in part to the recommendations of the Home Office Committee with regard to the standardization of light in industry. Legislation embodying these recommendations was, he said, contemplated.

Mr. Stroud then gave a short address dealing with modern lighting problems, and showed a number of lantern slides of various installations in schools, churches and workshops.

The distribution of light from most illuminants was not, he said, suitable for many lighting problems, the ordinary type of electric incandescent lamp, for instance, giving little light immediately below the lamp, where it was chiefly needed. Most of the light was directed horizontally, and the function of a scientific form of globe or reflector must, therefore, be to direct the light as well as screen the filament, or to diffuse the light over the surface of the shade so that it had only a moderate brilliancy, not irritating to the eye. This had been borne in mind in the many varieties of Holophane glassware designed and introduced.

The Holophane system is based on the use of prismatic glass, and in the original designs involved the use of two kinds of optical prisms. The interior flutings accomplish the diffusion and breaking up of the light rays. The horizontal exterior prisms have a second distinct purpose, namely, to direct the diffused light in a suitable manner, mainly in useful downward directions.

The later introduction of reflectors with an inner smooth surface and an outer surface formed of vertical prisms acting by total internal reflection marked a distinct advance. The feature of this method is the accuracy with which any desired distribution of light can be obtained. This distribution is determined largely by the contour of the reflector as well as by the nature of the prisms, and the percentage of light that can be reflected by "total internal reflection" is extremely high. The absorption by globes is only about 12 per cent. on the average, while in reflectors an absorption of only 5 per cent. is found.

Many special units adapted to the lighting of streets, shops, churches, factories, etc., have been developed, and more specialized devices, amongst which the new "Artificial Daylight" units (furnishing a light suitable for colour matching) and the Holophane motor-car headlight may be mentioned, have also been evolved in the Holophane laboratory.

After the address the guests adjourned to the laboratories where apparatus for the measurement of light and illumination was exhibited. "Artificial Daylight" units were also to be seen side by side with the ordinary type of uncorrected lamp, and the correct colour values obtained by the use of the former were very noticeable. Specimens of the multifarious types of Holophane glassware were examined, among them the first specimen produced, an interesting relic which is obviously regarded with intense veneration by the company.

New Inventions

Latest Patent Applications.

185944.—Moe, L. L. — Automobile garages.

Abstract Published.

184361.—Roofing shingles. — Abraham, H., 233 Broadway, New York, U.S.A. — Interlocking roofing-shingles, particularly such as are formed of a foundation of fabric or felt saturated with bituminous compositions, are formed with side indentations flanked by hooks which are adapted to interlock with similar hooks on adjacent shingles laid in staggered relation. The shingles, when laid, provide marginal overlaps with the lower ends or butts held down by adjacent shingles. Slate granules may be impressed on the shingles, a number of which can be cut from a single sheet of material.

The above particulars are prepared specially by Messrs. Rayner & Co., registered patent agents, of 5 Chancery Lane, London, W.C. 2, from whom readers of the Journal may obtain all information free relating to patents, trade marks, and designs. Messrs. Rayner & Co. will obtain printed copies of the published specifications and forward on post free for the official price of 1/- each.

A CORRECTION

We regret that wrong initials appeared at the end of the article on "Dutch Architecture, Old and New," published in our last issue. The author was Miss E. G. Cook.

Trade and Craft.

Glasgow Housing Exhibition.

At the stand of Messrs. Willis Heeley, of 196 St. Vincent Street, Glasgow, at the Glasgow Housing Exhibition, the interior walls and ceilings are lined with Fiberlic root fibre board instead of lath and plaster, and the walls are covered with a tapestry paper. The exterior is treated with washable distemper. Steel windows, easily cleaned, for every type of building, and various styles of opening, are shown with stained and leaded glass panes. Other exhibits are doors in every wood for all types of buildings, and reinforced concrete fencing posts and rails.

The Heating of Garages.

This subject is discussed in the current issue of "A Thousand and One Uses for Gas" (No. 104), and various practical methods are described for meeting differing local conditions. Drawings and photographs are included showing the best methods of equipping the small as well as the large garage. There is also a practical article (illustrated with photographs) on the heating of paint and varnish drying rooms in public garages and motor repair works. This latter information will undoubtedly be welcomed by all public garage owners who undertake general repair and painting work. The magazine can be obtained (6d. post free) from the Secretary, The British Commercial Gas Association, 30 Grosvenor Gardens, S.W.1.

A Guarantee for Paint.

Messrs. R. Gay & Co., Ltd., of Langthorne Works, Stratford Market, London, E.15, paint and enamel manufacturers, are giving a written guarantee to cover their impenetrable paint. The company guarantee their impenetrable paint to stand in reasonably good condition (fair wear and tear excepted, but free from cracks or peeling) for the period of: (*a*) On inside work seven years; (*b*) on outside work three years. In the event of the failure of the paintwork the company will (subject to certain provisions) bear the cost of repainting proportionately to the unexpired period of the guarantee. This is a guarantee for something more than quality of the materials used in manufacture. It covers the durability of the paint when used on either inside or outside work. It is believed that Messrs. R. Gay & Co., Ltd., are the only firm of manufacturers who issue a written guarantee as to durability. It should be noted that the guarantee will only be issued in connection with impenetrable paint which has been applied by the decorator. If a private person purchases and applies the paint himself it will not be issued.

Marseilles Roofing Tiles.

Marseilles roofing tiles are the subject of a booklet which has just been issued for the use of builders by Langley London, the sole agents for the United Kingdom. Marseilles tiles are not in any sense an innovation. They have been made and used for about a century, the present output of the works being 240,000,000 pieces per annum. Last year over 4,000 houses in England alone were covered with them, as well as a number of public buildings, churches, schools, hotels, and cinemas. Marseilles tiles are made of non-ferrous red clay, which bakes at a high temperature and is hard, strong, and durable. A point emphasized by the firm is the low porosity. It is claimed that, practically speaking, Marseilles tiles are non-absorbent, and that it is due to this, and also to the absence of iron, that they are unaffected by frost and by climatic conditions. They are also claimed neither to laminate nor disintegrate with age. It is stated that there are cases in England where these tiles have been in use for fifty years and more without a farthing being spent on repairs, and that there are houses under construction to-day which are being covered with Marseilles tiles stripped from old cottages erected nearly 100 years ago. The address of Messrs. Langley London is 161 Borough High Street, London, S.E.1.

The Broad View.

In the current issue of "The Broad View," an intimate little monthly published by Broad & Co., Ltd., to give news of themselves and their many products, reference is made to an improved heavy road manhole cover. It is called the No. 29 "Agripper" cover, and has been designed and patented by Broads to counteract any tendency to rock. The "Agripper" is made in a number of sizes in Broad's own foundry, and has the following special features: the seating of the cover is a series of serrations or inclined planes and abutments; traffic forces the cover down the inclined planes, against the abutments, thereby preventing the cover rocking; grit or other detritus falling on to the seating passes through the slots provided. It is claimed that there is no rocking nor movement of cover; no wearing of seating; and that it is easily lifted, as the cover is made with a good clearance. The "Agripper" can be supplied fitted with wood blocks if desired, and can be adapted in Broad's own foundry to meet any special requirements. Messrs. Broad & Co., Ltd., are sanitary specialists, manufacturers of Portland cement, bricks, drain pipes, and firegoods, and ironfounders. Their address is 4 South Wharf, Paddington, W.2.

THE

Cure for Damp Walls

IS

"PROTEX"

(BLACK CARBON EMULSION)

THE application of our **"PROTEX"** to the brick, plaster, or other surface produces a pliable film or coating which entirely prevents the passage of any damp or moisture.

"PROTEX" never becomes hard or brittle, neither will it crack nor flake. It is easily applied, being put on cold with an ordinary brush.

"PROTEX" is a tenacious bonding medium, and plaster or cement can be affixed to any wood, metal, or other surface without the aid of any special key.

TRADE MARK.

"PROTEX" gives a perfect damp-proof film, and the plaster can be applied directly to it, without furring or lathing, saving cost of materials and labour, and economizing space.

"PROTEX" can be papered over.

"PROTEX" is supplied in $\frac{1}{2}$, 1, and 2 gallon cans, 5 and 10 gallon drums, and 20 and 40 gallon casks.

Booklet with full particulars from—

CONTRACTS OPEN

Unless expressly stated to the contrary, all deposits required for bills of quantities, etc., are returned on receipt of bona-fide tenders. The words "Fair Wages Clause" inserted in certain paragraphs signify that persons tendering must conform to a fair wages clause in the contract, which requires them to pay the rates of wages current in the district.

BUILDING

October 19.—**REPAIRS. Walthamstow.**—Execution of repairs at the Monoux and Collard's Almshouses, 60–68 (even), Wood Street, and 2–14 (even), Church Path, Walthamstow, for the trustees of the Walthamstow Parochial Charities. Apply Mr. G. Houghton, Clerk to the Trustees, 195 Hoe Street, E.17.

October 19.—**ALTERATIONS. Salford.**—Structural alterations at Trafford Road Girls' School, for the Corporation. Apply Secretary, Education Office, Salford.

October 19.—**HOUSES. Ely, Cardiff.**—Erection of a limited number of houses at Ely, for the Corporation of Cardiff. Apply Office of the City Architect, City Hall, Cardiff. Deposit £2 2s.

October 19.—**URINALS. Leeds.**—Erection of public urinals, for the Corporation. Apply Office of Mr. W. T. Lancashire, City Engineer, Municipal Buildings, Leeds.

October 20.—**ALTERATIONS, &c. Epsom.**—Alterations and additions at the Cuddington Hospital, near Banstead Railway Station, for the Epsom (Rural), Sutton, Carshalton and Leatherhead Joint Hospital Board. Apply Mr. A. C. Williams, Ashley Road, Epsom.

October 20.—**REBUILDING. Halifax.**—Rebuilding a warehouse in Booth Fold, Bull Green. Apply Messrs. Walsh and Maddock, Architects and Surveyors, 10 Harrison Road, Halifax.

October 20.—**REINFORCED CONCRETE WORK. Hull.**—Builders' and reinforced concrete work required for the filtration plant at the East Hull Baths, for the Corporation. Apply Mr. F. W. Bricknell, M.I.C.E., City Engineer, Guildhall, Hull.

October 20.—**COTTAGE. Burlingham, Norfolk.**—Erection of a new cottage at Coxhill Farm, Burlingham estate, Norfolk, for the Small Holdings Committee. Apply County Land Agent, Shirehouse, Norwich. Deposit £1 1s.

October 20.—**BUILDINGS. Lizard.**—New buildings at H.M. W/T. Station, Mile End, Lizard, Cornwall, for the Admiralty. Apply Superintending Civil Engineer, H.M. Dockyard, Devonport, or Wireless Telegraphy Station, Mile End, Lizard.

October 20.—**BEDROOMS. Brierley.**—Additional bedrooms, bathrooms, water-closets, &c., at the administrative block at the Isolation Hospital, Brierley, for the Hemsworth Joint Hospital Committee. Apply Mr. W. T. Lynam, F.S.I., Surveyor to the Joint Committee, Union Offices, Hemsworth. Deposit £1 1s.

October 20.—**REPAIRS, &c. Overton, Flints.**—Repairs and painting at the police station at Overton, for the Flintshire County Council. Apply Mr. R. G. Whitley, A.M.I.C.E., County Architect and Surveyor, County Buildings, Mold.

October 21.—**HOUSES. Ebbw Vale.**—Erection of 28 houses on the Gantre site, Ebbw Vale, for the Ebbw Vale Urban District Council. Apply Mr. P. I. Davies, Housing Architect, Council Offices, Ebbw Vale. Deposit £5, which must be in postal orders.

October 21.—**BUNGALOW. Blaenffos, Pem.**—Erection of a bungalow for Mr. T. Morgan, Greenland Cottage, Blaenffos. Apply above address.

October 21.—**PAVILION, &c. Sowerby Bridge.** (1) Masons' and bricklayers'; (2) carpenters' and joiners'; (3) slaters' and plasterers'; and (4) plumbers' and glaziers' work required in connection with the bowling pavilion, conveniences, &c., Crow Wood, for the U.D.C. Apply Mr. J. Eastwood, A.M.I.C.E., Surveyor, Council Offices, Sowerby Bridge.

October 21.—**WASHHOUSE. Oldham.**—Erection and completion of a public washhouse in Cedar Street, Waterhead, for the Markets and Baths Committee. Apply Borough Surveyor's Office, Town Hall.

October 23.—**ALTERATIONS, &c. Durham.**—(1) Alterations to out-offices and drainage, Aycliffe Diamond Jubilee Council School; (2) general repairs and minor improvements, Easington Lane Council School; (3) drainage of playing fields, Ryhope Secondary School. Apply Mr. F. Willey, F.R.I.B.A., 34 Old Elvet, Durham.

October 23.—**HOUSES. Glasgow.**—Works in connection with the proposed erection of houses at Coplawhill:—(1) Digger, brick and concrete work; (2) carpenter, joiner and ironmongery work; (3) slater and roughcast work; (4) plaster and cement works; (5) plumber work; and (6) glazier work, for the Corporation. Apply Mr. J. Lindsay, Town Clerk, City Chambers, Glasgow.

October 26.—**ALTERATIONS, &c. London, E.**—Work at their relief offices at Raine Street, Old Gravel Lane, E.1, for the Guardians of St. George-in-the-East. Apply Mr. R. M. Lochner, Clerk, Raine Street, Old Gravel Lane, E.1.

October 27.—**ENGINE-HOUSE, &c. Deptford.**—Construction of an engine-house, chimney shaft, boiler setting, drainage, alterations to existing buildings, and other contingent works at Deptford Pumping Station, Brookmill Road, Deptford, in the Metropolitan Borough of Deptford, for the Metropolitan Water Board. Apply Offices of the Board, Chief Engineer's Department (Room 201), New River Head, 173 Rosebery Avenue, Clerkenwell, E.C.1. Deposit £5.

October 27.—**ENGINE-HOUSE, &c. Lea Bridge.**—Construction of engine-house, addition to and alteration to existing buildings, boiler setting, &c., at Lea Bridge Pumping Station, Lea Bridge Road, in the urban district of Leyton, for the Metropolitan Water Board. Apply Offices of the Board, Chief Engineer's Department (Room 201), New River Head, 173 Rosebery Avenue, Clerkenwell, E.C.1. Deposit £5.

October 28.—**SCHOOL. Prescot, Lancs.**—Erection of a new secondary school of semi-permanent construction, for 260 boys, at Prescot, near Liverpool, for the Lancashire Education Committee. Apply Mr. H. Littler, 16 Ribblesdale Place, Preston. Deposit £2.

October 28.—**HOUSES. Irvine.**—Works in connection with 18 additional houses to be erected in connection with the Bank Street housing scheme, for the Town Council. Apply to Messrs. D. Gillies, A. R. Wilson, Joint Town Clerks, Council Chambers, Irvine, mentioning trades for which schedules are desired, viz.:—(1) Digger and brick; (2) carpenter and joiner; (3) glazier; (4) slater and roughcasting; (5) plumber; (6) plaster; (7) drains and entrance paths. Apply Mr. J. Armour, Architect, Bridgegate, Irvine, who will point out the site to intending tenderers. Deposit £1 1s.

October 31.—**BUNGALOW. Newtown, Cardigan.**—Erection of a bungalow for Capt. Richards, at Newtown, Cardigan. Apply Capt. Richards, Aleybryn, Kilgerran, S.O.

November 30.—**PALACE. Barcelona.**—In construction of the Grand Palace of Nations. Apply Don José y Cadafalch, offices of the exhibition (Lerida Street), and Dept. of Overseas Trade (Room 50), 35 Old Queen Street, London, S.W.1.

No Date.—**HOUSES. Knaresborough.**—Erection of two semi-detached dwelling houses, proposed to be built on Crag Top, Knaresborough, for Mr. B. Walker. Apply Mr. Walker, 1 Park Row, Knaresborough.

No Date.—**RE-ROOFING. Sheffield.**—Re-roofing corrugated-iron building, 120 ft. by 36 ft. Apply Messrs. Durham, Churchill & Co., Grimesthorpe, Sheffield.

ELECTRICAL.

October 23.—**ELECTRIC LIGHTING INSTALLATION. Romford.**—Electric lighting installed at the Romford Union hospital, for the Guardians. Apply Master of the Institution.

October 23.—**TURBINES AND GENERATORS. New South Wales.**—The New South Wales Government invite tenders for the manufacture, supply and erection of two water turbines and generators, required in connection with Barren Jack hydro-electric development. Apply Consulting Engineer, 64 Victoria Street, London, S.W.1, or at the office of the Agent-General.

October 24.—**LIFT. Manchester.**—Supply, delivery and erection of an electric goods cage lift, for the Tramways Committee. Apply Mr. H. Mattinson, General Manager, Corporation Tramways, 55 Piccadilly, Manchester.

October 27.—**TRANSFORMERS. Nottingham.**—Manufacture, delivery, and erection of the following engineering works in connection with the North Wilford power station, for the Nottingham Corporation, viz: Section C—two 650-k.v.a. three-phase static transformers; two 900-k.v.a. six-phase static transformers; one 150-k.v.a. single-phase static transformer. Section G—three steam turbine-driven boiler-feed pumps, each for 25,000 gallons per hour, with three exhaust steam heating nozzles. Section L—four gravity bucket coal conveyors, with crushers, &c. Section M—accumulators, &c. Apply Messrs. Preece, Cardew and Rider, 8 Queen Anne's Gate, Westminster, S.W.1. Deposit £5 for each section.

October 30.—**ELECTRIC PLANT. Alexandria.**—Supply of a direct-coupled steam-engine and alternator, and switchboard for the Electric Power House, Gabbary, Alexandria. Apply Room 49 of the Department of Overseas Trade, 35 Old Queen Street, London, S.W.1.

October 31. — **SWITCHGEAR. Montevideo.**—Supply of switchgear for fifteen transformer sub-stations converting a.c. at 50 cycles from 6,600 to 220 volts. Apply Department of Overseas Trade (Room 49), 35 Old Queen Street, Westminster, London, S.W.1. (Ref. 6666/F.L./E.P.(D.).)

November 4.—**CABLES. Montevideo.**—Supply of three-phase high-tension (6,600 volts) cable and accessories. Apply Department of Overseas Trade (Room 49), 35 Old Queen Street, Westminster, London, S.W.1. (Ref. 6666/F.L./E.P.(C.).)

November 11.—**TURBO-ALTERNATOR. Montevideo, Uruguay.**—Construction, delivery, and erection in the State power-house at Montevideo of a turbo-alternator of 10,000-kw. capacity to run at 3,000 r.p.m., together with the necessary condensing plant and accessories, for the State Electric Light Works. Apply Department of Overseas Trade (Room 49), 35 Old Queen Street, Westminster, S.W.1. (Ref. 3667/F.L./E.P.)

November 21.—**SWITCHBOARD PARTS. Australia.**—Supply of switchboard parts, schedule 67 (Nov. 21) for the Commonwealth of Australia. Apply Supply Officer, Room 101, Australia House, Strand, London, W.C.2.

November 28.—**SWITCHGEAR. Mangahao, N.Z.**—Supervision of the erection, and of the testing after erection, of outdoor switchgear (section 21) and indoor switchgear (section 33) for the Khandallah sub-station forming part of the Mangahao power scheme, for the Public Works Tender Board. Apply Department of Overseas Trade, Room 49, 35 Old Queen Street, Westminster, S.W.1. (Ref. 9468/Ed./E.P.) Deposit £100.

November 28.—**TRANSFORMERS. Wellington.**—The Public Works Tender Board, Wellington, are inviting tenders for the manufacture, supply, and delivery, ex ship's slings Auckland, of two exciter transformers in connection with the Waikato power scheme, section 57. The transformers are required to transform three-phase 50-cycle power at 5,250 volts between phases to power at 400 volts between phases, and will be used for supplying power to 220 k.w. exciter units in the power house at Horahora. They are to be of the oil-filled and self-cooled type, and to be rated 275 k.v.a. 93 per cent. power factor. Apply Department of Overseas Trade (Room 49), 35 Old Queen Street, Westminster, London, S.W.1.

November 29.—**TRUCKS, &c. Melbourne.**—The Victorian Railways Commissioners are calling for tenders for supply of three electric industrial trucks, one trailer, and two spare batteries. Apply Department of Overseas Trade (Room 50), 35 Old Queen Street, London, S.W.1. Deposit half per cent. (Reference D.O.T./9623/E.D./E.C.).

December 15.—**PLANT. Wellington.**—The Southland Electric Power Board are calling for tenders for supply and delivery of plant and material. Apply Department of Overseas Trade (Room 49), 35 Old Queen Street, Westminster, S.W.1.

December 20.—**ELECTRIC CRANES AND LIFTS FOR EGYPT. Alexandria.**—The Administration of Ports and Lighthouses, Alexandria, is inviting tenders for fixed and moveable lifting apparatus for service at the port of Alexandria. Apply Department of Overseas Trade (Room 50), 35 Old Queen Street, London, S.W.1.

January 15-31.—**PLANT. Melbourne.**—Supply, delivery, &c., of plant for the Morwell power scheme, for the State Electricity Commission of Victoria. Apply Agent-General for Victoria, Melbourne Place, Strand, London, W.C.2. Deposit £2 2s.

ENGINEERING.

October 19.—**GIRDER BRIDGES. Bengal.**—Five-deck span girder bridges, 100 ft. span, for the Bengal-Nagpur Railway Co., Ltd. Apply Company's Offices, 132 Gresham House, Old Broad Street, London, E.C.2. Deposit £1 1s.

October 19.—**RETAINING WALL. Bristol.**—Construction of a retaining wall and subsidiary works at Powder House Point, on the north bank of the River Avon, between Netham and Hanham locks, for the Docks Committee. Apply Mr. T. A. Peace, Engineer, Avonmouth Dock.

October 20.—**PUMPS, &c. Antwerp.**—The Municipal Authorities at Antwerp invite tenders for (a) two horse-drawn portable steam pumps for emptying cesspits; (b) five galvanized steel cylindrical sewage tanks, mounted on wheels, 30 hectolitres capacity; (c) 14 (in three lots) four-wheeled sewage carts of 3 cubic metres capacity. Apply Department of Overseas Trade (Room 50), 35 Old Queen Street, London, S.W.1. (Reference D.O.T./16994/F.W.)

October 21.—**DESTRUCTOR UNIT. Birmingham.**—Supply and erection of a new destructor unit at the Montague Street destructor works, for the Salvage and Stables Committee. Tenders are to include pneumatic suction plants, the dismantling of the existing building and old cells, the erection of new building and approach roadway, also erection and supply of machinery for screening and elevating the refuse. Apply Mr. J Jackson, Superintendent, Salvage Department, Council House, Birmingham. Deposit £1 1s.

October 21.—**BOREHOLE. Stevenage.**—Sinking a borehole at the bottom of an existing well and supplying a pump for use in such borehole, for the Stevenage Urban District Council. Apply Mr. W. O. Times, Clerk, Council Offices, Stevenage. Deposit £2 2s.

October 23.—**TANKS. Atherstone.**—Construction of two service tanks having capacities of 75,000 gallons and 63,000 respectively, in solid concrete, for the Atherstone Rural District Council. Apply Mr. H. J. Coleby, Engineer and Surveyor to the Council. Deposit £1 1s.

October 25.—**MACHINERY. Ormskirk.**—Supply and fixing complete of the following laundry machinery, for the Guardians, viz.:—One ironing and finishing machine, 108 in. by 24 in., and one steam-heated garment press (make to be stated). Apply Mr. A. H. Whitaker, Master of the Poor Law Institution, Ormskirk.

October 27. — **STRENGTHENING CULVERT. Chester-le-Street.**—Lining with brickwork the Chester Dene culvert, for the Durham County Council. Apply Mr. A. E. Brookes, M.I.C.E.

October 28.—**BRIDGE. Grantham.**—Construction of a ferro-concrete highway bridge over the River Witham at Whalebone Lane, Little Ponton, for the Grantham Rural District Council. Apply Mr. A. H. Malim, Clerk, 79 Westgate, Grantham, or at the offices of the Engineer, Mr. E. J. Silcock, M.I.C.E., 17 Victoria Street, Westminster, and 10 Park Row, Leeds. Deposit £5.

Trade and Craft

Geekoduct Conduit.

The General Electric Co., Ltd., of Magnet House, Kingsway, London, W.C.2, have sent us a copy of the new edition of their catalogue section dealing with the Geekoduct conduit. The prices in the list have all been revised to include all reductions in price of material and labour to date. Copies may be obtained on application to Magnet House, or any of the provincial branches of the company.

Change of Address.

The business in the area covered by the Liverpool branch of Messrs. W. T. Henley's Telegraph Works Company, Ltd., has increased to such a large extent that the company find it necessary to take larger premises at 37–41 Duke Street, Liverpool. Communications should now be sent to that address instead of to 91 Whitechapel. The increased accommodation will enable the firm to carry larger stocks of electric wires and cables, flexible cords, jointing materials, tapes, boxes, etc., and the branch manager, Mr. W. S. Campbell, will give close personal attention to enquiries and orders. The new telephone number will be Liverpool, Royal 790, but the telegraph address ("Henletel" Liverpool) remains the same.

New Wharf for Percy C. Webb.

Messrs. Percy C. Webb, Ltd., have moved to large new waterside premises at Marble Wharf, Verney Road, Old Kent Road, on the Surrey Canal. The equipment at the works includes the following: Carborundum, frame and rip saws, rubbing tables, polishing machines, and moulding and electrical hand tools. On the wharf is a large electrical crane which serves the depot and the works buildings. With the increased plant and the more extensive accommodation at Verney Road, the firm will be able to give their clients better and speedier service than was ever possible at the old works. The office accommodation is excellent. There is a large general office, offices for the chief, the accountants, the drawing staff, and the works manager, a rest room for the staff, and a consulting room for the use of clients. Although situated in the south of London, the wharf is easily accessible. It is served by regular 'bus and tram routes from the "Elephant and Castle," which connect with the main London termini and all the London districts. Messrs. Webb invite any friends who are interested to inspect their new facilities.

New Warehouse for Manchester.

Work has been begun on the site, in Third Avenue, Trafford Park, Manchester, of the new building for Messrs. Richard Johnson, Clapham and Morris, Ltd. Mr. Arthur Clayton, M.S.A., is the architect. The site measures over 9,000 square yards. On the ground floor of the building the bulk of the goods of the company will be dealt with, the first floor being used only for the lighter goods. The American experience of Mr. A. L. Johnson, the managing director, and the general experience of the company has proved this to be the best method. Sidings, a motor garage, and road access will be provided. The first story will be formed by galleries cantilevered from the roof columns, and special arrangements will be made for connection across the various bays. Since 1918, owing to increased business, which outgrew the capacity of the Lever Street warehouses, the company have been in urgent need of additional accommodation. This has been partly met by the acquisition from time to time of bays in the "Hives" in Moseley Road, Trafford Park, and large sheds in Trafford Park. The decision of the company to erect the new building is the result of still further increased business. The contractors are Messrs. J. Byrom, Ltd., of Bury, and the engineering work is being carried out by Messrs. Johnson's Reinforced Concrete Engineering Company, Ltd.—a subsidiary company of Messrs. Richard Johnson, Clapham and Morris, Ltd. It is anticipated that the new building will be completed by this time next year. The Lever Street premises of the company will be continued as head offices, showrooms, etc.

Subsidy Houses in Birmingham

In Birmingham 757 houses have been erected by private enterprise under the Government's Subsidy Scheme. The final date for completion of houses erected under this scheme expired on June 23, and so far as is known there are no further applications to be received from builders in regard to houses completed by that date.

The subsidy applied to all houses having an area of not more than 1,400 ft. super and with not more than four bedrooms. The original amount of the subsidy was: for a house not less than 920 ft. super, £160; 780 ft. super, £140; 700 ft. super, £130. These amounts, however, were increased in May, 1920, by £100 in respect to houses commenced after April 1, 1920, and by £50 in such instances where commencement had been made before that date. Two-thirds of these amounts were payable in respect to buildings classified as of a temporary character. The first certificate "A" (which approves of plans as satisfying the Ministry's requirements) was issued by the Department on January 27, 1920, and in all 320 certificates have been granted covering 928 houses, classified as under: Houses, brick built, 672; concrete, 8. Bungalows, brick built, 142; concrete, 33. Timber-framed (permanent type), 50 (Standard Housing, etc.); timber-framed (temporary type), 9; pise-de-terre, 1. Flats, 13—giving a total of 928.

In some cases these houses were not proceeded with, and the final position of Birmingham in regard to houses erected by private builders under the Act is as follows: Houses, brick built, 565; concrete, 4. Bungalows, brick built, 113; concrete, 29. Timber-framed (permanent type), 35; timber-framed (temporary type), 9; pise-de-terre, 1. Flats, 1—giving a total of 757. Builders in the city have benefited to the extent of £191,386 13s. 4d., or an average of £252 16s. 5d. per house.

The committee have had 15,715 applications for houses under the Corporation scheme, and 2,150 applicants have been allotted houses.

The Paving of Old London

A great deal of unnecessary fuss has been made because a few of the streets of London are "up," says "The Morning Post." Let us be patient. London streets are far wider, cleaner, healthier, and more comfortable than they were two hundred years ago, when Gay instructed his fellows in the art of walking them. . . . The pavement of London was a matter of faith—the evidence of things not seen. A freestone pavement was laid in some of the principal thoroughfares about 300 years ago, and after the Great Fire it was ordered that all streets called High were to be "paved round, in causeway fashion." Early in the nineteenth century an experiment was made with blocks of cast iron in the form of square paving-stones, and covered with gravel; but the method was not a success. Later, although some of the streets had a flat paving of freestone, the narrow streets kept to the round stones hammered into the ground. "Petrified kidneys" they were sometimes called, and very painful they sometimes were. Posts protected the pathway, but there were no kerbs. In the middle of the street [says Besant] ran a gutter, sometimes foul, sometimes a succession of stagnant and noisome puddles, sometimes a rapid stream, the splashing from which, when a cart or a carriage passed along, was fatal to white stockings and neatly brushed shoes. . . . They knew nothing of broad streets with comfortable footways and horseways paved with wood or asphalt. No "rough pavement wounds the yielding tread" nowadays, and we should be patient when either Oxford Street or Fleet Street is "up." The temporary inconvenience makes for the permanent comfort.

Westminster Technical Institute

At the Westminster Technical Institute group courses of instruction have been arranged to enable students engaged in the offices of architects, surveyors, quantity surveyors, or builders, and in the building trades to follow out a systematic course of study extending over several years. The courses involve attendance for three or four evenings a week.

Students of the R.I.B.A., the Surveyors' Institute; and the Society of Architects who thus supplement their practical experience in their offices and on the works by a little enthusiasm and conscientious study on the lines suggested should be capable of passing the professional examinations of their respective Institutions on the completion of the full courses.

Homework is set each week and arrangements are made during the session to visit buildings in course of erection, museums and other places of architectural interest.

The staff of the Institute includes the following: F. G. Steed, A.R.C.S. (technical drawing); W. J. Wilsdon, Lic. R.I.B.A., and Major F. C. Webster, O.B.E., A.R.I.B.A., F.S.I. (building construction); M. J. Dawson, F.R.I.B.A. (architectural drawing, design and history of architecture); L. Lickis, F.S.I. (builders' quantities); and F. S. Mumford, P.A.S.I., M.R.San.I. (building laws, valuations, and sanitary science).

Housing Progress in Scotland

The following figures show the progress that has been made in State-aided housing schemes in Scotland to September 30 :—

Permanent houses completed ..	11,584
Temporary houses completed ..	665
Reconstructed houses completed	89
Houses completed under the Private Subsidy Scheme ..	2,146
	14,484

There are 7,794 houses at present under construction in connection with housing schemes carried out by local authorities and public utility societies.

The total amount paid by the Scottish Board of Health in respect of the 2,146 houses completed under the private subsidy schemes is £519,447.

Under section 67 of the Housing of the Working Classes Act, 1890, the Public Works Loan Commissioners are empowered to advance loans out of the funds at their disposal to certain companies, societies, and individuals for the purpose of constructing or improving, or of facilitating or encouraging the construction or improvement of dwellings for the working classes. Under that Act the amount of money that could be advanced by the Public Works Loan Commissioners could not exceed one-half of the value of the properties in respect of which the loan was obtained.

Section 4 of the Public Works Loans Act, 1922, provides, however, that, in the application of the above Section to any company, established for the above-mentioned purpose, which does not trade for profit, or whose constitution forbids the issue of any share or loan capital with interest or dividend exceeding the rate for the time being prescribed by the Treasury, the money to be advanced by the Loan Commissioners to such companies, on the security of a mortgage of any land or dwellings solely, may be increased to 75 per cent. of the value of the land or dwellings to be mortgaged, but in such cases the Commissioners are required by the Act to obtain, in addition to the mortgage, a further security of such value as they may think fit.

By minute dated September 29 the Treasury have for the time being fixed at 6 per cent. per annum the rate of interest or dividend on share or loan capital which must not be exceeded by any company wishing to obtain such loans.

The present rate of interest fixed by the Treasury in the case of such loans by the Loan Commissioners is 5 per cent. in respect of loans for periods not exceeding thirty years, and 5¼ per cent. in respect of loans not exceeding forty years, which is the maximum period allowed under section 67 of the 1890 Act for repayment of the loans.

The Scottish Board of Health have decided to discontinue the fluctuating basis of contract under which the final cost varies according to any alterations made in the standard rates of wages during the execution of the work. In future, contractors will be asked to tender on a firm basis as in pre-war days.

300-Year-old Gate at an Inn

During the demolition of the old Pelican Inn at Weybridge numbers of stones forming part of a one-time famous gateway were discovered lying hidden in the foundations. According to Dr. Eric Gardner, an entrance gate was built by Inigo Jones in 1617 for James I during his residence at Oatlands Palace. The gate was pulled down in 1728, but re-erected by Lord Lincoln in the Oatlands estate. About 1850 the gate was again pulled down and sold as building material to a man named Liberty, after which it was lost, but it has just reappeared in the foundations of the old inn. The original plans of Inigo Jones are still in existence, so that the gate can be reconstructed in the same style. The stones, which are considered to be good specimens of the architecture of several centuries ago, have not all been recovered yet. Dr. Gardner has appealed to the Weybridge District Council to prevent the stones from being broken up. The council has agreed to acquire them, and the gate will probably be reconstructed as an entrance to the local recreation ground.

The British Empire Exhibition

Forty-five plans, submitted in connection with the stadium of the British Empire Exhibition at Wembley have been formally disapproved by the Wembley Urban District Council. The Council have taken this action on the ground that they cannot take the responsibility of deciding as to the stability of works of such magnitude.

Mr. C. R. W. Chapman, the surveyor to the Council, in his report, stated that the undertaking was of such unusual magnitude that to attempt to express an opinion in one direction or the other would seem presumptuous, seeing that the authorities themselves had had unlimited means of securing the best expert and specialists' advice. The Council would not fail, he said, to remember the unique slip which occurred to the retaining wall of the Great Central Railway cutting a few years ago that left a somewhat apprehensive feeling in the minds of many with regard to the placing of so vast and concentrated a weight as that of the proposed stadium at the back of the same railway cutting, although at a different point. He understood, however, that the Great Central Railway had been consulted, and the site of the stadium removed far enough from the cutting.

The Council have informed the contractors that, in view of the surveyor's report, there being no precedent for an urban authority dealing with a work of such magnitude, they did not feel justified in taking upon themselves the responsibility of deciding as to the stability or otherwise of the proposed erections.

ARCHITECTURAL REFERENCE LIBRARY.

The attention of Architects, and of those interested in Architecture, is called to the facilities afforded by the specially appointed Reading Room at 27–29, Tothill Street, Westminster.

This Room has been set apart in order that the numerous Works in the Library may be referred to in quietude and ease.

Overseas Members of the Profession, and also Architectural Students, are cordially invited to make the fullest use of the Library.

Scagliola Marble

By Special Appointment to His Majesty

An old Italian process revived in the early part of the Sixteenth Century by Guido Sassi; is not a surface decoration, but a thoroughly artistic material. It was largely used by the Florentines in some of their most elaborate works, and was introduced into this country by Mr. J. Wyatt about 1750. It has been manufactured by this firm for the last 85 years, and fixed in many of the most important buildings in the Kingdom.

November 4.—**CABLES. Montevideo.**—Supply of three-phase high-tension (6,600 volts) cable and accessories. Apply Department of Overseas Trade (Room 49), 35 Old Queen Street, Westminster, London, S.W.1. (Ref. 6655/F.L./E.P.(C.).)

November 4.—**SWITCHGEAR. Torquay.**—Supply, delivery, and erection of e.h.t. switchgear for Newton Abbot power station and main sub-station at Torquay, for the Corporation. Apply Mr. H. F. G. Woods, Borough Electrical Engineer and Manager, Electricity Offices, Town Hall, Torquay. Deposit £2 2s.

November 6.—**CONTROL PANEL, &c. London, S.E.**—Manufacture, supply and erection of control panel and switchgear connections for No. 4 generator at Greenwich power station, for the London County Council. Apply Clerk of the Council, County Hall, Westminster Bridge, S.E.1 (Room No. 215). Deposit £2.

November 10.—**TURBO-ALTERNATOR, &c. Aberdeen.**—Supply, delivery, and erection at their electricity works of one 10,000-kw. turbo-alternator with surface condenser and auxiliaries for the Corporation. Apply Office of the City Electrical Engineer, Millburn Street, Aberdeen. Deposit £5 5s.

November 11.—**TURBO-ALTERNATOR. Montevideo, Uruguay.**—Construction, delivery, and erection in the State power-house at Montevideo of a turbo-alternator of 10,000-kw. capacity to run at 3,000 r.p.m., together with the necessary condensing plant and accessories, for the State Electric Light Works. Apply Department of Overseas Trade (Room 49), 35 Old Queen Street, Westminster, S.W.1. (Ref. 3667/F.L./E.P.)

November 13.—**CABLE. Warrington.**—Supply of high and low tension paper and lead covered cable, for the Electricity and Tramways Committee. Apply Mr. F. V. L. Mathias, Borough Electrical and Tramways Engineer, Howley, Warrington. Deposit £1 1s.

November 14.—**TURBO-ALTERNATOR. Bristol.**—Supply, delivery, and erection of one 4,000 k.v.a. single-phase (93 periodicity) continuously rated steam turbo-alternator, complete with condensing plant, for the Electrical Committee. Apply Mr. H. F. Proctor, M.I.C.E., M.I.E.E., Chief Engineer and General Manager, The Exchange, Bristol. Deposit £2 2s.

November 15.—**CRANES. Riga.**—Latvian Marine Department are inviting tenders for eight electrically driven rotating cranes for the Riga Customs Yard. Apply Department of Overseas Trade (Room 50), 35 Old Queen Street, S.W.1.

November 21.—**SWITCHBOARD PARTS. Australia.**—Supply of switchboard parts, schedule 67 (Nov. 21) for the Commonwealth of Australia. Apply Supply Officer, Room 101, Australia House, Strand, London, W.C.2.

November 23.—**SWITCHGEAR, &c. Pretoria.**—His Majesty's Trade Commissioner in South Africa reports that the date for the presentation of tenders for above has been extended from November 9 until 12 noon on November 23.

November 23.—**POLE FITTINGS, &c. Pretoria, S.A.**—Electric Supply and Tramways Department of the Pretoria Municipality is inviting tenders for supply of pole fittings, insulators, &c. Apply Department of Overseas Trade, Room 49, 35 Old Queen Street, Westminster, S.W.1. (Reference 9798/E.D./E.P.)

November 28.—**SWITCHGEAR. Mangahao, N.Z.**—Supervision of the erection, and of the testing after erection, of outdoor switchgear (section 21) and indoor switchgear (section 33) for the Khandallah sub-station forming part of the Mangahao power scheme, for the Public Works Tender Board. Apply Department of Overseas Trade, Room 49, 35 Old Queen Street, Westminster, S.W.1. (Ref. 9468/Ed./E.P.) Deposit £100.

November 28.—**TRANSFORMERS. Wellington.**—The Public Works Tender Board, Wellington, are inviting tenders for the manufacture, supply, and delivery, ex ship's slings Auckland, of two exciter transformers in connection with the Waikato power scheme, section 57 The transformers are required to transform three-phase 50-cycle power at 5,250 volts between phases to power at 400 volts between phases, and will be used for supplying power to 220 k.w. exciter units in the power house at Horahora. They are to be of the oil-filled and self-cooled type, and to be rated 275 k.v.a. 93 per cent. power factor. Apply Department of Overseas Trade (Room 49), 35 Old Queen Street, Westminster, London, S.W.1.

November 29.—**TRUCKS, &c. Melbourne.**—The Victorian Railways Commissioners are calling for tenders for supply of three electric industrial trucks, one trailer, and two spare batteries. Apply Department of Overseas Trade (Room 50), 35 Old Queen Street, London, S.W.1. Deposit half per cent. (Reference D.O.T./9623/E.D./E.C.)

December 15.—**PLANT. Wellington.**—The Southland Electric Power Board are calling for tender for supply and delivery of plant and material. Appl Department of Overseas Trade (Room 49), 35 Old Quee Street, Westminster, S.W.1.

December 20.—**ELECTRIC CRANES AND LIFTS FOR EGYPT. Alexandria.**—The Administration o Ports and Lighthouses, Alexandria, is inviting tender for fixed and moveable lifting apparatus for service at th port of Alexandria. Apply Department of Oversea Trade (Room 50), 35 Old Queen Street, London, S.W.1

January 9.—**CRANE. New Zealand.**—Supply an delivery of one electric travelling crane in connectio with the Waikato power scheme, section 58. The cran is to be designed for lifting, traversing and travellin loads up to 27 tons. Apply Department of Oversea Trade (Room 50), 35 Old Queen Street, Westminste London, S.W.1.

January 15-31.—**PLANT. Melbourne.**—Supply delivery, &c., of plant for the Morwell power scheme, fo the State Electricity Commission of Victoria. Appl Agent-General for Victoria, Melbourne Place, Strand London, W.C.2. Deposit £2 2s.

ENGINEERING.

November 3.—**FENCING, &c. Edinburgh.**—Fo (1) wood fencing and gates, and (2) hedges, for the Tow Council, for 360 houses at Wardie, all in accordanc with schedules of quantities. Apply Messrs. Fairbairn Lightbody and Cownie, FF.S., Surveyors, 53 Quee Street, Edinburgh.

November 3.—**PUMP. Cleethorpes.**—Supply of secondhand sand pump suitable for pumping sand on th foreshore, for the Urban District Council. Apply M L. W. Pye, A.M.I.C.E., Engineer and Surveyor, Counci Offices, Cleethorpes.

November 4.—**DOCKING. London, E.C.**—Docking and undocking the ambulance steamer "Red Cross," for the Metropolitan Asylums Board. Apply Office o the Board, Embankment, E.C.4.

November 8.—**OVERBRIDGE, &c. London, S.W**—Supply of (1) overbridge; (2) steel material for construction of wagons, &c.; and (3) wheels and axles, fo the Bombay, Baroda and Central India Railway Company. Apply The White Mansion, 91 Petty France Westminster, S.W.1. Deposit £1 each for Nos. 1 and and 10s. for No. 3.

November 10.—**WATER MAIN. Nuneaton.**—Excavating for and the haulage, laying and jointing o about 430 yards of 15 in. diameter and about 1,600 yard of 12 in. diameter cast-iron water main, for the Corporation. Apply Mr. R. C. Moon, A.M.I.C.E., Water Engineer, Queen's Road, Nuneaton. Deposit £2 2s.

November 14.—**POINT CONTROLLERS. Edinburgh.**—Supply, delivery, and fitting up in position o eight automatic point controllers, for the Corporation Apply Tramways Manager, 2 St. James Square, Edinburgh.

November 15.—**BOILERS, &c. South Shields.**—Manufacture, delivery and erection complete, at th Corporation Electricity Works, West Holborn, Sout Shields, of two water-tube boilers, with mechanica stokers, superheaters, economisers, induced draugh plant, and steel chimney; also for ash-handling plant an extension to boiler-house, for the Corporation. Appl Mr. J. Edgar, Electricity Offices, Victoria Terrace South Shields. Deposit £2 2s.

November 15.—**TUBULAR POLES. Perth.**—Th Postmaster-General's Department, Perth, Wester Australia, is inviting tenders for supply and delivery o 1,490 galvanized tubular poles. Apply Department o Overseas Trade (Room 47), 35 Old Queen Street, S.W.1

November 15.—**TUBULAR POLES. Australia.**—Supply of 1,500 galvanized iron or steel tubular pole for telegraph poles, 20 ft. long, schedule 755. Appl Supply Officer, Room 101, Australia House, Stran London, W.C.2.

November 16.—**GEAR WHEELS. Johannesburg**—28 tramcar gear wheels (contract No. 965), for th Municipal Council of Johannesburg. Apply Departmen of Overseas Trade (Room 50), 35 Old Queen Stree London, S.W.1.

November 18.—**TUBES. Johannesburg, S.A.**—Hi Majesty's Senior Trade Commissioner in South Afric reports that the Municipal Council of Johannesbur invites tenders for supply and delivery at Presiden Street store of 128 large and 128 small solid-drawn ste superheater tubes, 1½ in. outside diameter, No. 9 s.w.g for 17,000 lb. Babcock and Wilcox boiler, in accordanc with drawing No. 1,511, dated September 12, 1922 (Contract 977.) A deposit of 10 per cent. of the tota amount of the tender. Apply Department of Oversea Trade (Room 47), 35 Old Queen Street, Westminste S.W.1. (Ref. 9855/E.D./E.P.)

December 6.—**HARBOUR WORKS. Madeira.**—Construction of an artificial harbour at Funchal. Appl Department of Overseas Trade, 35 Old Queen Stree London, S.W.1.

December 18.—**COAL HANDLING PLANT. Melbourne.**—Supply, delivery, &c., of the following for th Morwell power scheme, for the State Electricity Commission of Victoria: Specification No. 282: Coal-handlin plant for Morwell power station and briquetting works Apply Agent-General for Victoria, Melbourne Plac Strand, London, W.C.2.

HY-RIB

For Plaster and Concrete Work

HY-RIB is a steel sheathing of great rigidity, which is both a centering and a reinforcement for concrete work.

HY-RIB eliminates timber shuttering or "false-work."

HY-RIB is used for Concrete Floors, Walls, Roofs, Partitions, Suspended Ceilings, etc.

HY-RIB is used in conjunction with any kind of framework—Reinforced Concrete, Structural Steel or Timber.

HY-RIB is suitable for every type of construction—large or small.

Leyland & Birmingham Rubber Co., Ltd.

MAKERS OF

RUBBER AND RUBLINO TILING.

Suitable for—
Banks,
Insurance Offices,
Hospital Wards,
Operating Theatres,
Kinemas,
Bathrooms,
Lavatories,
Ships' Smoking Rooms and Saloons,
Railway Carriages,
&c., &c.

RUBBER TILING LAID IN THE ENTRANCE HALL, QUEEN'S HOTEL, BIRMINGHAM.

Supplied to—
Lloyd's,
Guy's Hospital,
London Metal Exchange,
School of Economics,
L.&N.W.R.Hotels,
Union-Castle Line,
Cunard Line,
Canadian Pacific Line,
and many other Public Buildings and Steamship Lines.

WORKS: Leyland, near Preston; Maryhill, Glasgow; Pole Street Mills, Preston, and Mitcham, Surrey.
BRANCHES: London, Birmingham, Manchester, Dublin, Cardiff, Glasgow, Edinburgh, Newcastle-on-Tyne, Calcutta, Johannesburg, and Buenos Aires.

January 19.—**PLANT. Melbourne.**—Supply, delivery, &c., of the following for the Morwell power scheme, for the State Electricity Commission of Victoria: Specification No. 23-4.—Steam turbine-driven boiler feed pumps. Apply to Agent-General for Victoria, Melbourne Place, Strand, London, W.C.2. Deposit £1 1s.

No Date.—**FENCING, &c. Cardiff.**—Supplying and fixing approximately 1,436 yards of six wire reinforced concrete post and wire fencing at Craigwen, Penyrheol, and Caerphilly, for the Glamorgan Agricultural Committee. Apply the County Land Agent, 30 Park Place, Cardiff.

PAINTING.

November 6.—**PAINTING. Tolworth.**—External and internal painting at their Isolation Hospital, Red Lion Road, Tolworth, Surrey, for the Tolworth Joint Hospital Board. Apply Mr. A. J. Hardwick, Architect and Surveyor, Eagle Chambers, Kingston-on-Thames.

November 6.—**PAINTING. West Ham.**—Painting works and the construction of a light steel roof over screening chamber at the Abbey Mills pumping station, West Ham, for the London County Council. Apply Chief Engineer of the Council, at the Old County Hall, Spring Gardens, S.W.1. Deposit £1.

November 6.—**PAINTING. Beckton.**—Painting works at the main drainage works, Northern Outfall, near Beckton, East Ham, E.6, for the London County Council. Apply Chief Engineer of the Council, at the Old County Hall, Spring Gardens, S.W.1. Deposit £1.

November 7.—**PAINTING. Rochdale.**—Painters' work, for the Libraries Committee:—(a) Rochdale Free Public Library basement, internal painting; (b) Castleton Branch Library, internal painting. Particulars from the Borough Surveyor, Town Hall, Rochdale. Apply Mr. W. H. Hickson.

November 8.—**CLEANING AND PAINTING. London, S.E.**—Cleaning and painting works and repairs at Goldie Leigh Homes, Abbey Wood, S.E.2, for the Metropolitan Asylums Board. Apply Office of the Board, Embankment, E.C.4. Deposit £1.

ROADS AND SEWERS.

November 3.—**ROADS. Pontypool.**—Providing and fixing kerb and channel, making-up of footpaths, and top metalling and rolling roads, Penygarn housing scheme, Penygarn, Pontypool, for the Abersychan Urban District Council. Apply Mr. O. P. Bevan, Station Road, Bargoed, and at the Works Office, Penygarn.

November 4.—**IMPROVEMENT WORKS. Halifax.**—Private improvement works, at Manor Drive, Halifax, for the Highways Committee. Apply Mr. Alec. C. Tipple, Borough Engineer, Crossley Street, Halifax. Deposit £1 1s.

November 6.—**ROAD WIDENING, &c. Skipton.**—Works in connection with the Keighley Road, widening and covering of the Skibeden Beck, which includes masonry, retaining walls, concrete invert and superstructure, 20 in. by 7½ in. girders, steel troughing and stanchions, sett paving, flagging, mastic asphalte surfacing, &c., for the Skipton Urban District Council. Apply Mr. A. E. W. Aldridge, Surveyor, Town Hall, Skipton. Deposit £2.

November 7.—**MAKING-UP. Portslade-by-Sea.**—Making-up and completion of the following roads within their districts, for the Urban District Council, viz. Brambledean Road, Eastbrook Road, Park Crescent, St. Michael's Road, St. Peter's Road, Vale Road, and Wolseley Road. Apply Surveyor to the Council, Mr. A. Taylor Allen, Council Offices, Portslade-by-Sea. Deposit £1 1s.

November 7.—**SANITARY PIPES, &c. Bow.**—Supply of sanitary pipes and fittings for use at the Saint Andrew's Hospital, Bow, London, E.3, for the managers of the Poplar and Stepney Sick Asylum District. Apply Mr. S. G. Wright, Clerk, Saint Andrew's Hospital, Devons Road, Bow.

November 8.—**WIDENING, &c. Fordingbridge.**—Widening and improvement of the gradient on the Cranborne, Fordingbridge, and Southampton main road, about one mile east of Fordingbridge, for the Hants County Council. Apply Mr. W. J. Taylor, County Surveyor, The Castle, Winchester. Deposit £1 1s.

November 11.—**ROAD WORKS. Chester.**—Reconstruction with granite setts on reinforced concrete foundations of the following streets, viz.:—St. Anne's Street, George Street, Gorse Stacks, Victoria Road; also for the reconstruction with natural rock asphalte on reinforced concrete foundations of the following, viz.:—City Road, for the Town Council. Apply Mr. C. Greenwood, A.M.I.C.E.

November 13.—**MAKING-UP. Mortlake.**—Making-up of the passage at the rear of Nos. 461 to 497 Upper Richmond Road, Mortlake, S.W., with reinforced concrete on a hardcore foundation, for the Barnes U.D.C. Apply Surveyor, Council House, Mortlake.

November 13.—**SUBSOIL DRAINAGE. Mortlake.**—Execution of works of subsoil drainage, &c., at Palewell Common, Mortlake, for the Barnes U.D.C. Apply Surveyor, Council House, Mortlake.

No Date.—**PAVING. Goole.**—Paving of the footpaths to 14 houses in New Close Lane and Brough Street, for the Goole Urban District Council. Apply Mr. J. H. Castle, Engineer and Surveyor, Council Offices, Goole.

Law Reports

Light and Air Dispute

Slack v. *Leeds Industrial Co-operative Soc.*

Oct. 19. Chancery Division.
Before Mr. Justice Romer.

His Lordship delivered his reserved judgment in this case, which he tried in July last, a report of which appeared in the JOURNAL at the time.

The action was brought by Mr. Charles Henry Slack, baker and confectioner, of Albion Street, Leeds, for an injunction to restrain the Leeds Industrial Co-operative Society, Ltd., of Albion Street, from erecting a building in or near Albion Square so as to cause a nuisance by the obstruction of his ancient windows as they existed before the pulling down by defendants of 15 Albion Square or so as to obstruct or interfere with the roadway of Albion Square and the free use and enjoyment by plaintiff of that right of way. Plaintiff also complained of interference with his supply of air.

His Lordship, giving judgment, said that after considering the evidence in this case, which raised several issues, he had come to the conclusion that plaintiff had failed to establish the probability that the interference with air would alone entitle him to succeed, and he must hold that Mr. Slack had failed to discharge the onus of proof which lay upon him to satisfy the Court that there would be such an interference. With regard to the issue as to the interference with the lighting, his Lordship said he was not quite convinced that the interference would be as great as the plaintiff desired to set up, but he thought there was a probability that there would be interference, and therefore he would grant an injunction against the defendants on this issue with costs. On the other issues, however, defendants must succeed, and plaintiff must pay their costs.

Questions of Professional Practice

Stott v. *Ram Spinning Co., Ltd.*

Oct. 9 and 10. Chancery Court, Manchester.
Before Mr. R. B. Lawrence, Vice-Chancellor.

This was an action brought by Abraham Henthorn Stott, who carries on business as Stott and Sons, architects and consulting engineers, at Manchester, against the Ram Spinning Co., Ltd., and the Ram Mills, Ltd., to recover £2,073 14s., the balance due to him for services rendered in connection with the construction of the Ram Mill at Chadderton, near Oldham.

Mr. C. Atkinson, K.C., and Mr. Barker appeared for the plaintiff, and the defendants were represented by Mr. J. H. Cunliffe, K.C., Mr. J. Bennett, and Mr. T. Cunliffe.

The plaintiff based his claim upon an agreement dated November 5, 1909, to pay him 5 per cent. on the total amount of the expenditure and disbursements incurred, excluding expenditure charged against revenue. He estimated that the sum which thus became due to him was £9,323 14s., of which he had received £7,250.

The defendants alleged that Mr. Stott had received from contractors secret commissions, and that a payment of £300 in respect of the services of the clerk of works ought to have been credited by him to the company.

Mr. Stott said he had been concerned in the erection of many spinning mills, and in August 1906 he approached a Mr. Smethurst to know if he was prepared to build another mill on the bill of quantities, conditions, etc., which had applied to one of the other mills. They included a provision that 2½ per cent. should be paid to his firm for quantities, and that the contractor should also pay £300 in respect of the clerk of works. The company was registered on February 14, 1907, and the Memorandum of Association stated that the objects were "to erect, equip, and work two cotton spinning mills in the neighbourhood of Oldham, for which Messrs. Stott and Sons, of Manchester, architects, shall be architects and consulting engineers." The conditions of tender were on the table at the meeting of the Board, and were too well known for any particular discussion to arise upon them. One mill was completed, the other was not.

There was no definite arrangement at the beginning as to what his firm should receive for their services, but eventually the agreement of November 5, 1909, was come to. In July 1911 four of the directors were replaced by others, but witness's connection with the company as architect did not cease. He did not press his claim while the war was going on, but during the boom in the cotton trade, in December 1919, the concern was sold to the Ram Mills, Ltd., at an enormous price, and witness put forward his claim. A writ was issued on November 16, 1920.

Mr. Cunliffe quoted from the schedule sanctioned by the R.I.B.A. in 1872, and revised by the Royal Institute in 1898. The rule as to quantities "when an architect takes out and supplies to builders quantities on which to form estimates for executing his designs, he should do so with the concurrence of his client, and it is desirable that the architect should be paid by him rather than by the builder, the cost of such quantities not being included in the commission of 5 per cent."

The witness replied that it had nothing to do with the present case. It was a special bargain. Instead of 2½ per cent. he might have made it 1 per cent. or 10 per cent.

The witness added that the 2½ per cent. was paid by all the contractors except the people who supplied the textile machinery. The reason for that was that one firm of textile machinists decided not to pay any commission except to their recognized and authorized agents, and one of the promoters had stipulated that either this firm or another should supply textile machinery.

Mr. Cunliffe pointed out that Smethurst paid Messrs. Stott more than £1,600 immediately after the first meeting of the Board, when the contracts were made. The witness said the commission became due on the issue of the first certificate. The £1,600 was in excess of 2½ per cent. upon £48,000, the amount of Smethurst's contract, it included the £300 paid in respect of the clerk of works, and other items.

Re-examined: In March last negotiations were entered into with a view to a settlement. He insisted that all charges against him must be withdrawn, and a director of the defendant company, Mr. O'Neill, told him that all charges were unreservedly withdrawn, and they wanted to get the thing settled. He had no doubt that the directors knew about the 2½ per cent. It was not the professional practice, as laid down in the rules of the Institute, to regard the work of the quantity surveyor as part of the architect's services covered by the commission of 5 per cent. It was not an uncommon practice for an architect to employ a quantity surveyor.

When an architect prepares the quantities, *qua* quantity surveyor, what is the professional practice as to the people who pay the 2½ per cent.?—The contractor. Can you see that in any respect what you did here was not in accordance with professional practice?—It was in accordance with it.

Thomas Milnes Foden, an architect practising in Manchester and Liverpool, a member of the R.I.B.A., said the work of preparing quantities was quite different from the architect's services covered by the commission of 5 per cent. Some architects themselves did the work of the quantity surveyor; others did not. It was not uncommon in Manchester for the conditions of tender to specify that 2½ per cent. for quantities should be paid by the contractor to the architect. In cross-examination the witness agreed that the client should know whether his architect or quantity surveyor received remuneration from the contractor. In his opinion the client knew. When instructions were given for quantities to be got out the client must know that someone would have to be paid for the work, and that if he himself did not pay the contractor did.

Mr. E. T. Meadows, builder, of the firm of Messrs. T. W. Meadows, Stockport, said he had thirty-five years' experience of the building trade. In bills of quantities there was always an item which included a certain percentage to be paid on the first certificate by the contractor to the architect in respect of quantities. Sometimes the client paid direct.

On behalf of the defendants Mr. William O'Neill was called, and denied that he had any authority to compromise on behalf of the company. He could not have used the words "all charges are unreservedly withdrawn," because he did not know at the time what the charges were. He asked what Mr. Stott would settle for because he wanted the matter to be cleared out of the way.

Albert Thompson, a director of the company since 1907, stated that he knew nothing of the 2½ per cent. until after the action was brought.

Joseph Platt, the secretary, said he had no suspicion that Mr. Stott was receiving the 2½ per cent. in respect of the supply of engines and other material, but he knew that architects sometimes got 2½ per cent. from contractors for preparing quantities, and he assumed that Mr. Stott had done it.

Mr. Cunliffe submitted that the improper conduct of the plaintiff entitled the company to recover the amounts he had received in respect of his remuneration under the contract, and he must account for every penny that the contractors had paid him. Secret commissions were inconsistent with the decent and honourable conduct of business in the profession of an architect, and for that reason the Courts had laid down in unmistakable terms that whenever commission was paid to the architect, even if it was only in respect of building contracts, it must be disclosed to the client and his concurrence obtained.

The Vice-Chancellor held that the counter-claim failed, and he gave judgment for the plaintiff, the amount due to be ascertained by enquiry.

Professional Classes Aid Council

The Professional Classes Aid Council (Incorporated) have issued their first annual report for the year ended April, 1922. The Council exists to relieve, or assist in relieving, distress among professional and other highly educated people and their dependants. Its predecessor, the Professional Classes War Relief Council, was founded for a similar purpose in October, 1914, when the war had already caused widespread distress. By that Council an enormous amount of valuable work was done, more than 12,000 applications being considered. Help was given to numerous musicians, artists, schoolmasters, teachers and governesses; to architects and surveyors, authors and journalists, barristers and solicitors, engineers, doctors, actors, ministers of religion, nurses, civil servants, and members of many other callings. The close of the war was far from ending distress, and in 1921 the War Relief Council was reconstituted as the Professional Classes Aid Council.

The cardinal principle of the Council is that relief should be constructive. A line is always sought which affords a prospect of rendering the applicant self-supporting. In too many instances, unfortunately, age or infirmity render any such plan impossible, the only effective relief being some form of permanent maintenance. The Council have no funds for such cases, but they have assisted numerous applicants to obtain admission to homes, or to get pensions from funds established for that purpose, and have supported them during the period of waiting.

The forms of constructive relief have been varied. The most usual has been the education of children. With this ensured the parents can often struggle on without further help and with minds comparatively at ease. The school and period of education to be given are determined, according to the circumstances of each case, by an expert Committee in consultation with the parents. Of all the objects on which money is spent by the Council, they regard their large educational outlay as the most satisfactory, and its continuance as a work of the first importance.

Relief takes many other forms. The mere gift of a sum of money has rarely proved satisfactory, and is only made in a few special cases. Sometimes a period of rest or convalescence restores a worker to a state of health in which a living can be earned.

During the year 6,024 letters were received, 7,511 letters were sent out; 746 interviews were recorded in the eleven months during which the office was open. The total number of committee meetings was 135. The number of applicants dealt with during the year was as follows: New applicants—296 advised; 66 assisted financially; 16 under consideration; 57 withdrew or did not reply; 34 unsatisfactory; 49 not within our scope; making a total of 518. Former applicants re-applied—31 advised; 19 assisted financially; 2 under consideration; 12 withdrew or did not reply; 14 unsatisfactory; 30 not within our scope; making a total of 108, and a grand total of 626.

Those who applied before April, 1921, and have been in receipt of regular assistance since the time of their application, are not included in the above figures. The greater part of the direct financial assistance given during the year was to such persons: some have been receiving help for four or even five years, the total help to certain families having exceeded £500.

The office of the Council is 251 Brompton Road, S.W.3.

Obituary

The late Mr. J. Crocker.

We regret to record the death, at the age of seventy-two, of Mr. James Crocker, of Exeter, architect and surveyor. He was a Fellow of the R.I.B.A. (1886), an Institute Silver Medallist (1875), a past president and member of the Council of the Devon and Exeter Architectural Society, and an authority on local archæology. After being educated at Shebbear College, he went to Exeter, where, in 1867, he was articled to Mr. E. H. Harbottle, to whom eventually he was managing assistant for six years. In 1876 he commenced practice on his own account, and up to the time of his death was actively engaged at his office in Castle Street, Exeter. He carried out a large amount of work, including the "Queen's Hall," the Eastgate Arcade, the Coffee Tavern, "St. Just," "Langdon," and many business premises and private houses in Exeter; a small mansion at Torrington, and numerous country houses in the surrounding district, and he was also responsible for a large number of church and chapel restoration and rebuilding schemes. He also acted as arbitrator in many important architectural disputes. In 1886 he published a valuable book, "Old Exeter," containing sketches of old houses and ceilings, etc., many of which have since been demolished. He leaves a widow and two daughters. The interment took place at Throwleigh, where deceased was born.

ARCHITECTURAL REFERENCE LIBRARY.

The attention of Architects, and of those interested in Architecture, is called to the facilities afforded by the specially appointed Reading Room at 27–29, Tothill Street, Westminster.

This Room has been set apart in order that the numerous Works in the Library may be referred to in quietude and ease.

Overseas Members of the Profession, and also Architectural Students, are cordially invited to make the fullest use of the Library.

TERRA COTTA

has stood the mighty test of Time

MANY years before the Christian era buildings were faced with Terra Cotta, and those structures which still survive are convincing testimony to the beauty and durability of this wonderful facing material.

Terra Cotta is par excellence the material which combines permanence and durability with beauty, form and colour. Unaffected by climatic and atmospheric conditions Terra Cotta is unrivalled as a facing material; and the scope it affords for design and colour is practically unlimited.

Architects and builders who would give the finest and most permanent expression to their ideals should thoroughly investigate the claims of Terra Cotta.

❦

You are invited to write for a copy of "Terra Cotta," which contains many beautiful illustrations of buildings faced with Terra Cotta. Sent free and post paid, on application to the

184736.—Walls.—Dorph, V., 13 Adolph Frediks Kyrkogata, Stockholm.—One or two courses of solid bricks alternate with a course composed of solid bricks on edge and hollow bricks, which may be inside the wall or show on the face. The bricks are preferably spaced apart, and the hollows may be continuous along the course, or discontinuous. The spaces and hollows may be filled with turf, moss, sawdust, etc.

184584.—Walls, Building Blocks, etc.—Wallis, J. E., Troy Mill House, West Hyde, Rickmansworth, Hertfordshire. — In building blocks, etc., of the type having on two adjacent edges wedge-shaped ribs and on the remaining edges corresponding channels or grooves, registering ribs B^1, C^1 are provided projecting from the ribs and are adapted to fit the bottom of the grooves of adjacent blocks, so as to make them self-aligning. The horizontal rib B is preferably provided with two ribs B^1, while the vertical rib C has one rib C^1. In order to ensure the proper amount of mortar, etc., in the joints, the mortar, etc., is wiped on each side of the slab by a trowel laid with its edge on the line *x*. The invention is applicable to tiles and bricks.

Rayner & Co., registered patent agents, of 5 Chancery Lane, London, W.C. 2, from whom readers of the Journal may obtain all information free relating to patents, trade marks, and designs. Messrs. Rayner & Co. will obtain printed copies of the published specifications and forward on post free for the official price of 1/- each.

Electrical Notes

The Use of Light in Hospital Wards

" In designing an installation, whether of electricity, gas, or other illuminant, it should always be remembered that the human eye has been evolved under untold ages of Nature's environment and that any material departure from Nature's principles of illumination must give trouble." Thus Mr. John Darch introduced the subject of the Use of Light in Hospitals in a discussion by the Illuminating Engineering Society. There should, he continued, be no glare from visible light sources, reflections, or glaring glassware. It would be unpleasant to the nurses or doctors, but it may occasion real distress to the sick, particularly when the glare enters the lower part of the eye, so much the more likely with the ward patient. On the other hand, insufficient light is also injurious. I have seen patients straining their eyes and twisting their necks and bodies in the endeavour to read by insufficient and badly placed lights. Many wards have no patients' lights.

The characteristic of ward lighting should be one that is quiet and pleasing. This can best be obtained by a system of general lighting combined with local lighting. The general lighting need not be great—anything from a half to one foot-candle, according to the colour of the room, but it must be well diffused and without glare. It might be had by pendants of either indirect lighting with dishes of a quietly coloured and dense translucency not passing more than $\frac{1}{5}$ candle-power per sq. inch; or by a ring screen of coloured china or silk of size and form just to conceal the lamps. In either case they should spread the light evenly over the ceilings and friezes.

With this quiet and inoffensive general lighting each patient should be provided with his own local light giving him 3 foot-candles on his book, and under his or his nurse's control and for use only when he wants it. This may be on a short smooth bracket, set close back to the wall, so as not to be in view of the patient. It should not be in the centre of the bed head, as is usual, but about 15 inches to the patient's left to avoid heat on his head and gloss on his book. It should illumine the patient's chart and be useful for the nurse or doctor. As this lamp should offend no one else, it should be fully recessed in a dark green shade; or an alternative, which could be more easily cleaned, would be a semi-circular screen of the same material and colour.

Local lighting is also necessary on the sisters' and nurses' tables. Each should have one or more well-shaded table lamps adjustable so as to give an average of 4 foot-candles, with deep rose silk flounces with white lining that would thoroughly screen the lamps and give a cheerful touch of colour to the room.

Night light is of course necessary, and nothing is more soothing than a quiet indirect light. A small lamp could quite well be used in one or more of the general lighting units, but it should be on a separate circuit.

The decoration of the ward is an important factor in its illumination. Although ward ceilings and walls are frequently to be found varnished, there should be no gloss above the dado, as any success in avoiding glare is usually frustrated by seeing all the lamps mirrored in ceilings and walls.

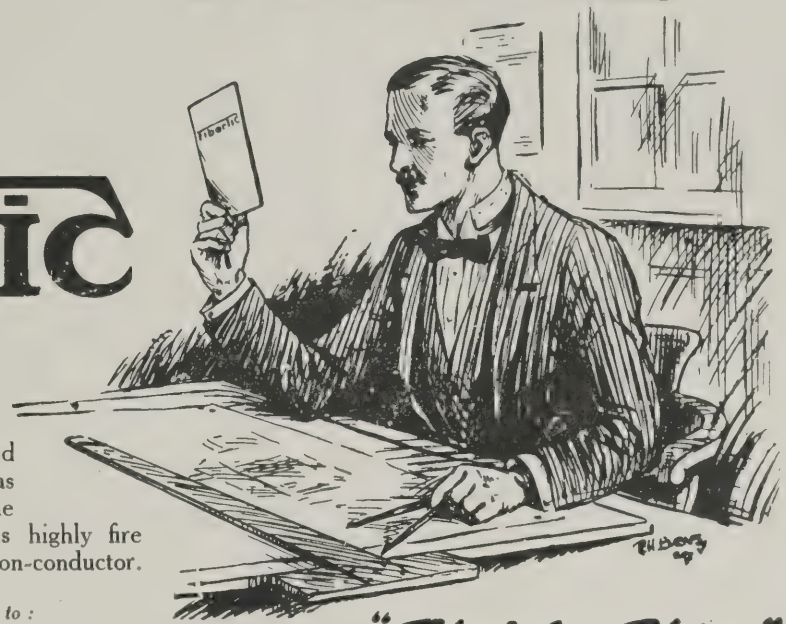
The ceilings and friezes should be white. I am aware that bed-ridden patients' eyes are directed upwards, but this will be no discomfort if the lighting is arranged as I have suggested. The walls below are better of a quiet and restful colour of medium strength, darker or lighter, according to window space and aspect. The dado should be dark, as it is of little value in illumination and the eye needs rest.

Another Building Problem Solved!

The Root Fibre Board

Fiberlic

For Walls & Ceilings



THIS fine Wallboard eliminates Lath and Plaster. It saves both time and money as it can easily be erected, and obviates the mess and bother entailed with Plaster. It is highly fire resisting, moisture proof, and is an excellent non-conductor.

BUILDING.

November 9.—**HOUSE. Morpeth.**—Re-erection of the manager's house, for the Stakeford Social Club, Ltd. Apply Mr. C. F. Murphy, Architect, Lloyds Bank Chambers, Morpeth.

November 9.—**HOUSES. Glasgow.**—Erection of eight houses in Auchinairn and four in Carlyle Drive, Cardonald, for the Glasgow Public Utility Society, Ltd. Apply Mr. J. Laing, Secretary, 203 West George Street. Deposit £1 1s.

November 9.—**HOUSE. Golcar.**—Erection (mason's work excepted) of a dwelling-house in Station Road, Golcar. Apply Messrs. J. Berry and Sons, Architects and Surveyors, 3 Market Place, Huddersfield.

November 9.—**ALTERATIONS, &c. Nantwich.**—Alterations and additions to the premises known as "The Mount," Nantwich, for the Guardians. Apply Mr. C. E. Davenport, Architect, 152 Hospital Street, Nantwich. Deposit 10s. 6d.

November 9-24. — **RESIDENCE. Otley.** — The Governors of Otley Grammar School invite tenders for erection of headmaster's residence in Farnley Lane, Otley. Apply not later than November 9, to the Education Department, County Hall, Wakefield, or Messrs. Sinclair and Atkinson, 40 Boroughgate, Otley.

November 9.—**REPAIRS. Alnwick.**—Repairs to dilapidations at the Workhouse, for the Guardians. Apply at the Workhouse.

November 9.—**GUN PARK AND HARNESS ROOM. Blandford.**—Building a gun park and harness room at Blandford for the Territorial Army Association of the County of Dorset. Apply Mr. C. W. Pike, Architect and Surveyor, Savernake House, High West Street, Dorchester. Deposit £2 2s.

November 10.—**SLATER WORK. Perkinsville, Durham.**—Slater's work at the Perkinsville (Co. Durham) housing site, for H.M.O.W. Apply Contracts Branch, H.M. Office of Works, King Charles Street, London, S.W.1.

November 10.—**ADDITIONS, &c. Hilgay, Norfolk.**—Additions and repairs to farmhouse at Pleasant House Farm, Hilgay, Norfolk, for the Small Holdings Committee. Apply County Land Agent, Shirehouse, Norwich. Deposit £1 1s.

November 10.—**REPAIR. Flitwick, Beds.**—Repair works to the temporary school premises at Flitwick, and the erection of a range of wooden earth closets, for the Education Committee of the Bedfordshire County Council. Apply County Surveyor, Shire Hall, Bedford.

November 10.—**HOUSES. Tividale.**—Erection of 12 houses at Rowley Regis and 16 houses at Tividale, for the Rowley Regis Urban District Council. Apply Council House, Old Hill.

November 10.—**HOUSE. Hammersmith.**—Erection of a detached house in Western Avenue new housing estate, Hammersmith. Apply Mr. J. E. Franck, F.R.I.B.A., 1 New Court, Lincoln's Inn. Deposit £2.2s.

November 11. — **MONUMENT. Netherthong, Yorks.**—Making and erection of a monument in Bradford stone, as a memorial to the fallen, at a cost of not more than £150. Apply Hon. Secretary, Mr. T. Dyson, Moorgate, Netherthong, Thongsbridge.

November 11.—**ADAPTATION. St. Columb, Cornwall.**—Adaptation and repair of the existing farm buildings at Ruthvoes Farm, St. Columb, for the Cornwall County Council. Apply County Land Agent, County Hall, Truro. Deposit £1 1s.

November 11.—**ADAPTATION. St. Columb. Cornwall.**—Adaptation of a cottage and erection of new farm buildings at Quoit Farm, St. Columb, for the Cornwall County Council. Apply County Land Agent, County Hall, Truro. Deposit £1 1s.

November 11.—**PULLING DOWN, &c. Manchester.**—Pulling down and setting back to the improved building line of the stone boundary wall at St. James's Rectory, Wellington Street, Gorton, for the Improvement and Buildings Committee. Apply City Surveyor (Improvement and Buildings Department). Deposit £1 1s.

November 11.—**EXTENSION. Bennitthorpe.**—Extension and alteration of the Comrades' Social Club, Bennitthorpe. Apply Mr. W. H. Butler, Secretary.

November 11.—**HOMES. Brighouse.**—Masons', joiners', plumbers', plasterers', slaters', electric light, and heating, and Terrazzo floor-layers' work in erection of additional homes at the Smith Orphan Homes, Boothroyd, Brighouse. Apply Mr. R. F. Rogerson, Architect, Brighouse.

November 13.—**EXTENSION. Grimsby.**—Extension to the kitchen at the rear of the ladies' lavatory in East Marsh Street, for the Public Conveniences Committee. Apply Borough Engineer, Mr. H. Gilbert Whyatt, M.I.C.E., 170 Victoria Street.

November 13.—**WORKS. Oxford.**—Building and sanitary work at their schools, "The Poplars," Cowley, Oxford, for the Guardians. Apply Schools.

November 13.—**COWHOUSE, &c. Colchester.**—Erection of a new cowhouse and additions to existing farm buildings at the Severalls Mental Hospital, near Colchester, for the Essex County Council. Apply County Architect, Old Court, Springfield, Chelmsford, or at the hospital.

November 14.—**HOUSES. Warsop, Notts.**—Erection of 100 houses near Welbeck Colliery, Warsop, Notts, for the New Hucknall Colliery Co., Ltd., near Mansfield, Notts. Apply Head Office, New Hucknall Colliery, near Mansfield. Deposit £5 5s.

November 14.—**REPAIRS. Sandown, I.W.**—Repairs to roofs of church, also sundry repairs, for the Parochial Church Council of Christ Church, Sandown. Apply Mr. E. L. Smith, P.A.S.I., Architect, Sandown.

November 14.—**ALTERATIONS. Perth.**—Alterations on the Mansion House of Murie, Errol, and the erection of pavilions and other buildings on the grounds thereof, for the Perth and Perthshire Joint Sanatorium Board. Apply Messrs. G. P. K. Young and Son, F. and A.R.I.B.A., 42 Tay Street, Perth. Deposit £2.

November 14.—**WALL. Rochdale.**—Construction of a rubble retaining wall in connection with the extensions of the sewage works at Roch Mills, Rochdale, for the Paving, &c., Committee. Apply Borough Surveyor's Office.

November 14.—**HOUSES. Cowdenbeath.**—Works in connection with erection of 16 houses in Stenhouse Street, for the Town Council. Apply Mr. C. A. Alexander, Burgh Surveyor, Town House, Cowdenbeath. Deposit £2 2s.

November 14.—**CONVENIENCE. Croydon.**—Construction of underground convenience for women, and sundry works of alteration to men's convenience in roadway adjoining the Swan and Sugar Loaf Hotel, South Croydon, for the Town Council. Apply Borough Engineer, Town Hall. Deposit £1 1s.

November 15.—**HOUSES. Dartford.**—Erection of 16 houses (in blocks of 4) on the Lowfield Street housing estate, for the U.D.C. Apply Mr. J. Hurtley, Clerk Council Offices, Dartford. Deposit £2 2s.

November 15.—**BUNGALOW. Huddersfield.** Erection of a bungalow in Talbot Avenue, Huddersfield. Apply Messrs. J. Berry and Sons, Architects and Surveyors, 3 Market Place, Huddersfield.

November 15.—**STABLING, &c. Reigate.**—Erection of stabling, &c., at the New Pond Farm, Earlswood, Redhill, for the Reigate Town Council. Apply Borough Surveyor, Municipal Buildings, Reigate.

November 15. — **TELEPHONE EXCHANGE. Golders Green.**—Erection of a telephone exchange at Golders Green, London, N.W., for H.M.O.W. Apply Contracts Branch, H.M. Office of Works, King Charles Street, London, S.W.1. Deposit £1 1s.

November 20.—**ENGINE-HOUSE. Isle of Dogs.**—Construction of an engine-house in brick and concrete, with slate roof, and foundations for engines, pumps, and auxiliary machinery; also the construction of supply, suction, and delivery culverts, and a penstock chamber and other subsidiary works at the Isle of Dogs pumping station, for the London County Council. Apply Chief Engineer to the Council, at the Old County Hall, Spring Gardens, S.W.1. Deposit £5.

November 20.—**URINAL. Wigan.**—Construction of a public urinal in Wallgate, for the Corporation. Apply Mr. R. B. Donald, M.I.C.E., Borough Engineer, Municipal Buildings, Wigan.

November 28.—**PUBLIC BATHS. Bolton.**—Erection of public baths and washhouses in Moss Street, for the Corporation. Apply Housing Office, 14 Acresfield, Bolton. Deposit £2 2s.

November 30.—**PALACE. Barcelona.**—In construction of the Grand Palace of Nations. Apply Don José y Cadafalch, offices of the exhibition (Lerida Street), and Dept. of Overseas Trade (Room 50), 35 Old Queen Street, London, S.W.1.

December 15.—**STAND, &c. Hertford.**—The Ground Improvement Committee of the Hertford Town Football Club invite tenders, together with plans, detail drawings, &c., for provision and erection of a sectional stand and other accommodation to seat 400 people. Apply Hon. Secretary (Mr. H. J. Gray, Club Headquarters, Salisbury Arms Hotel, Hertford).

No Date.—**STEEL STRUCTURE. Bangor.**—Supply and/or erection of steel structure with galvanized sides and roofing for motorbus garage in Bangor, North Wales. Secondhand or new structure, about 90 ft. by 90 ft. Apply Messrs. Avery and Roberts, Ltd., 81 Renshaw Street, Liverpool.

No Date.—**HOUSE. Boston, Lincs.**—Erection of a dwelling-house at Fishtoft. Apply Mr. S. Marjason, Architect, Market Place, Boston.

No Date.—**GARAGE. Burslem.**—Erection of a brick and tile garage, High Lane, Burslem. Apply Messrs. Ford and Slater, Architects, Burslem.

No Date.—**OFFICES, &c. Clitheroe.**—New offices and store at Clitheroe for Messrs. Oswald Rowe & Co., Ltd. Apply Fairbrother and Hall, Architects, Law Courts Chambers, Blackburn.

ELECTRICAL.

November 10.—**TURBO-ALTERNATOR, &c. Aberdeen.**—Supply, delivery, and erection at their electricity works of one 10,000-kw. turbo-alternator with surface condenser and auxiliaries for the Corporation. Apply Office of the City Electrical Engineer, Millburn Street, Aberdeen. Deposit £5 5s.

November 11.—**CRANE, &c. Plymouth.**—Additional electric crane, grab, and storage hoppers, to be erected at Corporation Wharf, Pottery Quay, Devonport, for the Gas Committee of the Plymouth Corporation. Apply Mr. W. P. Tervet, Engineer and Manager, Gasworks, Devonport.

November 11.—**TURBO-ALTERNATOR. Montevideo, Uruguay.**—Construction, delivery, and erection in the State power-house at Montevideo of a turbo-alternator of 10,000-kw. capacity to run at 3,000 r.p.m., together with the necessary condensing plant and accessories, for the State Electric Light Works. Apply Department of Overseas Trade (Room 49), 35 Old Queen Street, Westminster, S.W.1. (Ref. 3667/F.L./E.P.)

November 13.—**CABLE. Warrington.**—Supply of high and low tension paper and lead covered cable, for the Electricity and Tramways Committee. Apply Mr. F. V. L. Mathias, Borough Electrical and Tramways Engineer, Howley, Warrington. Deposit £1 1s.

November 14.—**TURBO-ALTERNATOR. Bristol.**—Supply, delivery, and erection of one 4,000 k.v.a. single-phase (93 periodicity) continuously rated steam turbo-alternator, complete with condensing plant, for the Electrical Committee. Apply Mr. H. F. Proctor, M.I.C.E., M.I.E.E., Chief Engineer and General Manager, The Exchange, Bristol. Deposit £2 2s.

November 15.—**CRANES. Riga.**—Latvian Marine Department are inviting tenders for eight electrically driven rotating cranes for the Riga Customs Yard. Apply Department of Overseas Trade (Room 50), 35 Old Queen Street, S.W.1.

November 21.—**SWITCHBOARD PARTS. Australia.**—Supply of switchboard parts, schedule 67 (Nov. 21) for the Commonwealth of Australia. Apply Supply Officer, Room 101, Australia House, Strand, London, W.C.2.

November 21.—**SLUDGE PUMPS. Dublin.**—The Corporation of Dublin are prepared to receive from the manufacturers of pumping machinery for sewage sludge particulars, designs and tenders for duplicate electrically driven units to raise about 78,000 gallons per hour of sludge through a lift of 34 ft. Apply City Engineer's Office, 28 Castle Street, Dublin, or Mr. J. S. Alford, M.I.C.E., 11 Victoria Street, Westminster, S.W.1. Deposit £2 2s.

November 23.—**SWITCHGEAR, &c. Pretoria.**—His Majesty's Trade Commissioner in South Africa reports that the date for the presentation of tenders for above has been extended from November 9 until 12 noon on November 23.

November 23.—**POLE FITTINGS, &c. Pretoria, S.A.**—Electric Supply and Tramways Department of the Pretoria Municipality is inviting tenders for supply of pole fittings, insulators, &c. Apply Department of Overseas Trade, Room 49, 35 Old Queen Street, Westminster, S.W.1. (Reference 9798/E.D./E.P.)

November 28.—**SWITCHGEAR. Mangahao, N.Z.**—Supervision of the erection, and of the testing after erection, of outdoor switchgear (section 21) and indoor switchgear (section 33) for the Khandallah sub-station forming part of the Mangahao power scheme, for the Public Works Tender Board. Apply Department of Overseas Trade, Room 49, 35 Old Queen Street, Westminster, S.W.1. (Ref. 9468/Ed./E.P.) Deposit £100.

November 28.—**TRANSFORMERS. Wellington.**—The Public Works Tender Board, Wellington, are inviting tenders for the manufacture, supply, and delivery, ex ship's slings Auckland, of two exciter transformers in connection with the Waikato power scheme, section 57 The transformers are required to transform three-phase 50-cycle power at 5,250 volts between phases to power at 400 volts between phases, and will be used for supplying power to 220 k.w. exciter units in the power house at Horahora. They are to be of the oil-filled and self-cooled type, and to be rated 275 k.v.a. 93 per cent. power factor. Apply Department of Overseas Trade (Room 49), 35 Old Queen Street, Westminster, London, S.W.1.

November 29.—**TRUCKS, &c. Melbourne.**—The Victorian Railways Commissioners are calling for tenders for supply of three electric industrial trucks, one trailer, and two spare batteries. Apply Department of Overseas Trade (Room 50), 35 Old Queen Street, London, S.W.1. Deposit half per cent. (Reference D.O.T./9623/E.D./E.C.)

December 15.—**PLANT. Wellington.**—The Southland Electric Power Board are calling for tenders for supply and delivery of plant and material. Apply Department of Overseas Trade (Room 49), 35 Old Queen Street, Westminster, S.W.1.

December 20.—**ELECTRIC CRANES AND LIFTS FOR EGYPT. Alexandria.**—The Administration of Ports and Lighthouses, Alexandria, is inviting tenders for fixed and moveable lifting apparatus for service at the port of Alexandria. Apply Department of Overseas Trade (Room 50), 35 Old Queen Street, London, S.W.1.

January 9.—**CRANE. New Zealand.**—Supply and delivery of one electric travelling crane in connection with the Waikato power scheme, section 58. The crane is to be designed for lifting, traversing and travelling loads up to 27 tons. Apply Department of Overseas Trade (Room 50), 35 Old Queen Street, Westminster, London, S.W.1.

January 15-31.—**PLANT. Melbourne.**—Supply, delivery, &c., of plant for the Morwell power scheme, for the State Electricity Commission of Victoria. Apply Agent-General for Victoria, Melbourne Place, Strand, London, W.C.2. Deposit £2 2s.

SANITARY FITTINGS SPECIALISTS

Walk in Safety

It would indeed need a deliberate attempt to cause a slip on Ferodo Stair Treads.

There is no other stair fitting which looks so well after the safety of the user as this chemically impregnated woven cotton.

The closely woven texture chemically "bonded" gives to the Treads the durability of metal. Even when worn to paper thickness they afford a sure foothold.

The many designs and colours in which Ferodo Treads are made are adapted to suit all staircases of wood, iron, marble, or stone.

FERODO
REGISTERED

Patent **Stair Treads**

Ferodo Stair Treads are designed to take all the wear of foot traffic, leaving the linoleum or carpet practically untouched.

Our illustrated list D gives full particulars of styles, colours, and prices. A post card will bring a copy by return.

FERODO Ltd., CHAPEL-EN-LE-FRITH,
DERBYSHIRE.

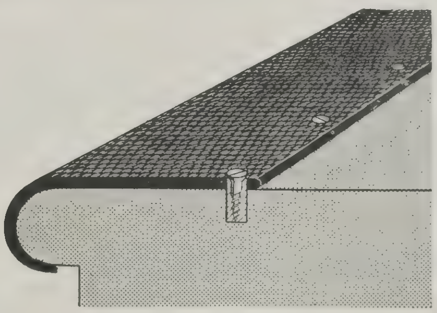
THREE TYPES of Ferodo Treads

1 ***No 1903. For stone steps.*** A special method of fitting Ferodo Stair Treads to Stone Steps. The tread is cemented to the step and fixed with ordinary wood screws. Can be fixed to worn steps.

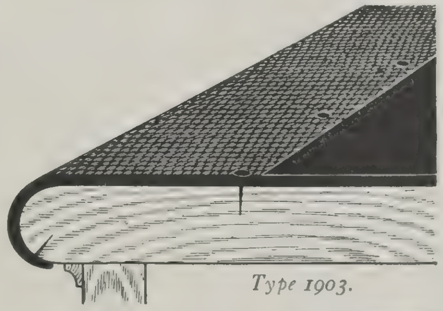
An excellent method of preserving stone staircases against wear.

2 ***No. 1903.***—A simple nosing without flange, may be used with or without linoleum backing. Supplied in any width.

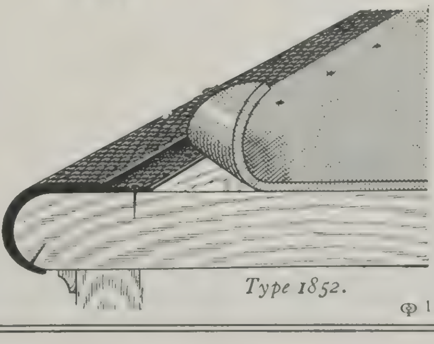
3 ***No. 1852.***—The flanged type to be used in conjunction with lino. or carpet. The flange allows a neat, almost invisible joint to be made and prevents any danger of the nosing breaking adrift.



Type 1903, for stone steps.



Type 1903.



Type 1852.

Φ 1

ENGINEERING.

November 10.—**WATER MAIN. Nuneaton.**—Excavating for and the haulage, laying and jointing of about 430 yards of 15 in. diameter and about 1,600 yards of 12 in. diameter cast-iron water main, for the Corporation. Apply Mr. R. C. Moon, A.M.I.C.E., Water Engineer, Queen's Road, Nuneaton. Deposit £2 2s.

November 14.—**POINT CONTROLLERS. Edinburgh.**—Supply, delivery, and fitting up in position of eight automatic point controllers, for the Corporation. Apply Tramways Manager, 2 St. James Square, Edinburgh.

November 15.—**BOILERS, &c. South Shields.**—Manufacture, delivery and erection complete, at the Corporation Electricity Works, West Holborn, South Shields, of two water-tube boilers, with mechanical stokers, superheaters, economisers, induced draught plant, and steel chimney; also for ash-handling plant and extension to boiler-house, for the Corporation. Apply Mr. J. Edgar, Electricity Offices, Victoria Terrace, South Shields. Deposit £2 2s.

November 15.—**TUBULAR POLES. Perth.**—The Postmaster-General's Department, Perth, Western Australia, is inviting tenders for supply and delivery of 1,490 galvanized tubular poles. Apply Department of Overseas Trade (Room 47), 35 Old Queen Street, S.W.1.

November 15.—**TUBULAR POLES. Australia.**—Supply of 1,500 galvanized iron or steel tubular poles for telegraph poles, 20 ft. long, schedule 755. Apply Supply Officer, Room 101, Australia House, Strand, London, W.C.2.

November 16.—**GEAR WHEELS. Johannesburg.**—28 tramcar gear wheels (contract No. 965), for the Municipal Council of Johannesburg. Apply Department of Overseas Trade (Room 50), 35 Old Queen Street, London, S.W.1.

November 18.—**TUBES. Johannesburg, S.A.**—His Majesty's Senior Trade Commissioner in South Africa reports that the Municipal Council of Johannesburg invites tenders for supply and delivery at President Street store of 128 large and 128 small solid-drawn steel superheater tubes, 1½ in. outside diameter, No. 9 s.w.g. for 17,000 lb. Babcock and Wilcox boiler, in accordance with drawing No. 1,511, dated September 12, 1922. (Contract 977.) A deposit of 10 per cent. of the total amount of the tender. Apply Department of Overseas Trade (Room 47), 35 Old Queen Street, Westminster, S.W.1. (Ref. 9855/E.D./E.P.)

November 20.—**LAUNDRY MACHINERY. Hemsworth.**—Delivery and erection of laundry machinery at the Hemsworth Poor Law Institution, Hemsworth, near Wakefield, for the Guardians. Apply Mr. W. T. Lynam, A.M.I.C.E., Engineer, Council Offices, Hemsworth, near Wakefield. Deposit £1 1s.

November 25.—**GASHOLDER TANKS. Birmingham.**—The construction of two concrete gasholder tanks, 254 ft. diameter by 45 ft. deep, at the site of the new gasworks, Washwood Heath, for the Corporation. Apply Engineer-in-Chief, City Gasworks, Saltley. Deposit £5.

November 27.—**PUMPING MACHINERY, &c. Hornchurch, Essex.**—Construction and erection of their proposed outfall works adjoining Rainham Creek, parish of Hornchurch, Essex, of the pumping machinery and other plant required, for Romford R.D.C. The contract includes centrifugal pumps, vertical semi-Diesel engines, overhead travelling crane, sludge ejectors, pipe work, and all auxiliary plant and accessories. Apply Mr. W. Fairley, M.I.C.E., Parliament Mansions, Westminster, S.W.1. Deposit £5 5s.

December 6.—**HARBOUR WORKS. Madeira.**—Construction of an artificial harbour at Funchal. Apply Department of Overseas Trade, 35 Old Queen Street, London, S.W.1.

December 18.—**COAL HANDLING PLANT. Melbourne.**—Supply, delivery, &c., of the following for the Morwell power scheme, for the State Electricity Commission of Victoria : Specification No. 282 : Coal-handling plant for Morwell power station and briquetting works. Apply Agent-General for Victoria, Melbourne Place Strand, London, W.C.2.

January 6.—**BRIDGE. Glasgow.**—The Corporation of Glasgow invite designs and offers for the construction of a ferro-concrete bridge over the Clyde at Oswald Street. Apply Office of Public Works, City Chambers, 64 Cochrane Street.

January 19.—**PLANT. Melbourne.**—Supply, delivery, &c., of the following for the Morwell power scheme, for the State Electricity Commission of Victoria : Specification No. 23-4.—Steam turbine-driven boiler feed pumps. Apply to Agent-General for Victoria, Melbourne Place, Strand, London, W.C.2. Deposit £1 1s.

No Date.—**FENCING, &c. Cardiff.**—Supplying and fixing approximately 1,436 yards of six wire reinforced concrete post and wire fencing at Craigwen, Penyrheol, and Caerphilly, for the Glamorgan Agricultural Committee. Apply the County Land Agent, 30 Park Place, Cardiff.

PAINTING.

November 11.—**PAINTING. Fence Houses, Durham.**—Painting and decorating of New Lambton Wesleyan Methodist Church. Apply Mr. G. R. Lowdon, 47 Station Avenue South, Fence Houses.

November 17.—**PAINTING. Pontypridd.**—Painting, colouring, and cleaning of the following schools during the Christmas holidays, for the Pontypridd Education Committee : Mill Street H.E. School (all departments); Pontshonorton Schools (manual training and girls' and infant departments); Graig Schools (boys', girls', and infant departments); Hopkinstown Schools (infant department); and Roman Catholic School (mixed and infant departments). Apply Mr. W. E. Lowe. Deposit £2.

November 22.—**PAINTING. Harrogate.**—Painting, colouring, limewashing, &c., at the Royal Bath Hospital and Rawson Convalescent Home, Harrogate. Apply Mr. E. P. L. Dixon, M.A., Secretary.

December 4.—**PAINTING, &c. Milnsbridge.**—Painting and decorating Milnsbridge Baptist Chapel. Apply Mr. G. E. Beaumont, Kirkfield, Cowlersley.

ROADS AND SEWERS.

November 9.—**CONVERSION. Beeston, Notts.**—Conversion of 200 pail closets into w.c.'s, for the Beeston Urban District Council. Apply Surveyor, Mr. E. A. Bush.

November 11.—**ROAD WORKS. Chester.**—Reconstruction with granite setts on reinforced concrete foundations of the following streets, viz. :—St. Anne's Street, George Street, Gorse Stacks, Victoria Road; also for the reconstruction with natural rock asphalte on reinforced concrete foundations of the following, viz. :—City Road, for the Town Council. Apply Mr. C. Greenwood, A.M.I.C.E.

November 13.—**DRAINAGE WORK. Mortlake.**—Drainage, piping-in ditches and watercourse, Palewell Common, Mortlake, for the Barnes U.D.C. Apply Mr. G. B. Tomes, A.M.I.C.E., Engineer and Surveyor, High Street, Mortlake.

November 13.—**MAKING-UP. Mortlake.**—Making-up of the passage at the rear of Nos. 461 to 497 Upper Richmond Road, Mortlake, S.W., with reinforced concrete on a hardcore foundation, for the Barnes U.D.C. Apply Surveyor, Council House, Mortlake.

November 13.—**SUBSOIL DRAINAGE. Mortlake.**—Execution of works of subsoil drainage, &c., at Palewell Common, Mortlake, for the Barnes U.D.C. Apply Surveyor, Council House, Mortlake.

November 15.—**STREET WORKS. Blackpool.**—Surface draining and forming of private streets, for the Highway Committee. Apply Borough Engineer's Office. Deposit £1.

No Date.—**PAVING. Goole.**—Paving of the footpaths to 14 houses in New Close Lane and Brough Street, for the Goole Urban District Council. Apply Mr. J. H. Castle, Engineer and Surveyor, Council Offices, Goole.

Trade and Craft

The Strength of Bryscom Stone.

The Bryscom Quarries, Ltd., Draycott, Somerset, have issued a leaflet showing the results obtained by Messrs. D. Kirkcaldy and Sons, who recently carried out some crushing strain tests on their stone. From this it appears that whilst the highest crushing strain of other stones ranged from 128 to 802 tons per sq. ft., Bryscom stone did not crush until tested at 1,011 tons per sq. ft.

Osram Lamps.

The General Electric Company have received the following letter from Mr. A. E. Farrow, chief engineer for the Windsor Electrical Installation Co., Ltd.: "Undoubtedly you saw in the daily papers that there has been an accident in Windsor through two motor-cars colliding with one of our street lighting standards. The standard in question was 25 ft. in height, and was broken in three pieces, but you will be interested to know that the Osram lamp (200 c.p.) was not broken."

"Met-wood."

Mr. E. T. Bartlett, 65 Victoria Street, S.W.1, has introduced on the English market an underfloor known as "Met-wood," a floor finish which has proved a great success. It is claimed to be suitable for flooring in ships' construction, being entirely free from magnesite or lye. The composition is entirely neutral, and it is delivered in liquid and powder form. When mixed on the site in the proportion of three to five, spread to a thickness of ⅜ in., it forms a homogeneous mass with a tenacity to adhere to steel, iron, stone or wood. Met-wood sets in about two or three days, and is then ready to receive lino, parquet, or rubber covering. A layer of Met-wood on old floor boards is said to lengthen the life of the top covering 75 per cent. Architects or others interested are invited to visit the above office and inspect a section of flooring.

The Improved Nautilus Grate.

A new illustrated catalogue has been issued by the Nautilus Fire Co., Ltd., to explain the improvements made to the Nautilus grate. The improvements consist mainly in the elimination of minor details rendered no longer necessary by certain adjustments of design. Though costing substantially less, therefore, the improved Nautilus is no less efficient than its predecessor, whilst it represents a considerable improvement in appearance. The fundamental Nautilus fuel-saving principle consists in the provision of two smoke outlets at the back of the grate. By this means, the heat which escapes up the chimney of an ordinary grate by reason of the chimney outlet being situated above the fire, is collected by the Nautilus heat-conserving canopy and given off into the apartment. With its specially built flue and essential fittings the Nautilus grate constitutes a self-contained heating system. One of the essential fittings is the Nautilus damper embodied in the cast-iron back. By means of this fitting, the rate of combustion can be completely and economically controlled. Wherever heating by coal or other solid fuel is favoured, and wherever it is desired to preserve the charm and associations of the open fire of coal, coke, wood, or peat, the Nautilus grate meets all requirements, decorative and useful. The Nautilus, indeed, is a familiar sight in many a fine old English mansion, where it has been desired to preserve the atmosphere of the particular period, whilst securing the advantages of an efficient principle of heating by solid fuel. Nautilus grates are to be seen in the Royal palaces of Balmoral and Osborne, as well as in clubs, hotels, offices of Government departments, of local authorities, and of railway companies, and in private residences of many descriptions. Copies of the catalogue may be obtained from the Company at 60 Oxford Street, London, W.1.

A Home of Advertising.

The new Samson Clark building, which has been formally opened by Lord Leverhulme, is the largest building in the country devoted solely to advertising service.

On a corner site, the architect, Mr. Courtenay Constantine, F.R.I.B.A., of Messrs. Constantine and Vernon, has endeavoured to take every advantage of its position, both from the architectural standpoint and from the point of utility, particularly as regards lighting and ventilation.

The building is constructed on the steel frame principle, and the façades, designed in a simple treatment of the English Renaissance, are faced in white glazed terra-cotta. The makers have assisted the architect very materially by moulding the material in large blocks, thereby preserving an architectural character which is not generally possible.

The building is surmounted by an octagonal tower placed at the angle of the two frontages, and a red Roman tile roof has been introduced to provide a contrast in colour to the otherwise unbroken front of white faïence.

In the seven floors of the building are assembled all the various departments of advertising work, including printing and block making. The conference room and recreation hall on the third floor is one of the most attractive features of the building, and is intended for business lectures and trade displays as well as for a staff recreation centre

Holophane Filterlite.

Messrs. Holophane, Ltd. (Scientific Illumination), of Elverton Street, Vincent Square, London, S.W.1, have sent us a pamphlet illustrating and describing the Holophane Filterlite, a new type of semi-indirect unit which they have recently placed on the market. The question of a really efficient semi-direct unit is one which has been receiving a great deal of attention for a considerable period, and the firm believe that with the new Holophane Filterlite they have solved the problem satisfactorily.

The Holophane Filterlite is a totally enclosed semi-indirect decorative unit embodying entirely new principles in interior lighting. It is a two-piece bowl having plain exterior surfaces with interior prismatic construction designed to control the light rays to give a wide light distribution with the maximum of efficiency and the minimum of contrasts and glare. Light control is achieved principally by means of retracting and diffusing prisms on the *inside* surface of the glass.

The enclosing glass bowl is horizontally divided into three zones: An upper prismatic light transmitting and diffusing zone; a central zone provided with light transmitting prisms calculated to refract the rays in an upward direction; and a lower zone adapted to reflect part of the light rays upwardly for transmission by the upper zone, diffusing the rays not so reflected, which gives a surface brightness to the bowl of low luminosity.

The construction, beside having the advantage of being dust-proof, gives a minimum of glare, a very wide distribution of light, and since the refracting area acts almost entirely by transmission rather than reflection, the light it governs suffers no diminution due to interference by the unit.

The Filterlite is recommended for showrooms, restaurants, offices, drawing offices, reading rooms, and in similar locations where general even illumination is required over an area without sharp contrasts due to the brightness of the light source or harsh shadows.

The chief advantages claimed for the Filterlite are summarized as follows:—

1. It is the most efficient and semi-indirect unit on the market, and as efficient as any that our engineers have ever produced.
2. It is totally enclosed, and is, therefore, dust and insect proof.
3. The prisms are on the interior, both on the upper and lower halves, which makes it easy to clean.
4. It is, to all intents and purposes, shadowless.
5. It is of imposing design and well suited to match any special architectural feature.

Bell's United Asbestos Company, Limited.

The above company, whose offices are in Southwark Street, have issued particulars of an issue of £100,000 5½ per cent. debentures. The issue is corollary to arrangements for the amalgamation of the "Poilite" (Asbestos-Cement) section of this company's business with the British Everite and Asbestilite Works, Limited, of Manchester, which carries on a similar business. The new company will be known as "Bell's Poilite and Everite Company, Limited," and the combined business will be under the same management as heretofore except that this (Bell's United Asbestos) company will hold a controlling interest therein. By standardizing their manufactures of the well-known "Poilite" and "Everite" (Asbestos-Cement) building materials, the new company will be able to effect deliveries from the factory nearest to customers, thereby saving transport charges, giving a more prompt and efficient service, and, through co-ordination of effort, effecting further improvements and economies in costs of production.

Under the terms of amalgamation this (Bell's United Asbestos) company has agreed to subscribe in cash for £50,000 debentures (forming part of an authorized issue of £150,000) of Bell's Poilite and Everite Company, Limited, secured upon the whole of its property, the purchase consideration for which, including stock-in-trade, is approximately £475,000 to be satisfied as to £20,000 in cash (payable to the British Everite and Asbestilite Works, Limited), and the balance in fully paid shares and debentures of the new company. As the directors of this (Bell's United Asbestos) company attach great importance, in the prevailing conditions of trade, to the maintenance of its exceptionally strong financial position, they have decided to provide for the subscription of £50,000 to Bell's Poilite and Everite Company, Limited, by making the present issue of debentures, which also provides for the redemption of the outstanding balance, viz., £42,200, of this company's 5 per cent. debentures, but holders are given the right of exchanging these for 5½ per cent. debentures now offered in terms of the circular.

British Industries Fair (Birmingham)

The preliminary arrangements for the booking of space and stands at the British Industries Fair (Birmingham) for the 1923 Fair, to be held from February 19 to March 2, are rapidly nearing completion. British manufacturers have flocked very readily to assist by their active support in making the 1923 Fair bigger than any of its predecessors. Hundreds of firms engaged in the production of the commodities and services which the exhibits will comprise have booked their space, anticipating that a very much larger number of home, colonial, and foreign buyers will be in attendance at Castle Bromwich during the period of the Fair than on any previous occasion.

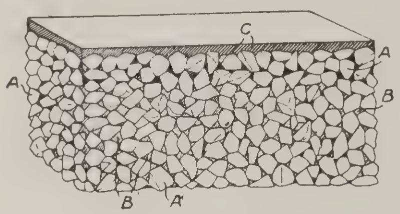
Abstract Published.

185669.—Paving-blocks, etc. — Pochin, C. D., the Hollies, Broughton Astley, near Leicester.—Blocks, etc., for pavings and floors, wall linings, etc., are formed of concrete impregnated with india-rubber or asphalt or other bitumen. Concrete formed of cement and the usual aggregate A with a small amount of water added is placed in a mould, and liquid or very plastic rubber, etc., is poured or compressed into the mould so that the interstices B of the concrete are filled and a tread surface C partly or entirely covers the surface. When rubber is employed the block is then vulcanized.



The above particulars are specially prepared by Messrs. Rayner & Co., Registered Patent Agents, of 5 Chancery Lane, London, W.C. 2, from whom readers of the Journal may obtain all information free relating to patents, trade marks, and designs. Messrs. Rayner & Co. will obtain printed copies of the published specifications and forward on post free for the official price of 1/- each.

Law Report

Claim for Work Done

Harloch v. *Smith.*

Oct. 24. Official Referees' Court.

Before Mr. G. A. Scott.

In this action the plaintiffs, who are builders and house decorators of Hackney, claimed £355 12s. 6d. from H. Hamilton Smith for work done and materials supplied. There was no appearance on the part of the defendant, who, in his defence, alleged that the work was incompetently done, and that the prices charged were unreasonable and excessive. According to the evidence of Mr. Harry Hastings Stevens, a member of the plaintiff's firm, he first met the defendant, who then resided at Bethnal Green, in October of last year, when he gave an estimate of £90 for certain specified work. That work was carried out, and defendant subsequently ordered other work which brought plaintiff's account up to the amount now claimed. Witness said that the charges were fair and reasonable, and the Referee gave judgment for the plaintiffs for the amount claimed with costs, dismissing the counterclaim, and ordering £75, which had been paid into court, to be paid out to plaintiffs' solicitors.

ART METAL STANDARDIZED STEEL SHELVING.

Art Metal Steel Shelving is made in a range of standard sizes that will accommodate any kind of materials, light or heavy, large or small, and may be secured in hundreds of combinations to fit all requirements.

Capacity in any Shelving installation is a matter of the number of shelves, their ability to sustain the necessary weight, and the strength of materials of which this Shelving is made. Judged by these standards Art Metal Shelving offers maximum storage capacity.

Art Metal Steel Shelving combines great strength with small bulk. Every possible cubic inch of space is available for the storage of goods. As compared with wood there is a definite gain per running foot of Shelving, due to the absence of bulk in the Upright members. While this additional capacity is of slight moment in a few feet of shelving, it becomes a decided importance in a large installation where there are several hundred running feet of shelving.

Art Metal Shelving costs no more than wood, and in many cases a great deal less than good wooden shelving.

ENQUIRIES ARE SOLICITED.

Estimates and Submission Plans for any work will be furnished on application.

CONTRACTS OPEN

Unless expressly stated to the contrary, all deposits required for bills of quantities, etc., are returned on receipt of bona-fide tenders. The words "Fair Wages Clause" inserted in certain paragraphs signify that persons tendering must conform to a fair wages clause in the contract, which requires them to pay the rates of wages current in the district.

BUILDING.

November 15–22.—**FLOORBOARDS, &c. Rothwell, Yorks.**—Laying of new floorboards and formation of open hoppers to the windows, &c., at Rothwell Council School, for the West Riding Education Committee. Apply Education Department, County Hall, Wakefield.

November 16.—**HOUSES, &c. Bridlington.**—Erection of dwelling-house and shop, Lansdowne Road, Bridlington, for Miss J. Thompson. Apply 14 Lansdowne Road.

November 16.—**RENOVATIONS, &c. Devonport.**—Renovations at the Children's Homes, 15 and 16 Cotehele Villas, for the Guardians. Apply Superintendent of the Children's Homes.

November 16.—**CONVERSION. Pontyclun.**—Work required to be done in the proposed conversion of the Victoria Buildings, Pontyclun, into Council Offices, for the Llantrisant and Llantwit Fardre Rural District Council. Apply Mr. T. Saunders, Surveyor, Council Offices, Pontyclun. Deposit £1 1s.

November 18.—**SCHOOL EXTENSION. Bromley, Kent.**—Temporary extension of the County School for Boys, Hayes Lane, Bromley, for the Education Committee. Apply Borough Engineer, Municipal Offices, Bromley. Deposit £2 2s.

November 18.—**STORY. Edmonton.**—Erecting and finishing for use an additional story over the Boardroom block, and certain alterations to the same, at 77 Bridport Road, Edmonton, for the Guardians. Apply Mr. E. Ridley, Clerk to the Guardians, 77 Bridport Road, N.18. Deposit £5 5s.

November 18.—**BUSINESS PREMISES. Frome.**—Erection of business premises in Bath Street and Palmer Street, Frome, for the Frome Co-operative and Industrial Society, Ltd. Apply Mr. P. B. Rigg, Architect, Monmouth House, Frome.

November 20.—**CONVENIENCE, &c. Port Talbot.**—Erection of a public convenience and store at the Goytre Cemetery, for the Corporation. Apply Borough Surveyor's Office, Municipal Buildings, Aberavon.

November 20.—**URINAL. Wigan.**—Construction of a public urinal in Wallgate, for the Corporation. Apply Mr. R. B. Donald, M.I.C.E., Borough Engineer, Municipal Buildings, Wigan.

November 20.—**HOUSES. Abergavenny.**—Erection and completion of six houses in three blocks of two, off Penypound, Abergavenny, for the Corporation. Apply Mr. W. H. Hopwood, Town Clerk, Town Hall, Abergavenny. Deposit £2 2s.

November 20.—**BOILER HOUSE. Cambridge.**—Erection of an additional boiler house at the pumping station, River Side, Cambridge, for the Town Council. Apply Borough Surveyor, Guildhall.

November 20.—**PUBLIC MARKET. Dundee.**—Reinforced concrete and other works required in erection of public market, for the Dundee Town Council. Apply Mr. J. Thomson, City Architect, 91 Commercial Street, Dundee.

November 20.—**ENGINE-HOUSE. Isle of Dogs.**—Construction of an engine-house in brick and concrete, with slate roof, and foundations for engines, pumps, and auxiliary machinery; also the construction of supply, suction, and delivery culverts, and a penstock chamber and other subsidiary works at the Isle of Dogs pumping station, for the London County Council. Apply Chief Engineer to the Council, at the Old County Hall, Spring Gardens, S.W.1. Deposit £5.

November 20.—**URINAL. Wigan.**—Construction of a public urinal in Wallgate, for the Corporation. Apply Mr. R. B. Donald, M.I.C.E., Borough Engineer, Municipal Buildings, Wigan.

November 20–27.—**JOINER WORKS, &c. Glasgow.**—Joiner works, etc., at the Gleneagles Hotel, for the Caledonian Railway Co. Apply Mr. M. Adam, Architect, 160 Hope Street, Glasgow. Deposit £2 2s. A representative of the company will attend at the site of the hotel building on November 15, 17, and 20, from 11 a.m. until 3 p.m.

November 21.—**HOUSES. Bargoed.**—Erection of 40 houses in blocks of four and two, types A and B, on the Heolddu site, Bargoed, for the Gellygaer Urban District Council. Apply Mr. P. Jones-Williams, Architect, Council Offices, Hengoed. Deposit £2 2s.

November 22.—**FARM PREMISES. Kelvedon and Coggeshall.**—Erection of sets of farm premises at Kelvedon and Coggeshall, Essex, for the Small Holdings Committee of the Essex County Council Deposit £1 1s.

November 28.—**PUBLIC BATHS. Bolton.**—Erection of public baths and washhouses in Moss Street, for the Corporation. Apply Housing Office, 14 Acresfield, Bolton. Deposit £2 2s.

November 30.—**PALACE. Barcelona.**—In construction of the Grand Palace of Nations. Apply Don José y Cadafalch, offices of the exhibition (Lerida Street), and Dept. of Overseas Trade (Room 50), 35 Old Queen Street, London, S.W.1.

December 2.—**ALTERATIONS, &c. Brentford.**—Alterations and additions to the public baths, Clifden Road, Brentford, for the Brentford Urban District Council. Apply Mr. W. J. W. Westlake, Engineer and Surveyor, Clifden House, Brentford. Deposit £2.

December 2.—**HOUSES. Brentford.**—Erection of (a) 20 houses and (b) 38 houses on land fronting Challis Road and Clayton Crescent, Brentford, for the Brentford Urban District Council. Apply Messrs. Dodge and Reid, Architects, 120 High Street, Brentford. Deposit £2.

December 15.—**STAND, &c. Hertford.**—The Ground Improvement Committee of the Hertford Town Football Club invite tenders, together with plans, detail drawings, &c., for provision and erection of a sectional stand and other accommodation to seat 400 people. Apply Hon. Secretary (Mr. H. J. Gray, Club Headquarters, Salisbury Arms Hotel, Hertford).

No Date.—**HOUSE, &c. Limbury.**—Erection of new house and homestead, &c., at Marsh Farm, Limbury, for the Bedfordshire County Council. Apply Mr. K. Tammell, A.R.I.B.A., Small Holdings Architect, 17 St. Peter's, Bedford. Deposit £2 2s.

No Date.—**REPAIRS. Withington, Salop.**—Repairs to Yew Tree Farm, Withington (between Shrewsbury and Wellington). Apply County Land Agent, Shirehall, Shrewsbury.

ELECTRICAL.

November 16.—**COOLING TOWERS. Hull.**—Supply of four natural-draught water-cooling towers, for the Electricity Committee. Apply City Treasurer, Guildhall, Hull. Deposit £1 1s.

November 20.—**ELECTRIC LIGHT INSTALLATION. Burton-on-Trent.**—Installing of electric light at the imbecile block, Poor Law Institution, Burton-on-Trent, for the Guardians. Apply Mr. H. S. Askew, Clerk to the Guardians, Union Offices, Burton-on-Trent.

November 21.—**SLUDGE PUMPS. Dublin.**—Designs and tenders for duplicate electrically driven units to raise about 78,000 gallons per hour of sludge through a lift of 34 ft., for the Corporation. Apply City Engineer's Office, 28 Castle Street, Dublin, and at the Offices of Mr. J. S. Alford, M.I.C.E., 11 Victoria Street, Westminster, S.W.1. Deposit £2 2s.

November 21.—**SWITCHBOARD PARTS. Australia.**—Supply of switchboard parts, schedule 67 (Nov. 21) for the Commonwealth of Australia. Apply Supply Officer, Room 101, Australia House, Strand, London, W.C.2.

November 21.—**SLUDGE PUMPS. Dublin.**—The Corporation of Dublin are prepared to receive from the manufacturers of pumping machinery for sewage sludge particulars, designs and tenders for duplicate electrically driven units to raise about 78,000 gallons per hour of sludge through a lift of 34 ft. Apply City Engineer's Office, 28 Castle Street, Dublin, or Mr. J. S. Alford, M.I.C.E., 11 Victoria Street, Westminster, S.W.1. Deposit £2 2s.

November 23.—**SWITCHGEAR, &c. Pretoria.**—His Majesty's Trade Commissioner in South Africa reports that the date for the presentation of tenders for above has been extended from November 9 until 12 noon on November 23.

November 23.—**POLE FITTINGS, &c. Pretoria, S.A.**—Electric Supply and Tramways Department of the Pretoria Municipality is inviting tenders tor supply of pole fittings, insulators, &c. Apply Department of Overseas Trade, Room 49, 35 Old Queen Street, Westminster, S.W.1. (Reference 9798/E.D./E.P.)

November 28.—**SWITCHGEAR. Mangahao, N.Z.**—Supervision of the erection, and of the testing after erection, of outdoor switchgear (section 21) and indoor switchgear (section 33) for the Khandallah sub-station forming part of the Mangahao power scheme, for the Public Works Tender Board. Apply Department of Overseas Trade, Room 49, 35 Old Queen Street, Westminster, S.W.1. (Ref. 9468/Ed./E.P.) Deposit £100.

November 28.—**TRANSFORMERS. Wellington.**—The Public Works Tender Board, Wellington, are inviting tenders for the manufacture, supply, and delivery, ex ship's slings Auckland, of two exciter transformers in connection with the Waikato power scheme, section 57 The transformers are required to transform three-phase 50-cycle power at 5,250 volts between phases to power at 400 volts between phases, and will be used for supplying power to 220 k.w. exciter units in the power house at Horahora. They are to be of the oil-filled and self-cooled type, and to be rated 275 k.v.a. 93 per cent. power factor. Apply Department of Overseas Trade (Room 49), 35 Old Queen Street, Westminster, London, S.W.1.

November 29.—**TRUCKS, &c. Melbourne.**—The Victorian Railways Commissioners are calling for tenders for supply of three electric industrial trucks, one trailer, and two spare batteries. Apply Department of Overseas Trade (Room 50), 35 Old Queen Street, London, S.W.1. Deposit half per cent. (Reference D.O.T./9623/E.D./E.C.)

November 29.—**PLANT, &c. St. Marylebone.**—Supply, delivery, and erection of :—Section A—Turbo-alternator and condensing plant. Section B—Water-tube boilers. Section C—Fan draught water-cooling tower. Section D—Rotary convertor plant, for the St. Marylebone Borough Council. Apply Mr. C. H. Smyth, Chief Engineer, Town Hall, Gloucester Place, London, W.

December 15.—**PLANT. Wellington.**—The Southland Electric Power Board are calling for tenders for supply and delivery of plant and material. Apply Department of Overseas Trade (Room 49), 35 Old Queen Street, Westminster, S.W.1.

December 20.—**ELECTRIC CRANES AND LIFTS FOR EGYPT. Alexandria.**—The Administration of Ports and Lighthouses, Alexandria, is inviting tenders for fixed and moveable lifting apparatus for service at the port of Alexandria. Apply Department of Overseas Trade (Room 50), 35 Old Queen Street, London, S.W.1

January 9.—**CRANE. New Zealand.**—Supply and delivery of one electric travelling crane in connection with the Waikato power scheme, section 58. The crane is to be designed for lifting, traversing and travelling loads up to 27 tons. Apply Department of Overseas Trade (Room 50), 35 Old Queen Street, Westminster, London, S.W.1.

January 15-31.—**PLANT. Melbourne.**—Supply, delivery, &c., of plant for the Morwell power scheme, for the State Electricity Commission of Victoria. Apply Agent-General for Victoria, Melbourne Place, Strand, London, W.C.2. Deposit £2 2s.

No Date.—**ELECTRIC LIGHTING. Wrexham.**—Electric lighting installations of 22 houses on the Acton Park estate, for the Corporation. Apply Mr. G. D. Coe, A.M.I.E.E., Borough Electrical Engineer, Willow Road, Wrexham.

ENGINEERING.

November 16.—**GEAR WHEELS. Johannesburg.**—28 tramcar gear wheels (contract No. 965), for the Municipal Council of Johannesburg. Apply Department of Overseas Trade (Room 50), 35 Old Queen Street, London, S.W.1.

November 18.—**EXCAVATING, &c. Mossend, Lanark.**—Messrs. Stewarts and Lloyds, Ltd., invite tenders for excavating and disposing of about 200,000 cubic yards of material from ground adjoining their Clydesdale Steelworks, Mossend. Apply Clydesdale Works, Mossend.

The Failure of Modern Sculpture, and the Remedy

Mr. W. P. Bloye, in reading a paper on "The Failure of Modern Sculpture, and the Remedy" before the Birmingham Architectural Association, said that sculpture was looked upon nowadays as first a luxury and secondly a something to be made just as the client wants it, and not as an expression of what the sculptor felt. The art of the so-termed Classic period obsessed the intellectual people of the last century. The technical accomplishment of the Classic sculptors gave a sort of material beauty, and the reason it appealed to the greater masses of to-day was because it approached very near to the present-day aspect. It was the awful sense of realism that put them below their archaic predecessors.

The present awakening of interest in the work of the archaic periods was not a fashion, but a genuine reaction against the soulless and commercial art of Modern Europe. Art was not, as some people thought, a limitless expression of anything they chose to do; too much liberty could easily become a hindrance. The substance of a work of art was first its spiritual quality, secondly its material quality, and thirdly its subject quality. By spirit they meant faith or truth. The spirit of the best work was truth, and with truth came force, while the spirit of the great majority of modern art was profane. In the main, our failure was due to the lack of understanding of our materials. The fact of material in sculpture should run through the whole of it, arranging, governing, and reigning over every portion of it. In all great buildings we saw that feeling, and it had come about because every one who had any part in the making of it was always subjected to the special sense of the particular material used.

Under present-day methods, all who were working on a building were subject to the demands of the architect, some of whom were prone to forget that sculptors required at least as much training to do their job as the architect required to do his. Knowledge was based on actual experience and experiment, and the only way to know what was right in stone was to go and carve it. The right and good were the common property of all architects and sculptors, and when these men combined good work would result.

Sculptors had, in the majority of cases, forgotten entirely the part played by material in their work. The failure was due to the fact of the clay model lying behind everything that was done. The word "cut" surely was the reverse to the word "model," or in other words, the thing from which you cut away must have an entirely different character from the thing to which you add.

Clay was the root of the evil of modern sculpture. It should be used only for work to be cast, for clay to be fired, and, to a very limited degree, for the furthering of one's knowledge of form. It was all a matter of finding out the way in which the best had been done, and of doing it The sculptor must be made entirely responsible for what he does, and must be given, within limits, a free hand. If architects, at the commencement of a design for a building where sculpture is required, would consult a sculptor, both would benefit greatly.

At the conclusion of the paper, which was illustrated by many lantern slides, a vote of thanks was proposed to Mr. Bloye by Mr. H. W. Hobbiss, seconded by Mr. A. L. Snow, and carried unanimously.

The Preservation of Stone

Professor A. P. Laurie, Professor of Chemistry at the Royal Academy of Arts, has delivered the last of his course of lectures at the Royal Academy. He took for his subject "The Preservation from Decay of Stone on Buildings." The professor dealt with the general causes of stone decay, and showed by experiments the distinctions between limestone, sandstone, with a calcide cement, and sandstone with a silica cement. He described the different methods necessary to make complete laboratory tests with a suggested preservative, and illustrated by photographs some of the difficult problems which have to be faced.

The Professor then described a new preparation which he had recently discovered. This preparation deposited hydrated silica as a cement between the particles of the stone. While not solving the problem of the preservation of limestones, he had great hopes that it would prove successful in the preservation of sandstones. He described the experiment he had made, and was at present engaged on, with this preservative. Professor Laurie further suggested that it might be worth while for the R.I.B.A. to experiment with this new material.

Abstracts Published.

185918.—Subaqueous structures. — H. Wade, 111 Hatton Garden, London. — Subaqueous structures for use in piers, wharves, docks, walls, jetties, foundations, bridges, etc., comprise a number of tubular units, with closed conical bottoms and internal strengthening ledges; the units, which may be built up of superposed sections, are sunk by filling them with concrete, and are slidably connected with each other so as to allow independent settling movement. The connections may consist of **I**-beams secured to the units and working in channel-irons bolted together. Where the units are spaced widely apart and connected by rods or metal frames, similar sliding joints are provided at the ends and points of intersection of the bracing-rods.

186165.—Building-blocks.—P. J. White, 329 High Holborn, London.—A building-block consists of two hollow bricks which are joined together and overlap one another to the extent of half the length of each. One brick is shorter than the other and the overlap is equal to half the length of the shorter brick. The blocks are adapted to be used with auxiliary blocks, and they may have grooves on their sides for purposes of grouting.

The above particulars are specially prepared by Messrs. Rayner & Co., Registered Patent Agents, of 5 Chancery Lane, London, W.C. 2, from whom readers of the Journal may obtain all information free relating to patents, trade marks, and designs. Messrs. Rayner & Co. will obtain printed copies of the published specifications and forward on post free for the official price of 1/- each.

Architects' Fees for Scottish Housing

The Scottish Board of Health has issued a memorandum with regard to the scale of fees payable to private architects in connection with abandoned, or partially abandoned, State-aided housing schemes. The terms and conditions have been approved by the Incorporation of Architects in Scotland. The terms and conditions do not apply in cases where an agreement providing for a specific payment for abandoned work has been made, or where a final settlement has been come to, between the local authority and the architect prior to the date of the memorandum.

The payments set forth are for the preparation of plans which have been abandoned after approval by the Board; but provision is also made for payment for work on plans that have not been approved by the Board or even submitted for approval. Copies of the memorandum may be obtained on application to the Board at 125 George Street, Edinburgh.

An Armenian Chapel for London

An Armenian chapel, designed by Mr. Davis (of Messrs. Mewès and Davis), has just been completed on a site in Kensington behind Harrod's stores. It is in the tradition of Armenian Byzantine of the thirteenth century, with a slight Saracenic influence. Mr. Davis has introduced into the art of London a building characteristic of Asia Minor, recalling the building and the cloisters of Haghbat, Armenia.

There is no external carving, the effect being obtained by masses, reposeful surfaces, accurate mouldings and inscriptions. In the angles of this cruciform structure there are some curious niches, which are compressed at the top like the corbelling of Moorish art. These are typical features of Armenian work. The building is crowned by a hexagonal turret, supported on seven columns. The doors are of oak, with intricate Arabesque carving.

The building is of diminutive size, designed to hold a congregation of seventy-five people, yet its scale is impressive both externally and internally. The architect has produced a building expressive of its purpose in Portland stone that does not look the least out of place in London.

Roadwork in London

Bermondsey is spending £33,700 on road work.

About 130 men will be found work for the winter on a new main from Lea Bridge waterworks to Woodford reservoir (about four miles).

Glasshouse Street, off Regent Street, near Piccadilly Circus, is to be widened at a cost of £16,000.

It is recommended by the L.C.C. Education Sub-Committee that preliminary work on the extension of the Hackney Institute should be begun forthwith; £9,000 will be expended before acceptance of tenders for the remainder of the work.

Trade and Craft

New Depots at Chadwell Heath.

The British Roofing Co., Ltd., of Premier House, 150 Southampton Row, W.C.1, have opened two builders' merchants' depots at Chadwell Heath, where they have good stocks of bricks, lime, cement, and all roofing materials.

The National Museum of Wales.

We understand that the floors in the above building, described in our issue for November 15, are of Ruboleum, supplied by the Korkoid and Ruboleum Tile Co.

New Thames Bridges

At the last meeting of the London County Council the Improvements Committee, holding that priority should be given to the widening of Putney Bridge, recommended the Council to decline to join in representations to be made to the Ministry of Transport by the Battersea, Fulham, and Wandsworth Borough Councils with regard to the suggested construction of an arterial road from Fulham to Streatham, including the reconstruction of Wandsworth Bridge. The recommendation was approved. It is now practically certain that the preliminary work in connection with the building of the new bridge over the Thames in the neighbourhood of St. Paul's will be taken in hand during the course of the next few weeks. The plans for this bridge and its approaches were drawn up before the war, and include the construction of a viaduct over Thames Street.

Educational Tour of Rome

Following on the successful educational tours arranged from "Leplay House," Rome is to be the next centre of study. A party will be taken to Rome during the Christmas vacation, leaving London on Wednesday, December 27 (nineteen days' tour, inclusive). The educational side of the tour is under the direction of Mr. Alexander Farquharson, M.A. Visits will be made to churches, palaces, and institutions of every kind, with guides who are authorities on the history of each centre. For those wishing to specialize on classical Rome, a series of visits devoted to that alone is being organized. A further group, to study Rome of to-day, with special reference to its educational, social and political institutions, is being arranged for. A course of lectures on the general history of Rome in relation to Italy and the world will be given during the tour. For full particulars, application should be made to Miss Margaret Tatton, director, Leplay House Educational Tours, 65 Belgrave Road, Westminster, S.W.1.

ARCHITECTURAL REFERENCE LIBRARY.

The attention of Architects, and of those interested in Architecture, is called to the facilities afforded by the specially appointed Reading Room at 27–29 Tothill Street, Westminster.

This Room has been set apart in order that the numerous Works in the Library may be referred to in quietude and ease.

Overseas Members of the Profession, and also Architectural Students, are cordially invited to make the fullest use of the Library.

Specify

TERRA COTTA

and

Create the Building Beautiful

NO other material is so suitable for Concrete Buildings. No need for *wood shuttering on the face.* The Concrete fills into the Terra Cotta Blocks quickly and easily. It is more effective than any other building material and more easily used. It adds beauty and lightness to the appearance of any building, while giving the advantages of strength and durability.

You are invited to write for a copy of "Terra Cotta," which contains many beautiful illustrations of buildings faced with Terra Cotta. Sent free and post paid on application to the

TERRA COTTA PUBLICITY BUREAU,
Room 614, IMPERIAL HOUSE, KINGSWAY, LONDON, W.C.2.

Electrical Notes

MR. L. GASTER, Hon. Secretary of the Illuminating Engineering Society, in reading a paper on "Notes on Events during the Vacation" before the Society, said that an event of outstanding importance had been the issue of the Third Report of the Home Office Departmental Committee on Lighting in Factories and Workshops. After summarizing recommendations contained in previous reports on the subject of glare, avoidance of shadows, etc., it is pointed out that further research is necessary before legal standards for working illumination can be framed. This matter, it is suggested, should be studied in co-operation with the chief industries concerned, but meanwhile minimum values, illustrative of good practice, are recommended for fine work (requiring three foot-candles) and very fine work (requiring five foot-candles). The original scheme of work of the Committee has been curtailed by the urgent demands in the interests of national economy, and it is, therefore, of importance that the aims of the Committee should be made familiar, both to the lighting industry and to managers of factories, and their aims fully understood. It is hoped to arrange for several papers before leading scientific societies and trade associations with the object of making these aims widely known.

The subject of street-lighting has been receiving attention, several new schemes having been recently introduced in Oxford Street and elsewhere in London, while in some provincial cities substantial economies, coupled with improvements in illumination, have been effected by the substitution of the latest superheated inverted gas burners for those of an obsolete type. Street-lighting as a factor in "street safety" has also been receiving attention from the London "Safety First" Council, with whom the Society continues to co-operate, and statistics have been published in the United States leading to the conclusion that 17·6 per cent. of street accidents occurring at night are due to inadequate lighting.

Progress in the Electrical Industry.

The committee on progress in electric lamps and lighting appliances—Mr. S. H. Callow (chairman), Mr. J. E. Edgecombe, Mr. J. W. Elliott (secretary), Mr. J. Y. Fletcher—have presented their report to the Illuminating Engineering Society.

It is stated that the past twelve months has been a period of steady progress for the electric lamp and fittings industry, and one of considerable interest and activity. December last witnessed the conclusion in the House of Lords of the long-drawn-out litigation concerning the gas-filled patent, which was there unanimously declared to be valid and of great commercial value.

The research laboratories and testing departments of the various manufacturers have been very active in research and experimental work, with the result that the quality of electric lamps, particularly of the gas-filled type, has been considerably improved. Furthermore, standardization has progressed, and it is hoped shortly to issue complete specifications (on the lines of those now existing for the vacuum type lamps) covering all the various types of electric lamps manufactured under the auspices of the B.E.S.A.

The manufacturers, always desirous of cheapening electric lighting with the idea of assisting to popularize its use, reduced, in some cases very considerably, the prices of electric lamps in September last, bringing such prices below pre-war level. This action was made possible, not by decreased labour and material costs, which naturally remain very much higher than in pre-war days, but by improved machinery and manufacturing methods.

There has been an increased demand recently for special types of lamps, such as candle types for electroliers, etc., and double-ended tubular lamps for shop-window and cornice lighting, and all such requirements can be satisfactorily met.

Noticeable developments in the case of gas-filled lamps are, firstly, the special lamps with opal bulbs which are meeting with much favour for shop-window lighting, and in such positions where the light from the lamp is almost on the eye level; secondly, the daylight lamp which has a spectrum closely approximating to that of daylight, and is suitable for colour matching, dye works, drapery stores, etc., and also in art schools, picture galleries, etc.; thirdly, considerable progress has been made with the projector type of gas-filled lamp, suitable for cinematograph work and special forms of flood-lighting.

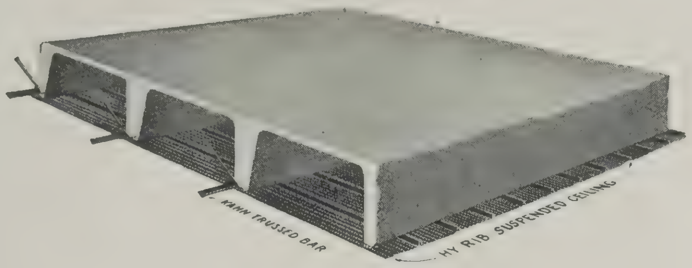
TRUSCON HOLLOW FLOOR

Long Span Slabs
with Flat Ceilings



THIS floor, being hollow, is soundproof, as well as fireproof, and is invaluable for Offices, Hospitals, Schools, Hotels, Flats and similar buildings.

It is the lightest floor procurable, and owing to its simplicity of construction is very economical.

This floor has been used in some of the largest buildings in England.

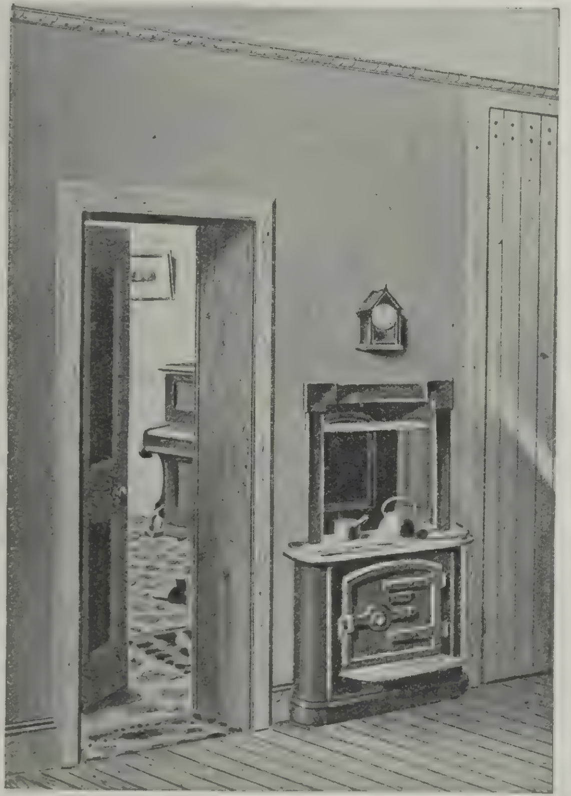
THE BACK-TO-BACK LIVING-ROOM GRATE & SCULLERY COOKER



WITH FIRE IN LIVING-ROOM.

Provides every facility for all domestic cooking purposes.

Ensures an abundant supply of hot water in a minimum of time.

Obviates the necessity of a gas cooker.

Permits of clothes being thoroughly and rapidly dried in Kitchen or Scullery.

Shows a saving of about 50 per cent. of Coal as compared with consumption of ordinary range.

Simple and effective heat-regulators, and no flues to clean behind covings.

Is being extensively used in Municipal and other housing schemes throughout the Kingdom with complete success.

CONTRACTS OPEN

Unless expressly stated to the contrary, all deposits required for bills of quantities, etc., are returned on receipt of bona-fide tenders. The words "Fair Wages Clause" inserted in certain paragraphs signify that persons tendering must conform to a fair wages clause in the contract, which requires them to pay the rates of wages current in the district.

BUILDING.

December 6.—**WALL, &c. Withnell, Lancs.**—Building a shoddy wall round the Council Offices, with piers and coping, etc.; also for an ornamental railing, gates, &c., to be fixed to the wall, for the Withnell U.D.C. Apply Surveyor, Council Offices, Brinscall.

December 6.—**HOMESTEAD, &c. Llanfechell.**—Erection of a homestead and the division and adaptation of existing house and buildings at Cromlech, Llanfechell. Apply Shire Hall, Llangefni.

December 7.—**HOUSE. Turriff.**—Mason, carpenter, slater, plaster and plumber works of house in Turriff, for Provost Stewart. Apply Mr. W. L. Duncan, Architect, Turriff.

December 7.—**HOUSES. Stourbridge.**—Erection of 24 B-type houses (12 north aspect and 12 south aspect) on the Grange Estate, for the Corporation. Apply Mr. F. Woodward, Borough Surveyor and Architect, Market Street, Stourbridge.

December 8.—**TELEPHONE EXCHANGE. Southall.**—Erection of a temporary telephone exchange at Southall (Middlesex), for H.M.O.W. Apply Contracts Branch, H.M. Office of Works, King Charles Street, London, S.W.1. Deposit £1 1s.

December 8.—**ADDITIONS. Southampton.**—Additions to the pavilion, Royal Pier, Southampton, for the Southampton Harbour Board. Apply Engineer, at the Board's Offices. Deposit £1.

December 8.—**ALTERATIONS. Liverpool.**—Alterations at the Custom House, Liverpool, for the Commissioners of His Majesty's Works. Apply H.M. Office of Works, National Provincial Bank Chambers, James Street, Liverpool, or Contracts Branch, H.M. Office of Works, King Charles Street, London, S.W.1. Deposit £1 1s.

December 8.—**ADDITIONS, &c. Burlingham St. Peter, &c., Norfolk.**—Additions and repairs to farm buildings at Glebe Farm, Burlingham St. Peter, and Willow Farm (late Red Farm), Burlingham St. Edmund, Norfolk, for the Norfolk Small Holdings Committee. Apply County Land Agent, Shirehouse, Norwich. Deposit £1 1s.

December 9.—**EXTENDING. Blackpool.**—Extending the common room and providing oak panelling and parquet floor at the Blackpool Secondary School War Memorial in Raikes Road. Apply Mr. F. Wood, M.I.C.E., Borough Engineer, Municipal Buildings, Blackpool. Deposit £1 1s.

December 11.—**TREATMENT CENTRE. Dewsbury.**—Erection and completion of proposed treatment centre at the General Infirmary, Dewsbury. Apply Mr. H. Dearden, Borough Engineer, Town Hall, Dewsbury.

December 11.—**HOUSE. Glasgow.**—Erection of a doctor's house at Robroyston Hospital, for the Corporation. Apply Office of Public Works, City Chambers, 64 Cochrane Street.

December 11.—**HOUSES. Royston, Yorks.**—Erection and completion of 12 houses, in two blocks of four and two pairs, on ground situate off Station Road, Royston; also for necessary roadmaking and laying 9 in. pipe sewer, for the Royston Urban District Council. Apply Messrs. Dyson, Cawthorne and Coles, Architects, 10 Regent Street, Barnsley. Deposit £1 1s.

December 11.—**WALL, &c. Saltash.**—Structural alterations—new north wall and new roof—at the Guildhall, Saltash, for the Corporation. Apply Borough Surveyor.

December 11.—**HOUSES. Wigan.**—Erection of 50 houses on the Ridyard Street site, in lots of 8, 8, 8, 12, and 14, for the Corporation. Apply Borough Engineer, Mr. R. B. Donald, M.I.C.E., Municipal Buildings, Library Street, Wigan. Deposit £2 2s.

December 12.—**HOUSES. Weybourne.**—Erection of five pairs of houses near the Elm Tree, Weybourne, for the Farnham Urban District Council. Apply Mr. J. W. Wright, Clerk, Council Offices, Farnham. Deposit £2 2s.

December 15.—**STAND, &c. Hertford.**—The Ground Improvement Committee of the Hertford Town Football Club invite tenders, together with plans, detail drawings, &c., for provision and erection of a sectional stand and other accommodation to seat 400 people. Apply Hon. Secretary (Mr. H. J. Gray, Club Headquarters, Salisbury Arms Hotel, Hertford).

December 15.—**SCHOOL. Brighton.**—Erection of a school of two departments on a site adjoining the northern boundary of the borough in Loder Road, Brighton, for the Education Committee. Apply Messrs. T. Simpson and Son, 16 Ship Street, Brighton. Deposit £3.

December 16.—**OPEN-AIR SWIMMING BATH. Harrow-on-the-Hill.**—Construction of an open-air swimming bath, together with conveniences, dressing sheds, &c., adjoining the Council's housing estate, for the Harrow-on-the-Hill Urban District Council. Apply Mr. J. P. Bennetts, Engineer and Surveyor to the Council. Deposit £5.

December 16.—**HOUSES. Methley.**—Erection and completion of 12 class "A" State-aided houses in blocks of four on the Mickletown housing site. Apply Mr. T. Thompson, Red House, Methley.

December 19.—**BOWL STORE, &c. Rochdale.**—Erection of bowl store and shelter at Falinge Park, for the Parks Committee. Apply Borough Surveyor, Town Hall, Rochdale.

December 19.—**HOUSES. Conisbrough.**—Erection of 22 non-parlour type houses, semi-detached, type 8a, in one to eleven blocks, and eight parlour-type houses, in blocks of four, type 9a, for the U.D.C. Apply Mr. H. Thirlwall, M.I.M. and Cy.E., Council Offices, Conisbrough, via Rotherham. Deposit £2 2s.

December 19.—**MOTOR GARAGE. London, S.W.**—Building construction of motor garage, Drayton Gardens, S.W.10 (other than steelwork and reinforced concrete). Apply Messrs. Waterer and Sons, Surveyors, Weybridge, Surrey, or 23 Westminster Palace Gardens, Victoria Street, London, S.W.1. Deposit £2 2s.

December 31-January 23.—**UNIVERSITY BUILDINGS. Cape Town.**—Buildings for the University on the Groote Schuur estate at Rondebosch, near Cape Town, for the Council of the University of Cape Town. Apply office of the High Commissioner for the Union of South Africa, Trafalgar Square, London, W.C. Deposit £15.

No Date.—**WORKS. Fraserburgh.**—For painter and glazier work of 10 houses (2nd development) in connection with the Fraserburgh housing scheme. Plans, &c., seen with Messrs. D. and J. R. M'Millan, Architects, 105 Crown Street, Aberdeen, from whom schedules of quantities may be obtained.

No Date.—**BUSINESS PREMISES. Pontypool.**—Erection of business premises and general offices. Apply Messrs. Badman, Williams & Co., Ltd., Trosnant Wharf, Pontypool.

No Date.—**BUNGALOWS. Lightcliffe, Halifax.**—Erection of three bungalows at Lightcliffe. Apply Mr. W. Hall, M.S.A., Architect and Surveyor, 26 George Street, Halifax.

No Date.—**STORY. Tillicoultry.**—Raising the spinning mill at Devonpark, Tillicoultry, an additional story. Apply Mr. A. Bracewell, A.R.I.B.A., for Messrs. Robert Archibald and Sons, Tillicoultry.

No Date.—**LIBRARY. Ystrad Mynach.**—Erection of the Penallta Workmen's Library and Institute, Ystrad Mynach. Apply Mr. H. G. Jones, Architect and Surveyor, Bank Chambers, Hengoed.

ELECTRICAL.

December 7.—**CABLE. London, S.W.**—The Pacific Cable Board, Queen Anne's Chambers, Westminster, tenders for the manufacture and laying of 1,313.75 nautical miles of submarine telegraph cable between Auckland (New Zealand) and Suva (Fiji), and also for the manufacture and laying on the same expedition of 539 nautical miles between Sydney (New South Wales, Australia) and Southport (Queensland, Australia), making in all a total length of cable of 1,852.75 nautical miles. Apply Offices of the Board, or Messrs. Clark, Forde and Taylor, 4 Gt. Winchester Street, E.C. Deposit £5 5s.

December 8.—**TELEPHONE INSTALLATION. Leeds.**—Supplying and fixing a switchboard for th private installation of telephones, at the lodge of the institutions. Beckett Street, Leeds, for the Guardians. Apply Master of the Institution.

December 9.—**ELECTRIC LIGHT INSTALLATION. Headington, Oxon.**—Installation of electric light in the infirmaries in their Institution situate on the London Road, Headington, near Oxford, for the Guardians of Headington Union. Apply the Master (Mr. L. Williams).

December 11.—**BATTERY, &c. Long Eaton.**—Supply, delivery, and erection at their electricity works of storage battery, three-wire booster, switchboard, and steel platform, for the U.D.C. Apply Mr. F. Newey, A.M.I.E.E., Engineer and Manager, Milner Road, Long Eaton, Notts. Deposit £2 2s.

December 15.—**EQUIPMENT. Abertillery.**—Supply, delivery, erection, and connection, at Aberbeeg Electricity Works, of (a) 2,200-volt h.t. feeder (500 yards overhead, 1,000 yards underground), including erection and laying; one 200-k.w. and one 30-k.w. converting sets, h. and l.t. switchgear; and (b) at Abertillery Town—static transformers and l.t. switchgear, a.c. overhead and underground distribution system, for the A.U.D.C. Apply Mr. M. J. Mortimer, A.M.I.C.E., Engineer and Manager, Aberbeeg. Deposit £2 2s.

December 15.—**PLANT. Wellington.**—The Southland Electric Power Board are calling for tenders for supply and delivery of plant and material. Apply Department of Overseas Trade (Room 49), 35 Old Queen Street, Westminster, S.W.1.

December 20.—**ELECTRIC CRANES AND LIFTS FOR EGYPT. Alexandria.**—The Administration of Ports and Lighthouses, Alexandria, is inviting tenders for fixed and moveable lifting apparatus for service at the port of Alexandria. Apply Department of Overseas Trade (Room 50), 35 Old Queen Street, London, S.W.1.

January 9.—**CRANE. New Zealand.**—Supply and delivery of one electric travelling crane in connection with the Waikato power scheme, section 58. The crane is to be designed for lifting, traversing and travelling loads up to 27 tons. Apply Department of Overseas Trade (Room 50), 35 Old Queen Street, Westminster, London, S.W.1.

January 9.—**PLANT. London, E.C.**—Supply of the following plant for electrification of Bombay suburban lines, for the Great Indian Peninsula Railway Co., viz. :—(1) Electrical equipment of coaches, fee for specification £2; (2) overhead equipment of permanent way and overhead distribution lines, £2. Apply Company's Offices, 48 Copthall Avenue, E.C.2.

January 15-31.—**PLANT. Melbourne.**—Supply, delivery, &c., of plant for the Morwell power scheme, for the State Electricity Commission of Victoria. Apply Agent-General for Victoria, Melbourne Place, Strand, London, W.C.2. Deposit £2 2s.

January 17.—**TELEPHONE AND TELEGRAPH APPARATUS, &c. Perth.**—Supply and delivery of telephone apparatus, testing instruments, and protective apparatus (schedule No. W.A. 751). Apply Department of Overseas Trade (Room 49), 35 Old Queen Street, Westminster, London, S.W.1.

January 26.—**ELECTRIC LIGHTING PLANT. Malmesbury, S. Africa.**—Electric lighting plant for Malmesbury as follows: (1) Supply, delivery, and erection of (a) superheated steam engines, boilers, pumps, piping, valves, alternatively (b) suction gas engines and producers, alternatively (c) Diesel oil engine and all accessories, with dynamos, and switchboard in power-station; the supply of all necessary cables and connections, trenches, chequer plating, hand rails, and the leaving of same in good working order, and completed according to specification and guarantee in a thoroughly efficient manner. (2) Supply, delivery, and erection of poles, overhead cables, street lamps and standards, house connections, &c., and all sundries and incidental material necessary to complete the outside work from the switchboard in the power-station to the consumer's premises, according to specification and guarantee, with the exception of items contained in (3). (3) Supply and delivery on site of meters and general testing instruments as specified. (4) Supply, delivery, erection of battery, connection to switchboard, and all sundries attached thereto as specified. Apply Department of Overseas Trade (Room 49).

ENGINEERING.

December 6.—**CULVERT. Wood Green.**—Construction of a granite concrete tube culvert and incidental work to carry the Mus Well stream from the Muswell Hill School, Albert Road, to Durnsford Road, for the U.D.C. Apply Mr. C. H. Croxford. Deposit £1 1s.

December 6.—**HARBOUR WORKS. Madeira.**—Construction of an artificial harbour at Funchal. Apply Department of Overseas Trade, 35 Old Queen Street, London, S.W.1.

December 6.—**WIDENING, &c., BRIDGE. Cardiff.**—Widening and reconstruction of Mill Bridge, Dinas Powis, for the Cardiff Rural District Council. Apply Engineer, Mr. W. Farrow, Park House, 20 Park Place, Cardiff. Deposit £2 2s.

December 7.—**RESERVOIR. Evington, near Leicester.**—Construction of a covered service reservoir of 5,000,000 gallons capacity at Evington, near Leicester, for the water committee. Apply Mr. G. T. Edwards, M.I.C.E., Water Engineer, Bowling Green Street, Leicester.

December 9.—**EXTENSION OF REFUSE DESTRUCTOR. Southgate.**—Extension of the refuse destructor, Barrowell Green, Winchmore Hill, for the Southgate Urban District Council. Apply Mr. R. Phillips, Surveyor to the Council.

December 11.—**BOREHOLE. Bolton.**—Sinking borehole having a commencing diameter of not less than 30 inches and a terminating diameter of not less than 18 inches at a depth of 600 ft., and construction of other works connected therewith, at Belmont, near Bolton, for the Bolton Corporation. Apply Mr. J. K. Swales, M.I.C.E., Waterworks Engineer, St. George's Street, Bolton. Deposit £2 2s.

December 12.—**PNEUMATIC PLANT. London, E.C.**—Supply of pneumatic plant for the Bengal Nagpur Railway Co., Ltd. Apply Company's Offices, 132 Gresham House, Old Broad Street, London, E.C.2. Fee £1 1s.

December 14.—**GIRDER BRIDGES. London, S.E.**—The High Commissioner for India is prepared to receive tenders for supply of girder bridges, 100 ft. spans. Apply Director-General, India Store Department, Branch No. 14, Belvedere Road, Lambeth, S.E.1.

December 14.—**AQUEDUCT. Aberdeen.**—Transporting, laying, and jointing of 1½ miles of 4 ft. piping and ancillary works between West Cults and Pitfodels, for the T.C. Apply Water Engineer's Office, 41½ Union Street, Aberdeen. Deposit £5.

December 16.—**CONCRETE DECK. St. Peter Port.**—Removal of the timber deck at the North (White Rock) Pier head and the construction of a new deck in reinforced concrete on the Considere system at the Harbour of St. Peter Port, Guernsey, for the Board of Administration. Apply Mr. J. H. Duquemin, States Engineer, States Office, Guernsey.

December 18.—**WATER TANK. Hitchin.**—Construction of a reinforced concrete water tank of 390,000 gallons capacity, with 12 in. cast-iron connections, to be erected at their pumping station, Queen Street, Hitchin, for the U.D.C. Apply Council Offices or Mr. W. Phillips, Gasworks, Luton. Deposit £2 2s.

December 18.—**COAL HANDLING PLANT. Melbourne.**—Supply, delivery, &c., of the following for the Morwell power scheme, for the State Electricity Commission of Victoria: Specification No. 282: Coal-handling plant for Morwell power station and briquetting works. Apply Agent-General for Victoria, Melbourne Place, Strand, London, W.C.2.

SANITARY EQUIPMENT
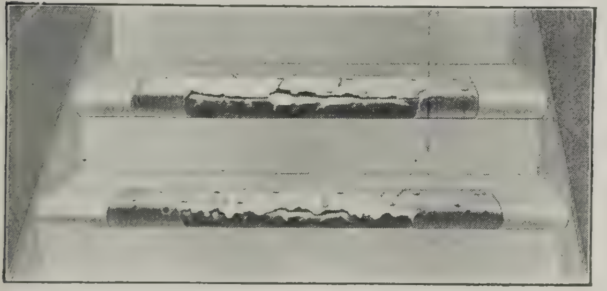
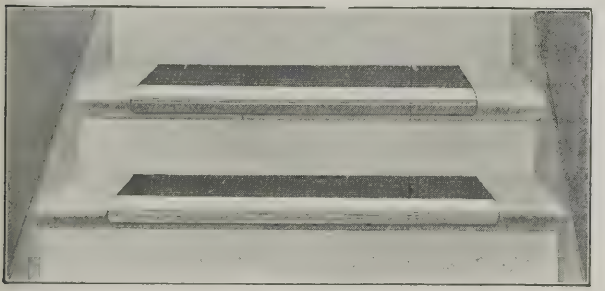
specially designed for Architects' and Engineers' requirements.

Why risk limbs on battered brass?





Look at these Photographs
They admirably illustrate the superiority of Ferodo Treads over brass in *looks*. The user can only appreciate their *efficiency* when he has experienced the perfect grip of the Ferodo Tread.
Brass is costly in upkeep, polish and labour. Ferodo Treads, once fixed, last many years without any further cost.

Why take chances with the most treacherous of all step coverings? Soon after use brass stair treads become highly polished and very slippery—when they near their last days their sharp edges are a very real danger to limbs and clothing.

Ferodo Patent Stair Treads never suffer with age—they are just as efficient on the last day as on the first—wet or dry, they afford a sure foothold—and above all they wear much longer than metal treads.

Made in many styles and colours for all staircases of wood, stone, iron or marble.

FERODO
Regd.

Patent STAIR TREADS

Our Illustrated list 'D' gives full particulars of styles, colours and prices—also an actual sample of Ferodo Stair Tread. A post card will bring a copy by return.

FERODO Ltd. - CHAPEL-EN-LE-FRITH

Φ2

December 19.—**WATER-TUBE BOILERS. Barking, Essex.**—Supply and erection of water-tube boilers for their Barking power-station, for the County of London Electric Supply Co., Ltd. Apply Mr. F. C. McQuown, Manager and Secretary, Moorgate Court Moorgate Place, E.C. Deposit £5 5s.

December 19.—**WATER SUPPLY WORKS. Lowdham, &c.**—Carting, excavating for, and laying about 14 miles of 7 in., 6 in., 5 in., 4 in., and 3 in. cast-iron pipes, including fixing of valves, hydrants, &c., erection of pumping station, service reservoir, in connection with water supply works for the parishes of Oxton, Epperstone, Lowdham, Gunthorpe, Caythorpe, and Hoveringham, for the Southwell Rural District Council. Apply Messrs. Sands and Walker, Milton Chambers, Milton Street, Nottingham. Deposit £3 3s.

December 19.—**STORM WATER BASIN. Birmingham.**—Construction of an additional storm water basin at their Nechells Outfall Works, for the Birmingham Tame and Rea District Drainage Board. Work includes the construction of a concrete basin of 6,000,000 gallons capacity, inlet channel, the laying of 12 in. and 15 in. dia. cast-iron suction and delivery mains, and other incidental works. Apply Mr. J. D. Watson, M.I.C.E., Engineer, The Rookery, Erdington Park, Birmingham.

PAINTING.

December 6.—**PAINTING. Manchester.**—Painting work at the Reference Library and Extension Buildings, Piccadilly, and Blackley Library, for the Libraries Committee. Apply City Architect. Deposit 10s. 6d. each.

December 6.—**PAINTING, &c. Aberayron.**—Painting, decorating and repairs inside and outside at the Aberayron Town Hall, for the Cardiganshire County Council. Apply 3 Market Street, Aberayron, and the office of the County Surveyor.

December 6.—**CLEANING AND PAINTING. Nottingham.**—Internal cleaning and painting at the following schools, for the Education Committee :—All Saints' Council School (Forest Road); Lenton Council School; New Basford Council School; Sneinton Boulevard Council School; St. Mary's Trust School, Barker Gate. Apply Mr. A. Dale, City Architect, Guildhall. Deposit £1.

December 11.—**PAINTING. Bridgwater.**—Works for the Education Authority :—(a) Exterior painting and renovation of teacher's house, Eastover Council School; (b) new flooring, Albert Street School; and (c) pulling down and reconstruction of back buildings, Moat Lane Cottages. Apply Office of the Borough Surveyor, Municipal Buildings, High Street.

December 14.—**CLEANING AND PAINTING. London, S.E.**—Internal cleaning and painting works, &c., at their hospital, East Dulwich Grove, S.E., for the Guardians of Southwark Union. Apply Guardians' Architects, Messrs. A. Saxon Snell and Phillips, 9 Bentinck Street, Manchester Square, W.1, from December 1 to 6. Deposit £2.

ROADS AND SEWERS.

December 6.—**ROAD WORKS. Hove, Sussex.**—Work to be executed in making-up the roadway, laying new sewer, new footway and other works in connection therewith in Westbourne Place, for the Corporation. Apply Borough Surveyor.

December 6.—**WIDENING, &c. Cardiff.**—Works, for the Glamorgan County Council :—(1) Widening and improving the Neath and Glynneath main road between Aberdulais and Resolven; (2) widening and improving the Swansea, Killay and Port Eynon main road between Killay and Fairwood Common; (3) widening and improving the Bridgend and Llantrisant main road between Lanelay and Talbot Inn; and (4) kerbing of footways at Caerphilly and Bedwas, Caerphilly and Llanbradach, and Neath and Port Talbot. Apply (1) at the County Police Station, Neath; for work No. (2) at the Police Station, Gowerton; for work No. (3) at the Police Station, Llantrisant, and at the County Hall Cardiff.

December 6-13.—**CONVERSION. Crigglestone, Yorks.**—Conversion of the conveniences into w.c.'s at Crigglestone Newmillerdam Council School, for the West Riding Education Committee. Apply Education Department, County Hall, Wakefield.

December 7.—**WIDENING. Newton Abbot, Devon.**—Widening of the Ashburton Road, for the Newton Abbot U.D.C. Apply Surveyor, Mr. Coleridge D. White, Town Hall, Newton Abbot.

December 9.—**PASSAGES. Ellesmere Port.**—Making and completing of the passages at the rear and gable ends of Beechfield Road and Briarfield Road, and passages at the rear of Prince's Road, within their district, for the U.D.C. Apply Council Offices, Ellesmere Port, during office hours.

December 9.—**WIDENING, &c. Bexleyheath.**—Widening and improvement of Vicarage Road, Bexley, for the Bexley U.D.C. Apply Mr. W. T. Howse, Surveyor to the Council. Deposit £3 3s.

December 11.—**SEWER WORKS. Kensington.**—Construction of a number of manholes, together with incidental means of ventilation on certain dead ends of sewers in the borough, for the Kensington B.C. Apply Borough Engineer and Surveyor, Town Hall, Kensington, W.8.

December 12.—**STREET WORKS. Easington.**—Making-up private street between North-Western Terrace and South-Western Terrace, Murton, for the Easington Rural District Council. Apply Mr. R. Urwin Harper, Highway Surveyor, Castle Eden. Deposit £2.

December 18.—**ALTERATIONS, &c., to SEWAGE WORKS. Kempston, Beds.**—Alterations of and additions to the existing sewage works, for the Kempston U.D.C. Apply Council Offices, New Town, Kempston, Bedford. Deposit £3 3s.

December 29.—**ROAD WORKS. Southport.**—Levelling, paving, metalling and making good Chesterfield Road and Sandringham Road, Ainsdale, for the Highways Committee. Apply Mr. A. E. Jackson, M.I.C.E., Borough Engineer, Town Hall, Southport. Deposit £2 2s.

SOUTHWARK STREET, LONDON, S.E.

Mr. F. J. Gayer on Building

The third public lecture of the Department of Architecture, Building, and Surveying of the Northern Polytechnic has been given by Mr. F. J. Gayer, F.I.O.B., past-president of the London Master Builders' Association, and vice-president of the Institute of Builders. Mr. Gayer commenced his lecture by referring to the many difficulties that the London master builder encountered either from the idiosyncrasies of those in authority—the difficulty, in some cases, of convincing a building owner that it is to his interests to employ an architect and a surveyor—or from certain stringent clauses in a building contract, all of which tended to destroy the value of organization and to cause in many cases serious financial loss. He then traced in detail the progress of building work from the invitation to tender to the completion of the work and the final settlement of accounts.

For the accurate framing of an estimate great experience was required of detailed and analysed costs. The successful estimator was one who had taken careful records of labour costs, covering capacities, wastage, shrinkage, and consolidation of materials. By reason of the highly technical nature of the work, there might be room for some small differences of opinion, based on varying records, but there was certainly no justification for the extraordinary differences that are occasionally revealed in the tender lists. These points pointed to the great need for more research and the publication of more reliable data.

During the execution of building work, it was suggested that clear records should be kept of all materials sent to a specific contract in order that they could be used as a rough check on the bills of quantities. By this means any variation could be noted readily and the way paved for an equitable adjustment at the completion of the contract. The timing of the arrival of materials in logical sequence was one of the great points of practical organization, and one that needed very special attention, since failure in this direction would frequently be the cause of loss to the builder. A knowledge of the subsoil of a building site was often a big factor in estimating, especially on large works, since the question of pumping and baling to keep a site free from water was an item which called for the greatest possible consideration. The estimator, n addition to his many qualifications, required to be a "water diviner."

There were two systems in operation with regard to maintaining contact between the office and the works; one being the employment of a walking foreman or works superintendent, and the other of passing the responsibility of this work to the estimator. The latter ystem was the one that Mr. Gayer advocated, since it placed the estimator n a much better position for settling he variation account, and incidentally ave the estimator an opportunity of adding to his practical knowledge, and t the same time assisting the general oreman with the more theoretical side—combination which undoubtedly produces the best results.

The present hours of labour he eferred to as being unreasonably short nd as depriving the operative of a means f adding to his wages without in any ay causing hardship to the worker. He stated that the present working hours were as unreasonably short as they were unreasonably long in the last century.

The actual form of contract was the next point surveyed, with the important question as to whether or not the quantities should be incorporated as part of the contract. The lecturer stated that there was only one fair system, and that was, that the quantities which had been used in arriving at a tender price should be included as part of the contract. This course had the virtue of granting the builder payment for any work not included in the quantities, and in a like manner an omission for any work included in the quantities but not executed.

Reference was made to public and other bodies who endeavour to use their own special form of contract and ignore the standard form which had been agreed between the R.I.B.A., the National Federation of Builders, and the Institute of Builders. Sub-contracting clauses of the standard form of agreement were also dealt with, and the difficulties encountered under this head were pointed out.

Safes and Strong Rooms

"Recent Developments in the Manufacture of Safes and Strong Rooms" was the subject of a paper read by Mr. Emory Chubb, M.I.Mech.E., before the last meeting of the Royal Society of Arts. Mr. Chubb said that, apart from the historical antiquity of the society, the occasion was one of peculiar interest to him as his grandfather and also his father had both addressed them within the last seventy years on this subject. In the more recent paper given them by the late Mr. H. W. Chubb, considerable attention was given to the early growth and development of the art of lock-making, but the speaker devoted the greater part of his remarks to the more modern aspect of this question of security. After explaining certain factors which influence them in design, the speaker showed a film to demonstrate the practical and detailed construction of what he believed were two of the finest security units yet built in this country. He also referred to the art and craft of the mediæval locksmith and safemaker.

Dealing with strong rooms, he said: In all strong-room work the greatest interest centres on the door, because provided you have good strong walls which are properly designed, the safemaker has to provide for blocking up the one weak spot in the room, which, of course, is the doorway. Here you have a break in your line of defence, and the skill of the safemaker is shown by the manner in which he can arrange to make this good.

Now, the ideal door towards which all thoughtful safe designers are working is not one which allows of the exposure of its component plates on which it relies for its principal strength. In this new design we have departed from all precedent, and although I do not claim that the new type of door is perfect, it represents, so far as I am aware, a great advance on anything that has yet been built in this country. The door itself consists of a hollow cast steel manganese box two inches thick all over and about two feet deep. Externally this is very accurately machined so as to ensure that it makes a metal to metal joint with its surrounding frame, which is cast in one piece out of the same metal. The interior of this box is filled up to a depth of about sixteen inches with the doorplate of armourplate and unburnable alloy, together with its additional flame-resisting covering. In front of the flame protector and directly behind the two-inch slab of manganese steel is placed an electric screen, which gives an alarm on being penetrated by any method. Inside the doorplate is placed the lock and bolt mechanism. When the smaller wheel on the outside of the door is turned the circular bolts shoot out and are secured behind the frame, which, of course, prevents the door from being pulled open, and the driving mechanism of these bolts is controlled by four keyless combination locks, which can be used either singly or in pairs. I fear there is not time to dilate on the merits of this type of lock, which from every point of view is superior to the key lock on security work of this sort. Instead of a keyhole extending from the outside right to the most vital part of the mechanism, you have a steel spindle or propeller, which is itself fortified to resist the action of drill and flame; it is turned to various diameters as it passes through the different layers of material, thus preventing the successful injection of liquid explosives. It is also worthy of note that the locks are not set in a direct line with the spindles, but by an arrangement of gears they assume a position independent of the lines of force which drive them. On the outside of the door is a knob attached to a small dial with numbers 1 to 100, and to withdraw the lock bolt, prior to opening the door, all that is necessary is to turn the knob to any four pre-arranged numbers between 1 and 100. The variety of possible combinations runs into several millions, and the numbers can be readily changed by the owner in a few minutes.

An additional control is given by the time lock. This consists of a bronze case containing four independent high quality chronometer movements. When the door is closed at night the time lock is wound and set in such a way that it will not permit of the door being opened, even by those in possession of the combination, until the pre-arranged hour. This lock was invented as the result of a burglary, when a bank manager disclosed his combination at the point of a revolver, and it is evident that where these locks are used no apprehension need be felt if the combination becomes known, or in some cases if keys are stolen.

The method of swinging this door is one of some interest, and the hinge stretches right across from the frame to the centre of the door. This is called a crane hinge, and is so made to ensure a metal to metal fit. By this means the last movement in closing is that of a direct slide inwards when both the back and front edges of the door move parallel to each other. Thus, to close the door, the first movement is to swing it in the ordinary way until it is within some three inches of being closed; at that point the pressure mechanism, which consists of a bar fitted with an eccentric movement at each end, is engaged, and on the large wheel being turned the door is driven bodily home. The steel bolts are next thrown by means of the smaller wheel, and the combination lock knobs are given a half turn and the door is locked.

Trade and Craft

B.R.C. Roads.

In reviewing a book of photographs, published by the British Reinforced Engineering Co., Ltd., the unfortunate omission of a word may possibly have led to some misapprehension. In the first column on page 706 of THE ARCHITECTS' JOURNAL of November 15, the paragraph beginning "In concrete less preparation is needed . . ." should read "In concrete *footpaths*, etc.," which, of course, gives rather a different meaning.

Office Requisites.

The Shannon, Ltd., of 57-59 Victoria Street, Westminster, S.W.1, have sent us a booklet which illustrates and describes many of the firm's desks and other office requisites. Each of the desks shown has its own special features, and it is easy from the many varieties illustrated for a professional or business man to choose one to more than satisfy his particular needs. One of the most striking is the "Efficiency" desk. When a desk is clear, and yet all papers relative to current contracts are at your finger-tips the minute you require them, one advantage is apparent. Further, your notes are on cards, properly indexed, which simplify reference and cannot be mislaid. Quarto or foolscap papers can be accommodated, and the drawers will take cards 5×3 in., 6×4 in., and 8×5 in., according to personal requirements. This is a characteristic feature of the "Efficiency" desk—its individuality. It can be adapted to the needs of the user. Telephonic communications entailing memorization can, without effort in hunting for a scrap of paper, be written on the slate at your elbow—a constant reminder of details that are otherwise apt to be forgotten. Office "tools," for which a special receptacle is provided of facile access, are always available for instant use. The desk is mouse-proof. The drawers of this desk are fitted with frictionless steel suspensions; they roll in or out at the lightest touch, however heavily loaded. Among the other useful requisites shown are a work organizer, swinging office stand, typists' desks, and tables.

"Pyruma."

A new booklet on "Pyruma," the fire cement with a hundred and one uses, has been issued by Messrs. J. H. Sankey and Son, Ltd., of 74 Cheapside, E.C.2. Sankey's "Pyruma" fire cements are specially suitable for setting, jointing, pointing and repairing all kinds of firebrick work in furnaces, kilns, retorts, dust destructors, anthracite stoves, ranges, grates, fixing tiles round stoves, etc. The use of "Pyruma" fire cement is a practical expression of the householder's "safety first," besides being a convenient and inexpensive preparation in actual use. For facing and coating firebrick work all that is necessary is to moisten the surface and apply "Pyruma" wash with a brush. This is supplied ready for use. This fills all interstices in the face of the brickwork.

"Pyruma" is made in two grades: "Pyruma" (coarse) for temperatures up to 1,760°C. approx. "Pyruma" putty (fine) for temperatures up to 1,400°C.

The firm's "Siluma" fire cement, which is finer ground and more siliceous, is specially useful for setting silica bricks. It can be used either as a fire cement or as a wash. "Graphuma" is made for resisting corrosion and clinkering in firebrick work, either as a cement or as a wash.

Because of its scientific composition and special process of manufacture, "Pyruma" can be used for repairs to a *red-hot* surface—therefore no cooling time is necessary.

The point of importance is that "Pyruma" fire cement sets hard without heat, and, possessing strong adhesive qualities, forms an efficient bonding medium whether submitted to a high temperature or not.

Relay Automatic Telephones.

One of the most interesting exhibits at the Institute of Engineering Exhibition, Cardiff, was that of the Relay Automatic Telephone Co., Ltd., who were showing a complete inter-departmental automatic telephone system, comprising automatic switchboard, power board, two sets of 24-volt batteries, and telephone instruments. The switchboard consists of an iron frame into which the relay groups are fitted. These groups can be increased as desired from time to time without putting the service out of action. The relay takes the place of the human operator, and, by a series of electrical circuits actuated through the dial on the telephone instrument, the caller becomes his own operator, and can automatically get into touch with any connection required within four seconds. The functions of power board and accumulators are to store and distribute the electric energy for working the switchboard. The power used for this purpose is supplied from a 24-volt battery of accumulators, which can be charged from the existing electric light system, either direct or through a motor generator. Instruments of the post office pattern were exhibited with a dial attachment, also a convenient form of box-type instrument, with combination hand-telephone, which is recommended for both desk and wall use. An important feature of the wiring system is that two wires only are necessary from each telephone to the switchboard, and that the caller can connect himself to any of the other telephones served by the switchboard. The General Post Office will now install on rental the Relay automatic telephone system for private branch exchanges, combining automatic communication between departments and connection to the public exchange service.

ARCHITECTURAL REFERENCE LIBRARY.
The attention of Architects, and of those interested in Architecture, is called to the facilities afforded by the specially appointed Reading Room at 27–29 Tothill Street, Westminster.
This Room has been set apart in order that the numerous Works in the Library may be referred to in quietude and ease.
Overseas Members of the Profession, and also Architectural Students, are cordially invited to make the fullest use of the Library.

THE

Cure for Damp Walls

IS

"PROTEX"

(BLACK CARBON EMULSION)

THE application of our **"PROTEX"** to the brick, plaster, or other surface produces a pliable film or coating which entirely prevents the passage of any damp or moisture.

"PROTEX" never becomes hard or brittle, neither will it crack nor flake. It is easily applied, being put on cold with an ordinary brush.

"PROTEX" is a tenacious bonding medium, and plaster or cement can be affixed to any wood, metal, or other surface without the aid of any special key.

PROTEX.
WATERPROOFS • AND • BONDS

TRADE MARK.

"PROTEX" gives a perfect damp-proof film, and the plaster can be applied directly to it, without furring or lathing, saving cost of materials and labour, and economizing space.

"PROTEX" can be papered over.

"PROTEX" is supplied in ½, 1, and 2 gallon cans, 5 and 10 gallon drums, and 20 and 40 gallon casks.

Booklet with full particulars from—

GEORGE M. CALLENDER & CO., LTD.
(Dept. PX.) 25 VICTORIA STREET, LONDON, S.W.

Telegrams: "QUARRIABLE, LONDON." Telephone: VICTORIA 4642.

CONTRACTS OPEN

Unless expressly stated to the contrary, all deposits required for bills of quantities. etc., are returned on receipt of bona-fide tenders. The words "Fair Wages Clause" inserted in certain paragraphs signify that persons tendering must conform to a fair wages clause in the contract, which requires them to pay the rates of wages current in the district.

BUILDING.

December 14.—**FLATS, &c. Exeter.**—Works in Coombe Street, Exeter, for the T.C.: (1) Demolition of buildings and clearing site; (2) concrete paving and drainage; (3) erection of flats. Apply City Architect, 2 Southernhay West. Deposit £1.

Law Reports

Building Contract Cancelled

Clarkson v. *Aldwych Building Estates Co., Ltd.*

November 16. Before Mr. Justice Romer.

This was an action by Mr. W. Clarkson, he theatrical costumier, against the Aldwych Building Estates Co., Ltd., for he cancellation of a building contract, possession of a site in Catherine Street, W.C., and other relief. The action was undefended.

Mr. Mulligan, for the plaintiff, stated hat he was the freeholder of certain land n Catherine Street, and two years ago ntered into a building agreement with he defendant company, and a second efendant guaranteed the performance of he contract. That gentleman had died ince the action was commenced, and his xecutors had not yet been added as parties, so that the action now came on gainst the company alone.

Counsel asked for judgment against the ompany for recovery of possession of he property, a declaration that the agreement was at an end, and delivery up for ancellation of the document, a declaration that £1,300 deposit paid by the company to the plaintiff was forfeited, udgment for £1,735 accrued rent, and an nquiry as to the rents and profits received by the company from advertisements on the hoardings round the property. He added that there was no respect of getting the last two items, nd that possession of the site was the mportant thing, as Mr. Clarkson had een offered £25,000 for the property.

His Lordship entered judgment for the laintiff as asked with costs.

Subsidence or Explosion?—Important Issue

Ellwood v. *The Salt Union, Ltd.*

November 24–28. King's Bench Division.
Before Mr. Justice Shearman.

His Lordship continued the hearing of he action he commenced at the Chester ssizes, by Mr. H. Ellwood and Mrs. H. llwood, of Ollershaw Lane, Marston, hester, against the Salt Union, Ltd., of olonial House, Liverpool, to recover amages for injuries to their property at Marston, due, they alleged, to an explosion or a nuisance at the defendant's elson mine. Alternatively plaintiffs ought damages on the ground of negligence. Defendants denied negligence or ability in the matter.

Mr. A. Jones, K.C., appeared for laintiffs, and Sir Ellis Griffiths, K.C., presented the defendants.

Mr. Beckett, a member of the Institute f Civil Engineers and a consulting engineer, of Manchester and London, called n behalf of plaintiffs, said he was a ative of Northwich, and was familiar ith the salt district. His personal nowledge extended to the Nelson mine. e had inspected the plaintiffs' property. e was familiar with cracks in property used by ordinary subsidence. Statutory subsidence went on gradually.

His Lordship: I inspected several parts Northwich as I wanted to see the cracks elsewhere, and I also saw the plaintiffs' houses.

Witness, continuing, said with regard to subsidence it found the weakest spot in a house and then appeared there. He inspected all the plaintiffs' houses. He thought the cracks in the plaintiffs' houses, of which complaint was made, were not due to ordinary subsidence, but in his opinion were due to explosion—tremors of the earth following an explosion. There were traces that the cracks started at the top of the houses.

His Lordship: That is the problem we have to solve.

Witness: The cracks I saw were of recent origin, and they do not extend to the bottom, but they extend in various directions. That, in my opinion, is very strong evidence of shock from explosion against the end of the house. Earth tremor would cause the cracks of the kind I saw.

You mean it is earthquake and the buildings swaying?—I attribute the damage to earth tremor chiefly.

Cross-examined: Witness formed the opinion that the explosion caused material damage to the plaintiffs' houses. In his opinion one-third of the damage might be due to subsidence or explosion. The other two-thirds of the damage, in his opinion, was due entirely to explosion. He had not inspected with a view to estimating the cost of the damage, but with a view to giving his opinion as to the cause of the damage.

His Lordship (to Sir Ellis Griffiths): Do you say you are not responsible for this eruption, I won't say explosion, because it came in the course of nature?

Sir Ellis: Yes, that will be my submission.

Mr. William Bowyer, builder, of Northwich, said he examined the property and gave an estimate for doing the necessary work, viz., in respect of the decorative work on the property about £240, and the structural work at about £140.

Mr. H. Hughes, an auctioneer and valuer, of Northwich and Crewe, estimated the depreciation, or loss on this property, at £1,000 in 1920. From what witness could learn he attributed the damage to the property to the eruption or explosion.

This was the case for the plaintiffs.

Sir Ellis Griffiths pointed out that the eruption was in July, 1920, and the first claim of plaintiffs was for £3,000. A year later the claim was for £2,100. Under these circumstances he asked the court to view the case with care and attention.

His Lordship said his difficulty was to disentangle the damage caused by the eruption from the damage done by subsidence.

Mr. W. A. Bennett, a surveyor in the Cheshire district, gave evidence for the defendants.

Prof. Wilkinson, civil engineer, of the University of Liverpool, also gave expert evidence on behalf of the defendants.

His lordship gave judgment in favour of the plaintiffs, and assessed the damages at £50, stating that he thought the injuries to the property from the eruptions complained of were not more. He thought the eruption was the result of pressure from the rising brine on the air in the mine space, which forced it up the shaft, blocked by the platform put in by the defendants. He thought this amounted to negligence, for which the defendants were responsible. The houses, four in number the property of Mrs. Ellwood, were damaged to the extent of £50. There was no damage from the explosion to the houses owned by Mr. Ellwood.

Judgment for Mrs. Ellwood for £50, and judgment for defendants against Mr. Ellwood, but without costs. Defendants to pay Mrs. Ellwood's costs of the action generally, but to have costs of issue respecting three houses in which she had failed to show damage. His Lordship explained that he had made the order as to costs because the greater part of the cost was incurred through the defendants' denial of all liability.

Erection of a Bungalow

Arding and Hobbs v. *W. S. Sandison.*

Nov. 29. Official Referees' Court.
Before Sir Francis Newbolt.

This was an action by Messrs. Arding and Hobbs, Ltd., builders, of Lavender Hill, London, against Mr. W. S. Sandison, of Barnet Wood Lane, Ashtead, Surrey, to recover the balance of charges for building a bungalow at Ashtead. For work and labour done and materials supplied the total charge was £2,145 8s., to which was added 15 per cent. for profit and establishment charges, bringing the total up to £2,552 3s. 8d. Of this, £1,700 had been paid, leaving the balance of £852 3s. 8d., which was the subject of the claim. The main defence was alleged defective work and overcharge.

From the statement of Mr. Fortune, who appeared for the plaintiffs, it transpired that on July 8, 1920, the plaintiffs gave defendant an estimate which, together with correspondence that followed, constituted the contract, which was accepted verbally and confirmed by plaintiffs. The estimated cost was £1,478, based upon time and material plus 15 per cent. for establishment charges and profits. Of the net cost 90 per cent. was to be paid as the work proceeded and the balance on completion. Mr. Candish was the architect. When the contract was made the defendant thought the work would cost £1,478, but no one really knew what the work would cost as it had to be done at a time of great inconvenience for builders. The plaintiffs, said counsel, had to struggle against great difficulties, and it was not likely that they would enter into anything like a binding contract. The work was carried out on the terms arranged, and when completed an account was sent in to the amount of about £2,500. The alterations and extras came to between £500 and £600. The account was sent in showing the balance of £1,152 3s. 8d. due, on February 19, 1921. That amount was altered in the writ to £852 owing to payments made on account, and every facility had been given to defendant to investigate by going through plaintiffs' books. The total prime cost for work came to £1,024 13s. 5d.

and the prime cost for materials was £1,111 14s. That was the total prime cost of the whole job, and after charging the 15 per cent. and making certain deductions, the amount claimed worked out at £786 3s. 10d., and how the result was arrived at was shown by plaintiffs' prime-cost book.

The defendant said that there was an overcharging of £486, and met the claim, said counsel, by a blank denial of everything. Continuing, plaintiffs' counsel said that defendant took from October to February to put in the defence, when £300 was paid into court; but this the plaintiffs were not prepared to accept. They, however, would have accepted the prime cost only without claiming any profit for the firm.

Mr. B. Hammond, plaintiffs' manager, was examined on the details of the work done, the cost and the fairness of the charges, and he was in the box under examination and cross-examination for two days. In the course of his cross-examination he said that the fluctuation of prices at the time when the work was done made it difficult to fix the amount upon which the 15 per cent. could be charged.

The witness was questioned closely on book entries and invoices with a view to supporting defendant's allegation that there had been a great overcharge for materials, that articles invoiced at a few shillings had been increased (according to defendant's counsel) from 60 to 200 per cent., and that there had been much too heavy a charge for extras.

Mr. H. S. Candish, architect and surveyor, who gave evidence on subpœna, said that in May and June 1921 he was acting for the building owners in two cases where Messrs. Arding and Hobbs were employed as builders. He prepared plans from sketches supplied by Messrs. Arding and Hobbs, but he had nothing to do with the contract. Some time after that he was employed by the defendant and acted on his behalf throughout the job. The work was started about July 12, and after that date he supervised on behalf of the defendant, and visited the site once or twice a week. He inspected the work from time to time and gave certificates. Treating the job as a whole he was of opinion that substantially it was well done, especially considering the troubled times in which it was done.

At the assembling of the court on Thursday, the fourth day of the hearing, Mr. Fortune, plaintiffs' counsel, announced that the parties had come to terms. The defendant having paid a further sum beyond the money paid into court, he now asked for an order for payment out of the £300 in court, and judgment for plaintiffs on the claim and counter-claim with costs.

The Official Referee said that defendant had been well advised in settling the case. The defendant had no doubt been taken by surprise by the contract and felt that he had a grievance, but when his architect ordered extras he (defendant) was responsible for them.

Judgment was entered for the plaintiffs on terms endorsed on counsel's brief.

Liability for Fall of House Cornice

Kidd v. *A. and F. Hathaway.*

Nov. 29. Court of Appeal.

Before Lords Justices Bankes, Warrington, and Scrutton.

This was an appeal by the plaintiff, Mr. E. Kidd, of Greenmount Road, Tenenure, Dublin, against a verdict of a special jury at a trial before Mr. Justice Coleridge at Ruthin.

Mr. Artemus Jones, K.C., in support of the appeal, said the plaintiff based his application for a new trial on the ground that the verdict of the jury was perverse, the jury having entirely disregarded the directions of the learned judge. Mr. Kidd lived in Dublin, and he brought the action against the defendants, the Misses Hathaway, who ran a private hotel at Colwyn Bay, for damages for personal injuries sustained by him whilst a visitor at the hotel in these circumstances: Mr. Kidd, on July 23, 1920, was sitting on a chair in front of the steps of the house, Mrs. Kidd sitting a little below him, and a Mr. Roberts, who was the proprietor of the hotel, was sitting close by in a Dutch chair. Whilst they were sitting talking a portion of the cornice which ornamented the front of the hotel, and which was made of concrete or cement, fell down, and as it crashed down it knocked against the balcony just above Mr. Roberts's head. Mr. Kidd, on hearing the noise, jumped up and dashed into the doorway, and as he did that his foot caught in something and he fell on his back and sustained injuries which developed when he got back to Dublin. Afterwards there was found on the chair in which Mr. Kidd had been sitting a piece of the cornice. The action was founded on negligence, and the defence, said counsel, was that the plaintiff's injuries arose through his own negligence, and there was a plea of contributory negligence.

Amongst other questions left to the jury by the judge was whether the plaintiff was injured by the fall of the cornice and which the jury answered in the negative. He (counsel) contended there was not a scrap of evidence on which the jury could return such an answer.

Without calling upon counsel for the respondents their Lordships dismissed the appeal, with costs.

Lord Justice Bankes, in giving judgment, said that the jury might have come to the conclusion that the plaintiff was s unreasonably frightened by what had happened that he had not looked where he was going. He did not know whethe that was so; but it was for the jury on the evidence to form their own opinion and in the circumstances he thought tha Court could not interfere with the verdict

CONTRACTS OPEN

Unless expressly stated to the contrary, all deposits required for bills of quantities, etc., are returned on receipt of bona-fide tenders. The words "Fair Wages Clause" inserted in certain paragraphs signify that persons tendering must conform to a fair wages clause in the contract, which requires them to pay the rates of wages current in the district.

BUILDING.

December 21.—**CONVENIENCE. Croydon.**—Construction of an underground convenience for men and women at the junction of Tamworth Road with Waddon New Road, West Croydon, for the Town Council. Apply Borough Engineer, Town Hall. Deposit £1 1s.

December 22.—**HOUSES. Leek, Staffs.**—Erection of 20 B-type and 98 A-type houses on the housing site off Buxton Road, Leek, for the Leek U.D.C. Apply Mr. W. E. Beacham, Architect and Surveyor, Town Hall, Leek.

December 22.—**MONUMENT. Dundee.**—Excavator, mason, and brickwork of the proposed monument on The Law, for the Dundee War Memorial Committee. Apply Mr. W. H. Blyth Martin, Clerk to the Committee, Town House, Dundee, or Mr. W. Gauldie, 26 Commercial Street, Dundee.

December 23.—**ADDITIONS. Ammanford.**—Additions to Bettws School, Ammanford, for the Carmarthenshire County Council. Apply Mr. W. V. Morgan, A.R.I.B.A., County Architect, County Offices, Carmarthen.

December 23.—**HOUSES. Perranporth, Cornwall.**—Erection of two dwelling-houses and business premises in Perranporth. Apply Mr. A. Mitchell, Beach Cottage, and Mr. H. V. Westcott, Post Office, Perranporth.

December 23.—**HOMES. Halifax.**—Erection of the John Mackintosh Memorial Cottage Homes, Halifax. Apply Messrs. Lumb and Walton, Architects, 19 Clifton Street, Blackpool; and Mr. Medley Hall, Resident Architect, 1 Harrison Road, Halifax. Deposit £1.

December 23.—**THEATRE. Merthyr.**—Erection of the Castle Theatre, High Street, Merthyr. Apply Messrs. Sir Charles T. Ruthen & Co., Architects, 44 Bedford Row, London, W.C.1, and Bank Chambers, Heathfield Street, Swansea.

December 28.—**HOUSES. Neath.**—Erection of 20 houses on Penyralley Road, Skewen, and 12 houses on Longford Road, Neath Abbey (type B, parlour), in brickwork, under the working classes housing scheme, upon roadside frontages, for the Neath R.D.C. Apply Mr. D. M. Davies, M.I.N. and C.E., M.S.A., Council Offices, Orchard Street, Neath. Deposit £2 2s.

December 28.—**HOUSES. Swansea.**—Erection of blocks of houses, for the Swansea R.D.C. :—(1) Alexandra Road site, Gorseinon, 10 blocks each of two houses of the A type and 10 blocks each of two houses of the B type; (2) Mount Street site, Gowerton, two blocks of two houses of A type and three blocks of two houses of B type. Apply Mr. J. T. J. Williams, M.S.A., 3 Temple Buildings, Goat Street, Swansea. Deposit £2 2s.

December 29.—**HOUSES. Halifax.**—All-trade tenders in erection of 32 scullery houses at Wakefield Road, Halifax, for the Housing Committee. Apply Mr. A. C. Tipple, Borough Engineer. Deposit £2 2s.

December 29.—**HOUSES. Dagenham, Essex.**—Erection of 222 houses and flats on the estate, for L.C.C. Apply Messrs. C. J. Wills and Sons, Ltd., Becontree Housing Estate, Chadwell Heath, Essex. Deposit £5 5s.

December 30.—**CHURCH. Leeds.**—Erection of the main portion of the First Church of Christ Scientist, Headingley, Leeds, adjacent to the existing school building. Apply Messrs. Schofield and Berry, Architects, 15 Park Row, Leeds. Deposit £2 2s.

December 30.—**HOUSES. Norton-on-Tees.**—Erection of houses on the Blue Hall Estate at Norton-on-Tees, for the Corporation of Stockton-on-Tees. Apply Housing Architect, 37a High Street, Norton-on-Tees.

December 31-January 23.—**UNIVERSITY BUILDINGS. Cape Town.**—Buildings for the University on the Groote Schuur estate at Rondebosch, near Cape Town, for the Council of the University of Cape Town. Apply office of the High Commissioner for the Union of South Africa, Trafalgar Square, London, W.C. Deposit £15.

January 1.—**HOUSES. Bristol.**—Construction of eight brick-built houses for lock-gatesmen at Cumberland Basin, Bristol, for the Docks Committee. Apply Chief Engineer, Avonmouth Dock. Deposit £2.

January 1.—**MEMORIAL HALL. Talgareg.**—Erection of proposed memorial hall at Talgareg. Apply Post Office, Talgareg.

January 1.—**ALTERATIONS. Croydon.**—Small alterations and internal decorations at (1) the Union House, Queen's Road, Croydon; (2) "Waingates," 316 London Road, Thornton Heath, for the Guardians. Apply Mr. H. Berney, Architect, 33-35 High Street, Croydon. Deposit £2 2s.

January 2.—**HOUSES. Glossop.**—Erection of 16 houses, in pairs and blocks of four, in Simmondley Lane, for the T.C. Apply Mr. H. C. Powell, A.R.I.B.A., 9 Albert Square, Manchester. Deposit £3 3s.

January 3.—**HOUSES. Mansfield.**—Erection of 24 houses, type A, in the borough, for the Town Council. Apply Mr. W. Thompson, A.M.I.C.E., Borough Engineer and Surveyor, Market Street, Mansfield.

January 5.—**HOUSES. Tunbridge Wells.**—Erection of houses for the working classes at the following sites, for the Tonbridge R.D.C. :—Two, Mount Pleasant Road, Paddock Wood; eight, Golden Green, Hadlow; four, Shipbourne Road, Hildenborough; eight, Capel. Apply Mr. F. Harris, Engineer and Surveyor, Broadway, Southborough, Tunbridge Wells. Deposit £1 1s.

January 8.—**REBUILDING. Church and Beddau.**—Rebuilding the Cross Inn, Church Village, and the Gelynog Inn, Beddau, for the Rhondda Valley and Ely Breweries, Ltd. Apply Rhondda Valley and Ely Breweries, Ltd., Taff Street, Pontypridd. Deposit £2 2s.

January 10.—**SUPERSTRUCTURE. Walton-on-Thames.**—Construction of the superstructure for the extension of the existing engine-house, boiler-house, elevated coal bunkers, and alterations to existing works, &c., at Walton-on-Thames, for the Metropolitan Water Board. Apply Mr. H. E. Stilgoe, M.I.C.E., Chief Engineer. Deposit £5.

January 17.—**IMPROVEMENTS, &c. Bettws.**—Carrying out improvements, interior reconstruction, new seating, &c., for the Committee of the C.M. Church, Bettws, near Newtown. Apply Mr. R. A. Ford, Architect and Surveyor, Llanidloes.

No Date.—**WINTER GARDENS, &c. Bangor, Ireland.**—Proposed winter gardens and palais de danse, Seacliffe Road, Bangor, for Mr. D. Nardini. Apply Mr. G. O'Neill, M.R.I.A.I., Architect, Bangor; or Messrs. M'Carthy and Lilburn, Quantity Surveyors, Belfast.

No Date.—**SHOPS, &c. Bangor, Ireland.**—Two shops and dwelling house, Central Avenue, Bangor. Apply Mr. G. O'Neill, M.R.I.A.I., Architect, Bangor.

No Date.—**ALTERATIONS, &c. Halifax.**—Alterations, &c., to premises in Bedford Street North, for Messrs. O. and C. Holdsworth. Apply Mr. W. Hall, M.S.A., Architect, 26 George Street, Halifax.

ELECTRICAL.

December 22.—**ELECTRIC TRAVERSER. London, E.C.**—Supply of 35-ton electric traverser, for the Bengal-Nagpur Railway Co., Ltd. Apply Company's Offices, 132 Gresham House, Old Broad Street, London, E.C.2. Deposit 10s. 6d.

January 1.—**SWITCHGEAR, &c. Cheadle.**—Sub-station switchgear (contract No. 2), and static transformers (contract No. 3), for the Cheadle and Gatley U.D.C. Apply Mr. C. H. Wordingham, C.B.E., M.I.C.E., M.I.E.E., 7 Victoria Street, Westminster, London, S.W.1, or 11 Mosley Street, Manchester. Deposit £3 3s. (contract No. 2); £1 1s. (contract No. 3).

January 1.—**ELECTRIFICATION. Manchester.**—Conversion of Davyhulme sewage works, Urmston, from steam to electric drive, for the Rivers Committee. Apply Secretary of the Rivers Department, Town Hall, Manchester.

January 9.—**CRANE. New Zealand.**—Supply and delivery of one electric travelling crane in connection with the Waikato power scheme, section 58. The crane is to be designed for lifting, traversing and travelling loads up to 27 tons. Apply Department of Overseas Trade (Room 50), 35 Old Queen Street, Westminster, London, S.W.1.

January 9.—**PLANT. London, E.C.**—Supply of the following plant for electrification of Bombay suburban lines, for the Great Indian Peninsula Railway Co., viz. :—(1) Electrical equipment of coaches, fee for specification £2; (2) overhead equipment of permanent way and overhead distribution lines, £2. Apply Company's Offices, 48 Copthall Avenue, E.C.2.

January 15-31.—**PLANT. Melbourne.**—Supply, delivery, &c., of plant for the Morwell power scheme, for the State Electricity Commission of Victoria. Apply Agent-General for Victoria, Melbourne Place, Strand, London, W.C.2. Deposit £2 2s.

January 17.—**TELEPHONE AND TELEGRAPH APPARATUS, &c. Perth; Australia.**—Supply and delivery of telephone apparatus, testing instruments, and protective apparatus (schedule No. W.A. 751). Apply Department of Overseas Trade (Room 49), 35 Old Queen Street, Westminster, London, S.W.1.

January 26.—**ELECTRIC LIGHTING PLANT. Malmesbury, S. Africa.**—Electric lighting plant for Malmesbury as follows: (1) Supply, delivery, and erection of (a) superheated steam engines, boilers, pumps, piping, valves, alternatively (b) suction gas engines and producers, alternatively (c) Diesel oil engine and all accessories, with dynamos, and switchboard in power-station; the supply of all necessary cables and connections, trenches, chequer plating, hand rails, and the leaving of same in good working order, and completed according to specification and guarantee in a thoroughly efficient manner. (2) Supply, delivery, and erection of poles, overhead cables, street lamps and standards, house connections, &c., and all sundries and incidental material necessary to complete the outside work from the switchboard in the power-station to the consumer's premises, according to specification and guarantee, with the exception of items contained in (3). (3) Supply and delivery on site of meters and general testing instruments as specified. (4) Supply, delivery, erection of battery, connection to switchboard, and all sundries attached thereto as specified. Apply Department of Overseas Trade (Room 49).

ENGINEERING.

December 21.—**BRIDGE. Spalding.**—Taking down of a brick bridge over the Hammond Beck, Quadring Fen, known as Calf Bridge, and for the erection of a girder bridge with brick abutments, for the Spalding R.D.C. Apply Mr. A. K. Maples, Clerk, Spalding.

December 22.—**PUMP. Manchester.**—Supply of one circulating pump, hot-water tube and fittings, to the Crumpsall Institution, Crescent Road, Manchester, for the Guardians. Apply Mr. Hargreaves, Superintendent of Works, Union Offices, All Saints', Manchester.

December 28.—**WATER MAIN. Southborough, Kent.**—Provision and laying of about 1,500 yards of 10 in. cast-iron water main and 6 in., 4 in., and 3 in. connections to existing branches in the main road, Southborough, for the Southborough U.D.C. Apply Messrs. G. and F. W. Hodson, Bank Chambers, Loughborough and London. Deposit £5 5s.

January 1.—**CONDUIT. Littleton and Hampton.**—Construction of about 35 yards of twin 96 in. diameter reinforced concrete conduits and about 3,900 lineal yards of 72 in. reinforced concrete conduit from Littleton to Kempton, also the laying only of about 2,000 yards of 48 in. diameter cast-iron pipe from Kempton to Hampton, together with a concrete intake channel to the Staines aqueduct and for contingent works, for the Metropolitan Water Board. Apply Offices of the Board, Chief Engineer's Department (Room 201). Deposit £20.

January 6.—**BRIDGE. Glasgow.**—The Corporation of Glasgow invite designs and offers for the construction of a ferro-concrete bridge over the Clyde at Oswald Street. Apply Office of Public Works, City Chambers, 64 Cochrane Street.

January 8.—**WATERWORKS. Okehampton.**—Supply, laying, and jointing of about 1,000 yards of 5 in. and 4 in. cast-iron socket pipes with their appendages, including all necessary sluice and air valves, hydrants and other works, for the improvement of the water supply of the town, for the T.C. Apply Messrs. Nichols and Unwin, 11 Victoria Street, Westminster, S.W.1. Deposit £2.

January 27.—**PLANT. Birmingham.**—Supply and erection of plant for refuse destructor and salvage works, Brookvale Road, Witton, for the Salvage and Stables Committee. Apply Mr. J. Jackson, Superintendent, Salvage Department, 161 Corporation Street, Birmingham Deposit £1 1s.

March 7.—**ASH AND DUST EXTRACTION PLANT. Melbourne.**—Supply, delivery, &c., of ash and dust extraction plant (specification No. 23-6), fo the Morwell power scheme. Apply Agent-General fo Victoria, Melbourne Place, Strand, London, W.C.2 Deposit £2 2s.

PAINTING.

December 22.—**PAINTING. Carlisle.**—Paintin the following properties, for the Corporation, viz. Town Hall, English Street; Lowther House, Lowthe Street, and premises, English Street and New Grape Lane. Apply Mr. H. C. Marks, M.I.C.E., City Enginee and Surveyor, 18 Fisher Street, Carlisle.

December 22.—**PAINTING. Sheffield.**—(a) Cor Exchange Hall, internal painting; (b) Norfolk Market internal and external painting; (c) Sheaf Market, paintin of stalls, for the Markets Committee. Apply Mr. F. E. P Edwards, City Architect, Town Hall, Sheffield.

ROADS AND SEWERS.

December 22.—**SEWAGE DISPOSAL WORK EXTENSION. Southall.**—Extension of the sewag disposal works, for the Southall-Norwood Urban Distric Council. Apply Mr. J. B. Thomson, A.M.I.C.E., &c. Engineer and Surveyor, Town Hall, Southall.

December 28.—**ROAD WORKS. Little Stanmore Middlesex.**—Kerbing, channelling, paving, and making up of the following streets, all in the parish of Littl Stanmore, for the Hendon R.D.C.: Churchill Road Gresham Road, and Montgomery Road. Apply M H. W. Rackham, Engineer and Surveyor, Stanmore Deposit £2 2s.

December 28.—**STREET WORKS. Waterloo with-Seaforth, Lancs.**—Works of sett paving, con creting, flagging, kerbing, draining, &c., in Seafort Road, Seaforth, for the Waterloo-with-Seaforth U.D.C Apply Mr. J. R. Fothergill, A.M.I.C.E., Surveyor to th Council.

December 29.—**ROAD WORKS. Southport.**—Levelling, paving, metalling and making good Chesterfield Road and Sandringham Road, Ainsdale, for th Highways Committee. Apply Mr. A. E. Jackso M.I.C.E., Borough Engineer, Town Hall, Southport Deposit £2 2s

January 3.—**SEWAGE DISPOSAL WORKS Sedgley.**—Provision, laying, and jointing of 12 in. an 9 in. stoneware pipe sewers; also for the construction manholes, engine-house, pump well, sedimentatio tanks, storm-water tanks, bacteria beds, humus tank sludge beds and other incidental works, for the U.D.C Apply Engineers, Messrs. Willcox and Raikes, 63 Templ Row, Birmingham. Deposit £5 5s.

Abstract Published.

186745.—Walls.—Rammage, A. W., 29 Amerland Road, West Hill, Wandsworth, and G. H. Pittaway, 65 Onslow Gardens, Muswell Hill, both in London. A double slab or block wall is formed by placing the slabs against a permanent light wooden framework composed of verticals and rails. The framework acts as a guide only and carries no load. The bottom is set in concrete, and, at the window and door openings, the frame seals the cavity and is rendered with cement. A space is left at the top of the wall, and is sealed with concrete in which are set straps to tie down the roof timbers. The slabs are secured by metal ties and the exterior is rendered in rough-cast cement or lime.

The above particulars are specially prepared by Messrs. Rayner & Co., registered patent agents, of 5 Chancery Lane, London, W.C. 2, from whom readers of the Journal may obtain all information free relating to patents, trade marks, and designs. Messrs. Rayner & Co. will obtain printed copies of the published specifications and forward on post free for the official price of 1/- each.

The Week's News

A Reading Architect's Estate.

Mr. Spencer S. Stallwood, a Reading architect, left £28,416.

Rochford Bungalow Costs.

Rochford Rural District Council are building bungalows at £360 each.

Town Planning at Luton.

The Luton Town Council have adopted a town-planning scheme.

The London County Hall.

It is proposed to make arrangements for the new County Hall to be open for public inspection on Saturday afternoons.

New Sports Ground for Folkestone.

A new sports ground, to cost £72,890, is to be constructed by the Folkestone Corporation.

London Heating Engineer's Estate.

Mr. Richard Crittall, of Bournemouth, and of Messrs. Richard Crittall & Co., Ltd., of London, engineers, left £7,345.

Repairs to a London Hospital.

£2,500 is urgently required for repairs to the Infants' Hospital, Vincent Square, Westminster.

New Industry for Middlesbrough.

A new industry for the manufacture of wire fabric for the reinforcement of concrete in road and building construction is shortly to be started at Middlesbrough.

St. George's Chapel, Windsor.

Towards the £80,000 still required for the restoration of St. George's Chapel, Windsor, an anonymous donor has given £1,000 a month for six months.

The Manchester Building Guild.

Messrs. J. A. Mactaggart & Co., Ltd., of Glasgow, contractors, are taking over the sole control of the National Building Guild, Ltd., of Manchester, for three years. The firm are also investing £50,000 in the business.

A Proposed Huddersfield Church.

Messrs. Lunn and Kaye, of Milnesbridge, Huddersfield, architects, have prepared plans for a new church in Huddersfield. It is for the Spiritualist denomination of Huddersfield.

Doncaster's New Sewage Scheme.

The Doncaster Corporation have begun the laying of new main sewers throughout the town. The total cost will amount to about £250,000. It is estimated that the work will take about five years to complete.

New County Hall's Acoustics.

The acoustics of the new London County Council Hall are as bad as ever. A large white sheet was suspended above the members at a recent meeting, but the speeches were no more audible than before.

New Yorkshire Light Railway.

Messrs. Stephen Sellon and Partners, of London, engineers, have prepared plans for a proposed light railway which will run from Barnsley to Mexborough. The work will include in addition to the railway, street widening, bridge work, rolling stock, buildings, and overhead wires, etc.

L.C.C. Housing Progress.

Under the State scheme of building, states a report by the L.C.C. Housing Committee, 6,477 houses have been completed up to date. The committee express the opinion that the provision of additional housing accommodation is desirable.

Doncaster's Proposed New Infirmary.

The Doncaster Infirmary Governors have decided to erect a new infirmary. The Infirmary Committee, the local doctors, and the miners' hospital committee have decided upon a site near Greenhouse in Thorne Road, Doncaster. The Governors are to be asked to sanction the scheme and to put the work in hand immediately.

Bournemouth's Pavilion Scheme.

Approval has been given by the Ministry of Health to the scheme of Bournemouth Corporation for the erection of a £100,000 pavilion on the Bellevue and Westover site near the pier. A competition is to be promoted in connection with which the corporation will offer prizes of £300, £200, and £100 for the most suitable designs.

Brighton Aquarium.

The Brighton Town Council have decided to retain the Aquarium under municipal control and to reject offers to lease the building at rentals varying from £1,000 to £4,000 a year. The Aquarium Committee have been instructed to bring up proposals for dealing with the site on lines of public improvement. Councillor H. B. Lewis has outlined a scheme for converting the site into public gardens, with a restaurant in the centre.

Roman Remains at Colchester.

Further discoveries of Roman remains have been made at Colchester, where excavations are taking place in connection with drainage works. In Culver Street, near the centre of the town, and well within the walls, Roman polished marble, Roman pottery fragments, and stone material have been unearthed in considerable quantity, as well as a stonemason's tools, shaped brickwork, buff ware, a bone hairpin, etc. The marble is believed to have been used in the wall design of some Roman building. In another part of the town, in a private garden on North Hill, Roman tesselated pavement, measuring 13 ft. by 5 ft., and apparently part of a 15 ft. square, has been discovered and is a very fine specimen. Of special interest is the discovery of the remains of ashes over the pavement. This is believed to indicate the destruction of the earliest Roman buildings by fire, possibly in the devastation of Camulodunum, caused by Boadicea when she attacked the Roman colony.

Incorporation of Architects in Scotland.

At the last meeting of the Council, held in Edinburgh, with Mr. T. P. Marwick in the chair, the scholarship and bursaries recommended by the Education Committee for the promotion of architectural education were approved. It was reported that considerable progress had been made in the matter of instituting a Scottish Degree in Architecture, and that the Architects' Registration Bill and the Landed Property Practitioners' Registration Bill were under consideration. A report was submitted by the incorporation's representative as to the work done in connection with formulating a new building code for Scotland. The president was appointed representative on the Grand Committee making arrangements for Sir Christopher Wren's bi-centenary celebration. The election was made of two associates and one student; and there were applications for membership from one Fellow, six Associates, and seven students.

R.I.B.A. Council Meeting

Appended are notes from the minutes of the last meeting of the Council of the R.I.B.A. :—

The Federal Council of the Australian Institutes of Architects.—Under the provisions of the Charter and By-laws, the Federal Council of the Australian Institutes of Architects was admitted as an allied society of the Royal Institute.

The University of London.—Mr. Paul Waterhouse and Mr. Arthur Keen were nominated for re-appointment as representatives of the Royal Institute on the Architectural Education Committee of the University of London.

The Joint Archæological Committee.—Mr. E. P. Warren, F.S.A., was appointed as representative of the Royal Institute on the Joint Archæological Committee.

Retired Fellowship. — Messrs. Harry Sirr, W. M. Dowdall, and C. H. Brodie were transferred to the class of retired Fellows.

"Architecture Reviewed"

Once again the Lyric Club of the A.A. has proved its versatility and wit. In "Architecture Reviewed," produced in aid of the Architects' Benevolent Fund, a light-hearted, but eminently successful attempt was made to present in nine "slides" the progress through the ages of the art.

Particular attention was devoted to the abuses thereof. In ancient Britain the workmen would not work, the students of Greece were not altogether appreciative of those set in authority over them, and competition awards led to dissatisfaction even in mediæval Italy.

The Georgian scene, frankly and skilfully "pinched from Mr. Gay," was a sheer delight, indeed, the scenery and effects all through were a matter for sincere congratulation.

Dr. Oscar Faber conducted an excellent orchestra with verve and abandon, and the numerous musical numbers, rich in topical allusions, added considerably to the gaiety of the entertainment.

Southend Competition Awards

The full awards have been made in the Southend-on-Sea Secondary School Competition. As announced in our issue for December 6 the first place was secured by the late Mr. H. H. Thomson, F.R.I.B.A., Leicester. The other awards are: Second, Messrs. Sharman and Moore and Stockdale, Harrison and Sons, Leicester; and third, Mr. T. R. Somerford, A.R.I.B.A., London.

Uses of "Alundum" Tiles

Seven or eight years ago the engineers of the subways in New York were confronted with the difficulty of finding a substance which would withstand the wear of many thousands of foot passengers over the subways and stairs. An experiment was made by breaking up some "Alundum" abrasive wheels, which are used in the engineering trade for grinding hardened steel and other metals, it being thought that such a substance would be practically wear-proof.

This experiment proved so successful that the Norton Co., Worcester, Mass., who had for many years manufactured "Alundum" abrasive wheels, were consulted, and after further experiments tiles were produced made entirely of "Alundum," bonded with a slight percentage of clay, and afterwards vitrified in a high-temperature furnace.

These tiles are comparatively smooth, but are claimed to be "slip-proof under wet, dry, or greasy conditions, and as the surface does not wear the tiles remain slip-proof through their long life." After forty millions of people had passed over the portion of the subway and stairs thus treated, it is stated that there was not the slightest trace of wear. Several colours which harmonize with existing building materials are supplied, and the tiles are made in all standard shapes. They are specially useful as the nosing for stair-treads, and can be easily fixed either by screwing direct to wood, or laying in cement on staircases of all constructions. The tiles may also be supplied as mats for the running boards of stairways of omnibuses, trams, and motors.

"Alundum" can also be supplied in crushed aggregates for mixing with cement and marble chips to make aggregate floors, or, if preferred, can be supplied as pre-cast aggregate tiles.

Half the stairs leading from the booking-office to the platforms at Victoria Underground Station, London, have been fitted with "Alundum" stair-treads, and a very moderate estimate, based on figures kindly given by the railway company, shows that one million two hundred thousand persons walk over these "Alundum" treads each month. Tramcars have also been fitted with them in London and the provinces.

The chief advantages claimed for "Alundum" are as follows: The surface remains slip-proof during its entire life; its non-wearing quality eliminates the cost of maintenance; the first cost is the only cost; it combines slip-proof effectiveness and durability with architectural attractiveness; the tread is restful and quiet, imparting to the step a sense of security. Full particulars of the "Alundum" tiles may be obtained from Messrs. Charles Churchill & Co., Ltd., Engineers, 9–15 Leonard Street, Finsbury, E.C.2.

Copper Alloy Pipe Fittings

Report No. 99-1922 on the subject of copper-alloy pipe fittings for pipe sizes from $\frac{1}{8}$ in. to 4 in. has just been issued by the British Engineering Standards Association. The report deals with the material to be employed, testing, and dimensions for equal and reducing sockets, elbows, tees, plugs, crosses, return bends, etc., and both short turn and long sweep fittings are included. The report contains numerous tables for equal fittings and the methods to be adopted for calculating the dimensions of reducing fittings, accompanied by explanatory figures in each case. Tables of centre to face dimensions for reducing fittings are given, and also the standard sizes of these fittings in both short and long sweep varieties. Each type of fitting dealt with is illustrated by a figure. Some notes follow on the design of the fittings. Copies of this specification, price 1s. 2d. post free, may be obtained from the offices of the B.E.S.A., 28 Victoria Street, London, S.W.1.

ARCHITECTURAL REFERENCE LIBRARY.

The attention of Architects, and of those interested in Architecture, is called to the facilities afforded by the specially appointed Reading Room at 27–29 Tothill Street, Westminster.

This Room has been set apart in order that the numerous Works in the Library may be referred to in quietude and ease.

Overseas Members of the Profession, and also Architectural Students, are cordially invited to make the fullest use of the Library.

Housing Scheme

Panelled with SX. Board

Photographs of Margate Houses–

Interiors
—lined with
'SX.' BOARD

THESE photographs showing how "SX" Board was applied to walls and ceilings in an important Housing Scheme clearly demonstrate the practicability of "SX" Board as an alternative to plaster. The fact that "SX" Board is unaffected by vibration and therefore cannot crack or fall is an important feature. A house lined with "SX" Board can be decorated and occupied immediately. There is no waiting while wet walls dry—this is another notable advantage. In view of the early revival in building which is anticipated in many quarters, the advantages of a good wallboard such as "SX" merit careful consideration.

CONTRACTS OPEN

Unless expressly stated to the contrary, all deposits required for bills of quantities, etc., are returned on receipt of bona-fide tenders. The words "Fair Wages Clause" inserted in certain paragraphs signify that persons tendering must conform to a fair wages clause in the contract, which requires them to pay the rates of wages current in the district.

BUILDING.

December 28.—**HOUSES. Neath.**—Erection of 20 houses on Penyralley Road, Skewen, and 12 houses on Longford Road, Neath Abbey (type B, parlour), in brickwork, under the working classes housing scheme, upon roadside frontages, for the Neath R.D.C. Apply Mr. D. M. Davies, M.I.N. and C.E., M.S.A., Council Offices, Orchard Street, Neath. Deposit £2 2s.

December 28.—**HOUSES. Swansea.**—Erection of blocks of houses, for the Swansea R.D.C. :—(1) Alexandra Road site, Gorseinon, 10 blocks each of two houses of the A type and 10 blocks each of two houses of the B type; (2) Mount Street site, Gowerton, two blocks of two houses of A type and three blocks of two houses of B type. Apply Mr. J. T. J. Williams, M.S.A., 3 Temple Buildings, Goat Street, Swansea. Deposit £2 2s.

December 28.—**SUB-STATIONS. Cleckheaton.**—Erection of sub-stations at Webster Lane, Scholes, and Whitechapel Road, Cleckheaton, for the Spenborough U.D.C. (Electricity Department). Apply Messrs. R. Castle and Son, Architects, Midland Bank Chambers, Cleckheaton.

December 29.—**HOUSES. Hereford.**—Erection of 28 non-parlour type houses at Hereford, for the T.C. Apply Mr. W. McNeil Shimmin, A.M.I.C.E., City Engineer and Surveyor, Town Hall, Hereford.

December 29.—**HOUSES. Halifax.**—All-trade tenders in erection of 32 scullery houses at Wakefield Road, Halifax, for the Housing Committee. Apply Mr. A. C. Tipple, Borough Engineer. Deposit £2 2s.

December 29.—**HOUSES. Dagenham, Essex.**—Erection of 222 houses and flats on the estate, for L.C.C. Apply Messrs. C. J. Wills and Sons, Ltd., Becontree Housing Estate, Chadwell Heath, Essex. Deposit £5 5s.

December 30.—**HOUSES. Abercorn.**—Erection of 36 additional three-story tenement houses at Abercorn, for the Edinburgh City Council. Apply Messrs. Fairlie, Reid and Forbes, Architects, 14 Randolph Place.

December 30.—**CHURCH. Leeds.**—Erection of the main portion of the First Church of Christ Scientist, Headingley, Leeds, adjacent to the existing school building. Apply Messrs. Schofield and Berry, Architects, 15 Park Row, Leeds. Deposit £2 2s.

December 30.—**HOUSES Norton-on-Tees.**—Erection of houses on the Blue Hall Estate at Norton-on-Tees, for the Corporation of Stockton-on-Tees. Apply Housing Architect, 37a High Street, Norton-on-Tees.

December 30.—**HOUSES. Clydebank.**—Erection of 22 houses at Whitecrook, for the Town Council. Apply Town Clerk, Municipal Buildings, Clydebank. Deposit £1 1s.

December 30.—**SHOP, &c. Dipton.**—Erection and completion of shop, &c., in reinforced concrete at Flint Hill, Dipton, for the Annfield Plain Industrial Co-operative Society, Ltd. Apply Architect's Office, The Grove, Lanchester.

December 30.—**ORGAN CHAMBER. Masham.**—Construction of a small building of stone, with reinforced concrete roof, for a blowing chamber for new organ at St. Mary's Church, Masham, for the Organ Fund Committee. Apply Messrs. T. and R. Theakston, Ltd., Masham.

December 30.—**HOUSE, &c. Tynewydd.**—Building of a new dwelling-house and adaptation of farm buildings at Tynewydd, near Whitland, for the Carmarthenshire C.C. Apply Mr. W. Vincent Morgan, A.R.I.B.A., County Offices, Carmarthen.

December 30.—**HOUSE. Woolacombe, Devon.**—Erection of a house at Woolacombe for Mr. S. W. Slatter. Apply Mr. J. C. Southcombe, P.A.S.I., Architect and Surveyor, Barnstaple.

December 30-January 20.—**STORES, &c. Rotherham.**—Erection of new stores and workshops at the Highways Depot, and of new municipal offices in Howard Street, for the Corporation. Apply Mr. V. Turner, A.M.I.C.E., Borough Engineer, Town Hall, Rotherham. Deposit £5.

December 31-January 23.—**UNIVERSITY BUILDINGS. Cape Town.**—Buildings for the University on the Groote Schuur estate at Rondebosch, near Cape Town, for the Council of the University of Cape Town. Apply office of the High Commissioner for the Union of South Africa, Trafalgar Square, London, W.C. Deposit £15.

January 1.—**HOUSES. Bristol.**—Construction of eight brick-built houses for lock-gatesmen at Cumberland Basin, Bristol, for the Docks Committee. Apply Chief Engineer, Avonmouth Dock. Deposit £2.

January 1.—**MEMORIAL HALL. Talgareg.**—Erection of proposed memorial hall at Talgareg. Apply Post Office, Talgareg.

January 1.—**ALTERATIONS. Croydon.**—Small alterations and internal decorations at (1) the Union House, Queen's Road, Croydon; (2) "Waingates," 316 London Road, Thornton Heath, for the Guardians. Apply Mr. H. Berney, Architect, 33-35 High Street, Croydon. Deposit £2 2s.

January 1.—**ADAPTATION, &c. Cherington.**—Adaptation and repairs to three cottages and four sets of farm buildings at Cherington, near Shipston-on-Stour, for the Warwickshire C.C. Apply Mr. A. C. Bunch, F.R.I.B.A., County Architect, 27 Binswood Avenue, Leamington. Deposit £2 2s.

January 1.—**HOUSES. Colchester.**—Erection of a block of six houses (non-parlour type) to be built at the Harwich Road housing site, for the Housing Committee. Apply Borough Surveyor.

January 2.—**HOUSES. Cwmbran.**—Erection of 10 houses on the Two Locks site, Cwmbran, for the Llantarnam U.D.C. Apply Mr. A. G. Jones, Engineer and Surveyor, Council Offices, Cwmbran. Deposit £2 2s.

January 2.—**HOUSES. Glossop.**—Erection of 16 houses, in pairs and blocks of four, in Simmondley Lane, for the T.C. Apply Mr. H. C. Powell, A.R.I.B.A., 9 Albert Square, Manchester. Deposit £3 3s.

January 3.—**HOUSES. Mansfield.**—Erection of 24 houses, type A, in the borough, for the Town Council. Apply Mr. W. Thompson, A.M.I.C.E., Borough Engineer and Surveyor, Market Street, Mansfield.

January 3.—**FOUNDATIONS. Aylesbury.**—Construction of concrete foundations, &c., for the new electrical plant at the Electricity Works, Exchange Street, Aylesbury, for the T.C. Apply Mr. W. H. Taylor, Borough Engineer and Surveyor.

January 3.—**CHIMNEY STACK REPAIRS. Homerton.**—Repairs to chimney stacks at the Eastern Fever Hospital, Homerton Grove, Homerton, E.9, for the Metropolitan Asylums Board. Apply Mr. T. Cooper, M.I.C.E., M.I.M.E., Engineer-in-Chief. Apply Office of the Board, Embankment, E.C.4. Deposit £1.

January 3.—**ALTERATIONS, &c. Rochdale.**—Alterations and additions at Marland Hospital, for the Health Committee. Apply Borough Surveyor, Town Hall, Rochdale.

January 4.—**HOUSES. Eltham, Kent.**—Erection of 50 houses on their housing estate at Eltham, for the Woolwich B.C. Apply Mr. G. Allen, F.R.I.B.A., 435 Strand, W.C.2. Deposit £3 3s.

January 5.—**HOUSES. Tunbridge Wells.**—Erection of houses for the working classes at the following sites, for the Tonbridge R.D.C. :—Two, Mount Pleasant Road, Paddock Wood; eight, Golden Green, Hadlow; four, Shipbourne Road, Hildenborough; eight, Capel. Apply Mr. F. Harris, Engineer and Surveyor, Broadway, Southborough, Tunbridge Wells. Deposit £1 1s.

January 8.—**REBUILDING. Church and Beddau.**—Rebuilding the Cross Inn, Church Village, and the Gelynog Inn, Beddau, for the Rhondda Valley and Ely Breweries, Ltd. Apply Rhondda Valley and Ely Breweries, Ltd., Taff Street, Pontypridd. Deposit £2 2s.

January 8.—**LAUNDRY. Birmingham.**—Erection of central establishment laundry, Woodcock Street, for the Baths Committee. Apply Mr. A. McKewan, F.R.I.B.A., Architect, King's Court, 115 Colmore Row, Birmingham. Deposit £2.

January 8.—**HOUSES. Saltcoats.**—Erection of 10 additional houses on the site adjoining Jacks Road, Saltcoats, for the T.C. Apply Mr. H. Thomson, Architect, 60 Hamilton Street, Saltcoats. Deposit £1.

January 10.—**SUPERSTRUCTURE. Walton-on-Thames.**—Construction of the superstructure for the extension of the existing engine-house, boiler-house, elevated coal bunkers, and alterations to existing works, &c., at Walton-on-Thames, for the Metropolitan Water Board. Apply Mr. H. E. Stilgoe, M.I.C.E., Chief Engineer. Deposit £5.

January 12.—**ADDITIONS, &c. Lingwood, &c., Norfolk.**—Additions and repairs to the farmhouses at the Church Farm, Lingwood, and the Green Farm, North Burlingham, Norfolk, for the Norfolk Small Holdings Committee. Apply County Land Agent, Shirehouse, Norwich. Deposit £1 1s.

January 13.—**HOUSE. Blaenanerch.**—Erection of a dwelling-house and outbuildings at Tremain. Apply Brynhyfryd, Blaenanerch.

January 17.—**IMPROVEMENTS, &c. Bettws.**—Carrying out improvements, interior reconstruction, new seating, &c., for the Committee of the C.M. Church, Bettws, near Newtown. Apply Mr. R. A. Ford, Architect and Surveyor, Llanidloes.

January 19.—**MARKET EXTENSION. Leeds.**—Extension of the Wholesale Meat Market, slaughterhouse, lairage, &c., in New York Street, for the Markets Committee. Apply Messrs. Braithwaite and Jackman, 6 South Parade, Leeds. Deposit £2 2s.

January 19.—**REBUILDING. London, E.C.**—Rebuilding of the Branch Post Office, Threadneedle Street, London, E.C., for H.M.O.W. Apply Contracts Branch, H.M. Office of Works, King Charles Street, London, S.W.1. Deposit £1 1s.

No Date.—**COVERING. Armley, Leeds.**—All trades except plasterers for covering over of yard in Hall Lane, Armley, for Messrs. Charles Hepworth and Son. Apply Mr. J. A. Webster, Architect, 12 Henley View, Hough Lane, Bramley.

No Date.—**PICTURE HOUSE. Bradford.**—Erection of picture house, North Wing, Bradford. Apply Messrs. Moore and Crabtree, Architects, Queensgate Chambers' Bradford.

ELECTRICAL.

December 30.—**WIRING. Halton, near Leeds.**—Electric wiring of 12 houses at Halton, near Leeds, for the Hunslet R.D.C. Apply Mr. W. P. Pindar, Clerk, Leek Street, Hunslet, Leeds.

January 1.—**SWITCHGEAR, &c. Cheadle.**—Sub-station switchgear (contract No. 2), and static transformers (contract No. 3), for the Cheadle and Gatley U.D.C. Apply Mr. C. H. Wordingham, C.B.E., M.I.C.E., M.I.E.E., 7 Victoria Street, Westminster, London, S.W.1, or 11 Mosley Street, Manchester. Deposit £3 3s. (contract No. 2); £1 1s. (contract No. 3).

January 1.—**ELECTRIFICATION. Manchester.**—Conversion of Davyhulme sewage works, Urmston, from steam to electric drive, for the Rivers Committee. Apply Secretary of the Rivers Department, Town Hall, Manchester.

January 9.—**CRANE. New Zealand.**—Supply and delivery of one electric travelling crane in connection with the Waikato power scheme, section 58. The crane is to be designed for lifting, traversing and travelling loads up to 27 tons. Apply Department of Overseas Trade (Room 50), 35 Old Queen Street, Westminster, London, S.W.1.

January 9.—**PLANT. London, E.C.**—Supply of the following plant for electrification of Bombay suburban lines, for the Great Indian Peninsula Railway Co., viz. :—(1) Electrical equipment of coaches, fee for specification £2; (2) overhead equipment of permanent way and overhead distribution lines, £2. Apply Company's Offices, 48 Copthall Avenue, E.C.2.

January 15-31.—**PLANT. Melbourne.**—Supply, delivery, &c., of plant for the Morwell power scheme. for the State Electricity Commission of Victoria. Apply Agent-General for Victoria, Melbourne Place, Strand, London, W.C.2. Deposit £2 2s.

January 17.—**TELEPHONE AND TELEGRAPH APPARATUS, &c. Perth; Australia.**—Supply and delivery of telephone apparatus, testing instruments, and protective apparatus (schedule No. W.A. 751). Apply Department of Overseas Trade (Room 49), 35 Old Queen Street, Westminster, London, S.W.1.

January 26.—**ELECTRIC LIGHTING PLANT. Malmesbury, S. Africa.**—Electric lighting plant for Malmesbury as follows: (1) Supply, delivery, and erection of (a) superheated steam engines, boilers, pumps, piping, valves, alternatively (b) suction gas engines and producers, alternatively (c) Diesel oil engine and all accessories, with dynamos, and switchboard in power-station; the supply of all necessary cables and connections, trenches, chequer plating, hand rails, and the leaving of same in good working order, and completed according to specification and guarantee in a thoroughly efficient manner. (2) Supply, delivery, and erection of poles, overhead cables, street lamps and standards, house connections, &c., and all sundries and incidental material necessary to complete the outside work from the switchboard in the power-station to the consumer's premises, according to specification and guarantee, with the exception of items contained in (3). (3) Supply and delivery on site of meters and general testing instruments as specified. (4) Supply, delivery, erection of battery, connection to switchboard, and all sundries attached thereto as specified. Apply Department of Overseas Trade (Room 49).

ENGINEERING.

December 28.—**WATER MAIN. Southborough, Kent.**—Provision and laying of about 1,500 yards of 10 in. cast-iron water main and 6 in., 4 in., and 3 in. connections to existing branches in the main road, Southborough, for the Southborough U.D.C. Apply Messrs. G. and F. W. Hodson, Bank Chambers, Loughborough and London. Deposit £5 5s.

December 30.—**WIDENING BRIDGE. Mirfield.**—Widening of Nun Brook Bridge, which carries the Dewsbury and Elland main road over Nun Brook, within the urban district of Mirfield, for the West Riding C.C. Apply West Riding Surveyor, County Hall, Wakefield. Deposit £1.

January 1.—**CONDUIT. Littleton and Hampton.**—Construction of about 35 yards of twin 96 in. diameter reinforced concrete conduits and about 3,900 lineal yards of 72 in. reinforced concrete conduit from Littleton to Kempton, also the laying only of about 2,000 yards of 48 in. diameter cast-iron pipe from Kempton to Hampton, together with a concrete intake channel to the Staines aqueduct and for contingent works, for the Metropolitan Water Board. Apply Offices of the Board, Chief Engineer's Department (Room 201). Deposit £20.

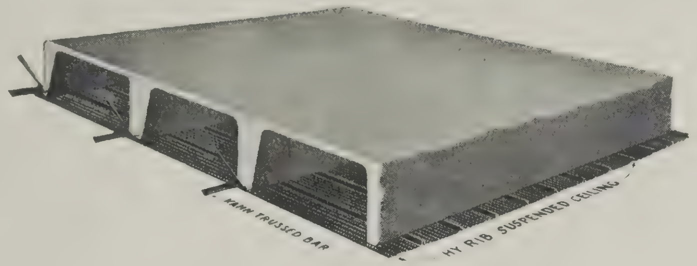
January 1.—**ECONOMISER. Basford.**—Removal of the existing economiser and the supply, delivery and erection of a new economiser, for the Guardians of Basford Union. Apply Mr. H. Stone, Clerk, Public Offices, Basford, Nottingham. Deposit £2 2s.

January 1.—**BRIDGE. Oxford.**—Reconstruction of Bulstake Bridge, for the T.C. Apply Mr. J. E. Wilkes, City Engineer, Town Hall, Oxford. Deposit £5 5s.

(*Continued on page* xx.)

TRUSCON HOLLOW FLOOR

Long Span Slabs
with Flat Ceilings



THIS floor, being hollow, is soundproof, as well as fireproof, and is invaluable for Offices, Hospitals, Schools, Hotels, Flats and similar buildings.

It is the lightest floor procurable, and owing to its simplicity of construction is very economical.

This floor has been used in some of the largest buildings in England.

The Sphere of the Architect.

GREEN & ABBOTT
LTD.

MAYFAIR 5800.
473 Oxford Street,
London, W.1.

We beg respectfully to give notice that we shall be removing at the end of December to a nice old Georgian House, No. 123 Wigmore Street, Portman Square, W.1.

January 3.—**WEIGHBRIDGES. London, E.C.**—Providing and fixing new self-contained coal-weighing weighbridges in the boiler-houses at several of the Board's institutions, for the Metropolitan Asylums Board. Apply Mr. T. Cooper, M.I.C.E., M.I.M.E., Engineer-in-Chief, Office of the Board, Embankment, E.C.4. Deposit £1.

January 6.—**BRIDGE. Glasgow.**—The Corporation of Glasgow invite designs and offers for the construction of a ferro-concrete bridge over the Clyde at Oswald Street. Apply Office of Public Works, City Chambers, 64 Cochrane Street.

January 8.—**WATERWORKS. Okehampton.**—Supply, laying, and jointing of about 1,000 yards of 5 in. and 4 in. cast-iron socket pipes with their appendages, including all necessary sluice and air valves, hydrants and other works, for the improvement of the water supply of the town, for the T.C. Apply Messrs. Nichols and Unwin, 11 Victoria Street, Westminster, S.W.1. Deposit £2.

January 8.—**BRIDGE. Southport.**—Construction of a new bridge over the London and North Western Railway, near Lloyds Siding, Birkdale, for the Town Planning and Improvement Committee. Apply Mr. A. E. Jackson, M.I.C.E., Borough Engineer, Town Hall, Southport. Deposit £4 4s.

January 9.—**PIPELAYING. Bideford.**—Supplying and laying about 3,500 lineal yards (about 100 tons) of 6 in., 4 in., 3 in., and 2 in. cast-iron pipes, together with sundry valves, for the U.D.C. Apply Messrs. St. George-Moore and La Trobe-Bateman, MM.I.C.E., 91 Victoria Street, Westminster, S.W.1, or Mr. R. E. L. Hookway, Borough Engineer, Bideford. Deposit £1.

January 11.—**STEEL ROOF, &c. Preston.**—Designs and tenders for the supply and erection of steel roof and covering over the Fish Market, Preston, for the Corporation. Apply Borough Surveyor, Town Hall, Preston.

January 27.—**PLANT. Birmingham.**—Supply and erection of plant for refuse destructor and salvage works, Brookvale Road, Witton, for the Salvage and Stables Committee. Apply Mr. J. Jackson, Superintendent, Salvage Department, 161 Corporation Street, Birmingham Deposit £1 1s.

February 8.—**FLOATING CRANES. Antwerp.**—Supply, in one lot, of two 10-ton floating cranes complete with the necessary accessories required for the Port of Antwerp. Apply Department of Overseas Trade (Room 50). Deposit 50,000 frcs.

March 7.—**ASH AND DUST EXTRACTION PLANT. Melbourne.**—Supply, delivery, &c., of ash and dust extraction plant (specification No. 23–6), for the Morwell power scheme. Apply Agent-General for Victoria, Melbourne Place, Strand, London, W.C.2. Deposit £2 2s.

ROADS AND SEWERS.

December 28.—**ROAD WORKS. Little Stanmore, Middlesex.**—Kerbing, channelling, paving, and making-up of the following streets, all in the parish of Little Stanmore, for the Hendon R.D.C.: Churchill Road, Gresham Road, and Montgomery Road. Apply Mr. H. W. Rackham, Engineer and Surveyor, Stanmore. Deposit £2 2s.

December 28.—**STREET WORKS. Waterloo-with-Seaforth, Lancs.**—Works of sett paving, concreting, flagging, kerbing, draining, &c., in Seaforth Road, Seaforth, for the Waterloo-with-Seaforth U.D.C. Apply Mr. J. R. Fothergill, A.M.I.C.E., Surveyor to the Council.

December 29.—**ROAD WORKS. Southport.**—Levelling, paving, metalling and making good Chesterfield Road and Sandringham Road, Ainsdale, for the Highways Committee. Apply Mr. A. E. Jackson, M.I.C.E., Borough Engineer, Town Hall, Southport. Deposit £2 2s.

January 1.—**SANITARY FITTINGS, &c. Burghill, Hereford.**—Providing and fixing sanitary fittings and hot-water supply at the Burghill Isolation Hospital. Apply Mr. E. G. Davies, M.S.A., Architect, 132 Widemarsh Street, Hereford.

January 1.—**ROAD WORKS. Tipton.**—Levelling, forming, making, fencing and other work as required for the construction of four hard tennis courts at the Victoria Park, Tipton, for the Tipton U.D.C. Apply Office of Mr. W. H. Jukes, M.E., Engineer and Surveyor, Public Offices, Tipton. Deposit £1 1s.

January 3.—**FOOTPATHS. Carlisle.**—Works of excavation, providing and laying wood verges and tarmacadam footpaths in Rickerby Park, for the Corporation. Apply City Engineer, Fisher Street. Deposit 10s.

January 3.—**PAVING. Hammersmith.**—Paving of the carriageways and footways on the L.C.C. Old Oak estate (Eastern Section, Part 3), for the Hammersmith B.C. Apply Mr. R. H. Clucus, M.I.C.E., Borough Engineer and Surveyor, Town Hall, Hammersmith, W.6.

January 3.—**SEWAGE DISPOSAL WORKS. Sedgley.**—Provision, laying, and jointing of 12 in. and 9 in. stoneware pipe sewers; also for the construction of manholes, engine-house, pump well, sedimentation tanks, storm-water tanks, bacteria beds, humus tanks, sludge beds and other incidental works, for the U.D.C. Apply Engineers, Messrs. Willcox and Raikes, 63 Temple Row, Birmingham. Deposit £5 5s.

January 5.—**RELAYING SEWER. Eastrington, Yorks.**—Relaying 45 yards of sewer at Eastrington, for the Howden R.D.C. Apply Mr. W. Maston, Market Place, Howden.

January 6.—**CLOSETS, &c. Northallerton.**—Works proposed to be done at the Newby Wiske Council School, including the provision of new earth closets and iron fencing, for the North Riding of Yorkshire C.C. (Education Committee). Apply Mr. J. C. Wrigley, Education Offices, Northallerton.

ROK
ROOFING

FOR THE HOUSE

"ROK" Roofing is extensively used for houses, bungalows, etc., being cheaper than tiles (yet more durable than iron), an excellent non-conductor, acid, alkali, and vermin-proof.

"ROK" is quickly laid and a most economical roofing. Of an artistic standard grey colour, "Rok" is made in four thicknesses.

"ROK" also makes an excellent flooring. We use it in our offices.

Samples, catalogues, and expert advice gladly supplied.

"Expamet" "Exmet" "Expanded Metal"

Their Architectural Application.

ARCHITECTS and Engineers are now using Expanded Metal more extensively than ever before, because experiment and practical experience have proved that where tensional stress has to be withstood "Expamet" is the most efficient reinforcement for all constructional concrete work. As lathing, it proves a perfect key for plasterwork. In regard to "Exmet," it is the finest possible reinforcement for brickwork. Every variety of walling can be reduced in thickness by bonding with "Exmet," reduced in cost and laterally strengthened. For example, by using this material, a 4½ in. fence wall has been found to cost less than a galvanized iron fence of the same height and length.

Here, briefly, are the main uses which will interest Architects :—

Concrete Reinforcement.

Foundations, walls, floors, roofs, lintels, arches, tanks, piers, abutments, conduits, roadways. Regarding these and other works, meshes generally used for concrete work vary from ¾ in. to 6 in. Our service is at the disposal of Architects who need the best method of application, and designs and estimates will be prepared whenever necessary—free of charge.

Architects will find our No. 5 Pamphlet very useful for such works. Ask our advice.

Lathing for Plaster.

"BB" Expanded Metal Lathing forms an ideal key for plaster in ceilings, steelwork encasing, solid and hollow partitions, and exterior walls.

Actual practice proves that owing to the diamond mesh shape, a minimum quantity of plaster is required; very little falls off and is wasted.

"EXMET" Reinforcement for Brickwork.

Brick walls and structures can be materially strengthened by embedding "Exmet" Reinforcement in cement-mortar between courses at varying intervals.

Practical loading tests prove that a brick wall reinforced with "Exmet" acts as a beam and sustains very much heavier loads; therefore, thicknesses can be reduced with a consequent decrease in cost.

"Exmet" is particularly applicable for use in footings, sleeper walls, garden walls, curtain walls, cornices, parapets, and over openings; it is used considerably and is especially desirable in the walls of power-houses, factory buildings, and similar structures. The "Exmet" Pamphlet No. 4 gives full details, and is invaluable for reference.

There are many other uses for "Expamet," "BB" Lathing, and "Exmet." You will probably have your ideas on the application of these materials in your work; we welcome enquiries and offer the full extent of our organization in solving your problems. Do not hesitate to approach us.

Some Famous Buildings and their Story

By W. A. CLAPHAM, F.S.A., and W. H. GODFREY.

Buildings that have been the scene of historical events, or have played a distinctive part in the development of national life, are commonly dealt with either at tedious length and in unattractive style, or are dismissed in a few sentences detailing dates and particulars that are frequently inaccurate. After much original research the present authors have been able to throw a flood of fresh light on buildings that are of outstanding architectural character, or that have a story to tell.

The book is written in a most interesting style, and is a veritable mine of information.

One Volume (10 *in. by* 6½ *in.*) *Price* 5s. *net.* 275 *pages.*

Special Trade Terms to all Merchants and Distributors.

Apply also for full particulars of our Artistic Bungalows and Garages.

Architects will specially appreciate this Fencing. It is an addition to any building of which no estate owner or farmer would be ashamed.

Its strength and neatness are universally commented on; the galvanized hard steel cable and substantial triangular spars, sawn from large section timber, form an entirely decay-defying combination. On undulating ground there is nothing to touch it.

Omnilac
COPAL OAK VARNISH

THE IDEAL VARNISH

THERE is no secret behind the praise bestowed upon OMNILAC General Purpose Varnish by those who have used it for years past. OMNILAC is made from the right raw materials under expert supervision, and allowed the right time in which to properly mature. Trouble often arises through the use of varnish which has not been well matured, for varnish, like wine, improves with age. Where varnish is tanked for two or three years before being used it is kept under strict observation. Tests are made, both by the laboratory staff and the coach painters, so that it is extremely unlikely that any fault can pass undetected. It is these repeated tests, extended over long periods, which enable a uniform standard of quality to be maintained. OMNILAC Copal Oak Varnish is known for its durability and reliability.

Radiators neatly embodied in the Architects' vertical panel scheme.

for neat adaptability

Conventional arrangements are like empirical methods of design—they are inadaptable to the special case. Sulzer Heating is simply exact knowledge and great experience. Therefore it is adaptable to the unusual, as example above.

Small Houses of the late Georgian Period

1750–1820

By STANLEY C. RAMSEY F.R.I.B.A.

Mainly through the efforts of a small band of enthusiasts, the Late Georgian house is now widely known; and to-day it is generally realized that no other period of domestic building so truly reflects the engaging characteristics of typical English home life.

The book contains about 100 carefully selected examples of small houses—both town and country—all finely reproduced to a large size from photographs specially taken under the direct supervision of the author, who has written an illuminating study of the whole period, dealing not only with the purely architectural aspect of the subject, but showing how, with true historical instinct, these charming little houses arose from the ocial and industrial conditions of he time.

Apart from its immediate practical utility as a rich fund of suggestions or the design of modern houses, this book is of positive educational value s affording a complete survey of most interesting phase of house esign. It appeals irresistibly to ll architects and to all lovers of rchitecture.

THE MODERN HOUSE

❦ ❦ ❦

Economy

ECONOMY must be the keynote of the Modern House both in building and in running costs.

Modern gas appliances mean economy in building costs. They save space and obviate the necessity of expensive chimney breasts.

Modern gas appliances mean economy of labour and money. They are clean, convenient and reliable. Being under the immediate control of the user, absolute economy can be rigorously exercised.

MODERN HOUSES SHOULD HAVE ECONOMICAL EQUIPMENT

Experience counts

ON the introduction of the Multigraph Machine into this country the International Multigraph Company were unable to obtain printing plates perfect enough to satisfy the high standard of work they knew their machines could produce.

IN 1910 we were called in by the Company and asked to produce a more perfect printing plate. So satisfactory were the results of our work that we are, and have been for the past eleven years, plate makers to the International Multigraph Company; and on this sound basis we have built up a most complete and efficient service. As the outcome of this we now number among our most valued clients some of the leading Industrial concerns, Banks, and Insurance Companies in the United Kingdom.

AVAIL yourselves of our Multigraph Plate Making Service, and ensure the best possible results from your Machine.

ARCHITECTURAL ETCHINGS *of* FRANK BRANGWYN, R.A.

The Collector's Edition of Reproductions.

Many great artists have paid tribute to Architecture as the Mistress Art, and she has inspired some of their finest work. Mr. Frank Brangwyn, R.A., has long been under her spell, and few indeed are the artists who have had it in their power to lay such lavish gifts as his at her feet.

The Etchings reveal in the full strength of its maturity the artist's consummate skill in expressing the spirit and laying bare the very soul of a building ; his touch revealing its content of grandeur, nobility, dignity, quaintness, its individuality, and its human interest. No characteristic of a building eludes the artist's penetrative vision.

The Fifteen Etchings reproduced in this edition, which has been prepared with an especial view to the requirements of the Architectural profession, were selected by the artist himself, who also passed all the Plates. These Plates form a magnificent series, and in size, subject, and treatment are a distinctly covetable possession. The Plates are printed by hand on hand-made paper and are protected by mounts, the size of the Plates being about 14 by 12 in., and with mounts, 24 by 19 in.

The Fifteen Etchings reproduced are :—

Old Houses, Ghent.
St. Peter's of the Exchange, Genoa.
Mosque of Ortakevi, Constantinople.
Notre Dame, Eu.
Abbey of St. Leonard's.
Pont Valentre, Cahors.
Building South Kensington Museum.
Pont Neuf, Paris.
St. Austrebert, Montreuil.
St. Walburgh, Furnes.
Apse of St. Walburgh, Furnes.
Santa Maria della Salute from the Street.
Browning's House, Venice.
Gate of Naples.
St. Nicolas des Champs, Paris.

Single Copies - - - - - - -	£1 1 0
Complete Set of Fifteen in Portfolio - - -	10 10 0

Extra for framing in Ebony or Mahogany, 10/6 per print.

An Illustrated Prospectus will be sent on application.
